PolyObjects are more restricted than TriObjects in that they only support "manifold topology". That is to say, you can't create "rat's nest" meshes out of polygon meshes. Each edge in a polygon mesh can be referenced only once on each "side", with a well defined "outside" and "inside" direction for every element of polygons. In TriObjects, you could create a mesh with 5 vertices and 3 faces: (0,1,2), (0,1,3), and (0,1,4). This would be illegal in PolyObjects because the edge (0,1) is referenced in the (0->1) direction by three different faces. (0,1,2), (1,0,3) would be a legal pair of faces, however, because the (0,1) edge is referenced only once in each direction. This implies also that the two faces have consistent normals - there's a well-defined inside and outside at the edge. It's impossible to have neighboring faces have inconsistent normals in a PolyObject, which is why the FlipNormals method in Editable Poly only works on entire elements.

PolyObjects have a complete edge list present virtually all the time. They also have full topological links - the edges reference the vertices and faces they use, the faces reference the vertices and edges, and the vertices also reference the edges and faces. This is somewhat wasteful of memory, but it makes it very easy to navigate the mesh and do complex algorithms like subdivision or Booleans. (Of course this also means there's more to keep track of in these operations.)

Mesh objects flowing up the pipeline should be freely convertible between TriObjects and PolyObjects. Virtually all data should be preserved in converting back and forth between these types. Exceptions include PolyObject edge data, such as crease values, which are lost upon conversion to TriObjects (since TriObjects have no edge lists).

Virtually all the public methods of PolyObject are based on the equivalent

methods in TriObject. class PolyObject provides implementations of all the required methods of Animatable, ReferenceMaker, ReferenceTarget, Base Object, Object, and GeomObject. All methods of this class are implemented by the system.

#### **Data Members:**

public:

**MNMesh mm;**

See [class MNMesh](#) for information about manipulating the mesh.

**The following global functions are not part of this class but are available for use:**

#### **Function:**

**ClassDesc\* GetPolyObjDescriptor();**

#### **Remarks:**

Gets the class descriptor for the PolyObject.

#### **Function:**

**void RegisterEditPolyObjDesc(ClassDesc\* desc);**

#### **Remarks:**

Allows a plugin to register an Editable Poly object. (This is done by epoly.dlo in the standard 3ds max distribution.) This is the object which is collapsed to when the stack is collapsed. The default if no such object is registered is to simply collapse to a PolyObject (which has no UI parameters).

#### **Parameters:**

**ClassDesc\* desc**

A pointer to the class descriptor.

#### **Function:**

**ClassDesc\* GetEditPolyObjDesc();**

#### **Remarks:**

This method is available in release 4.0 and later only.

Gets the class descriptor for the currently registered Editable Poly object.

**Function:**

**PolyObject \*CreateEditablePolyObject();**

**Remarks:**

This method is available in release 4.0 and later only.

Returns an Editable Poly object from the currently registered EPoly descriptor, cast as a PolyObject.

**Methods:**

public:

**Prototype:**

**DWORD GetSubSelState();**

**Remarks:**

This method returns the selection levels defined for class MNMesh:

**MNM\_SL\_OBJECT** (0), **MNM\_SL\_VERTEX** (1),  
**MNM\_SL\_EDGE** (2), and **MNM\_SL\_FACE** (3).

**Prototype:**

**void SetSubSelState(DWORD s);**

**Remarks:**

This method allows you to set the selection levels defined for class MNMesh:

**MNM\_SL\_OBJECT** (0), **MNM\_SL\_VERTEX** (1),  
**MNM\_SL\_EDGE** (2), and **MNM\_SL\_FACE** (3).

**Parameters:**

**DWORD s**

The selection level to set.

**Prototype:**

**BOOL CheckObjectIntegrity();**

**Remarks:**

Uses the **MNMesh::CheckAllData()** method, which uses **DebugPrint()** to give details about any errors that it finds.

**Prototype:**

**MNMesh& GetMesh();**

**Remarks:**

Accessor for the MNMesh mm data member.

**Displacement mapping subdivision methods in PolyObject**

Displacement mapping in materials can be enhanced by a subdivision algorithm which subdivides as needed based on the map. This algorithm is implemented in class TriObject, but can be accessed by PolyObjects since they need to convert to TriObjects for rendering anyway. The following methods are used to access and set the displacement mapping parameters.

**Prototype:**

**BOOL CanDoDisplacementMapping();**

**Remarks:**

Implementation of a class GeomObject method which indicates whether or not this object supports displacement mapping. It returns true as long as **GetDisplacementDisable()** returns false.

**Prototype:**

**void SetDisplacementApproxToPreset(int preset);**

**Remarks:**

Sets displacement subdivision parameters to match one of the standard displacement approximation presets.

**Parameters:**

**int preset**

Should be 0 for low, 1 for medium, or 2 for high.

**Prototype:**

**void SetDisplacementDisable (bool disable);**

**Remarks:**

Disables displacement subdivision (without altering the parameters).

**Parameters:**

**bool disable**

TRUE to disable; FALSE to enable.

**Prototype:**

**void SetDisplacementParameters (TessApprox & params);**

**Remarks:**

Sets most of the displacement parameters. See [class TessApprox](#) for details.

**Parameters:**

**TessApprox & params**

The tessellation approximation data.

**Prototype:**

**void SetDisplacementSplit (bool split);**

**Remarks:**

Controls displacement subdivision splitting.

**Parameters:**

**bool split**

TRUE to set; FALSE to unset.

**Prototype:**

**void SetDisplacement (bool displace);**

**Remarks:**

Turns displacement on or off.

**Parameters:**

**bool displace**

TRUE to turn on; FALSE to turn off.

**Prototype:**

**bool GetDisplacementDisable () const;**

**Remarks:**

Indicates whether displacement subdivision is currently disabled.

**Prototype:**

**TessApprox GetDisplacementParameters () const;**

**Remarks:**

Accesses most of the displacement parameters. See [class TessApprox](#) for details.

**Prototype:**

**bool GetDisplacementSplit () const;**

**Remarks:**

Indicates whether displacement subdivision splitting is on.

**Prototype:**

**bool GetDisplacement () const;**

**Remarks:**

Indicates whether displacement subdivision is on.

**Prototype:**

**TessApprox &DispParams();**

**Remarks:**

Accessor method for the displacement subdivision parameters that can be quicker to use than **SetDisplacementParameters()** and **GetDisplacementParameters()**.

**Prototype:**

**BOOL IsPointSelected(int i)**

**Remarks:**

This method is available in release 4.2 and later only.

Returns TRUE if the 'i-th' point is selected; otherwise FALSE.

**Parameters:**

**int i**

The zero based index of the point to check.

**Prototype:**

**float PointSelection(int i);**

**Remarks:**

This method is available in release 4.2 and later only.

Returns a floating point weighted point selection.

**Parameters:**

**int i**

The zero based index of the point to check.

**Return Value:**

Returns 1.0f if selected and 0.0f if not.

**Prototype:**

**float BOOL PolygonCount(TimeValue t, int& numFaces, int& numVerts);**

**Remarks:**

This method is available in release 4.2 and later only.

Retreives the number of faces and vertices of the polyginal mesh representation of the object. Note: Plug-In developers should use the global function GetPolygonCount(Object\*, int&, int&) to retrieve the number f vertices and faces in an arbitrary object.

**Parameters:**

**TimeValue t**

The time at which to compute the number of faces and vertices.

**int& numFaces**

The number of faces is returned here.

**int& numVerts**

The number of vertices is returned here.

**Default Implementation:**

```
{ return TRUE; }
```

## Class EPoly

See Also: [Class FPMixinInterface](#), [Class MNMesh](#), [Class IParamBlock2](#), [List of Edge Data Channels](#), [List of Vertex Data Channels](#)

```
class EPoly : public FPMixinInterface
```

### Description:

This class is available in release 4.0 and later only.

The EPoly class is the main interface to the Editable Poly Object. This class is a virtual class with no data members. More details can be found in the SDK samples under `\MAXSDK\SAMPLES\MESHEDITABLEPOLY`.

[Cache and update methods](#)

[Selection and component flag access](#)

[UI Button and Command Mode methods](#)

[Transform Methods](#)

[Slice plane accessors](#)

[Component data access methods](#)

[Displacement approximation methods](#)

[Drag operations](#)

[Regular Operations](#)

### Prototype:

```
FPInterfaceDesc *GetDesc();
```

### Remarks:

This method returns a description of the published function interface (for scripter access to EPoly functions).

### Prototype:

```
virtual MNMesh *GetMeshPtr();
```

### Remarks:

This method returns a pointer to the Editable Poly's **MNMesh**. See [class MNMesh](#) for fun things to do with an MNMesh.

### Default Implementation:

```
{ return NULL; }
```

### Prototype:

```
virtual IParamBlock2 *getParamBlock();
```

### Remarks:

Gets a pointer to the Editable Poly's parameter block, which can be used to get or set Editable Poly UI parameters. (See class IParamBlock2 for more information on access methods.) Here is a list of the available parameters, as defined in the ePolyParameters enum near the top of **iEPoly.h**. (Please see the Editable Poly documentation in the normal 3ds max User Reference file for more information on these parameters.)

#### Selection dialog parameters:

**ep\_by\_vertex**: select by vertex (checkbox)

**ep\_ignore\_backfacing**: Ignore backfacing (checkbox)

**ep\_show\_normals**: Currently unused.

**ep\_normal\_size**: Currently unused.

#### Soft Selection dialog parameters:

**ep\_ss\_use**: Use soft selection (checkbox)

**ep\_ss\_retro**: Currently unused

**ep\_ss\_edist\_use**: Use edge-based distances to compute soft selection (checkbox)

**ep\_ss\_edist**: Maximum number of edges to traverse in computing edge-based distances (int spinner - range: 1-999999)

**ep\_ss\_affect\_back**: Affect backfacing in soft selection (checkbox)

**ep\_ss\_falloff**: Falloff value for soft selection (float spinner)

**ep\_ss\_pinch**: Pinch value for soft selection (float spinner)

**ep\_ss\_bubble**: Bubble value for soft selection (float spinner)

#### Edit Geometry dialog parameters:

**ep\_extrusion\_type**: Type of face extrusion. (Radio.) Values:

**0**: Extrude by group (cluster)

**1**: Extrude by local normals

**2:** Extrude by polygon - each polygon extrudes separately.

**ep\_split:** Controls whether the Cut algorithm splits the mesh open.  
(Checkbox)

**ep\_refine\_ends:** Currently unused

**ep\_weld\_threshold:** Threshold for welding selected vertices. (float spinner)

**ep\_weld\_pixels:** Pixel threshold for Target welding (int spinner)

**Subdivide dialog parameters:**

**ep\_ms\_smoothness:** Smoothness value for MeshSmooth type subdivision  
(float spinner, range 0-1)

**ep\_ms\_smooth:** Currently unused.

**ep\_ms\_sep\_smooth:** Separate by smoothing groups for MeshSmooth type subdivision (checkbox)

**ep\_ms\_sep\_mat:** Separate by material IDs for MeshSmooth type subdivision (checkbox)

**ep\_tess\_type:** Tessellation type (Radio) Values:

**0:** by edge

**1:** by face.

**ep\_tess\_tension:** Tessellation tension (float spinner)

**Surface Properties dialog parameters (object level):**

**ep\_surf\_subdivide:** Apply NURMS-style MeshSmooth subdivision to polymesh. (checkbox)

**ep\_surf\_subdiv\_smooth:** Apply MeshSmooth smoothing group algorithm after subdividing (checkbox)

**ep\_surf\_ig\_sel:** Currently unused.

**ep\_surf\_iter:** Number of iterations of subdivision (int spinner)

**ep\_surf\_thresh:** "Smoothness" threshold for adaptive subdivision (float spinner, range 0-1)

**ep\_surf\_riter:** Render value of iterations (int spinner)

**ep\_surf\_rthresh:** Render value of smoothness threshold (float spinner, range 0-1)

**ep\_surf\_use\_riter:** Use Render iterations value when rendering (checkbox)

**ep\_surf\_use\_rthresh:** Use Render smoothness threshold when rendering (checkbox)

**ep\_surf\_sep\_smooth:** Separate by smoothing groups in subdivision (checkbox)

**ep\_surf\_sep\_mat:** Separate by materials in subdivision (checkbox)

**ep\_surf\_update:** Update type for subdivision (radio). Values:

0: Update always

1: Update when rendering

2: Update manually

**Surface Properties dialog parameters (vertex level):**

**ep\_vert\_sel\_color:** Target color for select-by-color (color swatch)

**ep\_vert\_selc\_r:** Tolerance of red values in select-by-color. (int spinner, range 0-255)

**ep\_vert\_selc\_g:** Tolerance of green values in select-by-color. (int spinner, range 0-255)

**ep\_vert\_selc\_b:** Tolerance of blue values in select-by-color. (int spinner, range 0-255)

**ep\_vert\_color\_selby:** Which kind of color to select by in select-by-color. Radio values:

0: Select by regular vertex color

1: Select by vertex illumination

**Surface Properties dialog parameters (face level):**

**ep\_face\_smooth\_thresh:** Autosmooth threshold (float spinner, angle units).

**Subdivision Displacement parameters (object level):**

**ep\_sd\_use:** Apply subdivision displacement (checkbox)

**ep\_sd\_split\_mesh:** Split the mesh (checkbox)

**ep\_sd\_method:** Subdivision displacement method (radio). Values:

0: Regular method

1: Spatial method

2: Curvature method

3: Use both spatial & curvature methods.

**ep\_sd\_tess\_steps:** Tessellation steps (for regular method) (int spinner)

**ep\_sd\_tess\_edge:** Edge size (for spatial method) (float spinner)

**ep\_sd\_tess\_distance:** Distance (for curvature method) (float spinner)

**ep\_sd\_tess\_angle:** Angle value (for curvature method) (float spinner)

**ep\_sd\_view\_dependent:** View dependency (checkbox)

**Advanced Subdivision Displacement parameters:**

**ep\_asd\_style:** Subdivision style. Radio values:

**0:** Grid-based

**1:** Tree-based

**2:** Delauney algorithm.

**ep\_asd\_min\_iters:** Minimum number of iterations (grid or tree style) (int spinner)

**ep\_asd\_max\_iters:** Maximum number of iterations (grid or tree style) (int spinner)

**ep\_asd\_max\_tris:** Maximum number of triangles (Delauney style) (int spinner)

**Default Implementation:**

```
{ return NULL; }
```

## Cache and update methods

**Prototype:**

```
virtual void LocalDataChanged(DWORD parts);
```

**Remarks:**

This method is used to indicate to the EPoly that some parts of its mesh have changed. This is automatically handled by most EPoly methods; you only need to use it if you're directly manipulating the mesh yourself.

**Parameters:**

**DWORD parts**

Parts of the mesh that have been changed, such as **PART\_GEOM**, **PART\_TOPO**, etc.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void InvalidateSoftSelectionCache();
```

**Remarks:**

This method invalidates soft selection values in the mesh and in any cached data.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void InvalidateDistanceCache();
```

**Remarks:**

This method invalidates pre-computed distances on which soft selection values are based (as well as soft selection values) - note this is automatically done when you call **LocalDataChanged (PART\_GEOM)**. This should also be done if the soft selection parameters are changed.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void RefreshScreen();
```

**Remarks:**

This is a handy method that does a simple call to **ip->RedrawViewports**. Also updates the named selection dropdown list. Also, if the EPoly project has been compiled as a debug build, it will verify that the MNMesh is free of errors using the **MNMesh::CheckAllData** method.

**Default Implementation:**

```
{ }
```

**Prototype:**

**virtual bool Editing();**

**Remarks:**

This method indicates if the Editable Poly object is currently being edited in the modifier panel (and has its UI present).

**Default Implementation:**

```
{ return FALSE; }
```

## Selection and component flag access

**Prototype:**

```
virtual int GetEPolySelLevel();
```

**Remarks:**

This method returns the EPoly selection level, as defined by the **ePolySelLevel enum**: One of the following values; **EP\_SL\_OBJECT**, **EP\_SL\_VERTEX**, **EP\_SL\_EDGE**, **EP\_SL\_BORDER**, **EP\_SL\_FACE**, **EP\_SL\_ELEMENT**.

**Default Implementation:**

```
{ return EP_SL_OBJECT; }
```

**Prototype:**

```
virtual int GetMNSelLevel();
```

**Remarks:**

This method returns the MNMesh's selection level, as defined by the **PMeshSelLevel enum** in **MNMesh.h**: one of the following; **MNM\_SL\_OBJECT**, **MNM\_SL\_VERTEX**, **MNM\_SL\_EDGE**, **MNM\_SL\_FACE**. (Note that the Editable Poly selection levels **EP\_SL\_BORDER** and **EP\_SL\_ELEMENT** are considered varieties of **MNM\_SL\_EDGE** and **MNM\_SL\_FACE** selection types, respectively.)

**Default Implementation:**

```
{ return MNM_SL_OBJECT; }
```

**Prototype:**

**virtual void SetEPolySelLevel(int level);**

**Remarks:**

This method sets the Editable Poly selection level.

**Parameters:**

**int level**

Possible values are defined by the **ePolySelLevel enum**: one of **EP\_SL\_OBJECT**, **EP\_SL\_VERTEX**, **EP\_SL\_EDGE**, **EP\_SL\_BORDER**, **EP\_SL\_FACE**, **EP\_SL\_ELEMENT**.

**Default Implementation:**

{ }

**Prototype:**

**virtual bool EpGetVerticesByFlag(BitArray & vset, DWORD flags, DWORD fmask=0x0);**

**Remarks:**

This method fills in a **BitArray** depending on whether or not each **MNVert** in the **MNMesh** has a particular flag or set of flags set or cleared.

Example: for instance to set the **BitArray** according to selected vertices, you'd just call **EpGetVerticesByFlag (vset, MN\_SEL)**. But to find vertices which do not have the **MN\_DEAD** flag set, but which do have the **MN\_WHATEVER** flag set, you'd call **EpGetVerticesByFlag (vset, MN\_WHATEVER, MN\_WHATEVER|MN\_DEAD)**.

**Parameters:**

**BitArray & vset**

The array for output to be stored in. The **vset** will be set to size of the number of verts in the mesh.

**DWORD flags**

The flags we're looking for in the vertices

**DWORD fmask=0x0**

The mask of flags we're checking. This is automatically or'd with "flags".

**Return Value:**

TRUE if successful, otherwise FALSE.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EpGetEdgesByFlag(BitArray & eset, DWORD flags,  
    DWORD fmask=0x0);
```

**Remarks:**

This method fills in a **BitArray** depending on whether or not each **MNEdge** in the **MNMesh** has a particular flag or set of flags set or cleared.

Example: for instance to set the **BitArray** according to selected edges, you'd just call **EpGetEdgesByFlag (eset, MN\_SEL)**. But to find edges which do not have the **MN\_DEAD** flag set, but which do have the **MN\_WHATEVER** flag set, you'd call **EpGetEdgesByFlag (eset, MN\_WHATEVER, MN\_WHATEVER|MN\_DEAD)**.

**Parameters:****BitArray & vset**

The array for output to be stored in. eset will be set to size of the number of edges in the mesh.

**DWORD flags**

The flags we're looking for in the edges

**DWORD fmask=0x0**

The mask of flags we're checking. This is automatically or'd with "flags".

**Return Value:**

TRUE if successful, otherwise FALSE.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EpGetFacesByFlag(BitArray & fset, DWORD flags,  
    DWORD fmask=0x0);
```

**Remarks:**

This method fills in a **BitArray** depending on whether or not each **MNFace**

in the **MNMesh** has a particular flag or set of flags set or cleared.

Example: for instance to set the **BitArray** according to selected faces, you'd just call **EpGetFacesByFlag (fset, MN\_SEL)**. But to find faces which do not have the **MN\_DEAD** flag set, but which do have the **MN\_WHATEVER** flag set, you'd call **EpGetFacesByFlag (fset, MN\_WHATEVER, MN\_WHATEVER|MN\_DEAD)**.

**Parameters:**

**BitArray & vset**

The array for output to be stored in. fset will be set to size of the number of faces in the mesh.

**DWORD flags**

The flags we're looking for in the faces

**DWORD fmask=0x0**

The mask of flags we're checking. This is automatically or'd with "flags".

**Return Value:**

TRUE if successful, otherwise FALSE.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual void EpSetVertexFlags(BitArray &vset, DWORD flags,  
DWORD fmask=0x0, bool undoable=true);
```

**Remarks:**

This method sets **MNVert** flags based on a **BitArray**.

Example: to hide vertices specified by the **BitArray**, you'd just call **EpSetVertexFlags (vset, MN\_HIDE)**. To unhide the vertices, you'd use **EpSetVertexFlags (vset, 0, MN\_HIDE)**.

**Parameters:**

**BitArray & vset**

This bitarray indicates which vertices should have their flags modified.

**DWORD flags**

The flags to set.

**DWORD fmask=0x0**

The flag mask - if it includes bits not in "flags", those bits are cleared in the specified vertices.

**bool undoable=true**

If (**undoable && theHold.Holding()**), a restore object for this flag change will be added to the current undo stack.

**Default Implementation:**

```
{ return; }
```

**Prototype:**

```
virtual void EpSetEdgeFlags(BitArray &eset, DWORD flags,  
    DWORD fmask = 0x0, bool undoable=true);
```

**Remarks:**

This method sets **MNEdge** flags based on a **BitArray**.

Example: to select edges specified by the **BitArray**, you'd just call **EpSetEdgeFlags (eset, MN\_SEL)**. To clear selection on the edges, you'd use **EpSetEdgeFlags (eset, 0, MN\_SEL)**.

**Parameters:****BitArray & vset**

This bitarray indicates which edges should have their flags modified.

**DWORD flags**

The flags to set.

**DWORD fmask=0x0**

The flag mask - if it includes bits not in "flags", those bits are cleared in the specified edges.

**bool undoable=true**

If (**undoable && theHold.Holding()**), a restore object for this flag change will be added to the current undo stack.

**Default Implementation:**

```
{ return; }
```

**Prototype:**

**virtual void EpSetFaceFlags(BitArray &fset, DWORD flags, DWORD fmask = 0x0, bool undoable=true);**

**Remarks:**

This method sets **MNFace** flags based on a **BitArray**.

Example: to hide faces specified by the **BitArray**, you'd just call **EpSetFaceFlags (fset, MN\_HIDE)**. To unhide the faes, you'd use **EpSetFaceFlags (fset, 0, MN\_HIDE)**.

**Parameters:**

**BitArray & vset**

This bitarray indicates which faces should have their flags modified.

**DWORD flags**

The flags to set.

**DWORD fmask=0x0**

The flag mask - if it includes bits not in "flags", those bits are cleared in the specified faces.

**bool undoable=true**

If (**undoable && theHold.Holding()**), a restore object for this flag change will be added to the current undo stack.

**Default Implementation:**

```
{ return; }
```

## **UI Button and Command Mode methods**

These methods allow the developer to simulate pushing the buttons available in the UI. Some buttons in Editable Poly, such as "Delete", complete an operation when pressed. Others, such as "Create", enter into an interactive command mode while they're depressed.

**Prototype:**

**virtual void EpActionButtonOp(int opcode);**

**Remarks:**

Completes the action corresponding to the specified UI button.

**Parameters:**

## **int opcode**

The list of "button operations" is defined by the **epolyButtonOp enum**.

Select dialog button operations:

**epop\_hide**: Hide current selection

**epop\_unhide**: Unhide current selection

**epop\_ns\_copy**: Copy named selection (brings up UI)

**epop\_ns\_paste**: Paste named selection (may bring up UI)

Edit Geometry dialog button operations:

**epop\_cap**: Cap currently selected borders

**epop\_delete**: Delete current selection.

**epop\_detach**: Detach current selection.

**epop\_attach\_list**: Attach any number of nodes using the attach by name dialog.

**epop\_split**: Split currently selected edges.

**epop\_break**: Break currently selected vertices

**epop\_collapse**: Collapse current selection

**epop\_reset\_plane**: Reset the slice plane

**epop\_slice**: Slice

**epop\_weld\_sel**: Weld current vertex or edge selection

**epop\_create\_shape**: Create a shape from current edge selection (brings up UI)

**epop\_make\_planar**: Make current selection planar

**epop\_align\_grid**: Align current selection to construction grid

**epop\_align\_view**: Align current selection at right angles to view.

**epop\_remove\_iso\_verts**: Remove isolated vertices

Subdivide dialog button operations:

**epop\_meshtsmooth**: Subdivide by MeshSmooth (NURMS Style)

**epop\_tessellate**: Subdivide by Tessellation

Surface Properties dialog button operations:

Object Level:

**epop\_update**: Update MeshSmooth subdivision

Vertex Level:

**epop\_selby\_vc:** Select by vertex color

Face Level:

**epop\_retriangulate:** Retriangulate currently selected faces

**epop\_flip\_normals:** Flip normals on currently selected elements

**epop\_selby\_matid:** Select faces by Material ID (brings up UI)

**epop\_selby\_smg:** Select faces by smoothing groups (brings up UI)

**epop\_autosmooth:** Autosmooth currently selected faces

**epop\_clear\_smg:** Clear all smoothing groups on currently selected faces.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void EpActionToggleCommandMode(int mode);
```

**Remarks:**

If the user is currently in the specified command mode, this method causes them to exit it. If the user is not, this method will enter it.

**Parameters:**

**int mode**

The list of command modes is defined by the **epolyCommandMode enum** and is given here for reference. (Their names are self-explanatory.)

**epmode\_create\_vertex**

**epmode\_create\_edge**

**epmode\_create\_face**

**epmode\_divide\_edge**

**epmode\_divide\_face**

**epmode\_extrude\_vertex** (note: currently inactive)

**epmode\_extrude\_edge** (note: currently inactive)

**epmode\_extrude\_face**

**epmode\_chamfer\_vertex**  
**epmode\_chamfer\_edge**  
**epmode\_bevel**  
**epmode\_sliceplane**  
**epmode\_cut\_vertex**  
**epmode\_cut\_edge**  
**epmode\_cut\_face**  
**epmode\_weld**  
**epmode\_edit\_tri**

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void EpActionEnterPickMode(int mode);
```

**Remarks:**

This method enters the specified pick mode, which is like a command mode but relates to picking nodes.

**Parameters:**

**int mode**

Currently there is only one pick mode supported by EPoly, which is defined in the **epolyPickMode enum: epmode\_attach**, which allows the user to pick a node to attach to this Editable Poly object.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void EpActionExitCommandModes();
```

**Remarks:**

This method exits from any command mode the system currently may be in.

**Default Implementation:**

{ }

## Transform Methods

### Prototype:

**virtual void MoveSelection(int level, TimeValue t, Matrix3& partm, Matrix3& tmAxis, Point3& val, BOOL localOrigin);**

### Remarks:

This method moves the current selection (including any soft selection) by the specified amount in the specified coordinate system.

### Parameters:

**int level**

The **enum ePolySelLevel**, being one of the following values;  
**EP\_SL\_OBJECT, EP\_SL\_VERTEX, EP\_SL\_EDGE, EP\_SL\_BORDER, EP\_SL\_FACE, EP\_SL\_ELEMENT.**

**TimeValue t**

The time at which to apply the move operation.

**Matrix3& partm**

The parent transformation matrix.

**Matrix3& tmAxis**

The transformation axis.

**Point3& val**

The vector describing the translation.

**BOOL localOrigin**

TRUE to move based on the local origin, otherwise FALSE.

### Default Implementation:

{ }

### Prototype:

**virtual void RotateSelection(int level, TimeValue t, Matrix3& partm, Matrix3& tmAxis, Quat& val, BOOL localOrigin);**

### Remarks:

This method rotates the current selection (including any soft selection) by the specified amount in the specified coordinate system.

**Parameters:**

**int level**

The **enum ePolySelLevel**, being one of the following values;  
**EP\_SL\_OBJECT, EP\_SL\_VERTEX, EP\_SL\_EDGE,**  
**EP\_SL\_BORDER, EP\_SL\_FACE, EP\_SL\_ELEMENT.**

**TimeValue t**

The time at which to apply the rotate operation.

**Matrix3& partm**

The parent transformation matrix.

**Matrix3& tmAxis**

The transformation axis.

**Quat& val**

The rotation quaternion.

**BOOL localOrigin**

TRUE to rotate based on the local origin, otherwise FALSE.

**Default Implementation:**

{ }

**Prototype:**

**virtual void ScaleSelection(int level, TimeValue t, Matrix3& partm, Matrix3& tmAxis, Point3& val, BOOL localOrigin);**

**Remarks:**

This method scales the current selection (including any soft selection) by the specified amount in the specified coordinate system.

**Parameters:**

**int level**

The **enum ePolySelLevel**, being one of the following values;  
**EP\_SL\_OBJECT, EP\_SL\_VERTEX, EP\_SL\_EDGE,**  
**EP\_SL\_BORDER, EP\_SL\_FACE, EP\_SL\_ELEMENT.**

**TimeValue t**

The time at which to apply the rotate operation.

**Matrix3& partm**

The parent transformation matrix.

**Matrix3& tmAxis**

The transformation axis.

**Point3& val**

The scaling value.

**BOOL localOrigin**

TRUE to scale based on the local origin, otherwise FALSE.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void ApplyDelta(Tab<Point3> & delta, EPoly *epol,  
TimeValue t);
```

**Remarks:**

This method applies a geometric "delta" vector to the current mesh at the specified time. (Note: if t!=0 and the system's animate feature is on, this will set keys.)

**Parameters:**

**Tab<Point3> & delta**

The table of geometry delta vectors.

**EPoly \*epol**

A pointer to the editable poly object to apply to.

**TimeValue t**

The time at which to apply the geometric delta.

**Default Implementation:**

```
{ }
```

**Slice plane accessors**

**Prototype:**

**virtual void EpResetSlicePlane();**

**Remarks:**

This method resets the slice plane.

**Default Implementation:**

```
{ }
```

**Prototype:**

**virtual void EpGetSlicePlane(Point3 & planeNormal, Point3 & planeCenter, float \*planeSize=NULL);**

**Remarks:**

This method returns the slice plane, as defined by its normal, center, and size. (Size is irrelevant for slicing, but defines the size of the slice gizmo the user sees.)

**Parameters:**

**Point3 & planeNormal**

The plane normal vector.

**Point3 & planeCenter**

The plane center.

**float \*planeSize=NULL**

The size of the plane.

**Default Implementation:**

```
{ }
```

**Prototype:**

**virtual void EpSetSlicePlane(Point3 & planeNormal, Point3 & planeCenter, float planeSize);**

**Remarks:**

This method sets the slice plane to have the specified normal, center, and size. (Unlike in **EpGetSlicePlane()**, size is not an optional argument here.)

**Parameters:**

**Point3 & planeNormal**

The plane normal vector.

## **Point3 & planeCenter**

The plane center.

## **float planeSize**

The size of the plane.

### **Default Implementation:**

```
{ }
```

## **Component data access methods**

### **Prototype:**

```
virtual Color GetVertexColor(bool *uniform=NULL, int *num=NULL, int mp=0, DWORD flag=MN_SEL, TimeValue t=0);
```

### **Remarks:**

This method obtains the vertex color for the flagged vertices in the indicated map channel.

### **Parameters:**

**bool \*uniform=NULL**

If non-NULL, the bool this pointer points to is set to true if all flagged vertices have the identical color, and false otherwise. (It's set to true if there are 0 vertices.)

**int \*num=NULL**

If non-NULL, the number of vertices currently flagged is computed and stored here.

**int mp=0**

The map channel we're using. Most vertex color applications use the standard vertex color channel, 0. However, you can also use this method with the Illumination channel (**MAP\_SHADING** = -1) or the alpha channel (**MAP\_ALPHA** = -2) - or even with a regular UVW map channel (1-99).

**DWORD flag=MN\_SEL**

This indicates the vertices we look at. If left at the default, selected vertices' colors are analyzed. If flag were to equal **MN\_WHATEVER**, then vertices with the **MN\_WHATEVER** flag would have their colors analyzed.

**TimeValue t=0**

This is not currently used.

**Return Value:**

The color of the flagged vertices, or black (0,0,0) if the vertices' colors are not the same.

**Default Implementation:**

```
{ return Color(1,1,1); }
```

**Prototype:**

```
virtual void SetVertexColor(Color clr, int mp=0, DWORD  
flag=MN_SEL, TimeValue t=0);
```

**Remarks:**

This method sets the vertex color for the flagged vertices in the indicated map channel.

**Parameters:****Color clr**

The color to set the vertices to.

**int mp=0**

The map channel we're using. Most vertex color applications use the standard vertex color channel, 0. However, you can also use this method with the Illumination channel (**MAP\_SHADING** = -1) or the alpha channel (**MAP\_ALPHA** = -2) - or even with a regular UVW map channel (1-99).

**DWORD flag=MN\_SEL**

This indicates which vertices we set. If left at the default, selected vertices' colors are set. If flag were to equal **MN\_WHATEVER**, then vertices with the **MN\_WHATEVER** flag would have their colors set.

**TimeValue t=0**

This is not currently used.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual Color GetFaceColor(bool *uniform=NULL, int *num=NULL, int mp=0, DWORD flag=MN_SEL, TimeValue t=0);
```

**Remarks:**

This method obtains the face color for the flagged faces in the indicated map channel.

**Parameters:**

**bool \*uniform=NULL**

If non-NULL, the bool this pointer points to is set to true if all flagged faces have the identical color, and false otherwise. (It's set to true if there are 0 flagged faces.)

**int \*num=NULL**

If non-NULL, the number of faces currently flagged is computed and stored here.

**int mp=0**

The map channel we're using. Most vertex color applications use the standard vertex color channel, 0. However, you can also use this method with the Illumination channel (**MAP\_SHADING** = -1) or the alpha channel (**MAP\_ALPHA** = -2) - or even with a regular UVW map channel (1-99).

**DWORD flag=MN\_SEL**

This indicates which vertices we set. If left at the default, selected vertices' colors are set. If flag were to equal **MN\_WHATEVER**, then vertices with the **MN\_WHATEVER** flag would have their colors set.

**TimeValue t=0**

This is not currently used.

**Return Value:**

The color of the flagged faces, or black (0,0,0) if the faces' colors are not the same.

**Default Implementation:**

```
{ return Color(1,1,1); }
```

**Prototype:**

```
virtual void SetFaceColor(Color clr, int mp=0, DWORD
```

**flag=MN\_SEL, TimeValue t=0);**

**Remarks:**

This method sets the vertex color for the flagged faces in the indicated map channel.

**Parameters:**

**Color clr**

The color to set the faces to.

**int mp=0**

The map channel we're using. Most vertex color applications use the standard vertex color channel, 0. However, you can also use this method with the Illumination channel (**MAP\_SHADING** = -1) or the alpha channel (**MAP\_ALPHA** = -2) - or even with a regular UVW map channel (1-99).

**DWORD flag=MN\_SEL**

This indicates which vertices we set. If left at the default, selected vertices' colors are set. If flag were to equal **MN\_WHATEVER**, then vertices with the **MN\_WHATEVER** flag would have their colors set.

**TimeValue t=0**

This is not currently used.

**Default Implementation:**

{ }

**Prototype:**

**virtual float GetVertexDataValue(int channel, int \*numSel, bool \*uniform, DWORD vertexFlags, TimeValue t);**

**Remarks:**

This method obtains floating-point vertex data from the flagged vertices in the specified vertex data channel.

**Parameters:**

**int channel**

The vertex data channel we're querying. See the [List of Vertex Data Channels](#) (which are defined in **mesh.h**).

**int \*numSel**

If non-NULL, this is filled in with the current number of flagged vertices.

**bool \*uniform**

If non-NULL, this is set to indicate whether the currently flagged vertices have uniform values or not.

**DWORD vertexFlags**

Indicates which vertices to evaluate. (Use **MN\_SEL** to get vertex data from selected vertices.)

**TimeValue t**

This is not currently used.

**Return Value:**

The vertex data value for the flagged vertices. If the vertices' values vary, the first value found is returned.

**Default Implementation:**

```
{ return 1.0f; }
```

**Prototype:**

```
virtual float GetEdgeDataValue(int channel, int *numSel, bool *uniform, DWORD edgeFlags, TimeValue t);
```

**Remarks:**

This method obtains floating-point edge data from the flagged edges in the specified edge data channel.

**Parameters:**

**int channel**

The edge data channel we're querying. See the [List of Edge Data Channels](#) (which are defined in **mnmesh.h**).

**int \*numSel**

If non-NULL, this is filled in with the current number of flagged edges.

**bool \*uniform**

If non-NULL, this is set to indicate whether the currently flagged edges have uniform values or not.

**DWORD edgeFlags**

Indicates which edges to evaluate. (Use **MN\_SEL** to get vertex data from selected vertices.)

### **TimeValue t**

This is not currently used.

### **Return Value:**

The edge data value for the flagged edges. If the edges' values vary, the first value found is returned.

### **Default Implementation:**

```
{ return 1.0f; }
```

### **Prototype:**

```
virtual void SetVertexDataValue(int channel, float w, DWORD  
vertexFlags, TimeValue t);
```

### **Remarks:**

This method sets floating-point vertex data for the flagged vertices in the specified vertex data channel.

### **Parameters:**

#### **int channel**

The vertex data channel we're modifying. See the [List of Vertex Data Channels](#) (which are defined in **mesh.h**).

#### **float w**

The value to set the flagged vertices to.

#### **DWORD vertexFlags**

Indicates which vertices to modify. (Use **MN\_SEL** to set vertex data in selected vertices.)

#### **TimeValue t**

This is not currently used.

### **Default Implementation:**

```
{ }
```

### **Prototype:**

```
virtual void SetEdgeDataValue(int channel, float w, DWORD  
edgeFlags, TimeValue t);
```

### **Remarks:**

This method sets floating-point edge data for the flagged edges in the specified edge data channel.

**Parameters:**

**int channel**

The edge data channel we're modifying. See the [List of Edge Data Channels](#) (which are defined in **mnmesh.h**).

**float w**

The value to set the flagged edges to.

**DWORD edgeFlags**

Indicates which edges to modify. (Use **MN\_SEL** to set edge data in selected edges.)

**TimeValue t**

This is not currently used.

**Default Implementation:**

{ }

**Prototype:**

**virtual void ResetVertexData(int channel);**

**Remarks:**

This method resets all vertex data in the specified channel. For instance, **ResetEdgeData (VDATA\_WEIGHT)** would reset all vertex weights to 1.

**Parameters:**

**int channel**

The vertex data. See the [List of Vertex Data Channels](#)

**Default Implementation:**

{ }

**Prototype:**

**virtual void ResetEdgeData(int channel);**

**Remarks:**

This method resets all edge data in the specified channel. For instance, **ResetEdgeData (EDATA\_CREASE)** would reset all edge crease values

to 0.

**Parameters:**

**int channel**

The edge data channel. See the [List of Edge Data Channels](#)

**Return Value:**

**Default Implementation:**

{ }

**Prototype:**

**virtual void BeginPerDataModify(int mnSelLevel, int channel);**

**Remarks:**

This method is used in combination with **EndPerDataModify** to store undo information for any vertex or edge data modification.

**Parameters:**

**int mnSelLevel**

Set to one of **MNM\_SL\_VERTEX** or **MNM\_SL\_EDGE** for vertex or edge data respectively.

**int channel**

Indicates the channel of vertex or edge data we're modifying. For instance, **BeginPerDataModify (MNM\_SL\_EDGE, EDATA\_CREASE)** would be used before modifying edge crease information.

**Default Implementation:**

{ }

**Prototype:**

**virtual bool InPerDataModify();**

**Remarks:**

This method returns true if we're between **BeginPerDataModify** and **EndPerDataModify** calls.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual void EndPerDataModify(bool success);
```

**Remarks:**

This method completes the undo object corresponding to the vertex or edge data modifications made since the related **BeginPerDataModify** call.

**Parameters:**

**bool success**

If FALSE, the system restores the original vertex colors and throws away the undo object.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void BeginVertexColorModify(int mp=0);
```

**Remarks:**

This method is used in combination with **EndVertexColorModify** to store undo information for any vertex or edge data modification.

**Parameters:**

**int mp=0**

The map channel we're using. Most vertex color applications use the standard vertex color channel, 0. However, you can also use this method with the Illumination channel (**MAP\_SHADING** = -1) or the alpha channel (**MAP\_ALPHA** = -2) - or even with a regular UVW map channel (1-99).

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual bool InVertexColorModify();
```

**Remarks:**

This method returns true if we're between **BeginVertexColorModify** and **EndVertexColorModify** calls.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual void EndVertexColorModify(bool success);
```

**Remarks:**

This method completes the undo object corresponding to the vertex color modifications made since the related **BeginVertexColorModify** call.

**Parameters:**

**bool success**

If FALSE, the system restores the original vertex colors and throws away the undo object.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual int GetMatIndex(bool *determined, DWORD  
flag=MN_SEL);
```

**Remarks:**

This method obtains the material index for the selected faces.

**Parameters:**

**bool \*determined**

The bool this points to (which should not be NULL) is filled with:

**FALSE** if there are no selected faces or if selected faces have different material indices

**TRUE** if at least one face is selected and all selected faces have the same material ID.

**DWORD flag=MN\_SEL**

Indicates which faces should have their material IDs set.

**Return Value:**

The material index of the selected faces, cast as an int.

**Default Implementation:**

```
{ determined=false; return 0; }
```

**Prototype:**

```
virtual void SetMatIndex(int index, DWORD flag=MN_SEL);
```

**Remarks:**

This method sets the material index for the flagged faces.

**Parameters:**

**int index**

The material index to set flagged faces to.

**DWORD flag=MN\_SEL**

Indicates which faces should have their material IDs set.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void GetSmoothingGroups(DWORD faceFlag, DWORD  
*anyFaces, DWORD *allFaces=NULL);
```

**Remarks:**

This method obtains smoothing group information for the specified faces.

**Parameters:**

**DWORD faceFlag**

Indicates which faces to read smoothing group information from. If this value is 0, all faces are read.

**DWORD \*anyFaces**

**DWORD \*allFaces=NULL**

These two parameters are where the output is stored. "**anyFaces**" has bits set that are present in any of the faces' smoothing groups. "**allFaces**", if non-NULL, has bits set that are present in all of the faces' smoothing groups. In other words, **anyFaces** or's together the faces' groups, while **allFaces** and's

them together.

**Default Implementation:**

```
{ if (anyFaces) *anyFaces = 0; if (allFaces) *allFaces = 0; }
```

**Prototype:**

```
virtual void SetSmoothBits(DWORD bits, DWORD bitmask,  
DWORD flag);
```

**Remarks:**

This method sets (or clears) smoothing group bits in the specified faces.

**Parameters:**

**DWORD bits**

The smoothing group bits to set in flagged faces.

**DWORD bitmask**

The smoothing group bits to clear in flagged faces

**DWORD flag**

Indicates which faces to set smoothing group information in. If this value is 0, all faces are modified.

**Default Implementation:**

```
{ }
```

## Displacement approximation methods

**Prototype:**

```
virtual void SetDisplacementParams();
```

**Remarks:**

This method copies displacement parameters from pblock to polyobject.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void UpdateDisplacementParams();
```

**Remarks:**

This method copies displacement parameters from polyobject to pblock.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void UseDisplacementPreset(int presetNumber);
```

**Remarks:**

This method engages a displacement approximation preset.

**Parameters:**

**int presetNumber**

The presetNumber values are either 0 (low), 1 (medium), or 2 (high).

**Default Implementation:**

```
{ }
```

## Drag operations

**Prototype:**

```
virtual void EpfnBeginExtrude(int msl, DWORD flag, TimeValue t);
```

**Remarks:**

This method is called at the beginning of an interactive extrusion operation. Performs the topological extrusion.

**Parameters:**

**int msl**

Indicates the MNMesh-based selection level we're extruding. (Currently, this must be **MNM\_SL\_FACE**.)

**DWORD flag**

Indicates the faces we're extruding.

**TimeValue t**

The current time.

**Default Implementation:**

{ }

**Prototype:**

**virtual void EpfndEndExtrude(bool accept, TimeValue t);**

**Remarks:**

This method is called at the end of an interactive extrusion operation. Completes the RestoreObjects and finalizes the geometric edit.

**Parameters:**

**bool accept**

If TRUE, end extrude normally. If FALSE, cancel the extrusion completely (undoing the original topological extrusion).

**TimeValue t**

The current time.

**Default Implementation:**

{ }

**Prototype:**

**virtual void EpfndDragExtrude(float amount, TimeValue t);**

**Remarks:**

This method is used to drag the current extrusion to the amount specified. May be called multiple times in one session between **EpfndBeginExtrude** and **EpfndEndExtrude**.

**Parameters:**

**float amount**

The (absolute) amount of the extrusion

**TimeValue t**

The current time

**Default Implementation:**

{ }

**Prototype:**

**virtual void EpfndBeginBevel(int msl, DWORD flag, bool**

**doExtrude, TimeValue t);**

**Remarks:**

This method is called at the beginning of an interactive bevel or outline operation. Performs the topological extrusion if necessary, and prepares certain cached data.

**Parameters:**

**int msl**

Indicates the MNMesh-based selection level we're beveling. (Currently, this must be **MNM\_SL\_FACE**.)

**DWORD flag**

Indicates the faces we're extruding.

**bool doExtrude**

Indicates whether or not a topological extrusion should be done for this bevel. (For instance, leaving this at false you to do "outlining", or to adjust a previous bevel.)

**TimeValue t**

The current time.

**Default Implementation:**

{ }

**Prototype:**

**virtual void EpfndBevel(bool accept, TimeValue t);**

**Remarks:**

This method is called at the end of an interactive bevel. Completes the **RestoreObjects** and finalizes the geometric edit.

**Parameters:**

**bool accept**

If TRUE, end bevel normally. If FALSE, cancel the bevel completely (undoing any earlier topological extrusion).

**TimeValue t**

The current time.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void EpfndragBevel(float outline, float height, TimeValue t);
```

**Remarks:**

This method is used to drag the current bevel to the outline and height specified. May be called multiple times in one session between **EpfndragBevel** and **EpfndragBevel**.

**Parameters:**

**float outline**

The (positive or negative) outline amount for the bevel.

**float height**

The (positive or negative) height of the bevel.

**TimeValue t**

The current time

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void EpfndragChamfer(int msl, TimeValue t);
```

**Remarks:**

This method is called at the beginning of an interactive chamfer operation. Performs the topological changes and prepares certain cached data.

**Parameters:**

**int msl**

Indicates the MNMesh-based selection level we're chamfering. (Either **MNM\_SL\_VERTEX** or **MNM\_SL\_EDGE**.)

**TimeValue t**

The current time.

**Default Implementation:**

```
{ }
```

**Prototype:**

**virtual void EfnEndChamfer(bool accept, TimeValue t);**

**Remarks:**

This method is called at the end of an interactive chamfer. Completes the **RestoreObjects** and finalizes the geometric edits.

**Parameters:****bool accept**

If TRUE, end chamfer normally. If FALSE, cancel the chamfer completely (undoing the earlier topological changes).

**TimeValue t**

The current time.

**Default Implementation:**

{ }

**Prototype:**

**virtual void EfnDragChamfer(float amount, TimeValue t);**

**Remarks:**

This method is used to drag the current chamfer to the amount specified. May be called multiple times in one session between **EfnBeginChamfer** and **EfnEndChamfer**.

**Parameters:****float amount**

The amount of the chamfer.

**TimeValue t**

The current time

**Default Implementation:**

{ }

**Regular operations****Prototype:**

**virtual bool EfnHide(int msl, DWORD flags);**

**Remarks:**

This method Hides flagged components.

**Parameters:****int msl**

MNMesh selection level - should be either **MNM\_SL\_VERTEX** or **MNM\_SL\_FACE**.

**DWORD flags**

Indicates which components to hide. For instance, **MN\_SEL** would cause it to hide selected vertices or faces.

**Return Value:**

TRUE if components were hidden, otherwise FALSE.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EfnUnhideAll(int msl);
```

**Remarks:**

This method unhides all components at the specified level.

**Parameters:****int msl**

MNMesh selection level - should be either **MNM\_SL\_VERTEX** or **MNM\_SL\_FACE**.

**Return Value:**

TRUE if components were unhidden, otherwise FALSE.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual void EfnNamedSelectionCopy(TSTR setName);
```

**Remarks:**

This method copies the named selection specified to the named selection copy/paste buffer.

**Parameters:****TSTR setName**

The name of the selection set.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void EpfNamedSelectionPaste(bool useDlgToRename);
```

**Remarks:**

This method pastes selection from named selection copy/paste buffer.

**Parameters:****bool useDlgToRename**

Only matters if there is a name conflict with an existing named selection. If true, the system should throw up an interactive dialog for the user to rename the selection. If false, 3ds max should use string techniques to rename the selection (by adding or increasing a number, etc.)

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual int EpfCreateVertex(Point3 pt, bool pt_local=false, bool select=true);
```

**Remarks:**

This method creates a new vertex in the mesh.

**Parameters:****Point3 pt**

The location of the new vertex in object or world space.

**bool pt\_local=false**

If true, the point passed is assumed to be in object space. If false, the point is assumed to represent world space, and the object space location must be computed by the method.

**bool select=true**

Indicates if the new vertex should be selected (have its **MN\_SEL** flag set).

**Return Value:**

The index of the new vertex, or -1 to indicate failure to create the vertex.

**Default Implementation:**

```
{ return -1; }
```

**Prototype:**

```
virtual int EpfnCreateEdge(int v1, int v2, bool select=true);
```

**Remarks:**

This method creates a new edge, dividing a polygon into two smaller polygons.

**Parameters:**

**int v1, v2**

The endpoint vertices for this edge. These vertices must have at least one face in common, or the creation will fail.

**bool select=true**

Indicates if the new edge should be selected (have its **MN\_SEL** flag set).

**Return Value:**

The index of the edge created.

**Default Implementation:**

```
{ return -1; }
```

**Prototype:**

```
virtual int EpfnCreateFace(int *v, int deg, bool select=true);
```

**Remarks:**

This method creates a new face on a set of vertices.

**Parameters:**

**int \*v**

An array of vertices for this new face. Note that each vertex must be an "open" vertex - it either must be on no edges or faces, or it must be part of a border (i.e. it's on more edges than faces).

**int deg**

The degree of the new face - and the size of the "v" array.

**bool select=true**

Indicates if the new face should be selected (have its **MN\_SEL** flag set).

**Return Value:**

The index of the face created.

**Default Implementation:**

```
{ return -1; }
```

**Prototype:**

```
virtual bool EPFN_CapHoles(int msl=MNM_SL_EDGE, DWORD  
targetFlags=MN_SEL);
```

**Remarks:**

This method caps the indicated holes.

**Parameters:**

**int msl=MNM\_SL\_EDGE**

MNMesh-based selection level, one of **MNM\_SL\_VERTEX**, **MNM\_SL\_EDGE**, or **MNM\_SL\_FACE**. The holes are border loops which can be identified by containing selected edges, using selected vertices, or being touched by selected faces.

**DWORD targetFlags=MN\_SEL**

The flags we're looking for (in the vertex, edge, or face levels, according to **msl**) to identify the holes we should cap.

**Return Value:**

TRUE if any hole was successfully capped, otherwise FALSE

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EPFN_Delete(int msl, DWORD delFlag=MN_SEL, bool  
delIsoVerts=false);
```

**Remarks:**

This method deletes the specified components (and any other components

dependent on them).

**Parameters:**

**int msl**

MNMesh-based selection level for deletion to occur on; one of **MNM\_SL\_VERTEX**, **MNM\_SL\_EDGE**, or **MNM\_SL\_FACE**. Note that edge deletion joins, rather than removes, the neighboring faces. Border edges cannot be deleted. Deleting an edge between two quads makes a hexagon. Etc.

**DWORD delFlag=MN\_SEL**

The flag indicating components to delete.

**bool delIsoVerts=false**

If deleting faces, this indicates whether vertices that are left isolated by the face deletion should also be deleted. (Note that in the reverse situation, faces dependent on deleted vertices are always deleted.)

**Return Value:**

TRUE if components were deleted, otherwise FALSE.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual void EPFNAttach(INode *node, INode *myNode, TimeValue t);
```

**Remarks:**

This method attaches the specified object to this mesh. The object given is first converted to a polymesh (if needed), then attached as an element in the Editable Poly, then the original is deleted.

**Parameters:**

**INode \*node**

A pointer to the node we want to attach.

**INode \*myNode**

A pointer to this Editable Poly's node (used to match the attached object to our object space).

**TimeValue t**

The current time.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void EPFNMultiAttach(INodeTab &nodeTab, INode  
*myNode, TimeValue t);
```

**Remarks:**

This method attaches a bunch of nodes to this mesh. The objects in the nodes are converted to polymeshes if needed, then attached as elements in this Editable Poly. (Then the originals are deleted.)

**Parameters:**

**INodeTab &nodeTab**

A table of nodes we want to attach.

**INode \*myNode**

A pointer to this Editable Poly's node (used to match the attached objects to our object space).

**TimeValue t**

The current time.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual bool EPFNDetachToElement(int msl, DWORD flag, bool  
keepOriginal);
```

**Remarks:**

This method detaches part of PolyMesh to a separate element.

**Parameters:**

**int msl**

Indicates the MNMesh-based selection level, one of **MNM\_SL\_VERTEX**, **MNM\_SL\_EDGE**, or **MNM\_SL\_FACE**.

**DWORD flag**

Flag indicates which components should be detached. For instance, **MNM\_SL\_VERTEX** and **MN\_SEL** means selected vertices.

**bool keepOriginal**

If TRUE, the original components are left intact and a new element is cloned instead.

**Return Value:**

TRUE if elements are detached, otherwise FALSE.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EpfnDetachToObject(TSTR name, int msl, DWORD  
flag, bool keepOriginal, INode *myNode, TimeValue t);
```

**Remarks:**

This method detaches part of PolyMesh to a separate object.

**Parameters:**

**TSTR name**

The desired name for the new node.

**int msl**

Indicates the MNMesh-based selection level, one of **MNM\_SL\_VERTEX**, **MNM\_SL\_EDGE**, or **MNM\_SL\_FACE**.

**DWORD flag**

Flag indicates which components should be detached. For instance, **MNM\_SL\_VERTEX** and **MN\_SEL** means selected vertices.

**bool keepOriginal**

If TRUE, the original components are left intact and the new object is cloned from them.

**INode \*myNode**

A pointer to this EPoly's node (for transform and other node property access).

**TimeValue t**

The current time.

**Return Value:**

TRUE if parts were detached, otherwise FALSE.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EpfnSplitEdges(DWORD flag=MN_SEL);
```

**Remarks:**

This method "splits" edges by breaking vertices on two or more flagged edges into as many copies as needed. In this way, any path of flagged edges becomes two open seams.

**Parameters:**

**DWORD flag=MN\_SEL**

Indicates which edges should be split. (Left at the default, selected edges are split.)

**Return Value:**

TRUE if any topological changes happened, FALSE if nothing happened.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EpfnBreakVerts(DWORD flag=MN_SEL);
```

**Remarks:**

This method breaks vertices into separate copies for each face using them. For example, breaking one corner of a box polymesh turns it into 3 vertices, one for each side that met at that vertex.

**Parameters:**

**DWORD flag=MN\_SEL**

Indicates which vertices should be broken. (Left at the default, selected vertices are broken.)

**Return Value:**

TRUE if any topological changes happened, FALSE if nothing happened.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual int EpfndivideFace(int face, Tab<float> &bary, bool  
select=true);
```

**Remarks:**

This method divides the face into triangles meeting at a point described by generalized barycentric coordinates on the face. An n-sided polygon will become n triangles using this technique.

**Parameters:**

**int face**

The face to divide.

**Tab<float> &bary**

A table of floats, of the same size as the face's degree, indicating the contribution of each of the face's vertices to the division point. They should all sum to 1, indicating that the division point is a linear combination of the vertices. If they are all equal (1/n), the center of the face will be used.

**bool select=true**

Indicates whether the new triangles should have the MN\_SEL flag set or not.

**Return Value:**

The index of the new vertex, or -1 for failure.

**Default Implementation:**

```
{ return -1; }
```

**Prototype:**

```
virtual int EpfndivideEdge(int edge, float prop, bool select=true);
```

**Remarks:**

This method divides an edge in two, creating a new vertex.

**Parameters:**

**int edge**

The edge to divide.

**float prop**

The proportion along the edge for the new vertex, going from 0 at the v1 end to 1 at the v2 end. For instance, a prop of .35 means that the new point will be located at;

$$.65*(v[e[edge].v1].p) + .35*(v[e[edge].v2].p)$$

**bool select=true**

Indicates if the new vertex should be selected. (The new edge picks up its selection flag from the old edge.)

**Return Value:**

The index of the new vertex, or -1 for failure.

**Default Implementation:**

```
{ return -1; }
```

**Prototype:**

```
virtual bool EpfnCollapse(int msl, DWORD flag);
```

**Remarks:**

This method will collapse the current selection, turning each cluster (in edge or face level) or all selected points into a single point. Some restrictions inherent in a 3ds max polygon-based mesh may prevent a complete collapse, if the result would have an illegal geometry.

**Parameters:**

**int msl**

MNMesh-based selection level, one of **MNM\_SL\_VERTEX**, **MNM\_SL\_EDGE**, or **MNM\_SL\_FACE**.

**DWORD flag**

The flag on the components we wish to collapse.

**Return Value:**

TRUE if any changes occurred, FALSE if nothing happened.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual void EpfnExtrudeFaces(float amount, DWORD flag,
```

**TimeValue t);**

**Remarks:**

This method extrudes the flagged faces by the specified amount. Note that this method uses the parameter block value for **ep\_extrusion\_type**. Values can be:

**0:** Extrude by group (cluster)

**1:** Extrude by local normals

**2:** Extrude by polygon - each polygon extrudes separately.

**Parameters:**

**float amount**

The height of the extrusion. Can be positive or negative.

**DWORD flag**

Indicates which faces should be beveled.

**TimeValue t**

The current time.

**Default Implementation:**

{ }

**Prototype:**

**virtual void EfnBevelFaces(float height, float outline, DWORD flag, TimeValue t);**

**Remarks:**

This method bevels the flagged faces by the specified height and outline. Note that this method uses the parameter block value for **ep\_extrusion\_type** in making the extrusion component. Values can be:

**0:** Extrude by group (cluster)

**1:** Extrude by local normals

**2:** Extrude by polygon - each polygon extrudes separately.

**Parameters:**

**float height**

The height of the desired bevel. Can be positive or negative.

**float outline**

The amount of the outlining in the bevel. Positive amounts make the selected region larger; negative amounts make it smaller.

**DWORD flag**

Indicates which faces should be beveled.

**TimeValue t**

The current time.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void EfnChamferVertices(float amount, TimeValue t);
```

**Remarks:**

This method chamfers the flagged vertices by the specified amount.

**Parameters:****float amount**

The amount of the chamfer.

**TimeValue t**

The current time.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void EfnChamferEdges(float amount, TimeValue t);
```

**Remarks:**

This method chamfers the flagged edges by the specified amount.

**Parameters:****float amount**

The amount of the chamfer.

**TimeValue t**

The current time.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual bool EpfnSlice(Point3 planeNormal, Point3 planeCenter,  
bool flaggedFacesOnly=false, DWORD faceFlags=MN_SEL);
```

**Remarks:**

This method slices the mesh with the specified plane.

**Parameters:**

**Point3 planeNormal**

**Point3 planeCenter**

The definition of the plane, by the normal and the "center" (which can be any point in the plane).

**bool flaggedFacesOnly=false**

If set, only the flagged faces should be sliced. If false, all faces should be sliced.

**DWORD faceFlags=MN\_SEL**

Indicates which faces should be sliced, if **flaggedFacesOnly** is TRUE.

**Return Value:**

TRUE if something has been sliced, or FALSE if nothing happened.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EpfnInSlicePlaneMode();
```

**Remarks:**

This method indicates whether the Editable Poly is currently in Slice Plane mode.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

**virtual int EpfncutVertex(int startv, Point3 destination, Point3 projDir);**

**Remarks:**

This method cuts from one vertex to another. Note that this algorithm uses the parameter block value for **ep\_split**, which controls whether the cut algorithm splits the mesh open.

**Parameters:**

**int startv**

The starting vertex for the cut

**Point3 destination**

The location of the ending vertex for the cut.

**Point3 projDir**

The direction of the "view". (projDir and the vector between the two vertices define the plane that the cut occurs in.)

**Return Value:**

The destination vertex, or -1 if the cut was unable to be completed for some reason.

**Default Implementation:**

```
{ return -1; }
```

**Prototype:**

**virtual int EpfncutEdge(int e1, float prop1, int e2, float prop2, Point3 projDir);**

**Remarks:**

This method cuts from one edge to another. Note that this algorithm uses the parameter block value for **ep\_split**, which controls whether the cut algorithm splits the mesh open.

**Parameters:**

**int e1**

The edge index along that edge for the start of the cut.

**float prop1**

The edge proportion along that edge for the start of the cut.

**int e2**

The edge index along that edge for the end of the cut.

**float prop2**

The edge proportion along that edge for the end of the cut.

**Point3 projDir**

The direction of the "view". (projDir and the vector between the two endpoints define the plane that the cut occurs in.)

**Return Value:**

The vertex created at the end of the cut, or -1 if the cut was unable to be completed for some reason.

**Default Implementation:**

```
{ return -1; }
```

**Prototype:**

```
virtual int EpfncutFace(int f1, Point3 p1, Point3 p2, Point3  
projDir);
```

**Remarks:**

This method cuts from one face to another, subdividing the start and end faces as needed for precisely matching the given start and end points. Note that this algorithm uses the parameter block value for **ep\_split**, which controls whether the cut algorithm splits the mesh open.

**Parameters:**

**int f1**

The face we should start on.

**Point3 p1**

The point (on face f1) for the start of the cut.

**Point3 p2**

The point at the end of the cut.

**Point3 projDir**

The direction of the "view". (projDir and the vector between the two endpoints define the plane that the cut occurs in.)

**Return Value:**

The vertex created at the end of the cut, or -1 if the cut was unable to be

completed for some reason.

**Default Implementation:**

```
{ return -1; }
```

**Prototype:**

```
virtual bool EpgnWeldVerts(int vert1, int vert2, Point3  
destination);
```

**Remarks:**

This method welds the specified vertices together (if possible), and puts the result at the location specified.

**Parameters:**

**int vert1, vert2**

The two vertices we wish to weld. Note that these vertices must be "border" vertices, that is, they must be used by some open (one-sided) edges.

**Point3 destination**

The desired location for the result. Usually this is **v[vert1].p**, **v[vert2].p**, or the average of the two.

**Return Value:**

Indicates if any welding successfully occurred. If FALSE, nothing happened.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EpgnWeldEdges(int edge1, int edge2);
```

**Remarks:**

This method welds the first edge to the second edge, leaving the result at the location of the second edge.

**Parameters:**

**int edge1, edge2**

The two edges we wish to weld. Note that these must be open (one-sided) edges.

**Return Value:**

Indicates if any welding successfully occurred. (If false, nothing happened.)

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EpcfWeldFlaggedVerts(DWORD flag);
```

**Remarks:**

This method welds all flagged vertices together to their average location.

**Parameters:**

**DWORD flag**

Indicates which vertices should be welded. Note that these vertices must be "border" vertices, that is, they must be used by some open (one-sided) edges.

**Return Value:**

Indicates if any welding successfully occurred. If FALSE, nothing happened.)

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EpcfWeldFlaggedEdges(DWORD flag);
```

**Remarks:**

This method welds flagged edges together.

**Parameters:**

**DWORD flag**

Indicates which edges should be welded. Note that these edges must be open (one-sided).

**Return Value:**

Indicates if any welding successfully occurred. (If false, nothing happened.)

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

**virtual bool EpcfCreateShape(TSTR name, bool smooth, INode \*myNode, DWORD edgeFlag=MN\_SEL);**

**Remarks:**

This method creates a new shape object from flagged edges in the polymesh.

**Parameters:**

**TSTR name**

The desired name for the new node containing the shape.

**bool smooth**

If TRUE, the new shape should be a smooth curve. If FALSE, it should be a linear shape which exactly follows the edges.

**INode \*myNode**

A pointer to the node of the PolyMesh (used to obtain transform and other node level information for the new shape node).

**DWORD edgeFlag=MN\_SEL**

Indicates which faces should be used in creating this shape.

**Return Value:**

TRUE if successful, otherwise FALSE.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

**virtual bool EpcfMakePlanar(int msl, DWORD flag=MN\_SEL, TimeValue t=0);**

**Remarks:**

This method moves the flagged area into its "average plane". (Plane computed using average vertex positions and normals.)

**Parameters:**

**int msl**

MNMesh-based selection level, one of **MNM\_SL\_VERTEX**, **MNM\_SL\_EDGE**, or **MNM\_SL\_FACE**.

**DWORD flag=MN\_SEL**

The flag that indicates which components to align. Ignored if **msl** is set to

**MNM\_SL\_OBJECT.**

**TimeValue t=0**

The current time. (This action can be used to set a key for animation.)

**Return Value:**

Indicates whether anything was moved.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EpfnMoveToPlane(Point3 planeNormal, float  
planeOffset, int msl, DWORD flag=MN_SEL, TimeValue t=0);
```

**Remarks:**

This method moved flagged region to the plane given (by orthogonal projection into the plane).

**Parameters:**

**Point3 planeNormal**

**float planeOffset**

The definition of the plane. The plane is that region of points X for which  $\text{DotProd}(\text{planeNormal}, X) = \text{planeOffset}$ .

**int msl**

MNMesh-based selection level, one of **MNM\_SL\_VERTEX**, **MNM\_SL\_EDGE**, or **MNM\_SL\_FACE**.

**DWORD flag=MN\_SEL**

The flag that indicates which components to align. Ignored if **msl** is set to **MNM\_SL\_OBJECT**.

**TimeValue t=0**

The current time. (This action can be used to set a key for animation.)

**Return Value:**

Indicates whether anything was moved.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EpfnAlignToGrid(int msl, DWORD flag=MN_SEL);
```

**Remarks:**

This method aligns flagged parts to be on the current construction plane (in the current viewport).

**Parameters:**

**int msl**

MNMesh-based selection level, one of **MNM\_SL\_OBJECT**, **MNM\_SL\_VERTEX**, **MNM\_SL\_EDGE**, or **MNM\_SL\_FACE**.

**DWORD flag=MN\_SEL**

The flag that indicates which components to align. Ignored if **msl** is set to **MNM\_SL\_OBJECT**.

**Return Value:**

Indicates whether anything was aligned.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EpfnAlignToView(int msl, DWORD flag=MN_SEL);
```

**Remarks:**

This method aligns flagged parts to be at right angles to the current view (through the active viewport).

**Parameters:**

**int msl**

MNMesh-based selection level, one of **MNM\_SL\_OBJECT**, **MNM\_SL\_VERTEX**, **MNM\_SL\_EDGE**, or **MNM\_SL\_FACE**.

**DWORD flag=MN\_SEL**

The flag that indicates which components to align. Ignored if **msl** is set to **MNM\_SL\_OBJECT**.

**Return Value:**

Indicates whether anything was aligned.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EpfnDeleteIsoVerts();
```

**Remarks:**

This method deletes isolated vertices, those that aren't used by any faces.

**Return Value:**

Indicates whether any vertices were deleted.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EpfnMeshSmooth(int msl, DWORD flag=MN_SEL);
```

**Remarks:**

This method applies the NURMS style MeshSmooth algorithm to the flagged area of the mesh. Uses parameter block parameters:

**ep\_ms\_smoothness:** Smoothness value for MeshSmooth type subdivision (float spinner, range 0-1)

**ep\_ms\_smooth:** Currently unused.

**ep\_ms\_sep\_smooth:** Separate by smoothing groups for MeshSmooth type subdivision (checkbox)

**ep\_ms\_sep\_mat:** Separate by material IDs for MeshSmooth type subdivision (checkbox)

**Parameters:**

**int msl**

MNMesh-based selection level, one of **MNM\_SL\_OBJECT**, **MNM\_SL\_VERTEX**, **MNM\_SL\_EDGE**, or **MNM\_SL\_FACE**.

**DWORD flag=MN\_SEL**

The flag that indicates which components to meshsmooth. Ignored if **msl** is set to **MNM\_SL\_OBJECT**.

**Return Value:**

TRUE if applied, otherwise FALSE.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EpcfTessellate (int msl, DWORD flag=MN_SEL);
```

**Remarks:**

This method tessellates flagged area of the mesh. Uses **ep\_tess\_type** and **ep\_tess\_tension** from the param block.

**Parameters:**

**int msl**

MNMesh-based selection level, one of **MNM\_SL\_OBJECT**, **MNM\_SL\_VERTEX**, **MNM\_SL\_EDGE**, or **MNM\_SL\_FACE**.

**DWORD flag=MN\_SEL**

The flag that indicates which components to tessellate. Ignored if **msl** is set to **MNM\_SL\_OBJECT**.

**Return Value:**

TRUE is tessellated, otherwise FALSE.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual void EpcfForceSubdivision();
```

**Remarks:**

This method will cue an update of the subdivision surface based on this Editable Poly. (See the Editable Poly documentation on the Object-level Surface Properties dialog for information on this surface.) Equivalent to the user pressing the "Update" button.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void EpcfSelectVertByColor(BOOL add, BOOL sub, int
```

**mp=0, TimeValue t=0);**

**Remarks:**

This method selects (or deselects) vertices based on their color. Note that the color to compare to is part of the parameter block - see **ep\_vert\_sel\_color** and related parameters for details.

**Parameters:**

**BOOL add**

If TRUE, this selection should be in addition to the current selection. If FALSE, only the vertices within the color range should be selected.

**BOOL sub**

If TRUE, then instead of the options under "add" above, the vertices within the specified color range are deselected (while other selections are unmodified).

**int mp=0**

The map channel used for vertex colors. Use 0 for the traditional vertex color channel, 1-99 for a texture map channel, **MAP\_SHADING** for the vertex illumination channel, or **MAP\_ALPHA** for the vertex alpha channel.

**TimeValue t=0**

The current time.

**Default Implementation:**

{ }

**Prototype:**

**virtual void EpfSetDiagonal(int face, int corner1, int corner2);**

**Remarks:**

This method modifies a polygon's triangulation so that the specified diagonal is part of it.

**Parameters:**

**int face**

The face whose triangulation we want to modify

**int corner1, corner2**

The endpoints of the new diagonal. They should be indices into the vertex list. So for instance corner values of (0,3) would refer to vertices **f[face].vtx[0]**

and **f[face].vtx[3]**. Note that if **(corner1+1)%deg == corner2** (or vice versa), or if **corner1==corner2**, nothing will happen.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual bool EfnRetriangulate(DWORD flag=MN_SEL);
```

**Remarks:**

This method will automatically re-triangulate flagged faces, using the standard polygon triangulation algorithm. Note that this algorithm is designed to work well on a single face, but not necessarily to produce the best results on groups of faces.

**Parameters:**

**DWORD flag=MN\_SEL**

Indicates which faces should be affected.

**Return Value:**

Indicates whether anything happened. (If nothing was in fact flagged, it returns false.)

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool EfnFlipNormals(DWORD flag=MN_SEL);
```

**Remarks:**

This method flips the normals in selected elements. (Note that because of topological rules for the PolyMesh, there is no way to flip a single face - whole elements must be flipped at once.)

**Parameters:**

**DWORD flag=MN\_SEL**

Indicates which elements should be flipped. An element is considered flagged if any of its faces have that flag set.

**Return Value:**

Indicates which elements should be flipped. An element is considered flagged if any of its faces have that flag set.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual void EpfnSelectByMat(int index, bool clear, TimeValue t);
```

**Remarks:**

This method selects or deselects faces by material ID.

**Parameters:**

**int index**

The material ID that indicates a face should be affected.

**bool clear**

If TRUE, these faces should have their selection cleared. (If FALSE, their selection is set.)

**TimeValue t**

The current time.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void EpfnSelectBySmoothGroup(DWORD bits, BOOL clear, TimeValue t);
```

**Remarks:**

This method selects or deselects faces by smoothing group.

**Parameters:**

**DWORD bits**

The smoothing group bits that indicate a face should be affected.

**BOOL clear**

If TRUE, these faces should have their selection cleared. (If FALSE, the selection is set.)

**TimeValue t**

The current time.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void EfnAutoSmooth(TimeValue t);
```

**Remarks:**

This method autosmooths the current face selection, using the autosmooth threshold set in the parameter block.

**Parameters:**

**TimeValue t**

The current time.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void CollapseDeadStructs();
```

**Remarks:**

This method deletes all the components in all the levels that have the MN\_DEAD flag set. Note that this causes a renumbering of affected component levels. If you're deleting faces in the middle of a complex operation, it's usually best to just set their MN\_DEAD flags, then call **CollapseDeadStructs** at the end, so that you don't have to worry about other faces' indices changing before you're done.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual int EfnPropagateComponentFlags(int slTo, DWORD flTo,  
int slFrom, DWORD flFrom, bool ampersand=FALSE, bool  
set=TRUE, bool undoable=FALSE);
```

**Remarks:**

This method is used for setting flags in the MNMesh components based on flags of other components that they touch. This is very versatile. For instance, to hide all faces that use selected vertices, you would call

**EpfNPropagateComponentFlags (MNM\_SL\_FACE, MN\_HIDE, MNM\_SL\_VERTEX, MN\_SEL, false, true, true).** (Hiding faces should be undoable.) To set the MN\_WHATEVER flag on all vertices that are used only by selected edges, you'd call **EpfNPropagateComponentFlags (MNM\_SL\_VERTEX, MN\_WHATEVER, MNM\_SL\_EDGE, MN\_SEL, true);**

**Parameters:**

**int slTo**

The selection level we wish to modify. (One of **MNM\_SL\_OBJECT**, **MNM\_SL\_VERTEX**, **MNM\_SL\_EDGE**, or **MNM\_SL\_FACE**.)

**DWORD flTo**

The flags we wish to change in that selection level.

**int slFrom**

The selection level we wish to base the changes on.

**DWORD flFrom**

The flags that indicate a change should happen.

**bool ampersand=FALSE**

When **slFrom** and **slTo** are different, this indicates whether the flags of the nearby components should be "or'd" or "and'd". If it's false, then any flagged components in the "from" level will cause the component in the "to" level to be affected. If true, then all the components in the "from" level that touch a component in the "to" level must be flagged in order for the "to" level component to be affected. (i.e., if from is faces and to is vertices, a vertex would only be modified if all faces that use it have the **flFrom** flag set.)

**bool set=TRUE**

If TRUE, this parameter indicates that the **flTo** flags should be set on targeted components. If false, it indicates that the flags should be cleared. For instance, to clear MN\_HIDE flags on vertices that are used by selected edges, you'd call **EpfNPropagateComponentFlags (MNM\_SL\_VERTEX, MN\_HIDE, MNM\_SL\_EDGE, MN\_SEL, false, false, true);**

**bool undoable=FALSE**

Indicates if this action should create an entry for the undo system. Changes to **MN\_SEL**, **MN\_HIDE**, and **MN\_DEAD** flags should generally be undoable, but changes to more minor flags like **MN\_WHATEVER** that are used to set up for other operations generally don't have to be.

**Return Value:**

The number of components in the **sITo** level that were affected by the call. (If 0, nothing happened.)

**Default Implementation:**

```
{ return 0; }
```

## Class ILookAtConstRotation

See Also: [Class Control](#), [Class FPMixinInterface](#).

class ILookAtConstRotation : public Control , public FPMixinInterface

### Description:

This class is available in release 4.0 and later only.

This class is an interface to the LookAt Constraint rotation controller. You can obtain a pointer to the list control interface using;

**GetILookAtConstInterface(cd)**. This macro will return **(ILookAtConstRotation\*)(CD)-**

**>GetFPInterface(LOOKAT\_CONSTRAINT\_INTERFACE).**

**LOOKAT\_ROT\_PBLOCK\_REF** may be used to access the look-at controller's references:

All methods of this class are Implemented by the System.

### Methods:

public:

### Prototype:

**virtual INode\* GetTarget(int targetNumber)=0;**

### Remarks:

This method will return a pointer to a node of one of the Look-At nodes that the Look-At constraint controller targets, specified by **targetNumber**.

### Parameters:

**int targetNumber**

The node number in the Look-At target list to be obtained.

### Prototype:

**virtual BOOL SetTarget(INode \*target, int targetNumber)=0;**

### Remarks:

Sets one of the Look-At nodes that the Look-At constraint controller targets, specified by **targetNumber**. If **targetNumber** is greater than the number of targets in the current list, it returns a FALSE. In this case use the function **AppendTarget**.

**Parameters:**

**INode \*node**

Points to the node to follow.

**int targetNumber**

The node number in the Look-At target list to be set.

**Return Value:**

TRUE if success; FALSE otherwise.

**Prototype:**

**virtual float GetTargetWeight(int targetNumber)=0;**

**Remarks:**

Gets the weight of one of the Look-At nodes that the Look-At constraint controller targets, specified by **targetNumber**.

**Parameters:**

**int targetNumber**

The node number in the Look-At target list whose weight is to be obtained.

**Prototype:**

**virtual BOOL SetTargetWeight(float weight, int targetNumber)=0;**

**Remarks:**

Sets the weight of one of the Look-At nodes that the Look-At constraint controller follows, specified by **targetNumber**.

**Parameters:**

**float weight**

The weight to set.

**targetNumber**

The node number in the Look-At target list whose weight is to be set.

**Return Value:**

TRUE if there is more than one Look-At targets in the list and you are trying to set weight, FALSE otherwise.

**Prototype:**

**virtual BOOL AppendTarget(INode \*target, float weight=50.0)=0;**

**Remarks:**

Appends the current Look-At target list by one and appends the current Look-At target weightlist by one.

**Parameters:**

**INode \*target**

The node that is to be appended to the current Look-At target list.

**float weight=50.0**

This is the weight that is to be assigned to the newly appended Look-At target. The default weight is 50.0.

**Return Value:**

TRUE if the target was appended, otherwise FALSE.

**Prototype:**

**virtual int GetNumTargets()=0;**

**Remarks:**

Returns the number of nodes in the list of nodes to look at.

**Prototype:**

**virtual BOOL GetRelative()=0;**

**Remarks:**

Gets the relative/absolute mode corresponding to the "Keep Initial Offset" checkbox in the UI.

**Prototype:**

**virtual BOOL GetVLisAbs()=0;**

**Remarks:**

Gets the ViewLine relative/absolute mode corresponding to the "Keep ViewLine Length Absolute" checkbox in the UI. When Viewline Length is absolute, the "ViewLine Length" spinner sets the length of the ViewLine. A negative length implies that starting from the source object the line travels opposite to the direction of the target object. The source/target distance has no

effect on the ViewLine length in this mode. If the "Keep ViewLine Length Absolute" checkbox is unchecked, the ViewLine length is determined from the spinner value, which is interpreted as a percentage of the source/target distance.

**Return Value:**

TRUE if the ViewLine length is absolute, FALSE otherwise.

**Prototype:**

**virtual void SetVLisAbs(BOOL rel)=0;**

**Remarks:**

Sets the relative/absolute mode corresponding to the "Keep ViewLine Length Absolute" checkbox in the UI.

**Parameters:**

**BOOL rel**

TRUE if "Keep ViewLine Length Absolute" is active (checked), FALSE otherwise.

**Prototype:**

**virtual BOOL GetUpnodeWorld()=0;**

**Remarks:**

Returns TRUE if the "World" checkbox is on; FALSE if off.

**Prototype:**

**virtual BOOL GetStoUPAxisFlip()=0;**

**Remarks:**

Returns TRUE if the "selected" axis flip checkbox is on; FALSE if off.

**Prototype:**

**virtual BOOL GetTargetAxisFlip()=0;**

**Remarks:**

Returns TRUE if the "source" axis flip checkbox is on; FALSE if off.

**Prototype:****virtual BOOL Get\_SetOrientation()=0;****Remarks:**

Returns TRUE if the orientation flag is set, FALSE if off.

**Prototype:****virtual int GetTargetAxis()=0;****Remarks:**

Gets the selection corresponding to the "Select LookAt Axis" button in the UI. Obtains which of the source axes is required to coincide with the target axis.

**Return Value:**

(0) if the target axis coincides with the x axis of the source object. (1) if the target axis coincides with the y axis of the source object. (2) if the target axis coincides with the z axis of the source object.

**Prototype:****virtual int GetUpNodeAxis()=0;****Remarks:**

Gets the selection corresponding to the "Source/Upnode Alignment: Aligned to UpNode Axis:" radiobutton in the UI. Obtains which of the upnode axes is required to align with a specified source axis.

**Return Value:**

(0) if the upnode x axis coincides with a specified source object. (1) if the upnode y axis coincides with a specified source object. (2) if the upnode z axis coincides with a specified source object.

**Prototype:****virtual int Get\_StoUPAxis()=0;****Remarks:**

Gets the selection corresponding to the "Source/Upnode Alignment: Aligned to UpNode Axis:" radiobutton in the UI. Obtains which of the source axes is required to align with a specified upnode axis.

**Return Value:**

(0) if the source x axis coincides with a specified upnode axis. (1) if the source y axis coincides with a specified upnode axis. (2) if the source z axis coincides with a specified upnode axis.

**Prototype:**

**virtual void SetRelative(BOOL rel)=0;**

**Remarks:**

This method allows you to set the "relative" flag.

**Parameters:**

**BOOL rel**

TRUE to set the relative flag, otherwise FALSE.

**Prototype:**

**virtual void SetUpnodeWorld(BOOL uw)=0;**

**Remarks:**

This method allows you to set the "World" flag.

**Parameters:**

**BOOL uw**

TRUE to set the world flag, otherwise false.

**Prototype:**

**virtual void SetTargetAxisFlip(BOOL rel)=0;**

**Remarks:**

This method allows you to set the "source" flip axis flag.

**Parameters:**

**BOOL rel**

TRUE to set the source flip axis flag, otherwise FALSE.

**Prototype:**

**virtual void SetStoUPAxisFlip(BOOL rel)=0;**

**Remarks:**

This method allows you to set the "selected" axis flip flag.

**Parameters:**

**BOOL rel**

TRUE to set the selected axis flip flag, otherwise FALSE.

**Prototype:**

**virtual void Set\_SetOrientation(BOOL rel)=0;**

**Remarks:**

This method allows you to set the orientation flag.

**Parameters:**

**BOOL rel**

TRUE to set the orientation flag, otherwise FALSE.

**Prototype:**

**virtual void Set\_Reset\_Orientation()=0;**

**Remarks:**

Resets to zero the amount of orientation offset, effected through the "Set Orientation" feature.

**Prototype:**

**virtual void SetTargetAxis(int axis)=0;**

**Remarks:**

Sets the selection corresponding to the "Set Orientation" button in the UI. Specifies which of the source axes is required to coincide with the target axis.

**Parameters:**

**int axis**

(0) if TargetAxis coincides with the X axis of the source object. (1) if TargetAxis coincides with the Y axis of the source object. (2) if TargetAxis coincides with the Z axis of the source object

**Prototype:**

**virtual void SetUpNodeAxis(int axis)=0;**

**Remarks:**

Sets the selection corresponding to the "Source/Upnode Alignment: Aligned to UpNode Axis:" radiobutton in the UI. Specifies which of the upnode axes is required to align with a specified source axis.

**Parameters:**

**int axis**

(0) if the upnode X axis coincides with a specified source axis. (1) if the upnode Y axis coincides with a specified source axis. (2) if the upnode Z axis coincides with a specified source axis.

**Prototype:**

**virtual void Set\_StoUPAxis(int axis)=0;**

**Remarks:**

Sets the selection corresponding to the "Source/Upnode Alignment: Aligned to UpNode Axis:" radiobutton in the UI. Specifies which of the source axes is required to align with a specified upnode axis.

**Parameters:**

**int axis**

(0) if the source X axis coincides with a specified upnode axis. (1) if the source Y axis coincides with a specified upnode axis. (2) if the source Z axis coincides with a specified upnode axis.

**Prototype:**

**virtual void DeleteTarget(int targetNumber)=0;**

**Remarks:**

This method allows you to delete a specified target.

**Parameters:**

**int targetNumber**

The zero based node number in the list of nodes the controller looks at.

## Class IOrientConstRotation

See Also: [Class Control](#), [Class FPMixinInterface](#).

```
class IOrientConstRotation : public Control, public FPMixinInterface
```

### Description:

This class is available in release 4.0 and later only.

The Orientation Constraint matches the orientation of an object to its target without affecting its position. Multiple weighted targets are supported. This class is an interface to the parameters of this controllers. You can obtain a pointer to the list control interface using; **GetIOrientConstInterface(cd)**. This macro will return **(IOrientConstRotation\*)(CD)->GetFPInterface(ORIENT\_CONSTRAINT\_INTERFACE)**.

**ORIENT\_ROT\_PBLOCK\_REF** may be used to access the orientation constraint controller's references:

All methods of this class are Implemented by the System.

### Methods:

public:

### Prototype:

```
virtual INode* GetNode(int targetNumber)=0;
```

### Remarks:

Gets one of the orientation nodes that the orientation constraint controller targets, specified by **targetNumber**.

### Parameters:

```
int targetNumber
```

The node number in the orientation target list to be obtained.

### Prototype:

```
virtual float GetTargetWeight(int targetNumber)=0;
```

### Remarks:

Gets the weight of one of the orientation nodes that the orientation constraint controller targets, specified by **targetNumber**.

**Parameters:**

**int targetNumber**

The node number in the orientation target list to set.

**Return Value:**

Returns the orientation target weight if the **targetNumber** is relevant, 0.0 otherwise.

**Prototype:**

**virtual BOOL SetTargetWeight(int targetNumber, float weight)=0;**

**Remarks:**

Sets the weight of one of the orientation nodes that the orientation constraint controller follows, specified by **targetNumber**.

**Parameters:**

**int targetNumber**

The node number in the orientation target list whose weight is to be set.

**float weight**

The weight to set.

**Return Value:**

TRUE if there is more than one orientation target in the list and you are trying to set weight, FALSE otherwise.

**Prototype:**

**virtual BOOL AppendTarget(INode \*target, float weight=50.0)=0;**

**Remarks:**

Appends the current orientation target list by one and appends the current orient\_targ\_wtlist (orientation target weightlist) by one.

**Parameters:**

**INode \*target**

The node that is to be appended to the current orientation target list.

**float weight=50.0**

This is the weight that is to be assigned to the newly appended orientation target. The default weight is 50.0.

**Return Value:**

TRUE if the target was appended, otherwise FALSE.

**Prototype:**

**virtual int GetNumTargets()=0;**

**Remarks:**

Returns the number of target nodes in the orientation target list.

**Prototype:**

**virtual BOOL DeleteTarget(int selection)=0;**

**Remarks:**

This method allows you to delete a specified target.

**Parameters:**

**int selection**

The node number in the orientation target list to delete.

**Return Value:**

TRUE if successful, otherwise FALSE.

## Class IPosConstPosition

See Also: [Class Control](#), [Class FPMixinInterface](#).

```
class IPosConstPosition : public Control, public FPMixinInterface
```

### Description:

This class is available in release 4.0 and later only.

This class represents the interface to the Position Constraint. You can obtain a pointer to the position constraint interface using;

**GetIPosConstInterface(cd)**. This macro will return

**(IPosConstPosition\*)(CD)-**

**>GetFPInterface(POS\_CONSTRAINT\_INTERFACE).**

**POSPOS\_PBLOCK\_REF** may be used to access the position constraint controller's references:

All methods of this class are Implemented by the System.

### Methods:

public:

### Prototype:

```
virtual INode* GetNode(int targetNumber)=0;
```

### Remarks:

Gets one of the position nodes that the position constraint controller targets, specified by **targetNumber**.

### Parameters:

**int targetNumber**

The node number in the position target list to be obtained.

### Prototype:

```
virtual float GetTargetWeight(int targetNumber)=0;
```

### Remarks:

Gets the weight of one of the position nodes that the position constraint controller targets, specified by **targetNumber**.

### Parameters:

### **int targetNumber**

The node number in the position target list to set.

### **Return Value:**

Returns the position target weight if the **targetNumber** is relevant, 0.0f otherwise.

### **Prototype:**

**virtual BOOL SetTargetWeight(int targetNumber, float weight)=0;**

### **Remarks:**

Sets the weight of one of the position nodes that the position constraint controller follows, specified by **targetNumber**.

### **Parameters:**

#### **int targetNumber**

The node number in the position target list whose weight is to be set.

#### **float weight**

The weight to set.

### **Return Value:**

TRUE if there is more than one position target in the list and you are trying to set weight, FALSE otherwise.

### **Prototype:**

**virtual BOOL AppendTarget(INode \*target, float weight=50.0)=0;**

### **Remarks:**

Appends the current position target list by one and appends.

### **Parameters:**

#### **INode \*target**

The node that is to be appended to the current position target list.

#### **float weight=50.0**

This is the weight that is to be assigned to the newly appended position target. The default weight is 50.0.

### **Return Value:**

TRUE if the target was appended, otherwise FALSE.

**Prototype:**

**virtual int GetNumTargets()=0;**

**Remarks:**

Returns the number of target nodes in the position target list.

**Prototype:**

**virtual BOOL DeleteTarget(int selection)=0;**

**Remarks:**

This method allows you to delete a specified target.

**Parameters:**

**int selection**

The node number in the position target list to delete.

**Return Value:**

TRUE if successful, otherwise FALSE.

# Class IPathPosition

See Also: [Class Control](#), [Class INode](#).

class IPathPosition : public Control, public FPMixinInterface

## Description:

This class is available in release 2.0 and later only.

This class represents the interface to the Path Position Controller. You can obtain a pointer to the path position controller interface using;

**GetIPathConstInterface(cd)**. This macro will return

**(IPathPosition\*)(CD)-**

**>GetFPInterface(PATH\_CONSTRAINT\_INTERFACE).**

**PATHPOS\_PATH\_REF** may be used to access the position constraint controller's references and **PATHPOS\_PBLOCK\_REF** to reference the parameter block.

All methods of this class are Implemented by the System.

## Methods:

public:

## Prototype:

**virtual int GetNumTargets()=0;**

## Remarks:

This method is available in release 4.0 and later only.

Returns the number of nodes in the path list.

## Prototype:

**virtual INode\* GetNode(int targetNumber)=0;**

## Remarks:

This method is available in release 4.0 and later only.

Gets one of the path nodes that the path controller follows, specified by **targetNumber**.

## Parameters:

### **int targetNumber**

The node number in the path list to be obtained.

#### **Prototype:**

**virtual float GetTargetWeight(int targetNumber)=0;**

#### **Remarks:**

This method is available in release 4.0 and later only.

Gets the weight of one of the path nodes that the path controller follows, specified by **targetNumber**, and time t. If the **targetNumber** is not relevant then 0.0f is returned.

#### **Parameters:**

### **int targetNumber**

The node number in the path list whose weight is to be obtained.

#### **Prototype:**

**virtual BOOL SetTargetWeight(int targetNumber, float weight)=0;**

#### **Remarks:**

This method is available in release 4.0 and later only.

Sets the weight of one of the path nodes that the path controller follows, specified by **targetNumber**.

#### **Parameters:**

### **int targetNumber**

The node number in the path list whose weight is to be set.

### **float weight**

The weight to assign.

#### **Return Value:**

TRUE if there is more than one path in the list and you are trying to set weight, FALSE otherwise.

#### **Prototype:**

**virtual BOOL AppendTarget(INode \*target, float weight=50.0)=0;**

#### **Remarks:**

This method is available in release 4.0 and later only.

Appends the current path list by one and appends the current weight list by one.

**Parameters:**

**INode \*target**

The node that is to be appended to the current path list.

**float weight=50.0**

The weight to be assigned to the newly appended path.

**Prototype:**

**virtual BOOL DeleteTarget(int selection)=0;**

**Remarks:**

This method is available in release 4.0 and later only.

This method allows you to delete a specified target.

**Parameters:**

**int selection**

The node number in the orientation target list to delete.

**Return Value:**

TRUE if successful, otherwise FALSE.

**Prototype:**

**virtual void SetFollow(BOOL f)=0;**

**Remarks:**

This method allows you to set the follow flag.

**Parameters:**

**BOOL f**

TRUE for on, FALSE for off.

**Prototype:**

**virtual BOOL GetFollow()=0;**

**Remarks:**

This method returns the state of the follow flag. TRUE if on; FALSE if off.

**Prototype:**

**virtual void SetBankAmount(float a)=0;**

**Remarks:**

Sets the bank amount parameter.

Bank and tracking are scaled in the UI.

The bank values are scaled in the user interface. The following macros may be used to convert to and from the UI values.

**#define BANKSCALE 100.0f**

**#define FromBankUI(a) ((a)\*BANKSCALE)**

**#define ToBankUI(a) ((a)/BANKSCALE)**

**Parameters:**

**float a**

The bank amount.

**Prototype:**

**virtual float GetBankAmount()=0;**

**Remarks:**

Returns the bank amount setting. See the remarks in **SetBankAmount()** above.

**Prototype:**

**virtual void SetBank(BOOL b)=0;**

**Remarks:**

Sets the bank parameter to on or off.

**Parameters:**

**BOOL b**

TRUE for on; FALSE for off.

**Prototype:**

**virtual BOOL GetBank()=0;**

**Remarks:**

Returns the on/off state of the bank parameter. TRUE if on; FALSE if off.

**Prototype:**

**virtual void SetTracking(float t)=0;**

**Remarks:**

Sets the smoothness parameter.

The smoothing (tracking) values are scaled in the user interface. The following macros may be used to convert to and from the UI values.

```
#define TRACKSCALE 0.04f
```

```
#define FromTrackUI(a) ((a)*TRACKSCALE)
```

```
#define ToTrackUI(a) ((a)/TRACKSCALE)
```

**Parameters:**

**float t**

The smoothness setting.

**Prototype:**

**virtual float GetTracking()=0;**

**Remarks:**

Returns the smoothness setting. See remarks in **SetTracking()** above.

**Prototype:**

**virtual void SetAllowFlip(BOOL f)=0;**

**Remarks:**

Sets the state of the 'Allow Upside Down' parameter.

**Parameters:**

**BOOL f**

TRUE for on; FALSE for off.

**Prototype:**

**virtual BOOL GetAllowFlip()=0;**

**Remarks:**

Returns the state of the 'Allow Upside Down' parameter.

**Return Value:**

TRUE for on; FALSE for off.

**Prototype:**

**virtual void SetConstVel(BOOL cv)=0;**

**Remarks:**

Sets the state of the 'Constant Velocity' parameter.

**Parameters:**

**BOOL cv**

TRUE for on; FALSE for off.

**Prototype:**

**virtual BOOL GetConstVel()=0;**

**Remarks:**

Returns the state of the 'Constant Velocity' parameter.

**Return Value:**

TRUE for on; FALSE for off.

**Prototype:**

**virtual void SetFlip(BOOL onOff)=0;**

**Remarks:**

Sets the state of the 'Flip' parameter.

**Parameters:**

**BOOL onOff**

TRUE for on; FALSE for off.

**Prototype:**

**virtual BOOL GetFlip()=0;**

**Remarks:**

Returns the state of the 'Flip' parameter.

**Return Value:**

TRUE for on; FALSE for off.

**Prototype:**

**virtual void SetAxis(int axis)=0;**

**Remarks:**

Set the state of the axis parameter.

**Parameters:**

**int axis**

The axis setting. One of the following values:

**0:** X axis.

**1:** Y axis.

**2:** Z axis.

**Prototype:**

**virtual int GetAxis()=0;**

**Remarks:**

Returns the axis setting.

**Return Value:**

One of the following values:

**0:** X axis.

**1:** Y axis.

**2:** Z axis.

**Prototype:**

**virtual void SetLoop(BOOL l)=0;**

**Remarks:**

This method allows you to set the state of the loop flag.

**Parameters:**

## **BOOL l**

TRUE for on; FALSE for off.

### **Prototype:**

**virtual BOOL GetLoop()=0;**

### **Remarks:**

Returns the state of the loop flag.

### **Return Value:**

TRUE for on; FALSE for off.

### **Prototype:**

**virtual void SetRelative(BOOL rel)=0;**

### **Remarks:**

This method allows you to set the state of the relative/absolute flag.

### **Parameters:**

**BOOL rel**

TRUE to set to relative; FALSE to set to absolute.

### **Prototype:**

**virtual BOOL GetRelative()=0;**

### **Remarks:**

Returns the state of the relative/absolute flag.

### **Return Value:**

TRUE if relative is on; FALSE is off (i.e. absolute).

## List of Reference Messages and their PartID parameters

See Also: [Class ReferenceTarget](#), [Class INode](#), [Class Control](#).

This section describes some of the common messages used by references and the meaning of the **PartID** parameter associated with these messages.

Some messages are sent by the system while others are sent by the plug-in. Each method may need to pass along additional information so the reference maker may process the message. This information is passed in the **PartID** parameter. The meaning of the information stored in the **PartID** is specific to the message sent along with it.

Note that not all messages use the **PartID** parameter (in fact most don't). In these cases the **PartID** will be set to 0. If the plug-in is sending the message, it should set the **PartID** to 0 if not used. In the cases where the **PartID** is used, it is documented below.

Developers who define their own reference messages should do so using a value greater than:

```
#define REFMSG_USER 0x00010000
```

The system uses numbers less than this value.

### **REFMSG\_CHANGE**

This is the most common message sent. Any time a reference target changes in a way that may affect items which reference it, this message should be sent.

Note the following for the **partIDs** that are sent during this message:

**PART\_HIDESTATE** -- This is a special **partID** sent by visibility controllers when they change the hidden in viewport state.

**PART\_TM** -- This is passed in **partID** when the reference is to a node in the scene and its transformation matrix has changed.

**PART\_OBJECT\_TYPE** -- This is sent if the object type changes.

Objects and Modifier set the **PartID** to the channel which changed. (See the section on the [Geometric Pipeline](#) for more information on channels). There are several specific **PartID** referring to channels. These are:

- **PART\_TOPO = TOPO\_CHANNEL**
- **PART\_GEOM = GEOM\_CHANNEL**

- **PART\_TEXMAP = TEXMAP\_CHANNEL**
- **PART\_MTL = MTL\_CHANNEL**
- **PART\_SELECT = SELECT\_CHANNEL**
- **PART\_SUBSEL\_TYPE = SUBSEL\_TYPE\_CHANNEL**
- **PART\_DISPLAY = DISP\_ATTRIB\_CHANNEL**
- **PART\_VERTCOLOR = VERTCOLOR\_CHANNEL**

### **REFMSG\_TARGET\_DELETED**

This message is sent when a reference target is deleted. This allows the reference maker to handle this condition if it depends on the deleted item. For example this is sent when the item you are referencing is actually deleted and you need to set your pointer to the item to NULL.

### **REFMSG\_IS\_OK\_TO\_CHANGE\_TOPOLOGY**

This message is sent to ask a reference maker if it is okay to change the topology of a node. If any dependents have made topology-dependent modifiers, they should return **REF\_FAIL**. A return of **REF\_SUCCEED** means that the answer is YES, it is okay to change the topology. A return of **REF\_FAIL** means that the answer is NO, it is not okay to change the topology.

### **REFMSG\_NODE\_LINK**

This message is sent by a node when it has a child linked to it or unlinked from it.

### **REFMSG\_NODE\_NAMECHANGE**

This message is sent by a node when its name has been changed. For example, the path controller displays the name of the node in the scene which it follows. It responds to this message by changing the name displayed in the UI.

### **REFMSG\_OBREF\_CHANGE**

This message is sent by a node (or derived object) when the object it references changes. Note: This message is no longer used. It is basically synonymous with **REFMSG\_SUBANIM\_STRUCTURE\_CHANGED**.

### **REFMSG\_MODIFIER\_ADDED**

This message is sent by a derived object when a modifier is added or deleted.

### **REFMSG\_CONTROLREF\_CHANGE**

This message is sent when an animatable switches controllers for one of its

parameters.

### **REFMSG\_GET\_PARAM\_NAME**

A parameter block sends this message to its client when it needs the name of the i-th parameter. The **PartID** is set to a pointer to a [GetParamName](#) structure. See the Advanced Topics section on [Parameter Blocks](#) for more details.

### **REFMSG\_GET\_PARAM\_DIM**

A parameter block sends this message to its client when it needs to know the dimension type of the 'i-th' parameter. The **PartID** is set to a pointer to a [GetParamDim](#) structure. See the Advanced Topics section on [Parameter Blocks](#) for more details.

### **REFMSG\_GET\_CONTROL\_DIM**

A controller can send this to its client to get its parameters dimension. It should set **PartID** to a [ParamDimension](#).

### **REFMSG\_TM\_CHANGE**

This message is sent by a node when its transformation matrix has changed because it was evaluated at a different time. Normally this isn't necessary - anyone depending on the node's TM would have a validity interval that reflected the validity of the TM. The axis system doesn't store a validity interval so this message is needed for it.

### **REFMSG\_RANGE\_CHANGE**

A node sends this message when its animation range changes.

### **REFMSG\_LINEHEIGHT\_CHANGE**

This message is sent to the track view when an animatable's line height changes.

### **REFMSG\_BECOMING\_ANIMATED**

A controller should send this message to the track view when it becomes animated. If the user has the animated only filter on then the track view will display this item.

### **REFMSG\_SUBANIM\_STRUCTURE\_CHANGED**

If a plug-in has a variable number of parameters this message may be used. This is intended mainly for the track view to tell it to re-generate the view below the message sender's level.

### **REFMSG\_REF\_DELETED**

This message is sent when a target has had a reference deleted.

## **REFMSG\_REF\_ADDED**

This message is sent when a target has had a reference added.

## **REFMSG\_BRANCHED\_HISTORY\_CHANGED**

This message is sent by an object that provides branching in the history to notify it that the structure of the branches has changed.

## **REFMSG\_NODEINSELSET\_CHANGED**

The selection set sends this notification when it receives a

**REFMSG\_CHANGE** from an item in the selection set. The selection set doesn't propagate the **REFMSG\_CHANGE** message.

## **REFMSG\_TEST\_DEPENDENCY**

This method is used to see if this reference target depends on something. In 3ds max 2.0 and later, if the **partID** is nonzero, the dependency test will include child nodes. Otherwise, child nodes will not be considered dependents. See **ReferenceTarget::BeginDependencyTest()**.

## **REFMSG\_WANT\_SHOWPARAMLEVEL**

A Parameter block sends this to its client to ask if it should display a distinct "**Parameters**" level in the track view hierarchy. A pointer to a boolean is passed in for **PartID**: set this to the desired answer. The default is NO -- in this case the message doesn't need to be responded to.

## **REFMSG\_BEFORE\_PASTE**

## **REFMSG\_NOTIFY\_PASTE**

These messages are sent before and after a paste has been done. Sent as **partID** is a pointer to a data structure containing three RefTargetHandle's: the reference maker, the old target, and the new target. The message is sent to the reference maker initially.

## **REFMSG\_UV\_SYM\_CHANGE**

This message is sent when a UV Generator changes symmetry, so interactive texture display updates.

## **REFMSG\_GET\_NODE\_NAME**

The first node that gets this message will fill in the **TSTR** which **partID** points to with its name and stop the message from propagating.

## **REFMSG\_SEL\_NODES\_DELETED**

This message is sent by the selection set whenever it has just deleted nodes.

## **REFMSG\_PRENOTIFY\_PASTE**

This message is sent **before** a reference target is pasted. It is sent by the target about to be replaced.

## **REFMSG\_SHAPE\_START\_CHANGE**

Sent when a shape enters a state where it'll be changing a lot and it would be a good idea for anybody using it for mesh generation to suppress updates.

## **REFMSG\_SHAPE\_END\_CHANGE**

Sent to terminate the above state.

## **REFMSG\_TEXMAP\_REMOVED**

A texture map has been removed. This tells the Materials Editor to remove it from the viewport if it is active.

## **REFMSG\_FLAG\_NODES\_WITH\_SEL\_DEPENDENTS**

Sent by an unselected node to see if any selected nodes depend on it. The **partID** parameter points to a boolean. If a selected node receives this message it should set the boolean to true and return **REF\_STOP**.

## **REFMSG\_CONTAINED\_SHAPE\_POS\_CHANGE**

This messages is sent by objects which contain shapes when the position changes.

## **REFMSG\_CONTAINED\_SHAPE\_SEL\_CHANGE**

This messages is sent by objects which contain shapes when the selection changes.

## **REFMSG\_CONTAINED\_SHAPE\_GENERAL\_CHANGE**

This messages is sent by objects which contain shapes when the selection, or the position changes.

## **REFMSG\_LOOPTEST**

This tests for a cyclic reference. It will return **REF\_FAIL** if there is a loop.

## **REFMSG\_BEGIN\_EDIT**

This is used by modifiers to indicate when they are beginning an edit. For example in **SimpleMod::BeginEditParams()** this message is sent.

## **REFMSG\_END\_EDIT**

This is used by modifiers to indicate when they are ending an edit. For example in **SimpleMod::EndEditParams()** this message is sent. Typically what a modifier will do while it is being edited it will have its **LocalValidity()** return **NEVER** so that a cache is built before it. This will

ensure it is more interactive while it is being edited. When this message is sent to indicate the edit is finished the system can discard the cache.

### **REFMSG\_MOD\_DISPLAY\_ON**

This is used by modifiers to indicate that their apparatus (gizmo) is displayed. For example in **SimpleMod::BeginEditParams()** this message is sent.

### **REFMSG\_MOD\_DISPLAY\_OFF**

This is used by modifiers to indicate that their apparatus (gizmo) is no longer displayed.

### **REFMSG\_MOD\_EVAL**

This is sent by a modifier to cause its ModApp to call **Eval()** on the modifier. If a modifier wants its **ModifyObject()** method to be called it can send this message.

The **PartID** should contain the bits that specify which channels are to be evaluated, for example **PART\_GEOM|PART\_TOPO** or **ALL\_CHANNELS**. The interval passed should be set to **Interval(t, t)**, where **t** is the time to evaluate. Note that before **NotifyDependents()** returns, **ModifyObject()** will be called.

### **REFMSG\_SELECT\_BRANCH**

This message is available in release 2.0 and later only.

When an object receives this message it should do whatever it needs to do (usually select the appropriate sub-object) to make the dependent object be the object returned from **Object::GetPipeBranch()**. The **partID** will point to an **Inode** pointer that will be filled in by the first node to receive this message. Thus, when an object that supports branching in the history receives this message it selects the target that sent the message.

### **REFMSG\_MOUSE\_CYCLE\_STARTED**

This message is available in release 2.0 and later only.

This message is sent to dependents of the transform controllers of selected objects when the user begins a mouse transformation in the viewports (move/rotate/scale).

### **REFMSG\_MOUSE\_CYCLE\_COMPLETED**

This message is available in release 2.0 and later only.

This message is sent to dependents of the transform controllers of selected objects when the user ends a mouse transformation in the viewports

(move/rotate/scale).

### **REFMSG\_CHECK\_FOR\_INVALID\_BIND**

This message is available in release 2.0 and later only.

Sent by a node to other nodes (which depend on that node) when the user attempts to link another node to a node. The **partID** parameter contains a pointer to the new parent node.

### **REFMSG\_OBJECT\_CACHE\_DUMPED**

This message is available in release 2.0 and later only.

Sent when a cache is dumped in the pipeline. A **REFMSG\_CHANGE** message used to be sent, however that was misleading since the object itself didn't change even though any old object pointer has become invalid. For example, if a path controller depends on a spline object and that object dumps some caches in the pipeline, the path controller hasn't actually changed.

### **REFMSG\_SFX\_CHANGE**

This message is available in release 3.0 and later only.

Sent by Atmospheric Effects or Render Effects when they make or delete a reference to a node. When Atmospherics or Effects add or delete a gizmo they should send this message via **NotifyDependents()**.

### **REFMSG\_OBJECT\_REPLACED**

This message is available in release 3.0 and later only.

Sent when objects are replaced from another scene (File->Replace). Other objects referencing the object that is replaced may want to perform some validity checking; this message is more specific than

### **REFMSG\_SUMANIM\_STRUCTURE\_CHANGED**

### **REFMSG\_NODE\_WIRECOLOR\_CHANGED**

This message is available in release 4.0 and later only.

Sent when nodes wireframe color is changed.

### **REFMSG\_NODE\_WSCACHE\_UPDATED**

This message is sent from the node (without propagation) whenever the world state cache gets updated (e.g. when the pipeline gets reevaluated).

### **REFMSG\_NODE\_HANDLE\_CHANGED**

After merging nodes into the scene, all merged objects will receive this reference notification. The PartID will be a pointer to a merge manager

interface that you can use to see if a specific handle was converted and convert between the old and the new handle; **IMergeManager\* pMergeManager = (IMergeManager\*)partID;**

### **REFMSG\_NUM\_SUBOBJECTTYPES\_CHANGED**

This message is available in release 4.0 and later only.

This message is sent to indicate that the sub-object types have changed and that the StackView should be updated.

### **REFMSG\_NODE\_MATERIAL\_CHANGED**

This message is sent from the node whenever the node material is replaced by a different material.

### **REFMSG\_SUBANIM\_NUMBER\_CHANGED**

This message is available in release 4.0 and later only.

This notification is sent to dependents when a subanim changes the ordering. It is used by things like scripted plugins and custom attributes to inform expression and wire controllers when the user redefines the ordering of parameters so these controllers can keep pointing at the correct parameter. The **PartID** is a **Tab<DWORD>\*** in which each DWORD contains an old-to-new mapping with the **LOWORD()** = old subanim number and the **HIWORD()** = new subanim number A new subanim ID of -1 implies the subanim was removed. See

**MAXSDK\SAMPLES\CONTROLLERS\EXPRCTRL.CPP** for example use.

### **REFMSG\_TAB\_ELEMENT\_NULLED**

This message is available in release 4.0 and later only.

Sent by a ParamBlock2 to its owner whenever a reftarg element in a **Tab<>** parameter is forcibly deleted and the reference set to NULL (typically for INODE\_TABs when a scene node is deleted in the viewport).

### **REFMSG\_GET\_NODE\_HANDLE**

This message is available in release 4.0 and later only.

The first node that gets this message will fill in the ULONG which partID points to with its handle and stop the message from propogating.

### **REFMSG\_END\_MODIFY\_PARAMS**

This message is available in release 4.0 and later only.

This will cause **Animatable::EndEditParams()** to be called on the object

displayed in the modify panel.

### **REFMSG\_BEGIN\_MODIFY\_PARAMS**

This message is available in release 4.0 and later only.

This will cause **Animatable::BeginEditParams()** to be called on the object displayed in the modify panel.

### **REFMSG\_MODAPP\_DELETING**

This message is used internally.

### **REFMSG\_EVAL**

This message is used internally.

### **REFMSG\_RESET\_ORIGIN**

This message is used internally.

### **REFMSG\_FLAGDEPENDENTS**

This message is used internally.

### **REFMSG\_TARGET\_SELECTIONCHANGE**

This message is used internally.

### **REFMSG\_DISABLE**

This message is used internally.

### **REFMSG\_ENABLE**

This message is used internally.

### **REFMSG\_TURNON**

This message is used internally.

### **REFMSG\_TURNOFF**

This message is used internally.

### **REFMSG\_LOOKAT\_TARGET\_DELETED**

This message is used internally.

### **REFMSG\_INVALIDATE\_IF\_BG**

This message is used internally.

### **REFMSG\_OBJXREF\_UPDITEMAT**

This message is for internal use only.

### **REFMSG\_OBJXREF\_GETNODES**

This message is for internal use only.

### **REFMSG\_NODE\_GI\_PROP\_CHANGED**

It's broadcasted when a property in the radiosity prop page changes

The following applies only to release 4.0 and later.

This section describes the messages sent by reference maker to its reference target.

Developers who define their own reference target messages should do so using a value greater than:

**#define TARGETMSG\_USER 0x00010000**

The system uses numbers less than this value.

### **TARGETMSG\_ATTACHING\_NODE**

This message is sent to a node's ObjectRef when the node is attaching the object to itself.

### **TARGETMSG\_DELETING\_NODE**

This message is sent to a node's ObjectRef when the node is about to be explicitly deleted.

### **TARGETMSG\_DETACHING\_NODE**

The message is sent to a Node's ObjectRef when the node is detaching the object from itself

## List of Miscellaneous Utility Functions

See Also: [Class Interface](#).

The following functions are not part of any class but are available as part of the API.

### Function:

```
int CoreExecute(int cmd, ULONG arg1=0, ULONG arg2=0,  
ULONG arg3=0);
```

### Remarks:

This global function is available in release 3.0 and later only.

This is a general purpose function that allows the API to be extended in the future. The 3ds max development team can assign new **cmd** numbers and continue to add functionality to this class without having to 'break' the API.

This is reserved for future use.

### Parameters:

**int cmd**

The command to execute.

**ULONG arg1=0**

Optional argument 1 (defined uniquely for each **cmd**).

**ULONG arg2=0**

Optional argument 2.

**ULONG arg3=0**

Optional argument 3.

### Return Value:

An integer return value (defined uniquely for each **cmd**).

### Function:

```
int MaxMsgBox(HWND hWnd, LPCTSTR lpText, LPCTSTR  
lpCaption, UINT type, UINT exType=0, DWORD *exRet=NULL);
```

### Remarks:

This global function is available in release 3.0 and later only.

This function provides an extended message box functionality. This is used to

easily support message dialogs with a 'Hold' button and/or a 'Don't Show Again' checkbox. Note that MB\_ABORTRETRYIGNORE, MB\_YESNOCANCEL, and MB\_RETRYCANCEL are not supported by this function and will be treated identically to MB\_OKCANCEL.

**Parameters:**

**HWND hWnd**

The parent window handle.

**LPCTSTR lpText**

Address of the string for the dialog body text.

**LPCTSTR lpCaption**

Address of the string for the dialog title caption.

**UINT type**

The type is the similar to the Win32 MessageBox() API.

**UINT exType=0**

The 'extended' type supports the following values (which are ORed together to create this argument):

**MAX\_MB\_HOLD**

Indicates to add a "Hold" button to the dialog.

**MAX\_MB\_DONTSHOWAGAIN**

Indicates to add a "Don't show this dialog again" checkbox to the dialog.

**DWORD \*exRet=NULL**

If non-NULL and **MAX\_MB\_DONTSHOWAGAIN** is specified above then this DWORD will have the **MAX\_MB\_DONTSHOWAGAIN** bit set if the checkbox was checked by the user.

**Return Value:**

The return value is zero if there is not enough memory to create the message box. If the function succeeds, the return value is similar to the Win32 MessageBox() API.

**Function:**

**inline float Dbl2Flt(double val, BOOL \*valid = NULL);**

**Remarks:**

This global function is available in release 3.0 and later only.

This function is defined in `\MAXSDK\INCLUDE\WINUTIL.H`. It provides safe type casting from double to float with an indication of overflow returned in the **valid** parameter.

**Parameters:**

**double val**

The value to cast.

**BOOL \*valid = NULL**

TRUE if the no overflow occurred; otherwise FALSE.

**Return Value:**

A float version of the double **val**.

**Sample Code:**

Depending on machine/compiler settings, the following code may throw an under/overflow exception or quietly return a junk value:

```
float val = (float)_tcstod(pNptr, ppEndptr);
```

A safer method would be:

```
BOOL valid;
```

```
float val = Dbl2Flt(_tcstod(pNptr, ppEndptr), &valid);
```

**Function:**

```
inline int Dbl2Int(double val, BOOL *valid = NULL);
```

**Remarks:**

This global function is available in release 3.0 and later only.

This function is defined in `\MAXSDK\INCLUDE\WINUTIL.H`. It provides safe type casting from double to int with an indication of overflow returned in the **valid** parameter.

**Parameters:**

**double val**

The value to cast.

**BOOL \*valid = NULL**

TRUE if the no overflow occurred; otherwise FALSE.

**Return Value:**

An int version of the double **val**.

**Function:**

**inline void SinCos(float angle, float \*sine, float \*cosine);**

**Remarks:**

This global function is available in release 3.0 and later only.

Returns both the sine and cosine of the angle specified, as floats. This routine uses assembly language on Intel CPUs. This is defined in **\MAXSDK\INCLUDE\GFLOAT.H**.

**Parameters:**

**float angle**

The angle in radians.

**float \*sine**

Points to storage for the output sine of the angle.

**float \*cosine**

Points to storage for the output cosine of the angle.

**Function:**

**inline float Sin(float angle);**

**Remarks:**

This global function is available in release 3.0 and later only.

Returns the sine of the angle specified as a float. This routine uses assembly language on Intel CPUs. This is defined in **\MAXSDK\INCLUDE\GFLOAT.H**.

**Parameters:**

**float angle**

The angle in radians.

**Function:**

**inline float Cos(float angle);**

**Remarks:**

This global function is available in release 3.0 and later only.

Returns the cosine of the angle specified as a float. This routine uses assembly language on Intel CPUs. This is defined in

## **\\MAXSDK\\INCLUDE\\GFLOAT.H.**

### **Parameters:**

**float angle**

The angle in radians.

### **Function:**

**inline float Sqrt(float arg);**

### **Remarks:**

This global function is available in release 3.0 and later only.

Returns the square root of the argument specified as a float. This routine uses assembly language on Intel CPUs. This is defined in

**\\MAXSDK\\INCLUDE\\GFLOAT.H.**

### **Parameters:**

**float arg**

The number whose square root is computed.

### **Function:**

**bool IsDebugging();**

### **Remarks:**

This global function is available in release 4.0 and later only.

Returns true if 3ds max is running under the debugger; otherwise false.

### **Function:**

**int NumberOfProcessors();**

### **Remarks:**

This global function is available in release 4.0 and later only.

Returns the number of processors in the machine 3ds max is running on.

### **Function:**

**bool IsWindows9x();**

### **Remarks:**

This global function is available in release 4.0 and later only.

Returns true if 3ds max is running on Windows 9x (95 or 98); otherwise false.

**Function:**

**bool IsWindows98or2000();**

**Remarks:**

This global function is available in release 4.0 and later only.

Returns true if 3ds max is running on Windows 98 or Windows 2000; otherwise false.

**Function:**

**int GetScreenWidth();**

**Remarks:**

This global function is available in release 4.0 and later only.

Returns the width of the screen (taking into consideration if multiple monitors are in use).

**Function:**

**int GetScreenHeight();**

**Remarks:**

This global function is available in release 4.0 and later only.

Returns the height of the screen (taking into consideration if multiple monitors are in use).

## Class CustAttrib

See Also: [Class ICustAttribContainer](#) , [Class ReferenceTarget](#) , [Class ParamDlg](#), [Class Animatable](#)

```
class CustAttrib: public ReferenceTarget
```

### Description:

This class is available in release 4.0 and later only.

This class represents the Custom Attributes.

A sample on how to use this class is located in

**\MAXSDK\SAMPLES\HOWTO\CUSTATTRIBUTIL**

### Methods:

public:

### Prototype:

```
virtual TCHAR* GetName();
```

### Remarks:

Implemented by the plugin.

A CustAttrib plugin can implement this method in order to provide the name that gets displayed in the TrackView.

### Default Implementation:

```
{ return "Custom Attribute";}
```

### Prototype:

```
virtual ParamDlg *CreateParamDlg(HWND hwMtlEdit,  
IMtlParams *imp);
```

### Remarks:

Implemented by the plugin.

This method gets called when the material or texture is to be displayed in the material editor parameters area. The plug-in should allocate a new instance of a class derived from ParamDlg to manage the user interface.

### Parameters:

**HWND hwMtlEdit**

The window handle of the materials editor.

### **IMtlParams \*imp**

The interface pointer for calling methods in 3ds max.

#### **Return Value:**

A pointer to the created instance of a class derived from **ParamDlg**.

#### **Default Implementation:**

```
{return NULL;}
```

#### **Prototype:**

```
virtual bool CheckCopyAttribTo(ICustAttribContainer *to);
```

#### **Remarks:**

Implemented by the plugin.

This method will check if it possible to copy the current custom attributes to the specified custom attributes container.

#### **Parameters:**

**ICustAttribContainer \*to**

A pointer to the custom attributes container you wish to check for possible reception of the custom attributes..

#### **Return Value:**

TRUE if it is possible to copy, otherwise FALSE.

#### **Default Implementation:**

```
{ return true; }
```

## Class ICollision

See Also: [Class CollisionOps](#), [Class CollisionPlane](#), [Class CollisionSphere](#), [Class CollisionVNormal](#), [Class CollisionMesh](#), [Class ReferenceTarget](#), [Class Box3](#), [Class Point3](#)

```
class ICollision : public ReferenceTarget
```

### Description:

This class is available in release 4.0 and later only.

This class represents the virtual class to support collision objects. All collision detection classes should derive from this class. The purpose of this class is to improve the particle collision system for older particle systems and to let other systems such as Flex and MAXScript benefit from a more open architecture and to provide an interface to determine if a particle hit a surface. Additionally three basic collision detection classes are provided, a planar, a spherical, and a mesh deflection class.

### Methods:

public:

### Prototype:

```
virtual int SupportedCollisions() = 0;
```

### Remarks:

This method returns the collision type supported by the engine.

### Return Value:

One of the following;

**POINT\_COLLISION** for point collision, currently supported.

**SPHERE\_COLLISION** for spherical collision, currently not supported.

**BOX\_COLLISION** for box collision, currently not supported.

**EDGE\_COLLISION** for edge collision, currently not supported.

### Prototype:

```
virtual void PreFrame(TimeValue t, TimeValue dt) = 0;
```

### Remarks:

This method will be called once before the checkcollision is called for each frame which allows you to do any required initialization.

**Parameters:**

**TimeValue t**

The time at which to initialize.

**TimeValue dt**

The delta of time the particle wil travel.

**Prototype:**

**virtual void PostFrame(TimeValue t, TimeValue dt) = 0;**

**Remarks:**

This method will be called at the end of each frame solve to allow you to destroy and deallocate any data you no longer need.

**Parameters:**

**TimeValue t**

The time at which to initialize.

**TimeValue dt**

The delta of time the particle wil travel.

**Prototype:**

**virtual BOOL CheckCollision (TimeValue t, Point3 pos, Point3 vel, float dt, float &at, Point3 &hitPoint, Point3 &norm, Point3 &friction, Point3 &inheritedVel) = 0;**

**Remarks:**

This method will be called to execute a point to surface collision and compute the time at which the particle hit the surface.

**Parameters:**

**TimeValue t**

The end time of the particle.

**Point3 pos**

The position of the particle in world space.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

**Prototype:**

**virtual BOOL CheckCollision (TimeValue t,Point3 pos, float radius, Point3 vel, float dt, float &at, Point3 &hitPoint, Point3 &norm, Point3 &friction, Point3 &inheritedVel) = 0;;**

**Remarks:**

This method will be called to execute a sphere to surface collision and compute the time at which the particle hit the surface.

**Parameters:**

**TimeValue t**

The end time of the particle.

**Point3 pos**

The position of the particle in world space.

**float radius**

The radius of the sphere.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

**Prototype:**

**virtual BOOL CheckCollision (TimeValue t, Box3 box, Point3 vel, float dt, float &at, Point3 &hitPoint, Point3 &norm, Point3 &friction, Point3 &inheritedVel) = 0;**

**Remarks:**

This method will be called to execute a box to surface collision and compute the time at which the particle hit the surface.

**Parameters:**

**TimeValue t**

The end time of the particle.

**Box3 box**

The box itself.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

**Prototype:**

**virtual BOOL CheckCollision (TimeValue t,Point3 edgeA,Point3 edgeB ,Point3 vel, float dt, float &at, Point3 &hitPoint, Point3 &norm, Point3 &friction, Point3 &inheritedVel) = 0;**

**Remarks:**

This method will be called to execute an edge to surface collision and compute the time at which the particle hit the surface.

**Parameters:**

**TimeValue t**

The end time of the particle.

**Point3 edgeA**

The first edge.

**Point3 edgeB**

The second edge.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

## Class RandGenerator

class RandGenerator

### Description:

This class is available in release 4.0 and later only.

This class has interfaces for **srand()** and **rand()** methods of VC++ and other functions for random number generation. The **srand()** and **rand()** methods from **stdlib.h** have two main problems:

a) It's not satisfactorily random. The **rand()** function returns a pseudorandom integer in the range 0 to 0x7fff=32767. If we need a lot of random numbers using **rand()** (i.e. for generating 100,000 particles), we run out of continuity of random numbers. Generated random numbers becomes too discrete.

b) The **rand()** method is global function, not class object. Hence it is shared between all modules of your plug-in. Changes in one module may change randomness pattern in other independent module. To solve this contradiction, rand methods have to be implemented as a class object.

The **RandGenerator** does exactly that. It has much more random numbers:  $RAND\_MAX = 0xFFFFFFFF = 4,294,967,295$ . Also, using instances of the class, it's much easier to create separate threads of random numbers for a specific module.

### Data Members:

public:

**static const DWORD32 RAND\_MAX**

This definition is used to override the VC++ rand methods.

### Methods:

public:

### Prototype:

**RandGenerator();**

### Remarks:

Constructor.

**Prototype:**

**void srand(DWORD32 seed);**

**Remarks:**

This method sets the starting point for generating a series of pseudorandom integers. To reinitialize the generator, use 1 as the seed argument. Any other value for seed sets the generator to a random starting point. **rand()** retrieves the pseudorandom numbers that are generated. Calling **rand()** before any call to this method generates the same sequence as calling it with seed passed as 1.

**Parameters:**

**DWORD32 seed**

The starting seed.

**Prototype:**

**DWORD32 rand(void);**

**Remarks:**

This method returns a pseudorandom integer in the range 0 to RAND\_MAX

**Prototype:**

**int RandSign(void);**

**Remarks:**

This method returns the random number sign, either -1 or 1.

**Prototype:**

**float Rand01(void);**

**Remarks:**

This method return a random number between 0.0f and 1.0f.

**Prototype:**

**float Rand11(void);**

**Remarks:**

This method return a random number between -1.0f and 1.0f.

**Prototype:**

**float Rand55(void);**

**Remarks:**

This method return a random number between -0.5f and 0.5f.

**Prototype:**

**int Rand0X(void);**

**Remarks:**

This method return a random number between 0 and maxnum.

**Prototype:**

**bool Valid(void) const;**

**Remarks:**

This method returns TRUE if the random number generator has been explicitly initialized by the **srand()** method.

## Class ID3DGraphicsWindow

See Also: [Class IDX8VertexShader](#), [Class IDX8PixelShader](#), [Class BaseInterface](#)

```
class ID3DGraphicsWindow : public BaseInterface
```

### Description:

This class is available in release 4.0 and later only.

The abstract interface to the D3D graphics window class. The methods here provide low-level access to 3ds max's Direct-3D graphics system. These methods are available for plug-ins to do any graphics work not possible using the standard high-level graphics methods of 3ds max. These methods are for use in the existing 3ds max viewports. Note that these APIs are not for casual use, as they are not intended to be a high level graphics library. A number of structures, classes, and data types used here are part of the Microsoft DirectX SDK.

### Methods:

public:

### Prototype:

```
virtual Interface_ID GetID();
```

### Remarks:

This method returns the interface ID of the class.

### Default Implementation:

```
{ return D3D_GRAPHICS_WINDOW_INTERFACE_ID; }
```

### Prototype:

```
virtual LifetimeType LifetimeControl();
```

### Remarks:

This method returns the type of lifetime control for this interface.

### Default Implementation:

```
{ return noRelease; }
```

### Prototype:

**virtual LPDIRECT3DDEVICE8 GetDevice() = 0;**

**Remarks:**

This method returns the Direct3D Device from GFX.

**Prototype:**

**virtual LPDIRECT3DVERTEXBUFFER8 GetVertexBuffer(UINT length, DWORD FVF) = 0;**

**Remarks:**

This method returns the VertexBuffer from GFX.

**Parameters:**

**UINT length**

The size of vertex buffer.

**DWORD FVF**

The Flexible Vertex Format. Unless older Flexible Vertex Formats are in use, FVF should be zero.

**Prototype:**

**virtual LPDIRECT3DINDEXBUFFER8 GetIndexBuffer(UINT length, D3DFORMAT format) = 0;**

**Remarks:**

This method returns the Direct-3D index buffer from GFX.

**Parameters:**

**UINT length**

The size of vertex buffer.

**D3DFORMAT format**

The Direct-3D format to use.

**Prototype:**

**virtual D3DXMATRIX GetWorldXform() = 0;**

**Remarks:**

This method returns the World transformation from GFX as a Direct-3D Matrix.

**Prototype:**

**virtual D3DXMATRIX GetViewXform() = 0;**

**Remarks:**

This method returns the View transformation from GFX as a Direct-3D Matrix.

**Prototype:**

**virtual D3DXMATRIX GetProjXform() = 0;**

**Remarks:**

This method returns the Projection transformation from GFX as a Direct-3D Matrix.

**Prototype:**

**virtual D3DCOLOR GetColor(ColorType t) = 0;**

**Remarks:**

This method returns the Constant Color of specified type from GFX.

**Parameters:**

**ColorType t**

The type of color you wish to retrieve.

**Prototype:**

**virtual Tab<D3DLIGHT8 \*> \*GetLights() = 0;**

**Remarks:**

This method returns a pointer to a table of pointers to enabled Direct3D Lights from GFX

**Prototype:**

**virtual D3DMATERIAL8 GetMaterial() = 0;**

**Remarks:**

This method returns the Direct-3D Material from GFX.

**Prototype:**

**virtual DWORD GetTextureTiling(int texStage, int coord) = 0;**

**Remarks:**

This method returns the Texture Tiling for specified texStage and coord from GFX.

**Parameters:**

**int texStage**

The specified texture stage to get the tiling for.

**int coord**

The specified texture coordinate to get the tiling for.

**Prototype:**

**virtual D3DXMATRIX GetTexXform(int texStage) = 0;**

**Remarks:**

This method returns the Texture Transform for specified texStage from GFX.

**Parameters:**

**int texStage**

The specified texture stage to get the texture transformation for.

## Class IDX8PixelShader

See Also: [Class ID3DGraphicsWindow](#), [Class IDX8VertexShader](#), [Class BaseInterface](#), [Class Material](#), [Class INode](#)

class IDX8PixelShader: public BaseInterface

### Description:

This class is available in release 4.0 and later only.

The abstract interface to the Direct-3D Pixel Shader architecture.

### Methods:

public:

### Prototype:

```
virtual Interface_ID GetID();
```

### Remarks:

This method returns the interface ID of the class.

### Default Implementation:

```
{ return DX8_PIXEL_SHADER_INTERFACE_ID; }
```

### Prototype:

```
virtual HRESULT ConfirmDevice(ID3DGraphicsWindow *gw) = 0;
```

### Remarks:

This method will confirm that the Direct3D Device can handle this PixelShader.

### Parameters:

**ID3DGraphicsWindow \*gw**

A pointer to the Direct-3D Graphics Window.

### Prototype:

```
virtual HRESULT ConfirmVertexShader(IDX8VertexShader *pvs) = 0;
```

**Remarks:**

This method will confirm that an associated VertexShader will work with this PixelShader.

**Parameters:**

**IDX8VertexShader \*pvs**

A pointer to the vertex shader to check for.

**Prototype:**

**virtual HRESULT Initialize(Material \*mtl, INode \*node) = 0;**

**Remarks:**

This method will load the PixelShader instructions and textures. PixelShader instructions should be loaded once and shared among all the nodes using this PixelShader. In addition, any textures necessary for the PixelShader effect should be loaded once and shared among all the nodes using this PixelShader.

**Parameters:**

**Material \*mtl**

A pointer to the pixel shader material.

**INode \*node**

A pointer to the node.

**Prototype:**

**virtual int GetNumMultiPass() = 0;**

**Remarks:**

This method returns the number of passes for the effect this PixelShader creates. Note that this value will depend on the hardware currently in use.

**Prototype:**

**virtual DWORD GetPixelShaderHandle(int numPass) = 0;**

**Remarks:**

This method returns the PixelShader handle for the specified pass for use in GFX.

**Parameters:**

**int numPass**

The pass for which to return the pixelshader handle.

**Prototype:**

**virtual HRESULT SetPixelShader(ID3DGraphicsWindow \*gw, int numPass) = 0;**

**Remarks:**

This method allows you to set the PixelShader for the specified pass. This call will be made at least once per object to set the per object data for the PixelShader such as the PixelShader constants.

**Parameters:**

**ID3DGraphicsWindow \*gw**

A pointer to the Direct-3D Graphics Window.

**int numPass**

The pass for which to set the pixel shader.

## Class IDX8VertexShader

See Also: [Class IVertexShader](#), [Class IDX8PixelShader](#), [Class ID3DGraphicsWindow](#) , [Class BaseInterface](#)

```
class IDX8VertexShader : virtual public IVertexShader, public BaseInterface
```

### Description:

This class is available in release 4.0 and later only.

The abstract interface to the Direct-3D Vertex Shader architecture.

The drawing functions are necessary as something other than a simple default body if:

- · The VertexShader needs to add additional per vertex data unknown to the Mesh to the VertexBuffer.
- · The VertexShader needs to have per vertex data ordered differently than the standard position, normal, {color, tex coords ordering}.
- · The VertexShader is being used to create cached VertexBuffers or using higher order surfaces.

In the cases of **DrawMeshStrips()** and **DrawWireMesh()**, the VertexShader has the option of not only locking and filling the VertexBuffer with data, but also of making the actual DrawPrimitive call. In the case of **StartLines()**, the VertexShader must make the DrawPrimitive call. The VertexShader indicates that it has done the drawing by returning 'true' in the Draw functions provided.

In the case where the VertexShader does not want to do the drawing but does want to fill in a VertexBuffer with data, the VertexShader can request the GFX to create a VertexBuffer (and possibly an IndexBuffer) of appropriate size. The GetVertexBuffer and GetIndexBuffer calls on the ID3DGraphicsWindow object will do this and return the allocated buffers in subsequent calls or reallocate them if necessary.

Please note that if a PixelShader or PixelShaders are in use, these Draw functions may need to set them for the appropriate passes of a multipass rendering if the drawing is done in these Draw() functions. If the GFX is doing the drawing, then these Draw() functions are only being used to fill in the VertexBuffer with data; the GFX will be doing the drawing and will be setting

the PixelShaders as appropriate.

**Methods:**

public:

**Prototype:**

```
virtual Interface_ID GetID();
```

**Remarks:**

This method returns the interface ID of the class.

**Default Implementation:**

```
{ return DX8_VERTEX_SHADER_INTERFACE_ID; }
```

**Prototype:**

```
virtual HRESULT ConfirmDevice(ID3DGraphicsWindow *gw) =  
0;
```

**Remarks:**

This method will confirm that the Direct3D Device can handle this VertexShader.

**Parameters:**

**ID3DGraphicsWindow \*gw**

A pointer to the Direct-3D Graphics Window.

**Prototype:**

```
virtual HRESULT ConfirmPixelShader(IDX8PixelShader *pps) =  
0;
```

**Remarks:**

This method will confirm that an associated PixelShader will work with this VertexShader.

**Parameters:**

**IDX8PixelShader \*pps**

A pointer to the pixel shader to confirm for.

**Prototype:****virtual bool CanTryStrips() = 0;****Remarks:**

This method will indicate if it can try tristrips for drawing or must geometry using this VertexShader be drawn as triangles? This should return TRUE unless additional per vertex data is generated by this VertexShader and this data does not map to the Mesh vertices in the same way as existing data the Mesh knows about such as texture coordinates.

**Prototype:****virtual int GetNumMultiPass() = 0;****Remarks:**

This method returns the number of passes for the effect this VertexShader creates. Note that this value will depend on the hardware currently in use.

**Prototype:****virtual DWORD GetVertexShaderHandle(int numPass) = 0;****Remarks:**

This method returns the VertexShader handle for the specified pass for use in GFX.

**Prototype:****virtual HRESULT SetVertexShader(ID3DGraphicsWindow \*gw, int numPass) = 0;****Remarks:**

This method allows you to set the VertexShader for the specified pass. This call will be made at least once per object to set the per object data for the VertexShader such as the VertexShader constants.

**Parameters:****ID3DGraphicsWindow \*gw**

A pointer to the Direct-3D Graphics Window.

**int numPass**

The pass for which to set the vertex shader.

**Prototype:**

```
virtual bool DrawMeshStrips(ID3DGraphicsWindow *gw,  
MeshData *data) = 0;
```

**Remarks:**

This method will draw the 3D Mesh as TriStrips. Fill in the VertexBuffer with data in the order desired by the VertexShader.

**Parameters:**

**ID3DGraphicsWindow \*gw**

A pointer to the Direct-3D Graphics Window.

**MeshData \*data**

A pointer to the mesh data.

**Return Value:**

TRUE if the Mesh has actually been drawn in this call, FALSE if the GFX is required to make the DrawPrimitive call.

**Prototype:**

```
virtual bool DrawWireMesh(ID3DGraphicsWindow *gw,  
WireMeshData *data) = 0;
```

**Remarks:**

This method will draw the 3D Mesh as wireframe. Fill in the VertexBuffer with data in the order desired by the VertexShader.

**Parameters:**

**ID3DGraphicsWindow \*gw**

A pointer to the Direct-3D Graphics Window.

**WireMeshData \*data**

A pointer to the wire mesh data.

**Return Value:**

TRUE if the Mesh has actually been drawn in this call, FALSE if the GFX is required to make the DrawPrimitive call.

**Prototype:**

```
virtual void StartLines(ID3DGraphicsWindow *gw,
```

**WireMeshData \*data) = 0;**

**Remarks:**

This method will draw 3D lines. A Mesh is being drawn by having line segments handed down one at a time. Pass in the Mesh data in preparation for drawing 3D lines.

**Parameters:**

**ID3DGraphicsWindow \*gw**

A pointer to the Direct-3D Graphics Window.

**WireMeshData \*data**

A pointer to the wire mesh data.

**Prototype:**

**virtual void AddLine(ID3DGraphicsWindow \*gw, DWORD \*vert, int vis) = 0;**

**Remarks:**

This method will draw 3D lines. A Mesh is being drawn by having line segments handed down one at a time. Add the connectivity information for one two point line segment.

**Parameters:**

**ID3DGraphicsWindow \*gw**

A pointer to the Direct-3D Graphics Window.

**DWORD \*vert**

The array of vertices.

**int vis**

The visibility flag.

**Prototype:**

**virtual bool DrawLines(ID3DGraphicsWindow \*gw) = 0;**

**Remarks:**

This method will draw the line segments accumulated. This should restart the filling of a VertexBuffer with the next AddLine call if additional data needs to

be drawn before EndLines is called.

**Parameters:**

**ID3DGraphicsWindow \*gw**

A pointer to the Direct-3D Graphics Window.

**Return Value:**

TRUE if the Mesh line segments have actually been drawn in this call, FALSE if the GFX is required to make the DrawPrimitive call.

**Prototype:**

```
virtual void EndLines(ID3DGraphicsWindow *gw,  
GFX_ESCAPE_FN fn) = 0;
```

**Remarks:**

This method will let the Mesh know that all drawing and data access is finished.

**Parameters:**

**ID3DGraphicsWindow \*gw**

A pointer to the Direct-3D Graphics Window.

**GFX\_ESCAPE\_FN fn**

The graphics escape function.

**Prototype:**

```
virtual void StartTriangles(ID3DGraphicsWindow *gw,  
MeshFaceData *data) = 0;
```

**Remarks:**

This method will Draw 3D triangles. A Mesh is being drawn by having triangles handed down one at a time. Pass in the Mesh data in preparation for drawing 3D triangles.

**Parameters:**

**ID3DGraphicsWindow \*gw**

A pointer to the Direct-3D Graphics Window.

**MeshFaceData \*data**

A pointer to the mesh face data.

**Prototype:**

```
virtual void AddTriangle(ID3DGraphicsWindow *gw, DWORD  
index, int *edgeVis) = 0;
```

**Remarks:**

This method will Draw 3D triangles. A Mesh is being drawn by having triangles handed down one at a time. Add the connectivity information for one triangle.

**Parameters:**

**ID3DGraphicsWindow \*gw**

A pointer to the Direct-3D Graphics Window.

**DWORD index**

The triangle index.

**int \*edgeVis**

The array of edge visibility information/

**Prototype:**

```
virtual bool DrawTriangles(ID3DGraphicsWindow *gw) = 0;
```

**Remarks:**

This method will draw the triangles accumulated. This should restart the filling of a VertexBuffer with the next AddTriangle call if additional data needs to be drawn before EndTriangles is called. Return 'true' if the Mesh triangles have actually been drawn in this call, 'false' if the GFX is required to make the DrawPrimitive call.

**Parameters:**

**ID3DGraphicsWindow \*gw**

A pointer to the Direct-3D Graphics Window.

**Prototype:**

```
virtual void EndTriangles(ID3DGraphicsWindow *gw,  
GFX_ESCAPE_FN fn) = 0;
```

**Remarks:**

This method will let the Mesh know that all drawing and data access is

finished.

**Parameters:**

**ID3DGraphicsWindow \*gw**

A pointer to the Direct-3D Graphics Window.

**GFX\_ESCAPE\_FN fn**

The graphics escape function.

# Class PatchTVert

See Also: [Class PatchMesh](#), [Template Class Tab](#), [Working with Patches](#).

## Description:

This class is available in release 4.0 and later only.

This class stores the texture vertex information associated with a patch and provides methods to access this. All methods of this class are implemented by the system.

## Data Members:

public:

**UVVert p;**

The texture vertex location.

**int aux1;**

Used to track topology changes during editing (Edit Patch).

## Methods:

### Prototype:

**PatchVert();**

### Remarks:

Constructor. The UVVert is set to 0,0,0. The aux member is set to -1.

### Prototype:

**PatchTVert(float u, float v, float w);**

### Remarks:

Constructor. The UVVert is set to the provided uvw parameters passed to the method. The aux member is set to -1.

### Parameters:

**float u, float v, float w;**

The u, v, and w values for the texture vertex.

## Operators:

### Prototype:

**PatchTVert& operator=(cont UVVert& from);**

**Remarks:**

Assignment operator.

**Parameters:**

**UVVert& from**

The texture vertex to copy from.

**Prototype:**

**operator UVVert&()**

**Remarks:**

Conversion operator. Returns a reference to UVVert p.

## Class ActionTable

See Also: [Class BaseInterfaceServer](#), [Class ClassDesc](#), [Structure ActionDescription](#), [Class ActionItem](#), [Class ActionCallback](#), [Class ActionContext](#), [Class IActionManager](#), [Class DynamicMenu](#), [Class DynamicMenuCallback](#), [Class Interface](#).

```
class ActionTable : public BaseInterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

This is the class used to create Action Tables. An ActionTable holds a set of ActionItems, which are operations that can be tied to various UI elements, such as keyboard shortcuts, CUI buttons, the main menu and the Quad menu. 3ds max's core code exports several ActionTables for built-in operations in 3ds max. Plug-ins can also export their own action tables via methods available in ClassDesc.

All methods of this class are implemented by the system. Note however that many methods are virtual and may be customized by the plug-in developer as this class may be sub-classed if required. See the Advanced Topics section [UI Customization](#) for details on sub-classing this class and ActionItem. For details on implementing an ActionTable please refer to `\MAXSDK\SAMPLESMODIFIERS\FFD`

### Methods:

```
public:
```

### Prototype:

```
ActionTable(ActionTableId id, ActionContextId contextId,  
TSTR& name, HACCEL hDefaults, int numIds,  
ActionDescription* pOps, HINSTANCE hInst);
```

### Remarks:

Constructor. This constructor builds the action table using an array of descriptors. It takes the ID of the table, the context id, a name for the table, a windows accelerator table that gives default keyboard assignments for the operations, the number of items, the table of operation descriptions, and the instance of the module where the string resources in the table are stored.

At the same time the action table is built developers need to register the action

context ID with the system. This is done using the **IActionManager::RegisterActionContext()** method.

**Parameters:**

**ActionTableId id**

The unique ID for the ActionTable. Every ActionTable has a unique 32-bit integer ID. For new tables exported by plug-ins, the developer should choose a random 32-bit integer. You can use the Class\_ID program to generate this identifier: See [Class Class\\_ID](#) for more details. Simply use one of the two DWORDs that comprise the Class\_ID for the ActionTableId.

**ActionContextId contextId**

The ActionContextID associated with this table. Several tables may share the same ActionContextID.

**TSTR& name**

The name for the ActionTable.

**HACCEL hDefaults**

The handle of the a windows accelerator table that gives default keyboard assignments for the operations.

**int numIds**

The number of items in the description array below.

**ActionDescription\* pOps**

Points to the array of the operator descriptors.

**HINSTANCE hInst**

The handle to the instance of the module where the string resources in the array of operator descriptors are stored.

**Prototype:**

**ActionTable(ActionTableId id, ActionContextId contextId,  
TSTR& name);**

**Remarks:**

Constructor. This constructor build a new empty action table with the given ID, context ID and name. You then need to add ActionItems to the table separately using the **AppendOperation()** method described below.

**Parameters:**

**ActionTableId id**

The unique ID for the ActionTable.

**ActionContextId contextId**

The ActionContextID associated with this table. Several tables may share the same ActionContextID.

**TSTR& name**

The name for the ActionTable.

**Prototype:**

**~ActionTable();**

**Remarks:**

Destructor. Deletes all the operations maintained by the table and deletes the keyboard accelerator table if in use.

**Prototype:**

**HACCEL GetHAccel();**

**Remarks:**

Returns the handle of the current keyboard accelerator for the table.

**Prototype:**

**void SetHAccel(HACCEL hAccel);**

**Remarks:**

Sets the current keyboard accelerator for the table.

**Prototype:**

**HACCEL GetDefaultHAccel();**

**Remarks:**

Get the default keyboard accelerator table. This is used when the user has not assigned any accelerators.

**Prototype:**

**TSTR& GetName();**

**Remarks:**

Returns the name of the ActionTable. This is the name in the Customize UI dialog drop-down.

**Prototype:**

**ActionTableId GetId();**

**Remarks:**

Returns the ActionTableId for this ActionTable.

**Prototype:**

**ActionContextId GetContextId();**

**Remarks:**

Returns the ActionContextId for this ActionTable.

**Prototype:**

**ActionCallback\* GetCallback();**

**Remarks:**

Get the current callback associated with this table. Returns NULL if the table is not active.

**Prototype:**

**void SetCallback(ActionCallback\* pCallback);**

**Remarks:**

Sets the callback object used by this ActionTable.

**Parameters:**

**ActionCallback\* pCallback**

Points to the callback to set.

**Prototype:**

**int Count();**

**Remarks:**

Returns the number of ActionItems in the table.

**Prototype:**

**ActionItem\* operator[](int i);**

**Remarks:**

This operator returns a pointer to the 'i-th' ActionItem.

**Parameters:**

**int i**

The zero based index in the list of ActionItems.

**Prototype:**

**ActionItem\* GetAction(int cmdId);**

**Remarks:**

Returns a pointer to the ActionItem associated with the command ID passed.

**Parameters:**

**int cmdId**

The command ID.

**Prototype:**

**void AppendOperation(ActionItem\* pAction);**

**Remarks:**

This method adds an operation to the table.

**Parameters:**

**ActionItem\* pAction**

Points to the ActionItem to append.

**Prototype:**

**BOOL DeleteOperation(ActionItem\* pAction);**

**Remarks:**

Remove an operation from the table

**Parameters:**

**ActionItem\* pAction**

Points to the ActionItem to delete.

**Return Value:**

TRUE if the operation was deleted; FALSE if it could not be found and wasn't.

**Prototype:**

```
void DeleteThis();
```

**Remarks:**

Deletes this ActionItem.

**Default Implementation:**

```
{ delete this; }
```

**Prototype:**

```
virtual BOOL GetButtonText(int cmdId, TSTR& buttonText);
```

**Remarks:**

This method retrieves the text that will be used when the ActionItem is on a text button.

**Parameters:**

**int cmdId**

The unique ID of the command whose button text is retrieved.

**TSTR& buttonText**

Storage for the text.

**Return Value:**

TRUE if the command is in the table; otherwise FALSE.

**Prototype:**

```
virtual BOOL GetMenuText(int cmdId, TSTR& menuText);
```

**Remarks:**

This method retrieves the text to use when the item is on a menu (either Quad menu or main menu bar). This can be different from the button text.

**Parameters:**

**int cmdId**

The unique ID of the command whose menu text is retrieved.

**TSTR& menuText**

Storage for the text.

**Return Value:**

TRUE if the command is in the table; otherwise FALSE.

**Default Implementation:**

```
{ return GetButtonText(cmdId, menuText); }
```

**Prototype:**

```
virtual BOOL GetDescriptionText(int cmdId, TSTR& descText);
```

**Remarks:**

This method gets the text that will be used for tool tips and menu help. This is also the string that is displayed for the operation in all the lists in the customization dialogs.

**Parameters:**

**int cmdId**

The unique ID of the command whose description text is retrieved.

**TSTR& descText**

Storage for the text.

**Return Value:**

TRUE if the command is in the table; otherwise FALSE.

**Prototype:**

```
virtual BOOL IsChecked(int cmdId);
```

**Remarks:**

Returns TRUE if the menu item should be checked or a CUI button should be in the pressed state.

**Parameters:**

**int cmdId**

The unique ID of the command.

**Default Implementation:**

```
{ return FALSE; }
```

**Prototype:**

**virtual BOOL IsItemVisible(int cmdId);**

**Remarks:**

This method determines if an item is to be visible on a menu. Returns TRUE if visible; FALSE if not.

**Parameters:**

**int cmdId**

The unique ID of the command.

**Default Implementation:**

**{ return TRUE; }**

**Prototype:**

**virtual BOOL IsEnabled(int cmdId);**

**Remarks:**

This method determines if the operation is currently enabled and available. Returns TRUE if enabled; FALSE if disabled.

**Parameters:**

**int cmdId**

The unique ID of the command.

**Default Implementation:**

**{ return TRUE; }**

**Prototype:**

**virtual void WritePersistentActionId(int cmdId, TSTR& idString);**

**Remarks:**

This method will write an action identifier to a \*.CUI file or \*.KBD file. It's default implementation is to write the integer ID but will be over-riden when command IDs are not persistent.

**Parameters:**

**int cmdId**

The unique ID of the command.

**TSTR& idString**

The action ID placed in the string.

**Prototype:**

**virtual int ReadPersistentActionId(TSTR& idString);**

**Remarks:**

This method will read an action identifier from a \*.CUI file or \*.KBD file. It's default implementation is to read the integer ID but will be over-riden when command IDs are not persistent.

**Parameters:**

**TSTR& idString**

The action ID string.

**Return Value:**

This method returns -1 if the command was not found in the table.

**Prototype:**

**virtual MaxIcon\* GetIcon(int cmdId);**

**Remarks:**

Returns an optional icon for the command, or NULL if there is none.

**Parameters:**

**int cmdID**

The unique ID of the command.

**Prototype:**

**void BuildActionTable(HACCEL hDefaults, int numIds,  
ActionDescription\* pOps, HINSTANCE hInst);**

**Remarks:**

This method will fill the action table with the given action descriptions.

**Parameters:**

**HACCEL hDefaults**

The handle of the a windows accelerator table that provides keyboard assignments for the operations.

**int numIds**

The number of ID's to add to the action table.

**ActionDescription\* pOps**

The array of action descriptions to build the table from.

**HINSTANCE hInst**

The handle to the instance of the module.

**Prototype:**

**ActionItem\* GetCurrentAssignment(ACCEL accel);**

**Remarks:**

Get the action assigned to the given accelerator, if any.

**Parameters:**

**ACCEL accel**

The accelerator key you wish to check the assignment for.

**Prototype:**

**void AssignKey(int cmdId, ACCEL accel);**

**Remarks:**

Assign the command to the given accelerator. Also removes any previous assignment to that accelerator.

**Parameters:**

**int cmdId**

The command ID.

**ACCEL accel**

The accelerator key you wish to assign.

**Prototype:**

**void RemoveShortcutFromTable(ACCEL accel);**

**Remarks:**

removes the given assignment from the shortcut table

**Parameters:**

**ACCEL accel**

The accelerator key you wish to remove from the shortcut table.

## Class GBufReader

See Also: [Class GBuffer](#), [Class GBufWriter](#), [Structure GBufData](#), [List of GBuffer Channels Indexes](#).

```
class GBufReader : public InterfaceServer
```

### Description:

This class is available in release 3.0 and later only.

This is the object returned by **GBuffer::CreateReader()**. Methods of this class allow the G-Buffer data to be read.

Here is an example of reading multiple layer data from the G-Buffer using methods of this class.

```
void ReadExample(GBuffer *gb) {  
    float zr, UBYTE midr;  
    GBufReader *rdr = gb->CreateReader();  
    for (int y=0; y<10; y++) {  
        rdr->StartLine(y);  
        for (int x=5; x<100; x+=4) {  
            int res = rdr->StartPixel(x);  
            rdr->ReadChannelData(GB_Z,(void *)&zr);  
            rdr->ReadChannelData(GB_MTL_ID,(void *)&midr);  
            while (rdr->StartNextLayer()) {  
                rdr->ReadChannelData(GB_Z,(void *)&zr);  
                rdr->ReadChannelData(GB_MTL_ID,(void *)&midr);  
            }  
        }  
    }  
    gb->DestroyReader(rdr);  
}
```

All methods of this class are implemented by the System.

### Methods:

public:

### Prototype:

**virtual int StartLine(int y)=0;**

**Remarks:**

Call this method to start a new scan line. Call this method before the first scan line.

**Parameters:**

**int y**

The zero based index of the scan line to start.

**Return Value:**

Returns -1 if there was no data for line, or the x value of first non-empty pixel.

**Prototype:**

**virtual BOOL StartPixel(int x)=0;**

**Remarks:**

Call this method to start a new pixel. This method automatically starts the first layer.

**Parameters:**

**int x**

The zero based index of the pixel to start.

**Return Value:**

Returns TRUE.

**Prototype:**

**virtual BOOL StartPixel(int x, int y)=0;**

**Remarks:**

This method is called to start a new line and pixel. This method is equivalent to:

**StartLine(y);**

**return StartPixel(x);**

**Prototype:**

**virtual BOOL StartNextLayer()=0;**

**Remarks:**

This method is called to begin reading data from a new layer. Do **not** call this method before reading the first layer.

**Return Value:**

TRUE if more data to read; otherwise FALSE.

**Prototype:**

**virtual int NextPixel()=0;**

**Remarks:**

Call this method to prepare for reading the next pixel.

**Return Value:**

Returns TRUE.

**Prototype:**

**virtual BOOL ReadChannelData(int chan, void \*data)=0;**

**Remarks:**

Reads a data element from the specified channel of the G-Buffer from the current scan line and pixel.

**Parameters:**

The channel to read. One of the items from: [List of GBuffer Channels Indexes](#).

**void \*data**

Points to storage for the data.

**Return Value:**

TRUE if data was available; otherwise FALSE.

**Prototype:**

**virtual BOOL ReadAllData(GBufData \*data)=0;**

**Remarks:**

Reads all the data from the G-Buffer into the **GBufData** structure passed from the current scan line and pixel.

**Parameters:**

**GBufData \*data**

Points to storage for the data. See [Structure GBufData](#).

**Return Value:**

TRUE if data was available; otherwise FALSE.

**Prototype:**

**virtual BOOL ModifyChannelData(int chan, void \*data)=0;**

**Remarks:**

This method is available in release 4.0 and later only.

This method allows values in the specified layer to be written. Note that it may seem strange, writing data from the reader, but developers asked for the capability of writing to the already created gbuffer, and it is much simpler to add this capability to the GBufReader than to GBufWriter, which is designed to construct gbuffers from scratch, not modify existing ones.

**Parameters:**

**int chan**

Specifies the channel to write to.

**void \*data**

Points to the data to write.

**Return Value:**

TRUE indicates success; FALSE indicates failure.

**Prototype:**

**virtual BOOL ModifyAllData(GBufData \*data)=0;**

**Remarks:**

This method is available in release 4.0 and later only.

This method allows values in the current layer to be written. Note that it may seem strange, writing data from the reader, but developers asked for the capability of writing to the already created gbuffer, and it is much simpler to add this capability to the GBufReader than to GBufWriter, which is designed to construct gbuffers from scratch, not modify existing ones.

**Parameters:**

**GBufData \*data**

Points to the data to write.

**Return Value:**

TRUE indicates success; FALSE indicates failure.

**Prototype:**

**virtual void DeleteThis()=0;**

**Remarks:**

Deletes this reader object. Call this method when finished.

**Prototype:**

**virtual INT\_PTR Execute(int cmd, ULONG arg1=0, ULONG arg2=0, ULONG arg3=0);**

**Remarks:**

This method is available in release 3.0 and later only.

This is a general purpose function that allows the API to be extended in the future. The 3ds max development team can assign new **cmd** numbers and continue to add functionality to this class without having to 'break' the API.

This is reserved for future use.

**Parameters:**

**int cmd**

The command to execute.

**ULONG arg1=0**

Optional argument 1 (defined uniquely for each **cmd**).

**ULONG arg2=0**

Optional argument 2.

**ULONG arg3=0**

Optional argument 3.

**Return Value:**

An integer return value (defined uniquely for each **cmd**).

**Default Implementation:**

**{ return 0; }**

## List of Material Requirement Flags

See Also: [Class MtlBase](#), [Class RenderInstance](#).

Material requirements flags. One or more of the following values:

### **MTLREQ\_2SIDE**

The material is 2-sided.

### **MTLREQ\_WIRE**

The material is a wire frame material.

### **MTLREQ\_WIRE\_ABS**

The material is a wire frame material, absolute size.

### **MTLREQ\_TRANSP**

The material uses transparency

### **MTLREQ\_UV**

The material requires UVW coordinates

### **MTLREQ\_FACEMAP**

The material uses "face map" UV coordinates.

### **MTLREQ\_XYZ**

The material requires object XYZ coordinates.

### **MTLREQ\_OXYZ**

This is not used.

### **MTLREQ\_BUMPUV**

The material requires UV bump vectors.

### **MTLREQ\_BGCOL**

The material requires the background color.

### **MTLREQ\_PHONG**

The material requires an interpolated normal.

### **MTLREQ\_AUTOREFLECT**

The material needs to build an auto-reflect map.

### **MTLREQ\_AUTOMIRROR**

The material needs to build an auto-mirror map

### **MTLREQ\_NOATMOS**

This suppress the atmospheric shader. This is used by the Matte material for example. The matte material samples the background itself and handles the

fogging characteristics. Thus it does not need to have the atmospheric shader do this again.

### **MTLREQ\_ADDITIVE\_TRANSP**

Specifies that transparent composites are done additively. Normally, if this is not specified, the background color is attenuated. For instance, say you have a material that is 30% transparent (70% opaque). This means that you take 30% of the background color and 70% of the material color.

Setting this flag causes the computation to be done by multiplying 0.7 times the material color and then adding this to the background color (which is left un-attenuated).

### **MTLREQ\_VIEW\_DEP**

This flag is available in release 2.0 and later only.

Maps or materials which depend on the view should set this bit in their Requirements() method.

### **MTLREQ\_UV2**

This flag is available in release 2.0 and later only.

The material requires the second uv channel values (vertex colors).

### **MTLREQ\_BUMPUV2**

This flag is available in release 2.0 and later only.

The material requires the second uv channel bump vectors.

### **MTLREQ\_PREPRO**

This flag is available in release 2.0 and later only.

Setting this flag will cause **MtlBase::BuildMaps()** to be called on every frame.

### **MTLREQ\_DONTMERGE\_FRAGMENTS**

This is no longer used.

### **MTLREQ\_DISPLACEMAP**

This flag is available in release 2.0 and later only.

Material has a Displacement map channel.

### **MTLREQ\_SUPERSAMPLE**

This flag is available in release 2.0 and later only.

Material requires super sampling. This tells the scanline renderer that you want super sampling (the Standard material uses this). This takes multiple samples spread around in the pixel which provides an additional level of anti-

aliasing.

### **MTLREQ\_WORLDCOORDS**

This flag is available in release 3.0 and later only.

Material has world coordinates that are used in material / map evaluation. This flag is set by UVGen and XYZGen when world coordinates are involved. The renderer looks at this and if it is set, takes the validity interval of the Node's transform matrix into account in computing the validity of a displacement mapped mesh.

### **MTLREQ\_TRANSP\_IN\_VP**

This flag is available in release 4.0 and later only.

This flag should be returned true for any material that wants to be transparent in the viewport.

### **MTLREQ\_FACETED**

This flag is available in release 4.0 and later only.

This material should be rendered faceted in the viewports.

# Class FaceCreate

See Also: [Class MeshDelta](#) , [Class Face](#)

class FaceCreate

## Description:

This class is available in release 4.0 and later only.

This class represents the notion of a face create within a MeshDelta. The public data members provide the index of any original face the new face may be based on as well as the new face itself. The virtue of providing the original face information is that we may use it to track per-face data that isn't contained within the face itself.

Note that this class relates closely to the new custom per-face data channels. For details on the implementations see [Class IFaceDataChannel](#), [Class IFaceDataMgr](#).

## Data Members:

public:

### **DWORD original;**

The face in the input mesh this new face should copy properties from. If UNDEFINED, this face is assumed to be totally original and should not copy properties from any faces in the input mesh.

### **Face face;**

The new face.

## Methods:

public:

## Prototype:

**FaceCreate (DWORD f, const Face & fc) : original(f), face(fc);**

## Remarks:

Constructor.

Constructor. Initializes data members to the values passed.

## Default Implementation:

```
{ }
```

**Prototype:**

**FaceCreate (const Face & fc) : original(UNDEFINED), face(fc);**

**Remarks:**

Constructor.

Constructor. Initializes face to the value passed, and initializes original to UNDEFINED.

**Default Implementation:**

{ }

**Prototype:**

**FaceCreate (DWORD f) : original(f);**

**Remarks:**

Constructor.

Constructor. Initializes original to the value passed. Does not initialize the face data member.

**Default Implementation:**

{ }

**Prototype:**

**FaceCreate () : original(UNDEFINED);**

**Remarks:**

Constructor. Initializes original to UNDEFINED. Does not initialize the face data member.

**Default Implementation:**

{ }

**Prototype:**

**FaceCreate (const FaceCreate & fc) : original(fc.original),  
face(fc.face);**

**Remarks:**

Constructor

Constructor. Initializes data members to match those in fc.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
FaceCreate & operator= (const FaceCreate & fc);
```

**Remarks:**

Assignment operator. Sets all data members to be equal to those in fc.

**Default Implementation:**

```
{ original = fc.original; face=fc.face; return *this; }
```

## Class MNMapFace

See Also: [Class MNMesh](#), [Class MNMap](#).

```
class MNMapFace
```

### Description:

This class is available in release 3.0 and later only.

This class is a face used to store map vertex information for a given face and map channel. It replaces the information previously contained in the MNFace::tvrt and MNFace::cvrt data members (prior to release 3).

By way of analogy: MNMapFace is to MNFace as TVFace is to Face. MNMapFace is to MNMap as MNFace is to MNMesh as TVFace is to MeshMap as Face is to Mesh.

### Friend Classes:

```
friend class MNMesh;
```

### Data Members:

```
public:
```

```
    int deg
```

Degree of this face. Must match degree of related MNFace in MNMesh.

```
    int *tv
```

Mapping vertices used by this mapping face. (This array is of size **deg**).

### Methods:

```
public:
```

### Prototype:

```
    MNMapFace();
```

### Remarks:

Constructor. Calls **Init()**.

### Prototype:

```
    MNMapFace(int d);
```

### Remarks:

Constructor. Sets the degree and hidden vertex count.

**Parameters:**

**int d**

Desired degree.

**Prototype:**

**~MNMapFace();**

**Remarks:**

Destructor. Calls **Clear()**.

**Prototype:**

**void Init();**

**Remarks:**

Initializes MNMapFace. **deg** is set to 0, pointers set to NULL.

**Prototype:**

**void Clear();**

**Remarks:**

Clears and frees MNMapFace.

**Prototype:**

**void SetAlloc(int d);**

**Remarks:**

Allocates enough memory in the arrays for the face to have degree **d**, but does not actually set the degree. If the arrays are already large enough (or larger), it does not reallocate them.

**Parameters:**

**int d**

The degree for this map face.

**Prototype:**

**void SetSize(int d);**

**Remarks:**

Allocates enough memory in the arrays for the face to have degree **d**, but does not actually set the degree. If the arrays are already large enough (or larger), it does not reallocate them. You generally don't need to use this method separately; MakePoly, Insert, and other methods which may require additional memory will call this if needed.

**Prototype:**

```
void MakePoly(int fdeg, int *tt);
```

**Remarks:**

Makes this face into a polygon with the specified vertices and other information.

**Parameters:**

**int fdeg**

The degree to set this face to.

**int \*tt**

The list of vertices for this face.

**Prototype:**

```
void Insert(int pos, int num=1);
```

**Remarks:**

Inserts space for more vertices at the specified position.

**Parameters:**

**int pos**

The location within the map face where the new vertices should be added.

**int num=1**

The number of new vertices to add.

**Prototype:**

```
void Delete(int pos, int num=1);
```

**Remarks:**

Deletes vertices from this map face.

**Parameters:**

The location within the map face where the vertices should be deleted.

**int num=1**

The number of vertices to delete.

**Prototype:**

**void RotateStart(int newstart);**

**Remarks:**

Re-indexes the vertices and edges so that the vertex in position **newstart** becomes the new first vertex. Triangulation is also corrected.

**Parameters:**

**int newstart**

The new first vertex.

**Prototype:**

**void Flip();**

**Remarks:**

Reverses order of verts, effectively inverting the face.

**Prototype:**

**int VertIndex(int vv);**

**Remarks:**

Returns the position of vertex **vv** in this face's list of vertices.

**Parameters:**

**int vv**

The vertex whose index is returned.

**Prototype:**

**void ReplaceVert(int ov, int nv);**

**Remarks:**

Replaces vertex **ov** with vertex **nv** in the list of vertices.

**Parameters:**

**int ov**

The vertex to replace.

**int nv**

The vertex to replace it with.

**Prototype:**

**MNMapFace & operator=(const MNMapFace & from);**

**Remarks:**

Assignment operator.

**Prototype:**

**void MNDebugPrint(bool hinfo=TRUE);**

**Remarks:**

Uses DebugPrint to print out information to the Debug Results window in DevStudio. This includes the **tv** array and optionally the **htv** array.

**Parameters:**

**bool hinfo=TRUE**

If TRUE the **htv** array is output.

## Class MNFace

See Also: [Class FlagUser](#), [Class MNFace](#), [Class BitArray](#).

```
class MNFace : public FlagUser
```

### Description:

This class is available in release 2.0 and later only.

**MNFace** is the face structure used with the **MNMesh** mesh. **MNFaces** need not be triangles. They also may contain "hidden" vertices which are used in converting the face back to triangles. This "triangulation" is always maintained in the face.

All methods of this class are implemented by the system.

### Friend Classes:

```
friend class MNMesh;
```

### Data Members:

private:

#### **int dalloc**

This is the amount of space allocated for verts, edges, mapping coords, and other information that's based on degree (deg).

#### **int talloc**

This is the amount of space allocated for the triangulation.

public:

#### **int deg**

Degree: this is the number of vertices and edges that this face has.

#### **int \*vtx**

This is the list of vertices that make up the corners of this face. Each value is an index into the parent MNMesh's list of MNVerts.

#### **int \*edg**

This is the list of edges that border this face, in order. Each edg[i] goes between vtx[i] and vtx[(i+1)%deg]. Each value is an index into the parent MNMesh's list of MNEdges. These values may not be valid if the MNMesh's MN\_MESH\_FILLED\_IN flag is not set.

#### **int \*diag**

This is where the triangulation is stored. The number of triangles in a face is

given by  $\text{deg} - 2 + \text{hdeg} * 2$ . This array contains three times this number, for all the corners of all the sub-triangles. The triangle values are indices into the vtx and hvtx arrays of this face. Hidden vertices are indicated by values less than zero: hvtx[i] is represented by -1-i. Thus a triangle (1, 2, -2) would represent a triangle using vtx[1], vtx[2], and hvtx[-1]. The diag array's allocated size is always  $(\text{dalloc}-3)*2$ . If  $\text{dalloc}==3$  (triangle), this pointer is NULL.

### **DWORD smGroup**

This contains the smoothing groups assigned to this face.

### **MtlID material**

This is the material ID assigned to this face.

### **int track**

This member is obsolete and should not be used.

### **BitArray visedg**

Contains a visibility bit for each edge on this face. See the MNMesh note on edge selection & visibility for more information.

### **BitArray edgsel**

Contains a selection bit for each edge on this face. See the MNMesh note on edge selection & visibility for more information.

## **Flags:**

### **MN\_SEL**

Indicates that the face is selected.

### **MN\_TARG**

Indicates that the face is targeted. (See the MNMesh methods starting with the words TargetBy.)

### **MN\_DEAD**

Indicates that the face is not used and should be ignored. Faces with the MN\_DEAD flag are deleted in the next MNMesh call to CollapseDeadFaces ().

### **MN\_FACE\_OPEN\_REGION**

This flag is available in release 2.5 and later only.

This face is part of a region of the mesh that is not closed, i.e. there are 1-sided edges. This means that the mesh is not a solid object, it has gaps or holes. The flag is set by the

### **MN\_FACE\_CHECKED**

This flag is available in release 2.5 and later only.

Reserved for internal use (in recursive face-traversing algorithms).

### **MN\_FACE\_CHANGED**

This flag can be cleared on all faces before an operation that moves some of the vertices of an MNMesh, then set for each face touching one of the moved vertices. This tells the parent MNMesh that these faces may need to have information such as triangulation recomputed. This flag is set by the MNMesh method SabinDoo in particular.

## **MN\_FACE\_CULLED**

Indicates that the face is culled (used during hit-testing). **Release 4.2 and above**

## **MN\_FACE\_WHATEVER**

Developers should not use this flag and should restrict themselves to **MN\_USER** and higher bits.

## **MN\_USER(1<<16)**

Flag bits at or above **MN\_USER** are reserved in all MNMesh components for the plug-in developer, if needed. Since FlagUser-derived classes have 32 flag bits, this allows for up to 16 user-defined flags.

### **Methods:**

#### **Prototype:**

**MNFace();**

#### **Remarks:**

Constructor. Initializes the face's arrays to NULL.

#### **Prototype:**

**MNFace(int d);**

#### **Remarks:**

Constructor. Initializes the face's degree to d and allocates space for all the arrays.

#### **Prototype:**

**MNFace(const MNFace \*from);**

#### **Remarks:**

Constructor. Copies flags, smoothing groups, and material from "from", but initializes the face's arrays to NULL and degree to 0.

#### **Prototype:**

**~MNFace();**

#### **Remarks:**

Frees all arrays.

**Prototype:**

**void Init();**

**Remarks:**

This method is available in release 4.0 and later only.  
Initialize the face.

**Prototype:**

**void SetDeg (int d);**

**Remarks:**

This method is available in release 4.0 and later only.  
Set the number of edges and vertices this face has.

**Parameters:**

**int d**

Number of vertices and edges.

**Prototype:**

**void Clear();**

**Remarks:**

Frees all arrays, setting them to NULL, and resets degree.

**Prototype:**

**int TriNum();**

**Remarks:**

This method is available in release 3.0 and later only.  
Returns the number of triangles in this face.

**Prototype:**

**int FindTriPoint (int edge);**

**Remarks:**

This method is available in release 4.0 and later only.

Given the index of a particular edge, this routine returns the point (distinct from edge and  $(edge+1)\%deg$ ) that forms a triangle with the edge, given the current scheme of diagonals.

**Parameters:**

**int edge**

An index into the vertex array (in the range 0 to  $deg-1$ ) that indicates the starting vertex of the edge. (In other words, the edge falls between vertex  $vtx[edge]$  and  $vtx[(edge+1)\%deg]$ .)

**Return Value:**

The index of the desired vertex, again in the  $(0,deg-1)$  range, or edge if there's an error.

**Prototype:**

**int FindTriPoint (int a, int b);**

**Remarks:**

This method is available in release 4.0 and later only.

Given two verts that form a diagonal in the polygon, this method finds the vertex between them that connects by a diagonal or an outer edge to both of them. (Here, "between them" means after a and before b in sequence around the outside of the polygon. If we have an octagon where  $a=6$  and  $b=2$ , the result would be 7, 0, or 1. To get the other result, in the 3,4,5 range, call the method with  $a=2$  and  $b=6$ .)

**Parameters:**

**int a, b**

Two vertices, "internally indexed" in the 0 to  $deg-1$  range. This method is only guaranteed to work if the vertices share a diagonal. (Otherwise, there may be no solution.)

**Return Value:**

The index of the desired vertex, again in the  $(0,deg-1)$  range, or a if there's an error.

**Prototype:**

**void GetTriangles (Tab<int> &tri);**

**Remarks:**

This method is available in release 4.0 and later only.

This method fills in the table with the full triangulation for the face, based on the internal diagonal list. The table is set to size  $(deg-2)*3$ .

**Parameters:**

**Tab<int> &tri**

The table of triangles.

**Prototype:**

**void DiagSort (int dnum, int \*diag);**

**Remarks:**

This method is available in release 4.0 and later only.

**Note that this function is not part of the class but is available for us.**

This sorts the diagonals in the following fashion: each diagonal is reordered so that its smaller index comes first, then its larger. Then the list of diagonals is sorted so that it increases by second index, then decreases by first index. Such an ordered list for a 9-gon might be (1,3),(0,3), (0,4),(5,7),(4,7),(4,8). (This order is especially convenient for converting into triangles - it makes for a linear-time conversion.) **DiagSort()** uses qsort for speed.

**Parameters:**

**int dnum**

The size of the diag array - essentially double the number of diagonals.

**int \*diag**

The diagonals.

**Prototype:**

**void SetAlloc(int d, int h=0);**

**Remarks:**

Allocates enough memory in the arrays for the face to have degree d, but does not actually set the degree. If the arrays are already large enough (or larger), it does not reallocate them. You generally don't need to use this method separately; MakePoly, Insert, and other methods which may require additional

memory will call this if needed.

**Prototype:**

```
void MakePoly(int fdeg, int *vv, bool *vis=NULL, bool *sel=NULL);
```

**Remarks:**

This method is available in release 3.0 and later only.

Makes this face into a polygon with the specified vertices and other information. This routine also supplies a default triangulation for the face; however, since this MNFace-level routine cannot access the vertex positions contained in the parent MNMesh, this triangulation may not work for non-convex faces. If the face may not be convex, a call to MNMesh::RetriangulateFace for this face will correct the triangulation.

**Parameters:**

**int fdeg**

The degree to set this face to.

**int \*vv**

The list of vertices for this face. There must be at least fdeg of these. These values should be indices into the parent MNMesh's array of MNVerts.

**bool \*vis=NULL**

The edge visibility flags for the edges of this face. If this is NULL, it is ignored; otherwise, there must be at least fdeg of these. vis[i] represents the visibility of the edge going from vv[i] to vv[(i+1)%fdeg]. See the MNMesh note on edge selection & visibility for more information.

**bool \*sel=NULL**

The edge selection flags for the edges of this face. If this is NULL, it is ignored; otherwise, there must be at least fdeg of these. sel[i] represents the selection bit of the edge going from vv[i] to vv[(i+1)%fdeg]. See the MNMesh note on edge selection & visibility for more information.

**Prototype:**

```
void Insert(int pos, int num=1);
```

**Remarks:**

Inserts space for more vertices and edges on this face. This is used, for

example, when two faces are joined, to add room for the vertices & edges of one face to the other. This routine also renumbers the existing vertices and corrects the existing face triangulation, although it cannot provide the triangulation for the new vertices. It reserves space for the new triangles at the end of the triangle array. If you do not want to compute the triangulation for the new vertices yourself, you may use the MNMesh RetriangulateFace method after filling in the new vertices.

**Parameters:**

**int pos**

The location within the face where the new vertices and edges should be added.

**int num**

The number of new vertices and edges.

**Prototype:**

**void Delete(int pos, int num=1, int edir=1, bool fixtri=TRUE);**

**Remarks:**

Deletes vertices & edges from this face. This routine also corrects the face triangulation, removing those triangles that include the deleted edges and re-indexing the rest. However, delete may cause the triangulation to become invalid, by causing one or more of the corrected triangles to have a flipped normal.

**Parameters:**

**int pos**

The position of the first vertex to be deleted.

**int num=1**

The number of vertices & edges to delete.

**int edir=1**

There are two choices for the edges to be deleted: we can delete the edges going from pos to pos+1, pos+1 to pos+2, ... pos+num-1 to pos+num, or we can delete pos-1 to pos, pos to pos+1, ... pos+num-2 to pos+num-1.

(pos+num-1 is the last vertex deleted.) That is to say, we can delete the edges "before" the vertices we're deleting, or we can delete the edges "after" them. If edir is positive, we delete the edges after the vertices. If it's negative, we

delete the edges before. Keep in mind that this also affects edge visibility and selection information on this face.

**bool fixtri=TRUE**

This parameter is available in release 3.0 and later only.

This argument indicates how far Delete should go in fixing the triangulation. Delete will always correct the values of the tri array to correspond to the reduced-degree face. If fixtri is true, it will also delete those triangles that have collapsed because they had two vertices in the deleted region. If not, it will leave these triangles with overlapping vertices, as in (0,0,2).

**Return Value:**

Delete returns TRUE if fixtri is FALSE. If fixtri is TRUE, Delete will return TRUE if it successfully corrected the triangulation, or FALSE if there was a problem. If FALSE is returned, the triangulation will need to be revised with a call to RetriangulateFace.

**Prototype:**

**RotateStart(int newstart);**

**Remarks:**

This method is available in release 2.5 and later only.

Re-indexes the vertices and edges so that the vertex in position **newstart** becomes the new first vertex. Triangulation is also corrected. Mapping coordinates and vertex colors are corrected automatically.

**Prototype:**

**void Flip();**

**Remarks:**

This method is available in release 2.5 and later only.

Reverses order of verts, effectively inverting the face. vtx[0] remains unchanged, but vertex deg-1 becomes vertex 1, etc. Note that this operation wreaks havoc on nearby edges and should be used with caution.

**Prototype:**

**int VertIndex(int vv, int ee=-1);**

**Remarks:**

Returns the position of vertex **vv** in this face's list of vertices. For a given face

fc, if `fc.vtx[i] = vv`, `fc.VertIndex (vv) = i`.

Sometimes a single vertex from the MNMesh's MNVert list can be referenced more than once by a single face. The picture below illustrates this problem. The small triangle is actually outside of the face, and the vertex at the top of it is referenced twice by the face. Thus an additional edge parameter can be accepted. If `ee` is -1, it is ignored, and the first instance of `vv` is used. If `ee > -1`, this method looks for the instance of `vv` that starts out edge `ee`. Thus if `fc.vtx[i] = vv` and `fc.vtx[j] = vv`, but `fc.edg[i] != ee` and `fc.edg[j] = ee`, `j` is returned.

IMPORTANT: If no vertex is found matching the given parameters, this method generates an assertion failure. Please be sure that vertex `vv` is actually on the face (and that edge `ee` follows it if `ee` is not -1) before using this method.

**Prototype:**

**`int EdgeIndex(int ee, int vv=-1);`**

**Remarks:**

Returns the position of edge `ee` in this face's list of edges. For a given face `fc`, if `fc.edg[i] = ee`, `fc.EdgeIndex (ee) = i`.

Sometimes a single edge from the MNMesh's MNEdge list can be referenced more than once by a single face. The small rectangle is actually outside of the face, and the edge above it is referenced twice by the face, once in each direction. Thus an additional vertex parameter can be accepted. If `vv` is -1, it is ignored, and the first instance of `ee` is used. If `vv > -1`, this method looks for the instance of `ee` that starts out with vertex `vv`. Thus if `fc.edg[i] = ee` and `fc.edg[j] = ee`, but `fc.vtx[i] != vv` and `fc.vtx[j] = vv`, `j` is returned.

IMPORTANT: If no edge is found matching the given parameters, this method generates an assertion failure. Please be sure that edge `ee` is actually on the face (and that vertex `vv` follows it if `vv` is not -1) before using this method.

**Prototype:**

**`ReplaceVert(int ov, int nv, int ee=-1);`**

**Remarks:**

This method is available in release 2.5 and later only.

Replaces vertex **ov** with vertex **nv** in the list of vertices. It is possible for a

face to reference the same vertex more than once, however the combination of a vertex followed by a specified edge is unique. Therefore if **ee<0**, all instances of **ov** are replaced by **nv**, but if not, only the instance of **ov** followed by **ee** is replaced.

**Prototype:**

**ReplaceEdge(int oe, int ne, int vv=-1);**

**Remarks:**

Replaces edge **oe** with edge **ne** in the list of edges. It is possible for a face to reference the same edge twice, however the combination of an edge preceded by a specified vertex is unique. Therefore if **vv<0**, all instances of **oe** are replaced by **ne**, but if not, only the instance of **oe** preceded by **vv** is replaced.

**Prototype:**

**void MNDebugPrint(bool triprint=FALSE, bool hinfo=TRUE);**

**Remarks:**

This method is available in release 2.5 and later only.

Uses DebugPrint to print out face information to the Debug Results window in DevStudio. The information consists of the vertices and edges used by this face. It is generally a good idea to put in a DebugPrint immediately before this with the index of the edge, so you know which one is being printed out:

**DebugPrint("Face %d: ", fid);**

**F(fid)->MNDebugPrint();**

**Parameters:**

**bool triprint=FALSE**

Print out triangulation information.

**bool hinfo=TRUE**

Print out hidden vertex information.

**Prototype:**

**MNFace & operator=(const MNFace & from);**

**Remarks:**

Assignment operator. Copies all information from "from", including triangulation, hidden vertices, flags, smoothing & material info, and "track".

**Prototype:**

```
int &operator[](int i);
```

**Remarks:**

This method is available in release 4.0 and later only.

Access operator.

**Default Implementation:**

```
{ return vtx[i]; }
```

**Prototype:**

```
const int &operator[](int i) const;
```

**Remarks:**

This method is available in release 4.0 and later only.

Access operator.

**Default Implementation:**

```
{ return vtx[i]; }
```

## Class MNMap

See Also: [Class FlagUser](#), [Class MNMapFace](#), [Class Point3](#), [Class Matrix3](#).

```
class MNMap : public FlagUser
```

### Description:

This class is available in release 3.0 and later only. It replaces the old `tv` and `cv` arrays in `MNMesh`, and the old `tvrt` and `cvrt` arrays in `MNFace`.

Each `MNMap` holds the mapping information for a particular map channel of the `MNMesh`. As with regular Mesh maps, the `MNMap` holds an array of map vertices and an array of map faces that define how those mapping vertices are applied to the `MNMesh`. The number (`numf`) of mapping faces should always match the number of faces in the parent `MNMesh`, and each `MNMapFace` gives the map vertices for the related `MNFace`. The number of map vertices may be different from the number of `MNVerts` in the parent `MNMesh`.

### Friend Classes:

```
friend class MNMesh;
```

### Data Members:

```
public:
```

```
    MNMapFace *f;
```

The array of map faces.

```
    UVVert *v;
```

The array of UVVerts. Note: **typedef Point3 UVVert;**

```
    int numv
```

The number of vertices in the `v` array.

```
    int numf;
```

The number of map faces in the `f` array.

### Methods:

```
public:
```

### Prototype:

```
    MNMap();
```

### Remarks:

Constructor. This calls **Init()**.

**Prototype:**

**~MNMap();**

**Remarks:**

Destructor. This calls **ClearAndFree()**.

**Prototype:**

**void Init();**

**Remarks:**

Initializes the map – sets numv and numf to 0, and sets the pointers to NULL. Also initializes private allocation related data members.

**Prototype:**

**void VAlloc(int num, bool keep=TRUE);**

**Remarks:**

Allocates the specified number of UVVerts in the **v** array. (If you're creating a number of map verts, but you're not sure exactly how many, it's good to pre-allocate a large number using this method.) This method doesn't affect MNMap::numv, only the allocation amount.

**Parameters:**

**int num**

The number of UVVerts to allocate.

**bool keep=TRUE**

If TRUE any previous verts are kept; otherwise they are discarded.

**Prototype:**

**void FAlloc(int num, bool keep=TRUE);**

**Remarks:**

Allocates the specified number of map faces in the **f** array. This method doesn't affect MNMap::numf, just the number allocated.

**Parameters:**

**int num**

The number of map verts to allocate.

**bool keep=TRUE**

If TRUE any previous map faces are kept; otherwise they are discarded.

**Prototype:**

**int VNum() const;**

**Remarks:**

Returns the current number of UVVerts.

**Prototype:**

**UVVert V(int i) const;**

**Remarks:**

Returns the 'i-th' UVVert.

**Parameters:**

**int i**

The zero based index into the **v** array of the UVVert to return.

**Prototype:**

**int FNum() const;**

**Remarks:**

Returns the number of map faces.

**Prototype:**

**MNMapFace \*F(int i) const;**

**Remarks:**

Returns a pointer to the 'i-th' map face.

**Parameters:**

**int i**

The zero based index of the map face to return.

**Prototype:**

**int NewTri(int a, int b, int c);**

**Remarks:**

Like MNMesh::NewTri, this creates a new mapping face, of degree 3, with the specified map vertices.

**Parameters:**

**int a**

**int b**

**int c**

The mapping vertices for the new triangle.

**Prototype:**

**int NewTri(int \*vv);**

**Remarks:**

Like MNMesh::NewTri, this creates a new mapping face, of degree 3, with the specified map vertices.

**Parameters:**

**int \*vv**

The mapping vertices for the new triangle.

**Prototype:**

**int NewQuad(int a, int b, int c, int d);**

**Remarks:**

Like MNMesh::NewQuad, this creates a quad, with the specified map vertices.

**Parameters:**

**int a**

**int b**

**int c**

**int d**

The mapping vertices for this quad. (The two faces are formed with mapping verts (a,b,c) and (c,d,a).

**Prototype:**

**int NewQuad(int \*vv);**

**Remarks:**

Like MNMesh::NewQuad, this creates a quad, with the specified map vertices.

**Parameters:**

**int \*vv**

The mapping vertices for this quad. (The two faces are formed with mapping

verts (vv[0],vv[1],vv[2]) and (vv[2],vv[3],vv[0]).

**Prototype:**

**int NewFace(int degg=0, int \*vv=NULL);**

**Remarks:**

Like MNMesh::NewFace, this creates a new mapping face with the specified degree and map vertices.

**Parameters:**

**int degg=0**

The degree of the new face. (Note that this should match the degree of the associated MNFace.)

**int \*vv=NULL**

The new mapping vertices, in order around the perimeter.

**Prototype:**

**void setNumFaces(int nfnun);**

**Remarks:**

Sets the number of map faces keeping any previously allocated faces.

**Parameters:**

**int nfnun**

The number of faces to set.

**Prototype:**

**int NewVert(UVVert p, int uoff=0, int voff=0);**

**Remarks:**

Allocates storage for a new specified UVVert. An optional offset to the UVVert may be supplied. (The offset is useful when you want to create a new UVVert which is on the other side of a seam in U or V from some existing UVVert p.)

**Parameters:**

**UVVert p**

The UVVert to store.

**int uoff=0**

If non-zero this is an offset applied in U when p is stored.

**int voff=0**

If non-zero this is an offset applied in V when p is stored.

**Prototype:**

**void setNumVerts(int nvnum);**

**Remarks:**

Sets the number of UVVerts keeping any previously allocated UVVerts.

**Parameters:**

**int nvnum**

The number of UVVerts to set.

**Prototype:**

**void CollapseDeadVerts(MNFace \*faces);**

**Remarks:**

Eliminates the mapping vertices not used by any active mapping faces in this map. (Analogous to the Mesh::DeleteIsoMapVerts method.)

**Parameters:**

**MNFace \*faces**

This should point to the MNFace array of the parent MNMesh. This allows the method to find out if any faces should be considered MN\_DEAD, so that it won't mark such faces' map verts as used. (The MN\_DEAD flag is stored in the MNFace, but not in the related MNMapFaces.)

**Prototype:**

**void CollapseDeadFaces(MNFace \*faces);**

**Remarks:**

Eliminates the MN\_DEAD map faces from the array. This should be called immediately before calling CollapseDeadFaces on the parent MNMesh, to keep the face arrays in sync.

**Parameters:**

**MNFace \*faces**

The parent MNMesh's array of MNFaces. This array is used to find out which faces are MN\_DEAD.

**Prototype:**

**void Clear();**

**Remarks:**

Sets the number of UVVerts and map faces to 0.

**Prototype:**

**void ClearAndFree();**

**Remarks:**

Sets the number of UVVerts and map faces to 0 and deallocates the memory.

**Prototype:**

**void Transform(Matrix3 & xfm);**

**Remarks:**

Transforms each UVVert with the specified matrix.

**Parameters:**

**Matrix3 &xfm**

The matrix to transform the UVVerts by.

**Prototype:**

**MNMap & operator=(const MNMap &from);**

**Remarks:**

Assignment operator.

**Prototype:**

**MNMap & operator+=(const MNMap &from);**

**Remarks:**

Appends the specified MNMap object onto this MNMap.

**Parameters:**

**const MNMap &from**

The source MNMap.

**Prototype:**

**MNMap & operator+=(const MNMesh &from);**

**Remarks:**

Appends a default planar map corresponding to the mesh passed onto this map. This is typically used when joining two MNMeshes together when one

MNMesh has a map channel active but the other doesn't. Rather than eliminate the map channel, we just use the object coordinates of the other mesh to generate a planar map for its faces.

**Parameters:**

**const MNMesh &from**

The source MNMesh.

**Prototype:**

**void ShallowCopy(const MNMap & from);**

**Remarks:**

Copies pointers. To avoid memory errors, this method should only be used by the pipeline.

**Parameters:**

**const MNMap & from**

The map to copy pointers from.

**Prototype:**

**void NewAndCopy();**

**Remarks:**

Creates new pointers and copies over all the data. To avoid memory errors, this method should only be used by the pipeline.

**Prototype:**

**void MNDebugPrint(MNFace \*faces);**

**Remarks:**

Uses DebugPrint to print out information about this MNMap to the Debug Results window in DevStudio. This includes all map verts and faces, one per line.

**Parameters:**

**MNFace \*faces**

This should be the MNFace array of the parent MNMesh. It's used to prevent the DebugPrinting of MN\_DEAD faces.

**Prototype:**

**bool CheckAllData(int mp, int nf, MNFace \*faces);**

**Remarks:**

Checks the MNMap for internal errors, such as a MNMapFace referring to an out of range map vertex. If an error is found, an error message is DebugPrinted, and the method returns FALSE. This is strictly a debugging tool of no use in releases – a good way to use it is to say DbgAssert (CheckAllData()), so it won't be called when not in a Debug build, and so it'll throw up an assertion failure if something's wrong.

Error messages generated:

Map %d: Wrong number of faces. Should be %d, is %d. (Sent if nf != MNMap::numf)

Map %d, Face %d has wrong degree. Should be %d, is %d. (Sent if f[i].deg != faces[i].deg)

Map %d, Face %d has wrong hdegree. Should be %d, is %d. (Sent if f[i].hdeg != faces[i].hdeg)

Map %d, Face %d has an out-of-range map vertex: %d.

Map %d, Face %d has an out-of-range hidden map vertex: %d

**Parameters:****int mp**

The map channel this MNMap represents – used to give more helpful debug information.

**int nf**

The number of faces of the parent MNMesh.

**MNFace \*faces**

The parent MNMesh's face array. This is used to prevent checking of MN\_DEAD faces, which may safely be invalid.

**Prototype:**

**IOResult Save(ISave \*isave, MNFace \*faces=NULL);**

**Remarks:**

Used internally to save this MNMap to the 3ds max file.

**Prototype:**

**IOResult Load(ILoad \*iload, MNFace \*faces=NULL);**

**Remarks:**

Used internally to load this MNMap from the 3ds max file.

## Class RadiosityEffect

See Also: : [Class ObjLightDesc](#), [Class RadiosityInterface](#), [Class IRadiosityEffectExtension](#), [Class NodeDisplayCallback](#), [Class IRadiosityPreferences](#)

```
class RadiosityEffect : public SpecialFX
```

### Description:

This class is only available in release 5 or later.

The class provides the interfaces for creating Advanced Lighting plug-ins in 3ds max. RadiosityEffect plug-ins are controlled through the Advanced Lighting dialog from the render menu.

A RadiosityEffect behaves as a light in the scene. An implementation of RadiosityEffect must also provide an implementation of ObjLightDesc, to be returned from RadiosityEffect::CreateLightDesc(). This ObjLightDesc is then used by the renderer to apply the radiosity light during a render.

The architecture is designed to support scene based lighting solvers (which use a precalculated solution), as well as image based solvers (which calculate their solution at render time). The method RunProcess() and its relatives, StopProcess(), AbortProcess(), and WaitForCompletion() are called by the system to request processing of a scene based solution. Image based solvers only need stub implementations of these methods.

See also [Class NodeDisplayCallback](#). A RadiosityEffect can use a NodeDisplayCallback to control the viewport display of scene geometry. In particular, it is possible for a lighting solution to be displayed interactively in the viewport if the NodeDisplayCallback provides geometry with appropriate vertex illumination.

A RadiosityEffect may want to reference objects in the scene to detect events which invalidate its lighting solution. A problem arises that the RadiosityEffect can become inundated with reference messages, so to address this problem the RadiosityEffect should ignore any message where the PART\_EXCLUDE\_RADIOSITY flag is set in the PartID of the message. Any message where ((partID|PART\_EXCLUDE\_RADIOSITY)!=0) is an event that the system deems should not invalidate the radiosity, for example, when texture display in viewport is turned on or off.

See also `IsInterestedInChannels()` in [Class IRadiosityEffectExtension](#).

All methods of this class are implemented by the plug-in.

**Methods:**

**Prototype:**

**virtual void SetActive(bool active, TimeValue t)**

**Remarks:**

Enables or disables the radiosity effect. Corresponds to the Active checkbox in the Advanced Lighting dialog. Although a TimeValue parameter is passed to this method, the active state of the plug-in is not animatable. Plug-ins should call the default implementation of `SetActive()`, optionally adding their own code.

**Parameters:**

**bool active**

Specifies whether the plug-in is active or inactive

**TimeValue t**

Specifies the current scene time when the method is called.

**Prototype:**

**virtual IOResult Merge(ILoad\* iload, )**

**Remarks:**

Reserved for future versions. Not currently used

**Default Implementation:**

```
{ return IO_OK; }
```

**Prototype:**

**virtual RadiosityParamDlg \*CreateParamDlg(IRendParams \*ip)**

**Remarks:**

This method creates and returns a new instance of RadiosityParamDlg to manager the user interface. This displays one or more rollouts in the Advanced Lighting dialog. A typical implementation would call ClassDesc2::CreateParamDialogs() to instantiate the RadiosityParamDlg.

**Parameters:**

**IRendParams \*ip**

This is the interface given to the plug-in so it may display its parameters.

**Return Value:**

The instance of RadiosityParamDlg to manager the plug-in's UI

**Default Implementation:**

```
{ return NULL; }
```

**Prototype:**

**virtual BOOL SetDlgThing(RadiosityParamDlg \*ip)**

**Remarks:**

Implement this if you are using the ParamMap2 AUTO\_UI system and the RadiosityEffect has secondary dialogs that don't have the effect as their 'thing'. Called once for each secondary dialog for you to install the correct thing.

Note: Developers needing more information on this method can see the remarks for [MtlBase::CreateParamDlg\(\)](#) which describes a similar example of this method in use (in that case it's for use in a texture map plug-in).

**Parameters:**

## **RadiosityParamDlg \*ip**

Points to the ParamDlg.

### **Return Value:**

Return TRUE if you process the dialog; otherwise FALSE

### **Default Implementation:**

```
{ return FALSE; }
```

### **Prototype:**

```
virtual bool UseLight(INode* node)
```

### **Remarks:**

Returns whether the given light should render it's illumination in the production render. If the return value is true, the light is disabled while rendering.

This is used to allow the radiosity plug-in to override lights in the scene with light from it's own solution.

### **Parameters:**

**INode\* node**

The INode of the light.

### **Return Value:**

Return true if the light should be enabled while rendering; or false if it should be disabled

### **Default Implementation:**

```
{ return true; }
```

**Prototype:****virtual int NumLightDesc() const = 0****Return Value:**

The number of ObjLightDesc objects the RadiosityEffect will return from CreateLightDesc()

**Prototype:****virtual void CreateLightDesc(ObjLightDesc\*\* buffer) = 0****Remarks:**

Creates light objects that the renderer can use to get the RadiosityEffect's contribution. CreateLightDesc() creates a number of ObjLightDesc objects indicated by NumLightDesc(), and stores their addresses in the buffer. Caller is responsible for ensuring that the buffer is large enough.

Note: the caller will delete the ObjLightDesc objects when the render is completed, so this method should dynamically allocate the ObjLightDesc instances, rather than providing static instances.

**Parameters:****ObjLightDesc\*\* buffer**

The buffer into which the ObjLightDesc pointers should be stored.

**Prototype:****virtual void RunProcess(TimeValue t, RenderGlobalContext\* rgc, bool interactiveRender) = 0****Remarks:**

Called by the system to start the radiosity processing. This should start the process from the beginning, or where it stopped previously, if applicable. The method should launch a separate thread and return immediately; the system will call WaitForCompletion() to wait for the thread to complete.

This is specific to solvers which use a pre-calculated solution. Other solvers need only a stub implementation.

**Parameters:**

**TimeValue t**

Specifies the scene time when the method is called.

**RenderGlobalContext\* rgc**

This can be used to retrieve information about the global rendering environment.

**bool interactiveRender**

Specifies whether the lighting solution is being calculated for interactive rendering. Note that the default renderer does not support interactive rendering with Advanced Lighting, but other plug-in renderers might potentially do so, in which case the RadiosityEffect should attempt to generate a fast, lower quality solution for interactive display.

**Prototype:**

**virtual void StopProcess(bool allowAbort = true) = 0**

**Remarks:**

Stop the lighting calculation. If possible, the RadiosityEffect should attempt to reach an intermediate solution, so that calculation can be continued later. However, this may take awhile, and If allowAbort is true, the RadiosityEffect is expected to prompt the user with a dialog, asking if they wish to abort.

**Parameters:**

**bool allowAbort node**

If true, the RadiosityEffect is expected to prompt the user with a dialog so they may abort the process of stopping the calculation and saving an intermediate solution

**Prototype:****virtual void AbortProcess() = 0****Remarks:**

Abort the lighting calculation. The RadiosityEffect should to abort immediately, without saving an intermediate solution.

**Prototype:****virtual void WaitForCompletion(RenderContext\* rc = NULL, DWORD timeout = INFINITE) = 0****Remarks:**

This is called by the system when waiting for the lighting calculation to finish. This method should not return to the caller until the calculation is complete, or when the timeout (in milliseconds) expires. The RenderContext can be used to display the progress of the calculation to the user, and to check if the cancel button is pressed.

**Parameters:****RenderContext\* rc**

Use this to display a progress bar for the user, or to detect when the user hits the cancel button.

**DWORD timeout**

An amount of time (measured in milliseconds) that the system is willing to wait. The method should measure its own running time and return to the caller when the timeout expires.

**Prototype:****virtual bool NeedsCamVerts(TimeValue t, RenderGlobalContext\* rgc, bool interactiveRender, bool saveMem)**

**Remarks:**

Indicates whether the RadiosityEffect plug-in wants the renderer to build camera-space vertices.

**Parameters:****TimeValue\* t**

Specifies the current scene time when the method is called.

**RenderGlobalContext\* rgc**

This can be used to retrieve information about the global rendering environment.

**bool interactiveRender**

Specifies whether the lighting solution is being calculated for interactive rendering. Note that the default renderer does not support interactive rendering with Advanced Lighting, but other plug-in renderers might potentially do so, in which case the RadiosityEffect should attempt to generate a fast, lower quality solution for interactive display.

**bool saveMem**

True if the user has selected “Conserve Memory” in the Render Dialog, under the “MAX Default Scanline A-Buffer” rollout, or if the render is occurring in the material editor.

**Return Value:**

True if the RadiosityEffect wants the renderer to calculate camera-space vertices, false otherwise.

**Default Implementation:**

```
{ return false; }
```

## Class ISpecularCompositeShader

```
class ISpecularCompositeShader : public BaseInterface
```

### Description:

**This class is only available in release 5 or later.**

This class is only used to communicate some information between the MAX Standard Material and the Shaders for the MAX Standard Material. The information that the Shaders require that wasn't supplied previous is the RenderGlobalContext. This would be used by 3rd parties who want to write shaders for the MAX standard material. This is only required if the shader performs operations that are not valid for arbitrary light values. For example: Using the default values, the Physical Sun has light multiplier values that are around 60.

Several standard MAX shaders, like the Aniso and ONB shaders, composite specular highlights over the diffuse light, and the calculation looks something like:

**color = diffuse \* (1 - specular) + specular;**

This works fine as long as specular is between 0 and 1. If specular goes above 1, you get all kinds of unusual artifacts. This calculation is done this way to prevent color clipping because of bright specular highlights. With lighting values at 60, the specular is frequently greater than 1. With an exposure control, the exposure control manages the color clipping and we can simply add the diffuse and specular components.

This interface gives the shader a chance to investigate the render parameters and decide how the lighting is to be combined.

This is usually done by using multiple inheritances and deriving the Shader

Implementation from Shader and ISpecularCompositeShader.

The Shader needs to override GetInterface(Interface\_ID id) and return the address of the ISpecularCompositShader interface and GetRequirements also needs to be overridden to return MTLREQ\_PREPRO as one of the shader requirements.

Then the shader needs to implement ChooseSpecularMethod. The typical implementation is:

```
void CombineComponentsCompShader::ChooseSpecularMethod(TimeValue t,
RenderGlobalContext* rgc)
{
useComposite = true;
if (rgc == NULL) {
ToneOperatorInterface* tint = static_cast<ToneOperatorInterface*>
(
GetCOREInterface(TONE_OPERATOR_INTERFACE));
if (tint != NULL) {
ToneOperator* top = tint->GetToneOperator();
if (top != NULL && top->Active(t))
useComposite = false;
}
} else {
ToneOperator* top = rgc->pToneOp;
if (top != NULL && top->Active(t))
useComposite = false;
}
}
}
```

**Methods:**

**Prototype**

**virtual void ChooseSpecularMethod(TimeValue t,  
RenderGlobalContext\* rgc) = 0**

**Remarks:**

To be implemented Material Shaders. Provides a selection mechanism for the specular methods provided by various tone operators either provided by the System or by the implementing Shader.

**Parameters:**

## **TimeValue t**

Present scene time value.

**RenderGlobalContext \*rgc**

Pointer to a RenderGlobalContext that encapsulates the shared data between a Standard Material and the implementing Shader.

**Return Value:**

None

## Class IEmissionColor

```
class IEmissionColor : public BaseInterface
```

### Description:

**This class is only available in release 5 or later.**

Function-published class: Material emission color, for self-illuminates meshes in viewport

### Methods:

#### Prototype

```
virtual Interface_ID GetID() { return  
EMISSION_COLOR_INTERFACE_ID; }
```

#### Remarks:

Returns the Function Published interface ID for this interface.

It is **#define EMISSION\_COLOR\_INTERFACE\_ID  
Interface\_ID(0x4f803aa8, 0x71611798)**

#### Prototype

```
virtual LifetimeType LifetimeControl() { return noRelease; }
```

#### Remarks:

#### Prototype

```
virtual void SetColor(Point3 color)=0;
```

#### Remarks:

Sets the emission color as Point3.

### **K Prototype**

**virtual Point3 GetColor()=0;**

#### **Remarks:**

Returns the emission color as Point3.

### **K Prototype**

**virtual void SetAlpha(float alpha)=0;**

#### **Remarks:**

Sets the alpha color value for the emission in the range of 0.f to 1.f.

### **K Prototype**

**virtual float GetAlpha()=0;**

#### **Remarks:**

Gets the alpha color value for the emission in the range of 0.f to 1.f.

## Class INodeGIProperties

```
class INodeGIProperties : public FPMixinInterface
```

### Description:

**This class is only available in release 5 or later.**

This class defines an interface for accessing a node's global illumination properties.

An instance of this interface can be retrieved using the following line of code (assuming 'node' is of type INode\*):

```
static_cast<INodeGIProperties*>(node->GetInterface(NODEGIPROPERTIES_INTERFACE))
```

Geometric and object objects have different properties. Accessing/setting geometric properties of non-geometric objects is safe, but will have no effect in the global illumination solution.

Here is a description of the global illumination properties:

GENERAL PROPERTIES (all types of objects)

- **Excluded:** Excluded objects should be ignored by the radiosity engine. They should act as if these objects do not exist.
- **ByLayer:** Specifies whether the GI properties of this node's layer should be used instead of the local settings.

GEOMETRIC OBJECTS (affects only geometric objects):

- Occluder: Occluding objects will block rays of light that hit their surface. Non-occluding objects will not block those rays, but will still receive illumination if the Receiver property is set.
- Receiver: Receiver objects will receive and store illumination from rays of light that hit their surface. Non-receiver objects will not store illumination.
- Diffuse: Diffuse surfaces will reflect and transmit light based on their diffuse color and transparency value.
- Specular: Specular surfaces will generate specular reflections and transparency. ex.: glass is specular transparent and a mirror is specular reflective.
- UseGlobalMeshSettings: When subdividing the geometry for a more accurate GI solution, this flag specifies whether some 'global' settings, or the node's local settings should be used.
- MeshingEnabled: When using local settings, this specifies whether geometry subdivision should occur on this node.
- MeshSize: The maximum size, in MAX universe units, that a face should have after being subdivided.
- NbRefineSteps: This is the saved number of refining steps to be performed on this node by the global illumination engine.
- ExcludedFromRegather: Set to 'true' to excluded an object from the 'regathering' process.
- RayMult: Specifies a multiplier that will increase or decrease the number of rays cast for this object when regathering.

#### LIGHT OBJECTS (affects only light sources):

- StoreIllumToMesh: Specifies whether the light emitted from this object should be stored in the GI solution's mesh, and not be re-cast at render-time.

### **K Prototype**

**virtual void CopyGIPropertiesFrom(const INodeGIProperties& source) = 0;**

#### **Remarks:**

Clones the properties from a source

### **K Prototype**

**virtual BOOL GIGetIsExcluded() const = 0;**

#### **Remarks:**

Saves local properties - to be called on every node

### **K Prototype**

**virtual void GISetIsExcluded(BOOL isExcluded) = 0;**

#### **Remarks:**

Saves local properties - to be called on every node. See also GIGetIsExcluded()

### **K Prototype**

**virtual float GIGetMeshSize() const = 0;**

#### **Remarks:**

Geometry object property – retrieves the current mesh size for the node.

### **K Prototype**

**virtual void GISetIsOccluder(BOOL isOccluder) = 0;**

#### **Remarks:**

Geometry object property – query for whether the node is an occluder object in the global illumination computations.

### **K Prototype**

**virtual void GISetIsReceiver(BOOL isReceiver) = 0;**

**Remarks:**

Geometry object property – query for whether the node is a receiver for global illumination.

**K Prototype**

**virtual void GISetIsDiffuse(BOOL isDiffuseReflective) = 0;**

**Remarks:**

Geometry object property – query for whether the node has diffuse properties for usage in global illumination.

**K Prototype**

**virtual void GISetIsSpecular(BOOL isSpecular) = 0;**

**Remarks:**

Geometry object property – query for whether the node has specular properties for usage in global illumination.

**K Prototype**

**virtual void GISetUseGlobalMeshSettings(BOOL globalMeshing) = 0;**

**Remarks:**

Geometry object property – set usage of global rendering context mesh refinement settings..

**K Prototype**

**virtual void GISetMeshingEnabled(BOOL meshingEnabled) = 0;**

**Remarks:**

Geometry object property – set whether mesh refinement is enabled for this pass.

## **K Prototype**

**virtual void GISetNbRefineSteps(unsigned short nbRefineSteps) = 0;**

### **Remarks:**

Geometry object property – set the number of mesh refinement steps for the regathering pass.

## **K Prototype**

**virtual void GISetNbRefineStepsDone(unsigned short nbRefineStepsDone) = 0;**

### **Remarks:**

Geometry object property – query the number of steps performed thus far during the mesh refinement stage.

## **K Prototype**

**virtual void GISetMeshSize(float size) = 0;**

### **Remarks:**

Geometry object property – query for the refinement mesh size for the regathering pass.

## **K Prototype**

**virtual BOOL GIGetIsExcludedFromRegather() const = 0;**

### **Remarks:**

Geometry object property – query whether this node is to be excluded from the regathering pass.

## **K Prototype**

**virtual void GISetIsExcludedFromRegather(BOOL isExcluded) = 0;**

**Remarks:**

Geometry object property – set whether this node is to be excluded from the regathering pass.

**K Prototype**

**virtual BOOL GIGetStoreIllumToMesh() const = 0;**

**Remarks:**

Get light object property.

**K Prototype**

**virtual void GISetStoreIllumToMesh(BOOL storeIllum) = 0;**

**Remarks:**

Set light object property.

**K Prototype**

**virtual BOOL GIGetByLayer() const = 0;**

**Remarks:**

Get 'by layer' flag for radiosity properties.

**K Prototype**

**virtual void GISetByLayer(BOOL byLayer) = 0;**

**Remarks:**

Set the 'by layer' flag for radiosity properties.

**K Prototype**

**virtual float GIGetRayMult() const = 0;**

**Remarks:**

Getting regathering ray multiplier node property

**K Prototype**

**virtual void GISetRayMult(float rayMult) = 0;**

**Remarks:**

Setting regathering ray multiplier node property.

## Class ISplineIKControl

### **Description:**

**This class is only available in release 5 or later.**

This class refers to the new modifier which, when assigned to a spline (or a NURBS) curve, generates a certain number of helper objects attached to the knots of the curve.

Spline IK Control Modifier (works for NURBS Point curve and NURBS CV Curve too): This is a modifier and can be used independently of the SplineIK. When applied to a spline, this modifier creates one point helper for each knot of the spline. The user can then animate the spline by simply animating (position and rotation) the point helpers. Thus to animate the spline, the user wouldn't need to get into the sub-object level.

There are three options Link Types, presented as a set of 3 radio buttons:

### **Link All in Hierarchy (default):**

Makes a helper a child to its immediately previous helper. So, Helper#2 is child to Helper#1, Helper#3 is child to Helper#2, and so on. Helper#1 is still child to the world. Translation and rotation of a helper then "solidly" moves/rotates part of the spline *\_subsequent\_* to the selected helper. The part of the spline previous to the helper is unaffected.

### **Link All to Root**

Makes all helpers children to Helper#1, i.e., knot#1. Helper#1 can be position constrained or linked to another object, like it is possible above. Additionally individual helpers can be moved and rotated without any other helper being affect.

### **No Linking**

All helpers are independent -- not linked to any other helper -- so that they can be moved and rotated without any other helper being affect.

### **"Create Helpers" button:**

Helpers are not automatically added to the spline on the assignment of the modifier. To do that the user need to press the "Create Helpers" button.

Helper Display:

These are the all the options:

- center marker (default OFF)
- axis tripod (default OFF)
- cross (default OFF)
- box (default ON)
- size (default 20.0)
- constant screen size (default OFF)
- draw on top (default ON) for a standard point object.

If the user adds ("insert") a knot to the spline, a new helper object is automatically created at that knotpoint.

Furthermore, please refer to the implementation project which is in **/maxsdk/samples/modifiers/splineikcontrol**.

The following helper methods have been added to **istdplug.h** for general access:

### **Methods:**

#### **Prototype:**

**virtual int GetHelperCount()=0;**

#### **Remarks:**

Obtain the number of helpers created

#### **Prototype:**

**virtual int GetKnotCount()=0;**

**Remarks:**

Gets the total number of knots for spline.

**Prototype:**

**virtual BOOL LinkToRoot() = 0;**

**Remarks:**

Makes all helpers children to Helper#1, i.e., knot#1. Helper#1 can be position constrained or linked to another object, like it is possible above. Additionally individual helpers can be moved and rotated without any other helper being affected.

**Prototype:**

**virtual BOOL LinkInHierarchy() = 0;**

**Remarks:**

Makes a helper a child to its immediately previous helper. So, Helper#2 is child to Helper#1, Helper#3 is child to Helper#2, and so on. Helper#1 is still child to the world. Translation and rotation of a helper then "solidly" moves/rotates part of the spline *\_subsequent\_* to the selected helper. The part of the spline previous to the helper is unaffected.

**Prototype:**

**virtual BOOL UnLink() = 0;**

**Remarks:**

All helpers are independent - not linked to any other helper so that they can be moved and rotated without any other helper being affected.

**Prototype:**

**virtual BOOL CreateHelpers(int knotCt) = 0;**

**Remarks:**

Helpers are not automatically added to the spline on the assignment of the modifier. To do that the user need to press the "**Create Helpers**" button.

## Class MaxBakeElement

See Also: [Class IRenderElement](#) , [Class MaxRenderElement](#)

```
class MaxBakeElement : public MaxRenderElement
```

### Description:

**This class is only available in release 5 or later.**

The class provides the interfaces for creating a Texture Baking plugins in 3ds max. The texture baking plugins are controlled through the Maxscript “Render To Texture”. There are methods available in this class that provide the ability to produce a dynamic UI in Maxscript.

This class provides the basic infrastructure for the UI and Maxscript interaction, to fully understand the workings of these plugins please look at the RenderElement samples

For an example of this class in use by **Texture Baking** plug-ins see  
`\MAXSDK\SAMPLES\RENDER\RENDERELEMENTS\INCLUDE\`

All methods of this class are implemented by the plug-in.

### Methods:

#### Prototype:

```
virtual void SetOutputSz( int xSz, int ySz ) = 0
```

### Remarks:

Set the size of the bitmap to be created

### Parameters:

**int xSz**

Specifies the width of the output.

**int ySz**

Specifies the height of the output.

**Prototype:**

**virtual void GetOutputSz( int& xSz, int &ySz ) = 0**

**Remarks:**

Get the size of the bitmap to be created

**Parameters:**

**int& xSz**

The new width

**int& ySz**

the new height

**Prototype:**

**virtual void SetFileName( TCHAR\* newName) = 0**

**Remarks:**

This is the name used in the UI, so it does not consist of the path – just the actual file name

**Parameters:**

**TCHAR\* newName**

The name to set for the UI

**Prototype:**

**virtual TCHAR \* GetFileName()const = 0**

**Remarks:**

Returns the actual filename. See remark above

**Prototype:**

**virtual void SetFileType( TCHAR\* newType) = 0**

**Remarks:**

This is full name of the file including path, that is used by the renderer to actually create the bitmap to store the baked element. This should not really be set as it is created dynamically for sole use by the renderer.

**Parameters:**

**TCHAR\* newType**

The name for the full file name

**Prototype:**

**virtual const TCHAR\* GetFileType() const = 0**

**Remarks:**

Returns the filename used for this baked element – See comment above

**Prototype:**

**virtual void SetFileNameUnique(BOOL on) = 0**

**Remarks:****Prototype:**

**virtual BOOL IsFileNameUnique() const = 0**

**Remarks:****Prototype:**

**virtual void SetRenderBitmap( Bitmap\* pBitmap ) = 0**

**Remarks:**

The render will create a bitmap from the data available and will pass the Bitmap to the plugin. This will be the Bitmap the max actually uses to render to.

**Parameters:**

**Bitmap\* pBitmap**

The bitmap used for the output

**Prototype:**

**virtual Bitmap\* GetRenderBitmap() const = 0**

**Remarks:**

Returns the bitmap containing the final output

**Prototype:**

**virtual void SetLightApplied(BOOL on) = 0**

**Remarks:**

This defines whether the baker uses lighting or not. For example a diffuse texture baker can specify whether the result uses lighting or not.

**Parameters:**

**BOOL on**

The state for the lighting parameter

**Prototype:**

**virtual BOOL IsLightApplied() const = 0**

**Remarks:**

Returns whether lighting is used in the calculation

**Prototype:**

**virtual void SetShadowApplied(BOOL on) = 0**

**Remarks:**

This defines whether the baker uses shadows or not. For example a diffuse texture bake can specify whether the result uses shadows or not.

**Parameters:**

**BOOL on**

The state for the shadow parameter

**Prototype:**

**virtual BOOL IsShadowApplied() const = 0**

**Remarks:**

Returns whether shadows are used in the calculation

**Prototype:**

**virtual void SetAtmosphereApplied(BOOL on) = 0**

**Remarks:**

Defines whether the texture baking uses Atmosphere in the final result.

**Parameters:**

**BOOL on**

Specifies whether Atmospheres are used or not.

**Prototype:**

**virtual BOOL IsAtmosphereApplied() const = 0**

**Remarks:**

Returns whether Atmospheres are used. Most texture baking plugins would return false.

**The following methods are used for the creation of the Maxscript UI in the Render To Texture tool**

**Prototype:**

**virtual int GetNParams() const = 0**

**Remarks:**

Return the number of parameters to be exposed to the UI

**Prototype:**

**virtual const TCHAR\* GetParamName( int nParam ) = 0**

**Remarks:**

Returns the name used by maxscript for the parameter value passed in. This is a 1 based access, so if GetNParams returned 8 the valid range for GetParamName will be 1 to 8.

**Parameters:**

**int nParam**

The value for the parameter whose name is to be returned.

**Prototype:**

**virtual const int FindParamByName( TCHAR\* name ) = 0**

**Remarks:**

Returns the index of the parameter based on the name

```
const int FindParamByName1( TCHAR* name ) {  
    for( int i = 0; i < 8; ++i ){  
        if( strcmp( name, GetString( paramNames[i] )) == 0 )
```

```
    return i+1;
}
return 0;
}
```

**Prototype:**

**virtual int GetParamType( int nParam ) = 0**

**Remarks:**

Currently only 1 = Boolean, 0 = Undefined are supported. In release 5 this means that any parameter you have is defined and used as a Boolean in maxscript

**Parameters:**

**int nParam**

The value for the parameter whose type is to be returned.

**Prototype:**

**virtual int GetParamValue( int nParam ) = 0**

**Remarks:**

The value to set when the Render to Texture tool is loaded

**Parameters:**

**int nParam**

The value for the parameter whose value is to be returned.

**Prototype:**

**virtual void SetParamValue( int nParam, int newVal ) = 0**

**Remarks:**

The Render to Texture Tool will save out the data

**Parameters:**

**int nParam**

The value for the parameter whose value is to be set

**int newVal**

The value to set

## Class IViewportShaderManager

See Also: : [Class IDXShaderManagerInterface](#)

```
class IViewportShaderManager : public FPStaticInterface
```

### Description:

**This class is only available in release 5 or later.**

The class provides access to the Viewport Shaders the Viewport manager hosts.

### Methods:

#### Prototype:

```
virtual int GetNumEffects()=0
```

#### Remarks:

This will return the number of viewport shaders the ViewportManager has in its database.

#### Prototype:

```
virtual ReferenceTarget* GetActiveEffect()=0
```

#### Remarks:

This will return the effect that is currently active in the viewport. This ReferenceTarget can be queried for any Interfaces it may be hosting including

.

The following code can be used to get an IDXDataBridge interface where effect is a ReferenceTarget

```
IDXDataBridge * vp = (IDXDataBridge*)effect->GetInterface(VIEWPORT_SHADER_CLIENT_INTERFACE);
```

#### Prototype:

**virtual TCHAR \* GetEffectName(int i)=0**

**Remarks:**

This will return the name of the effect based on the index passed in. This is a 1 based index, so that it can be used from Maxscript directly. The reason for this is that internally position "0" is reserved for the "None" element in the drop down list.

**Parameters:**

**int i**

The index of the effect whose name will be returned

**Prototype:**

**virtual ReferenceTarget \* SetViewportEffect(int i)=0**

**Remarks:**

This will set the active effect and return a pointer to it for further setup etc

**Parameters:**

**int i**

The index of the effect the set.

**Prototype:**

**virtual void ActivateEffect(MtlBase \* mtl, BOOL State)=0**

**Remarks:**

For a shader to be initialized and allowed to draw in the viewport the material needs to be told that it contains a Hardware Shader (or effect). This method controls this flag.

**Parameters:**

**MtlBase \* mtl**

The material whose flag is to be set

## **BOOL State**

True if the flag is to be set or FALSE to clear it

## Class IDXDataBridge

See Also: : [Class IDXShaderManagerInterface](#), [Class IViewportShaderManager](#), [Class IHardwareMaterial](#)

```
class IDXDataBridge: public BaseInterface
```

### Description:

**This class is only available in release 5 or later.**

This is the interface used by the Viewport Shader plugins. For the manager to load up a Viewport Shader it must implement this class.

As well as implementing the dialog loading it also provides a link to the GFX. This means the developer is free use IDX8VertexShader and IDX8PixelShader interfaces, for more advanced shaders. Examples of these shaders are

`\MAXSDK\SAMPLES\HardwareShaders\Cubemap\Cubemap.cpp`

and

`\MAXSDK\SAMPLES\HardwareShaders\Membrane\Membrane.cpp`

**An important point to make with the usage of these plugins is in the way the ViewportManager loads them up. To determine whether the plugin is a shader it checks the Category in the ClassDesc. This must return “DXViewportEffect” otherwise it will not be listed in the database. The reason for this is that the Manager supports deferred loading, and this is one way of checking the plugin without requiring a full DLL load.**

For an example of this class in use by **ViewportShader** plug-ins see

`\MAXSDK\SAMPLES\HardwareShaders\LightMap\Lightmap.cpp`

If the Viewport Shader plugin hosts any animated parameters that will be viewed in the Trackview then it is important the plugin implements the following Reference Message in the

```

RefResult LightMap::NotifyRefChanged(Interval changeInt,
RefTargetHandle hTarget, PartID& partID, RefMessage message )
{
  switch (message)
  {
    //this allows the manager to control the TV better.
    case REFMSG_WANT_SHOWPARAMLEVEL:
    {
      BOOL * pb = (BOOL*)(partID);
      *pb = TRUE;
      return REF_STOP;
    }
  }
  return(REF_SUCCEED);
}

```

This will make sure that the Parameters show up under the Viewport Manager in the correct format.

All methods of this class are implemented by the plug-in.

### **Methods:**

### **Prototype:**

**virtual Interface\_ID GetID()**

### **Remarks:**

The returns the unique ID for this interface. By default it will return VIEWPORT\_SHADER\_CLIENT\_INTERFACE

### **Prototype:**

**virtual ParamDlg \* CreateEffectDlg(HWND hWnd, IMtlParams \* imp)= 0**

**Remarks:**

This allows the Viewport shader to create a UI. This will be added as a child of the Viewport Manager.

**Parameters:**

**HWND hWnd**

The window handle to the parent window

**IMtlParams \* imp**

This can be used in the call to CreateParamsDlg.

**Prototype:**

**virtual void DisableUI()=0**

**Remarks:**

Currently this method is not used

**Prototype:**

**virtual TCHAR \* GetName()=0**

**Remarks:**

This allows the plugin to return a name to be used in max. This may be extended for future use, but currently it is only used in the trackview.

**Prototype:**

**virtual void SetDXData(IHardwareMaterial \* pHWMTl, Mtl \* pMtl)=0**

**Remarks:**

This allows the plugin to use methods of [Class IHardwareMaterial](#) to perform custom drawing of an object. This could be special texture setups and control over the Render States and Texture Stages. If the developer needs finer control

over the object, then the r4 interfaces `IDX8VertShader` can be used instead, and this function will not do anything. This method will be called whenever the object needs drawing. For a detailed example of this usage, please look at the Lightmap sample in the sdk

**Parameters:**

**`IHardwareMaterial * pHWMTl`**

Provides access to various drawing techniques

**`Mtl * pMtl`**

A pointer to the parent material.

# Class IHardwareMaterial

See Also: [Class IDXDataBridge](#)

class IHardwareMaterial: public BaseInterface

## Description:

**This class is only available in release 5 or later.**

A pointer to this class is provided by **IDXDataBridge::SetDXData()**. The GFX layer will implement all these methods. Most of the methods are direct replicas of the DirectX API for SetRenderState and SetTextureStageState.

The reason for this is that only one thread can access the graphics hardware at any one time. Using this interface means that the GFX driver can have its database initialized with the DirectX states required for this object, when it comes to access the graphics device.

To use this class good knowledge of DirectX is needed, a copy of the DirectX documentation is also recommended.

For an example usage of this class see

**MAXSDK\SAMPLES\HardwareShaders\LightMap\Lightmap.cpp**

## Methods:

### Prototype:

**virtual Interface\_ID GetID()**

### Remarks:

The returns the unique ID for this interface. By default it will return **IHardware\_Material\_Interface\_ID**

### Prototype:

**virtual void SetFillMode(DWORD mode) = 0**

### Remarks:

This is equivalent to the DirectX method SetRenderState(FILLMODE,mode)

**Parameters:**

**DWORD mode**

A member of D3DFILLMODE

**Prototype:**

**virtual void SetShadeMode(DWORD mode) = 0**

**Remarks:**

This is equivalent to DirectX method SetRenderState(SHADEMODE,mode)

**Parameters:**

**DWORD mode**

A member of D3DSHADEMODE

**Prototype:**

**virtual void SetMaterial(LPD3DXMATERIAL pMtl) = 0**

**Remarks:**

Please see the DirectX documentation for more information on this method

**Prototype:**

**virtual void SetDiffuseColor(LPD3DXCOLOR pClr) = 0**

**Remarks:**

Specifies Diffuse color to be set by using the DirectX data structure **LPD3DXCOLOR**.

**Prototype:**

**virtual void SetDiffuseColor(Color c, float alpha = 1.0f) = 0**

**Remarks:**

Allows the Diffuse color to be set

**Parameters:**

**Color c**

The diffuse color

**float alpha**

The colors alpha

**Prototype:**

**virtual void SetDiffuseColor(Point3 c, float alpha = 1.0f) = 0**

**Remarks:**

Allows the Diffuse color to be set

**Parameters:**

**Point3 c**

The diffuse color

**float alpha**

The colors alpha

**Prototype:**

**virtual void SetAmbientColor(LPD3DXCOLOR pClr) = 0**

**Remarks:**

Specifies the Ambient color to set by using a DirectX data structure.

**Prototype:**

**virtual void SetAmbientColor(Color c, float alpha = 1.0f) = 0**

**Remarks:**

Allows the Ambient color to be set

**Parameters:**

**Color c**

The ambient color

**float alpha**

The colors alpha

**Prototype:**

**virtual void SetAmbientColor(Point3 c, float alpha = 1.0f) = 0**

**Remarks:**

Allows the Ambient color to set

**Parameters:****Point3 c**

The ambient color

**float alpha**

The colors alpha

**Prototype:**

**virtual void SetSpecularColor(LPD3DXCOLOR pClr) = 0**

**Remarks:**

Specifies the Specular color to set by using a DirectX data structure.

**Prototype:**

**virtual void SetSpecularColor(Color c, float alpha = 1.0f) = 0**

**Remarks:**

Allows the Specular color to be set

**Parameters:****Color c**

The specular color

**float alpha**

The colors alpha

**Prototype:**

**virtual void SetSpecularColor(Point3 c, float alpha = 1.0f) = 0**

**Remarks:**

Allows the Specular color to set

**Parameters:**

**Point3 c**

The specular color

**float alpha**

The colors alpha

**Prototype:**

**virtual void SetEmissiveColor(LPD3DXCOLOR pClr) = 0**

**Remarks:**

Allows the Emissive color to set by using a DirectX data structure.

**Prototype:**

**virtual void SetEmissiveColor(Color c, float alpha = 1.0f) = 0**

**Remarks:**

Allows the Emissive color to be set

**Parameters:**

**Color c**

The emissive color

## **float alpha**

The colors alpha

### **Prototype:**

**virtual void SetEmissiveColor(Point3 c, float alpha = 1.0f) = 0**

### **Remarks:**

Allows the Emissive color to be set

### **Parameters:**

#### **Point3 c**

The emissive color

#### **float alpha**

The colors alpha

### **Prototype:**

**virtual void SetSpecularPower(float power) = 0**

### **Remarks:**

Allows the specular exponent of the material to be set

### **Parameters:**

#### **float power**

The specular amount

### **Prototype:**

**virtual void SetNumTexStages(DWORD numStages)= 0**

### **Remarks:**

This sets the internal size for the table that will hold the Texture information for the material. If you are not using any Texture stages then this should be set

to zero, otherwise it should match exactly the number of textures being used.

**Parameters:**

**DWORD numStages**

The number of Texture stages

**Prototype:**

**virtual bool SetTexture(DWORD stage, DWORD\_PTR pTexture) = 0**

**Remarks:**

This allows a texture to be loaded to the graphics device. In this case the texture is loaded/created by the GFX via calls to `IHardwareRenderer::BuildTexture()` which will return a `DWORD_PTR`, which is an internal representation of the texture. The texture was allocated it will return true.

**Parameters:**

**DWORD stage**

The stage to hold the texture

**DWORD\_PTR pTexture**

A texture pointer returned by `IHardwareRenderer::BuildTexture()`

**Prototype:**

**virtual bool SetTexture(DWORD stage, LPCSTR filename) = 0**

**Remarks:**

This allows a texture to be loaded to the graphics device. The file is assumed to exist. If successful it will return true.

**Parameters:**

**DWORD stage**

The stage to hold the texture

**LPCSTR filename**

A string containing the filename of the texture to load

**Prototype:**

**virtual bool SetTextureUVWSource(DWORD stage, DWORD type)  
= 0**

**Remarks:**

This specifies where the Texture Coordinates will be retrieved. Most of the time the mesh will supply them so the type would be UVSOURCE\_HWGEN. However a Viewport Shader could create them dynamically so would supply. If successful it will return true.

**Parameters:**

**DWORD stage**

The stage to set

**DWORD type**

The UVW Source. It can be any of the following :-

**UVSOURCE\_MESH**

**UVSOURCE\_XYZ**

**UVSOURCE\_MESH2**

**UVSOURCE\_WORLDXYZ**

**UVSOURCE\_FACEMAP**

**UVSOURCE\_HWGEN**

**Prototype:**

**virtual bool SetTextureMapChannel(DWORD stage, DWORD  
numChan) = 0**

**Remarks:**

This specifies what mapping channel from the mesh the Texture Coordinates will be retrieved. This is used in the stripping code so that the VertexBuffer is populated with the correct TVs. If successful it will return true.

**Parameters:**

**DWORD stage**

The stage to set

**DWORD type**

The mapping channel to use

**Prototype:**

**virtual bool SetTextureCoordIndex(DWORD stage, DWORD index)  
= 0**

**Remarks:**

This specifies what texture coordinate the stage will use. This value is used in the DirectX call **SetTextureStageState(stage, D3DTSS\_TEXCOORDINDEX, index)**. If successful it will return true.

**Parameters:**

**DWORD stage**

The stage to set

**DWORD index**

The texture coordinate index to use

**Prototype:**

**virtual bool SetTextureTransformFlag(DWORD stage, DWORD  
flag) = 0**

**Remarks:**

This specifies what texture flag the stage will use. This value is used in the DirectX call **SetTextureStageState(stage, D3DTSS\_TEXTURETRANSFORMFLAGS, flag)**. If successful it will return true.

**Parameters:**

**DWORD stage**

The stage to set

**DWORD flag**

The DirectX flag to set

**Prototype:**

**virtual bool SetTextureTransform(DWORD stage, LPD3DXMATRIX pTransform)= 0**

**Remarks:**

This specifies what texture flag the stage will use. This value is used in the DirectX call **SetTransform((D3DTRANSFORMSTATETYPE) (D3DTS\_TEXTURE0+stage), pTransform)**. If successful it will return true.

**Parameters:**

**DWORD stage**

The stage to set

**LPD3DXMATRIX pTransform**

The DirectX matrix to set

**Prototype:**

**virtual bool SetTextureColorOp(DWORD stage, DWORD colorOp)= 0**

**Remarks:**

**This method is a direct replica if the DirectX color operators used with D3DTSS\_COLOROP. Please refer to the DirectX documentation for further information**

**Parameters:**

**DWORD stage**

The stage to set

**DWORD colorOp**

A member of the DirectX enumerated type **D3DTEXTUREOP**

**Prototype:**

**virtual bool SetTextureColorOpArg(DWORD stage, DWORD argNum, DWORD colorArg) = 0**

**Remarks:**

This method is a direct replica of the DirectX Texture Argument flag used with D3DTSS\_COLOROPARG. The argNum defines which argument to set.  
**Please refer to the DirectX documentation for further information**

**Parameters:**

**DWORD stage**

The stage to set

**DWORD argNum**

The argument index to set. If this is set to 1 then **D3DTSS\_COLORPARG1** will be addressed

**DWORD colorArg**

The Argument to set.

**Prototype:**

**virtual bool SetTextureAlphaOp (DWORD stage, DWORD alphaArg)= 0**

**Remarks:**

This method is a direct replica of the DirectX alpha blending operators used with D3DTSS\_ALPHAOP. **Please refer to the DirectX documentation for further information**

**Parameters:**

**DWORD stage**

The stage to set

**DWORD alphaArg**

A member of the DirectX enumerated type **D3DTEXTUREOP**

**Prototype:**

**virtual bool SetTextureAlphaArg(DWORD stage, DWORD argNum, DWORD AlphaArg) = 0**

**Remarks:**

This method is a direct replica of the DirectX Texture Alpha Argument flag

used with D3DTSS\_APLHAPARG. The argNum defines which argument to set. **Please refer to the DirectX documentation for further information**

**Parameters:**

**DWORD stage**

The stage to set

**DWORD argNum**

The alpha argument index to set. If this is set to 1 then **D3DTSS\_ALPHAARG1** will be addressed

**DWORD colorArg**

The Alpha Argument to set.

**Prototype:**

**virtual bool SetVertexShader(DWORD\_PTR pVertexShader)=0**

**Remarks:**

This method allows a DirectX vertex shader to be loaded. It is used in conjunction with `IHardwareRenderer::LoadVertexShader` which will return a `DWORD_PTR` of internal storage for the shader. There are methods in [IHardwareRenderer](#) that provide a means to supply the constants used in the shader.

**Parameters:**

**DWORD\_PTR pVertexShader**

The vertex shader to load.

**Prototype:**

**virtual bool SetPixelShader(DWORD\_PTR pPixelShader)=0**

**Remarks:**

This method allows a DirectX pixel shader to be loaded. It is used in conjunction with `IHardwareRenderer::LoadPixelShader` which will return a

DWORD\_PTR of internal storage for the shader. There are methods [IHardwareRenderer](#) that provide a means to supply the constants used in the shader.

**Parameters:**

**DWORD\_PTR pPixelShader**

The vertex shader to load

**Prototype:**

**virtual bool SetEffect(DWORD\_PTR pEffect)=0**

**Remarks:**

This method allows a DirectX effect. It is used in conjunction with `IHardwareRenderer::LoadEffectFile` which will return a `DWORD_PTR` of internal storage for the file. There are methods in [IHardwareRenderer](#) that provide a means to connect the application to the effects file.

**Parameters:**

**DWORD\_PTR pEffect**

The effect file to load

## Class RotationValue

### Description:

**This class is only available in release 5 or later.**

This class is to hold different representations of the rotation. In particular, it holds rotation value as represented by Euler angles or quaternion. Different types of rotation controllers may use different representations. To avoid losing information due to converting from one representation to another, we can use RotationValue to hold the result.

For example, the Skin pose feature reads rotation of a node from the rotation controller and stores the result in RotationValue (c.f. `maxsdk\include\iSkinPose.h`).

```
// Assuming node is a valid pointer to INode.  
ISkinPose* skpose = ISkinPose::GetISkinPose(*node);  
// skpose should not be null for Max version 5.0 or later.  
RotationValue rv = skpose->SkinRot();
```

It is guaranteed that rv keeps the original representation of the controller.

Being asked of Euler angles, RotationValue will return 3 float numbers in the format of Point3. There must be an association between numbers and axes.

There are two classes of Euler angle types. In one class, the rotation axes are not repeated (non-repetitive). They are enum's from kXYZ to kZYX. In the other class, one of the rotation axes is repeated (repetitive). They are enum's from kXYX to kZXZ. For convenience,

enum `kReptd` is used to denote the starting one: `kRept == kXYX`.

For non-repetitive Euler angles, there are two well-defined methods to associate three ordered angles, to three axes.

First, we can associate angles with x-, y-, and z-, axes, respectively. The first angle, for example, is always associated with the x-axis, no matter where it appears in the Euler order. Suppose

**Point3 a(0.1, 0.2, 0.3)**

then `a.x` (`==0.1`), `a.y` (`==0.2`), `a.z` (`==0.3`), are the angles of the x-axis, y-axis, and z-axis, respectively, no matter whether the order (type) of the Euler angles is `kXYZ` or `kZXY`.

Let's call this way of association by axis (name).

Second, we can associate them by position: the first angle, from left, is always associated with the first axis in the Euler angle order. For examples, the first angle is applied to the x-axis for `kXYZ` and `kXZY`, but to the y-axis for `kYXZ` and `kYZX`, etc. Suppose `a` is a `Point3`, `a[0]` (`==a.x`), `a[1]` (`==a.y`), `a[2]` (`==a.z`), are the angles of the z-axis, x-axis, and y-axis, respectively, for Euler type `kZXY`.

Let's call this way of association by order.

For repetitive Euler type, the association by axis is ambiguous because one axis may appear twice in the Euler axes. In this case, "by order" is well defined.

This class uses the association of by axis for non-repetitive types and by order for repetitive type. Suppose,

**Point3 a = rv.Euler(RotationValue::kZZXZ) // repetitive Euler type**

Then, a[0] and a[2] are both applied to the Z axis, but a[0] corresponds to the first z-axis from left, a[2] corresponds to the second z-axis (third axis) from left, and a[1] corresponds to the x-axis.

## **Methods:**

### **Prototype:**

```
static bool IsEuler(int rep) { }
```

### **Remarks**

Conveniency (static) method to test whether an integer corresponds to an enum of rotation representations used in RotationValue of type Euler angles

### **Prototype:**

```
static bool IsRepetitive(int rep) { }
```

### **Remarks:**

Conveniency (static) method to test whether in cases where a call to **IsEuler(int rep)** is made, and the return value is of type Euler angles, this method call returns whether it has repetitive axes (such as **XYX**).

### **Prototype:**

```
static bool IsQuat(int rep) }
```

### **Remarks:**

Conveniency (static) method to test whether an integer corresponds to an enum of rotation representations used in RotationValue of type Quaternion.

**Prototype:**

```
void Set(const Point3& a, EulerType et) { }
```

**Remarks:**

Set an object of RotationValue to an Euler angle representation. Angles are assumed in radians. To set to Euler angles of x, y, z, of order XYZ, do, for example:

```
RotationValue a;
```

```
a.Set(Point3(x, y, z), RotationValue::kXYZ);
```

**Prototype:**

```
void Set(const Quat& q) { }
```

**Remarks:**

Set an object of RotationValue to a quaternion representation.

**Prototype:**

```
RotationValue();
```

**Remarks:**

Constructor

**Prototype:**

```
RotationValue(const Point3& a, EulerType et);
```

**Remarks:**

Constructor

**K Prototype:**

```
RotationValue(const Quat& q);
```

**Remarks:**

Constructor.

**Prototype:**

**RotationValue(const RotationValue& src);**

**Remarks:**

Copy constructor.

**Prototype:**

**Point3 Euler(EulerType et =kXYZ) const {}**

**Remarks:**

Used to get the rotation in specific representation. Suppose rv is a RotationValue, to get it in terms of Euler angles of order XYZ:

**rv.Euler();**

in order ZXY:

**rv.Euler(RotationValue::kZXY);**

or, to get it in quaternion:

**(Quat)rv;**

to get it in matrix form:

**(Matrix3)rv**

**Prototype:**

**operator Quat() const {}**

**Remarks:**

Please see method Euler() for fuller explanation.

**Prototype:**

**operator Matrix3() const;**

**Remarks:**

Please see method Euler() for fuller explanation.

**Prototype:**

**void PreApplyTo(Matrix3& m) const;**

**Remarks:**

Given a matrix, m, we can apply the rotation, rv, of RotationValue from left side (PreApplyTo)

**rv.PreApplyTo(m) == ((Matrix3)rv) \* m**

**Prototype:**

**void PostApplyTo(Matrix3& m) const;**

**Remarks:**

Given a matrix, m, we can apply the rotation, rv, of RotationValue from right side (PoseApplyTo)

**rv.PoseApplyTo(m) == m \* (Matrix3)rv**

**Prototype:**

**void PostRotate(const AngAxis& aa);**

**Remarks:**

To apply a rotation, aa, as represented as AngAxis to a RotationValue, rv, from the right side,

**rv.PostRotate(aa)**

The internal representation of rv after applying to it will not be change. Mathematically,

**(Matrix3)rv.PostRotate(aa) == ((Matrix3)rv) \* MatrixOf(aa)**

If rv is in Euler angles, this method will try to keep the Euler angles from jumping at the borders of (+/-)180 degrees.

**Prototype:**

```
int NativeRep() const { return mRep; }
```

**Remarks:**

Used to get the internal representation and returns the representation type. If it is a Euler angle type, the first three numbers of the Quat returned from GetNative() are to be interpreted as Euler angles.

**Prototype:**

```
Quat GetNative() const { return mQ; }
```

**Remarks:**

Used to get the internal representation and returns the actual float numbers.

## Class ISkinPose : public FPMixinInterface

### Description:

Interface class for setting and getting a special, non-animated, transformation pose, [SkinPose](#).

### Methods:

### Prototype:

**static ISkinPose\* GetISkinPose(INode& n)**

### Remarks:

Method to obtain the interface pointer for a given INode.

### Parameters:

**INode& n**

The node having the transformation pose.

**Return Value:**

**ISkinPose\***

A pointer to this interface class.

**Prototype:**

```
virtual Point3 SkinPos() const = 0;
```

**Remarks:**

Method to obtain the position part of the transformation pose.

**Return Value:**

**Point3**

The position of the pose expressed as 3-vector (Point3).

**Prototype:**

**virtual RotationValue SkinRot() const = 0;**

**Remarks:**

Method to obtain the rotation part of the transformation pose.

**Return Value:****RotationValue**

The rotation of the pose expressed as an RotationValue, which can be quaternion or Euler angle type.

**Prototype:**

**virtual ScaleValue SkinScale() const = 0;**

**Remarks:**

Method to obtain the scale part of the transformation pose.

**Return Value:**

**ScaleValue**

The scale of the pose expressed as possibly unequal values along the principal axes of a coordinate system whose orientation is defined by a quaternion.

**Prototype:**

```
virtual void SetSkinPos(const Point3&) = 0;
```

**Remarks:**

Method to set the pose position to a given point.

**Parameters:**

**Point3**

The desired point for the pose.

**Prototype:**

```
virtual void SetSkinRot(const RotationValue&) = 0;
```

**Remarks:**

Method to set the pose rotation to a given value.

**Parameters:****RotationValue**

The rotation of the pose expressed as an Euler angle or quaternion type.

**Prototype:**

```
virtual void SetSkinRot(const Point3&) = 0;
```

**Remarks:**

Method to set the pose rotation to a given Euler angle.

**Parameters:****Point3**

The rotation of the pose expressed as an Euler angle vector.

**Prototype:**

```
virtual void SetSkinScaleFactors(const Point3&) = 0;
```

**Remarks:**

Method to set the potentially differing pose scale factors.

**Parameters:**

**Point3**

The point containing the scale factors x, y, and z.

**Prototype:**

**virtual void SetSkinScaleOrient(const Quat&) = 0;**

**Remarks:**

Method to set the orientation of the scale factor axes.

**Parameters:**

**Quat&**

The quaternion specifying the orientation of the scale factor axes.

**Prototype:**

**virtual bool IsSkinPosEnabled() const = 0;**

**Remarks:**

Method to determine if the pose position is enabled.

**Return Value:**

**bool**

If true, the pose position is enabled.

If false, the pose position is disabled.

**Prototype:**

**virtual bool IsSkinRotEnabled() const = 0;**

**Remarks:**

Method to determine if the pose rotation is enabled.

**Return Value:**

**bool**

If true, the pose rotation is enabled.

If false, the pose rotation is disabled.

**Prototype:**

**virtual bool IsSkinScaleEnabled() const = 0;**

**Remarks:**

Method to determine if the pose scale is enabled.

**Return Value:**

**bool**

If true, the pose scale is enabled.

If false, the pose scale is disabled.

**Prototype:**

**virtual bool SkinPoseMode() const = 0;**

**Remarks:**

Member function yielding a Boolean whether the node is in the Skin Pose mode. In this mode, the node will assume the skin pose, subject to “enabled” flags of the three (position, rotation, and scale) parts, as its transformation,

rather than from the normal channel, the transform controller.

**Return Value:**

**bool**

If true, the node transformation is in the skin pose mode.

If false, it is in the normal mode.

**Prototype:**

**virtual void EnableSkinPos(bool) = 0;**

**Remarks:**

Sets the state of the pose position transform.

**Parameters:**

**bool**

If true, the pose position transform is enabled.

If false, the pose position transform is disabled.

**Prototype:**

**virtual void EnableSkinRot(bool) = 0;**

**Remarks:**

Sets the state of the pose rotation transform.

**Parameters:**

**bool**

If true, the pose rotation transform is enabled.

If false, the pose rotation transform is disabled.

**Prototype:**

**virtual void EnableSkinScale(bool) = 0;**

**Remarks:**

Sets the state of the pose scale transform.

**Parameters:**

**bool**

If true, the pose scale transform is enabled.

If false, the pose scale transform is disabled.

**Prototype:**

**virtual void SetSkinPoseMode(bool) = 0;**

**Remarks:**

Puts the node transform in the skin pose or normal mode.

**Parameters:**

**bool**

If true, the node transform is put in the skin pose mode.

If false, the node transform resumes to the normal mode.

**Prototype:**

**virtual void SetSkinPose(TimeValue) = 0;**

**Remarks:**

Sets the state of all three non-animated skin pose transforms, subject to the

“enabled” flags, to the animated normal pose at a particular time.

**Parameters:**

**TimeValue**

Time at which the animated normal pose is used as the target to set the skin pose transforms.

**Prototype:**

**virtual void AssumeSkinPose(TimeValue) = 0;**

**Remarks:**

Sets the state of all three animated normal pose transforms, subject to the “enabled” flags, at a particular time, to the non-animated skin pose transforms.

**Parameters:**

**TimeValue**

Time at which to set the normal pose transforms.

**Prototype:**

**virtual void TMSetValue(TimeValue, SetXFormPacket&) = 0;**

**Remarks:**

This is a utility method used to set value to the node transform. According to whether it is in the skin pose mode and the three “enabled” flags, it will set value to the TM controller or the skin pose transforms.

**Parameters:**

**TimeValue**

Time at which to set the pose transform.

## **SetXFormPacket&**

Controller values for the transform.

### **Prototype:**

**Point3 SkinRotAngles() const;**

### **Remarks:**

Method to obtain the Euler angles of the pose rotation.

### **Return Value:**

**Point3**

The Euler angles about x, y, and z.

### **Prototype:**

**Point3 SkinScaleFactors () const;**

### **Remarks:**

Method to obtain the scale factors of the pose transformation.

### **Return Value:**

**Point3**

The scale factors along the x, y, and z axes.

### **Prototype:**

**Quat SkinScaleOrient() const;**

**Remarks:**

Method to obtain the scale factor orientation of the pose transformation.

**Return Value:****Quat**

The axis and angle of the scale factor orientation.

**Prototype:**

**void SetSkinScale(const ScaleValue&);**

**Remarks:**

Method to set the scale values for the pose transform.

**Parameters:****ScaleValue&**

The scale of the pose expressed as possibly unequal values along the principal axes of a coordinate system whose orientation is defined by a quaternion.

**Prototype:**

**void SetSkinRotAngles(const Point3&);**

**Remarks:**

Method to set the rotation angles for the pose transform.

**Parameters:****Point3&**

The Euler angles of the pose rotation.

**Prototype:**

**bool ShowSkinPos() const;**

**Remarks:**

Method to determine if the pose position component is enabled and the node is in the skin pose mode.

**Return Value:**

**bool**

If true, the position of the node transform will come from the skin pose.

If false, the position of the node transform comes from the normal TM controller.

**Prototype:**

**bool ShowSkinRot() const;**

**Remarks:**

Method to determine if the pose rotation component is enabled and the node is in the skin pose mode.

**Return Value:**

**bool**

If true, the rotation of the node transform will come from the skin pose.

If false, the rotation of the node transform comes from the normal TM controller.

**Prototype:**

**bool ShowSkinScale() const;**

**Remarks:**

Method to determine if the pose scale component is enabled and the node is in the skin pose mode.

**Return Value:****bool**

If true, the scale of the node transform will come from the skin pose.

If false, the scale of the node transform comes from the normal TM controller.

**Prototype:****bool IsACompEnabled() const;****Remarks:**

Method to determine if one or more pose components; position, rotation, or scale are enabled.

**Return Value:****bool**

If true, one or more components are enabled.

If false, none of the components are enabled.

**Prototype:****virtual bool NeedToSave() const = 0;****Remarks:**

Method to indicate that a post transform component has changed from the default and needs to be saved.

**Return Value:**

**bool**

If true, a pose component has changed.

If false, no pose component has changed.

**Prototype:**

```
virtual IOResult Save(ISave*) const = 0;
```

**Remarks:**

Method to write pose data to a file.

**Parameters:**

**ISave\***

Pointer for use in calling write methods.

**Return Value:****IOResult**

If IO\_OK, the method succeeded.

If IO\_ERROR, the method was unsuccessful.

**Prototype:**

**virtual IOResult Load(ILoad\*) = 0;**

**Remarks:**

Method to read pose data from a file.

**Parameters:**

**ILoad\***

Pointer for use in calling read methods.

**Return Value:****IOResult**

If IO\_OK, the method succeeded.

If IO\_ERROR, the method was unsuccessful.

**Prototype:**

**virtual void Copy(const ISkinPose&) = 0;**

**Remarks:**

Method to copy data members from an existing ISkinPose instance to the current one.

**Parameters:**

**ISkinPose&**

Reference to instance of this class to copy from.

**Prototype:**

```
virtual const void* ObjectOf(void*) const = 0;
```

**Remarks:**

Determines whether this is a const object of a particular subclass derived from ISkinPose. It is used for the internal implementation purpose.

**Parameters:**

**void\***

Pointer to the subclass identifier to test.

**Return Value:**

**void\***

Const pointer to subclass.

**Prototype:**

**virtual void\* ObjectOf(void\*) const = 0;**

**Remarks:**

Determines whether this is an object of a particular subclass derived from ISkinPose. It is used for the internal implementation purpose.

**Parameters:**

**void\***

Pointer to the subclass identifier to test.

**Return Value:**

**void\***

Pointer to subclass.

**Prototype:**

**FPInterfaceDesc\* GetDesc();**

**Remarks:**

Method to obtain the function publishing interface description.

**Return Value:**

**FPInterfaceDesc \***

Pointer to the interface descriptor.

## Class IUnwrapMod2

### Description:

**This class is only available in release 5 or later.**

The new class allows for Normal, Flatten, and Unfold mapping. You can bring them up through a dialog or through a script command. All these tools basically work the same. They are either applied to the current selected faces or the whole object if no faces are selected.

As this class has been fully developed with the new Function-Published System (FPS), all of its methods have a one-to-one correspondence with MaxScript commands. For the sake of brevity, references to MaxScript commands mean that there is an attendant C++ method in iunwrap.h that is prepended by lowercase **fn**. Examples of this are as follows ( MaxScript and its attendant C++ method):

copy **fpCopy()**;

normalMapNoParams **fnNormalMapNoParams()**.

There are three distinct modes of unmapping:

### Normal Mapping

Normal Mapping is mapping based solely are the normals provided. This is identically to box mapping except you customize what normals you want to project on. There are three methods to apply a "normalMap" which applies a normal map based on the parameters passed in (see the methods below) , "normalMapNoParams" which applies a normal map using the default setting, and "normalMapDialog" which brings up a dialog that lets you set the setting. Right now there are 6 types of default mapping Back/Front, Left/Right, Top/Bottom, Box Mapping No Top, Box Mapping, and Diamond mapping. Just apply the mapping to a teapot to see the differences they are pretty obvious once you see the effect. Parameters in the Normal Mapping dialog are:

- Mapping Type which are the 6 mapping types listed above.
- Spacing which determines how much space there is between each cluster.
- Normalize Cluster will normalize the cluster from 0 to 1
- Rotate Clusters will rotate the clusters so they take the least amount of area.
- Align By Width will sort the clusters by their width otherwise it will use their heights.

Hitting the Save As Default will take the current setting and set them as defaults for the next time you bring up the dialog and when you use the script command **"normalMapNoParams"**.

### **Flatten Mapping**

Flatten Mapping is similar to normal mapping, except it uses an angle threshold to define the clusters and the clusters will always be contiguous faces. This type of mapping will generate mapping that does not overlap so it is useful for baking textures and lighting. Just like normal mapping this comes in 3 flavors "flattenMap" which applies a normal map based on the parameters passed in (see the methods below) , "flattenMapNoParams" which applies a map using the default setting, and "flattenMapDialog" which brings up a dialog that lets you set the setting. The parameters for the Flatten Map Dialog are:

Face Angle Threshold - when building contiguous faces this the angle used to determine whether a face is part of that cluster. The larger this angle the larger the cluster will be, but you will get more distortion since the texture faces area will start deviating from their geometric face area.

- Spacing which determines how much space there is between each cluster.
- Normalize Cluster will normalize the cluster from 0 to 1
- Rotate Clusters will rotate the clusters so they take the least amount of area.
- Fill Holes will fill clusters with holes. It places smaller cluster in the gaps of larger clusters.

## Unfold Mapping

Unfold Mapping where as the Normal and Flatten Mapping basically use a lot of planar mapping to get their results, this is an actual unfolding algorithm. It guarantees that all texture faces will have the exact same proportions as their geometric equivalents, but you may get faces that overlap. This type of mapping is only good on meshes that are very regular things like cylinders etc. This has the same type of function calls as the above "unfoldMap" which applies an unfold map based on the parameters passed in (see the methods below) , "unfoldMapNoParams" which applies a map using the default setting, and "unfoldMapDialog" which brings up a dialog that lets you set the setting. The parameters for the Unfold Map Dialog are:

- Unfold Type which consists of Walk to closest face and Walk to farthest face. This determines the order of which face gets unfolded. Under almost all conditions you want to walk to the closest face.
- Normalize Cluster will normalize the cluster from 0 to 1

Copy/Paste allows you to copy a texture face/faces from one part or mesh to another or to a new mesh. These functions are extremely topology dependant so if you copy faces onto faces that have a different topology or face order you will get unpredictable results. There is a "copy" script which takes the current selected faces and puts them in the copy buffer. There is the "Paste" and "PasteInstance" commands which do the pasting to current selected faces. "Paste" take one parameter called rotate which determines if every time you paste to the same face whether the tvs are reoriented. For instance if you paste a quad onto a another quad there are actually 4 possible ways you can paste it onto it. If rotate is on, every time you paste it will go onto the next variation. "Paste Instance" forces the faces that are being pastes to use the vertices that the copy buffer use (NOTE you cannot paste instance across objects). This similar to doing a regular paste and then selecting all the overlapping vertices and doing a weld. There is no rotate option with this method. As noted above Pasting faces that have a different topology or face order will result in unpredictable results.

Stitching allows you find all the texture vertices that are assigned to the same geometric vertex and bring them all to the same spot and weld them together. This allows you take faces that geometrically contiguous, but not texture face contiguous and line them up. There is a `stitchVerts` command which takes parameters, `stitchVertsNoParams` which uses the current defaults, and a `stitchVertsDialog` which brings up a dialog to apply a stitch and set defaults. The Stitch Tool params are:

- **Align Cluster** which if checked and the edges to be stitched are on separate clusters it will try to align the clusters and then stitch the vertices.
- **Bias** determines which direction the vertices will move (to or from the source). At a Bias of 0.0 the vertices will move to the source and 1.0 they will move to the target.

Note stitching will respect the soft selection.

## **Methods:**

*Nb: the following are MaxScript commands, however, referring to the above qualifier, their C++ method name is the same as in MaxScript but prepended with `fn`.*

*The format for input/output parameters is as follows:*

*<output type> <name of function> <input type params 1...n>*

**copy** - this takes the selected faces and places them in the copy buffer

**paste**

rotate TYPE\_BOOL if this on, every time you paste to the same selection it will try a different variation

This paste the current copy buffer onto the current face selection.

**pasteInstance** this forces the faces that are being pastes to use the vertices that

the copy buffer use (NOTE you cannot paste instance across objects). This is similar to doing a regular paste and then selecting all the overlapping vertices and doing a weld. There is no rotate option with this method.

### **SetDebugLevel**

level TYPE\_INT level of debug info 0 means no debug info, the higher the value the more spam you will see in your script window  
Debugging tool so I can control the amount of debug info that goes to the listener and script window.

**TYPE\_BOOL getTileMap** - returns whether the background is tiled.

### **setTileMap**

tile TYPE\_BOOL - whether or not to tile the background  
This allows you to set the tile state of the background

**TYPE\_INT getTileMapLimit** - returns the max number of tiles to use in a direction

### **setTileMapLimit**

limit TYPE\_INT - the number of tile to limit in a direction  
This allows you to set the tile limit

**TYPE\_FLOAT getTileMapBrightness** returns the brightness of the tiles.

### **setTileMapBrightness** brightness

TYPE\_FLOAT - the brightness of the tiled maps  
This allows you to set the brightness of the tiled maps

New Maxscript functions

**TYPE\_BOOL getShowMap** returns the state of the show map button

### **TYPE\_VOID setShowMap**

showMap TYPE\_BOOL the state you want to set the show map button  
Lets you set the state of the show map button

**TYPE\_BOOL getLimitSoftSel** returns whether the soft selection limit is on/off

### **SetLimitSoftSel**

limit TYPE\_BOOL state the to set the soft selection limit  
Allows you to set the soft selection limit state

**TYPE\_INT getLimitSoftSelRange** returns the edge limit for the for the soft selection

### **setLimitSoftSelRange**

range TYPE\_INT this is how far out in edges that soft selection will expand to  
This lets you set the edge limit range for soft selection

### **TYPE\_FLOAT getVertexWeight**

index TYPE\_INT the index of the vertex you want to inspect  
returns the soft selection weight of a particular vertex

### **setVertexWeight**

index TYPE\_INT the index of the vertex you want to change  
weight TYPE\_FLOAT the soft selection weight you want to set the vertex to

This lets you set the soft selection weight of a particular vertex. Note once you set the weight of a vertex, it is tagged as being modified and will not change value unless you unmodify or call setVertexWeight on it again.

### **TYPE\_BOOL isWeightModified**

index TYPE\_INT the index of the vertex you want to inspect  
This returns whether a vertex is modified or not.

### **modifyWeight**

index TYPE\_INT the index of the vertex you want to change  
modify TYPE\_BOOL the modified state of the vertex

This lets you set the modified state of vertex. If a vertex is modified it ignores regular UI soft selection and the vertex soft selection weight is locked to its current state and can only be changed by the `setVertexWeight` method.

**TYPE\_BOOL getGeomSelectElementMode** returns whether you are in element mode for face selection in the viewport.

### **setGeomSelectElementMode**

mode TYPE\_BOOL - the state that you want to put viewport selection in  
Lets you set the viewport element mode.

**TYPE\_BOOL getGeomPlanarThresholdMode** return the whether you are in planar select mode.

### **setGeomPlanarThresholdMode**

mode TYPE\_BOOL the state that you want to put planar selection mode  
Lets set the planar selection mode.

**TYPE\_FLOAT getGeomPlanarThreshold** return the planar selection angle threshold

### **setGeomPlanarThreshold**

angle TYPE\_FLOAT the angle threshold  
Lets you set the angle threshold for the planar selection mode.

**TYPE\_INT getWindowX** returns the current X position of the Unwrap Edit window

**TYPE\_INT getWindowY** returns the current Y position of the Unwrap Edit window

**TYPE\_INT getWindowW** returns the current width of the Unwrap Edit window

**TYPE\_INT getWindowH** returns the current height of the Unwrap Edit window

**TYPE\_BOOL getIgnoreBackFaceCull** returns the state of the Ignore Back Face mode

### **setIgnoreBackFaceCull**

ignoreBackFaceCull TYPE\_BOOL state of the Ignore Back Faces mode  
Lets you set the Ignore Back Face mode

**TYPE\_BOOL getOldSelMethod** returns whether the system is in the old selection mode. Where drag selection always uses back faces and single pick mode ignore back faces.

### **SetOldSelMethod**

oldSelMethod TYPE\_BOOL the state of the old selection method  
This lets you set the system back to the old selection method. Where drag selection always uses back faces and single pick mode ignore back faces.  
This will override the Ignore Back Faces mode.

### **SelectByMatID**

matID TYPE\_INT the matID of the face that you want to select  
This lets you select faces by material ids.

### **selectBySG**

sg TYPE\_INT the smoothing group that you want to select  
This lets you select faces by smoothing group

**TYPE\_VOID expandGeomFaceSelection** - expands your current viewport face selection

**TYPE\_VOID contractGeomFaceSelection** - contracts your current viewport face selection

**TYPE\_BOOL getAlwaysEdit** - This returns whether the always edit mode is on. This mode will always bring up the edit dialog when the Unwrap rollup

window is displayed.

### **TYPE\_VOID setAlwaysEdit**

always TYPE\_BOOL the state that you want to set the always edit mode to.

This lets you set the always edit mode. This mode will always bring up the edit dialog when the Unwrap rollup window is displayed.

**TYPE\_BOOL getShowVertexConnections** this returns whether vertex connection indices are displayed. Vertex Connections are TV vertices that share the same geometric vertices

### **TYPE\_VOID setShowVertexConnections**

show TYPE\_BOOL whether to display the vertex connection data.  
This lets you toggle the vertex connection data.

**TYPE\_BOOL getFilterSelected** this returns the state of the Filter Selected Faces button

### **TYPE\_VOID setFilterSelected**

filter TYPE\_BOOL the filter state  
This lets you set the Filter Selected Faces button

**TYPE\_BOOL getSnap** this returns the snap state.

### **TYPE\_VOID setSnap**

snap TYPE\_BOOL the snap state  
This lets you set the snap state.

**TYPE\_BOOL getLock** this returns the lock selection state

### **TYPE\_VOID setLock**

lock TYPE\_BOOL state of the lock selection.  
This lets you set the state of the lock selection

### **TYPE\_VOID pack**

method `TYPE_INT` - 0 is a linear packing algorithm fast but not that efficient, 1 is a recursive algorithm slower but more efficient.  
spacing `TYPE_FLOAT` - the gap between cluster in percentage of the edge distance of the square  
normalize `TYPE_BOOL` - whether the clusters will be fit to 0 to 1 space.  
rotate `TYPE_BOOL` - whether a cluster will be rotated so it takes up less space.  
fillholes `TYPE_BOOL` - whether smaller clusters will be put in the holes of the larger cluster.  
This lets you pack the texture vertex elements so that they fit within a square space.

**`TYPE_VOID packNoParams`** - this packs the clusters using the default parameters.

**`TYPE_VOID packDialog`** - this brings up a dialog that lets the user set the parameters and then packs the clusters.

**`TYPE_INT getTVSubObjectMode`** sets the current texture subobject mode  
1 vertices, 2 edges, 3 faces.

**`TYPE_VOID setTVSubObjectMode`**

mode `TYPE_INT` - the subobject mode 1 vertices, 2 edges, 3 faces.  
Lets you set the tv subobject mode.

**`TYPE_BITARRAY getSelectedFaces`** returns the selected face list

**`TYPE_VOID selectFaces`**

Selection `TYPE_BITARRAY` selection that you want to make the face selection

This lets you set the face selection

**`TYPE_BOOL IsFaceSelected`**

Index `TYPE_INT` the index of the face you want to check  
This lets you check to see if a face is selected.

**TYPE\_INT getFillMode** - returns the fill mode type for face selections. The fill modes are as follows.

**FILL\_MODE\_OFF 1**  
**FILL\_MODE\_SOLID 2**  
**FILL\_MODE\_BDIAGONAL 3**  
**FILL\_MODE\_CROSS 4**  
**FILL\_MODE\_DIAGCROSS 5**  
**FILL\_MODE\_FDIAGONAL 6**  
**FILL\_MODE\_HORIZONTAL 7**  
**FILL\_MODE\_VERTICAL 8**

**TYPE\_VOID setFillMode**

mode TYPE\_INT - the fill mode that you want to set  
This lets you set the fill mode for selected faces.

**MoveSelected, RotateSelected, RotateSelectedCenter, ScaleSelectedCenter, and ScaleSelected** are identical to their vertex counter parts but are applied to the current selection.

**TYPE\_VOID MoveSelected**

Offset TYPE\_POINT3

**TYPE\_VOID RotateSelectedCenter**

Angle TYPE\_FLOAT

**TYPE\_VOID RotateSelected**

Angle TYPE\_FLOAT

Axis TYPE\_POINT3

**TYPE\_VOID ScaleSelectedCenter**

Scale TYPE\_FLOAT

Dir TYPE\_INT

**TYPE\_VOID ScaleSelected**

Scale TYPE\_FLOAT

Dir TYPE\_INT

Axis TYPE\_POINT3

**TYPE\_BITARRAY getSelectedEdges** returns the selected edge list

### **TYPE\_VOID selectEdges**

Selection TYPE\_BITARRAY selection that you want to make the edge selection

This lets you set the edge selection

### **TYPE\_BOOL IsEdgeSelected**

Index TYPE\_INT the index of the edge you want to check

This lets you check to see if a face is selected.

**TYPE\_BOOL getDisplayOpenEdges** returns whether the open edges will display

### **TYPE\_VOID setDisplayOpenEdges**

displayOpenEdges TYPE\_BOOL the state of the open edge display

This lets you set the open edge display

**TYPE\_POINT3 getOpenEdgeColor** returns the color used for the open edges

### **TYPE\_VOID setOpenEdgeColor**

color TYPE\_POINT3 the color to be used for open edges

This lets you set the open edge color

**TYPE\_BOOL getUVEdgeMode** returns whether you are in the UV Edge Selection mode. This mode will try to automatically select all the U or V edges when you select an edge. Since this is based on edges, the regular tri mesh may produce incorrect results since the hidden edges are not taken into account.

### **TYPE\_VOID setUVEdgeMode**

uvEdgeMode TYPE\_BOOL the state of the you want to set the UV Edge mode

This lets you set the UV Edge mode

**TYPE\_VOID uvEdgeSelect** - this is a command that will take your current edge selection and try to expand out along the U and V directions. Works best when you only have one edge selected.

**TYPE\_BOOL getOpenEdgeMode** returns whether you are in the Open Edge Selection mode. This mode will try to automatically select all the opens edges when you select an open edge.

### **TYPE\_VOID setOpenEdgeMode**

uvOpenMode TYPE\_BOOL the state of the you want to set the Open Edge mode

This lets you set the Open Edge mode

**TYPE\_VOID openEdgeSelect** - this is a command that will take your current selection and try to expand all the open edges in it.

**TYPE\_VOID vertToEdgeSelect** - this command takes your vertex selection and converts it to the edge selection.

**TYPE\_VOID vertToFaceSelect** - this command takes your vertex selection and converts it to the face selection.

**TYPE\_VOID edgeToVertSelect** - this command takes your edge selection and converts it to the vertex selection.

**TYPE\_VOID edgeToFaceSelect** - this command takes your edge selection and converts it to the face selection.

**TYPE\_VOID faceToVertSelect** - this command takes your face selection and converts it to the vertex selection.

**TYPE\_VOID faceToEdgeSelect** - this command takes your face selection and converts it to the edge selection.

**TYPE\_BOOL getDisplayHiddenEdges** return whether hidden edges of a tri mesh are displayed.

### **TYPE\_VOID setDisplayHiddenEdges**

displayHiddenEdges TYPE\_BOOL - the state that you want to the hidden

display to be.

This lets you turn on/off whether tri mesh hidden edges are displayed.

**TYPE\_POINT3 getHandleColor** - returns the color that will be used to display patch handles.

**TYPE\_VOID setHandleColor**

color TYPE\_POINT3 - the color that you want to set patch handles to

This lets you set the color that will be used to display patch handles.

**TYPE\_BOOL getFreeFormMode** this toggle the free form mode on and off. This mode is similar to the Photoshops free form mode. You select any where inside the bounding rectangle to move the selection. You select the corners to scale the selection, and you you select the edge centers to rotate the selection. You can also move the center cross which is your rotation pivot point.

**TYPE\_VOID setFreeFormMode**

freeFormMode TYPE\_BOOL the state of the free form mode.

Lets you turn on/off the free from mode.

**TYPE\_POINT3 getFreeFormColor** returns the color of the free form gizmo.

**TYPE\_VOID setFreeFormColor**

color TYPE\_POINT3 the color that you want the gizmo to be

This lets you set the color of the Free Form Gizmo

**TYPE\_VOID ScaleSelectedXY**

ScaleX TYPE\_FLOAT the x scale factor

ScaleY TYPE\_FLOAT the y scale factor

Axis TYPE\_POINT3 the axis to scale around

This lets you nu scale the current selection around an axis

**TYPE\_VOID SnapPivot**

Pos TYPE\_INT - the pivot position where

1 is the center

- 2 is the lower left of the selection
- 3 is the lower center of the selection
- 4 is the lower right of the selection
- 5 is the right center of the selection
- 6 is the upper right of the selection
- 7 is the upper center of the selection
- 8 is the upper left of the selection
- 9 is the left center of the selection

This lets you quickly snap the free form gizmo pivot the bounding rectangle.

**TYPE\_POINT3 getPivotOffset** - returns the pivot offset of the free form gizmo. This is an offset from the center of the selection.

**TYPE\_VOID setPivotOffset**

offset TYPE\_POINT3 the offset of the free form gizmo pivot  
This lets you set the offset of the free form gizmo pivot.

**TYPE\_POINT3 fnGetSelCenter** this returns the selection center so you can compute the pivot offset from a world uv position.

**TYPE\_BOOL getPolygonMode**

This returns whether the polygon mode for sub object face mode is on. Polygon Mode will just select across triangles across hidden edges of a triangle.

**TYPE\_VOID setPolygonMode**

mode TYPE\_BOOL the state you want to set the Polygon Mode  
This lets you set the state the of the Polygon Mode

**TYPE\_VOID PolygonSelect**

This is command that will take your current selection and expand it to include all polygons.

**TYPE\_VOID sketch**

IndexList TYPE\_INT\_TAB the indices of the points you want to move.  
PositionList TYPE\_POINT3\_TAB the list of a points you want to align your vertices to.

This lets you align texture vertices to a series of points

### **TYPE\_VOID sketchNoParams**

This puts you in sketch mode using the default parameters.

### **TYPE\_VOID sketchDialog**

This brings up the sketch options dialog.

### **TYPE\_VOID sketchReverse**

This will reverse the order of the select vertices that are being used for sketch when you use the Use Current Selection option.

### **TYPE\_INT getHitSize**

This returns the hit size whne you do a single click in pixels.

### **TYPE\_VOID SetHitSize**

size TYPE\_INT the size you want to set the hit size to  
This lets you set the hit size of a single click.

### **TYPE\_BOOL getResetPivotOnSelection**

This will return whether the Transform Gizmo will reset when the selection is changed.

### **TYPE\_VOID SetResetPivotOnSelection**

reset TYPE\_BOOL the state you want to set the reset pivot on selection  
This lets you set the Reset the Pivot On Selection.

### **TYPE\_BOOL getAllowSelectionInsideGizmo**

This returns whether a user can select sub objects inside the gizmo or not. If this is FALSE the user is in move mode when inside the gizmo unless they are over the pivot. If this is TRUE the user is in move mode when they are inside and over a selected sub object otherwise they are in select mode.

### **TYPE\_VOID Set AllowSelectionInsideGizmo**

select TYPE\_BOOL - the state you want to set the Allow Selection Inside Gizmo to be

This lets you set the Allow Selection Inside Gizmo flag

### **TYPE\_VOID SaveCurrentSettingsAsDefault**

This takes the current state of Unwrap UVW and save it to the plugin cfg directory into a file called unwrapUVW.ini. The next time the user creates an Unwrap UVW modifier this ini file will be used to set the defaults.

### **TYPE\_VOID LoadDefault**

This will load the unwrapUVW.ini defaults into the current Unwrap UVW modifier.

### **TYPE\_BOOL getShowShared**

This returns whether shared sub objects are displayed. Shared sub objects are texture vertices or edges that share the same geometric vertex or edge.

### **TYPE\_VOID setShowShared**

select TYPE\_BOOL whether to display shared sub objects or not.  
This lets you toggle the Show Shared flag.

### **TYPE\_POINT3 getSharedColor**

This returns the color that will be used to show shared sub objects.

### **TYPE\_VOID setSharedColor**

color TYPE\_POINT3 the color to be used for shared sub objects  
This lets you set the color to be used for shared sub objects.

### **TYPE\_VOID showIcon**

index TYPE\_INT index of the icon to be display/hidden. The icons are as follows:

- 1 - Move Mode
- 2 - Rotate Mode
- 3 - Scale Mode

- 4 - Transform Mode
- 5 - Mirror Tool
- 6 - Expand Selection
- 7 - Contract Selection
- 8 - Soft Selection Falloff
- 9 - Soft Selection Space
- 10 - Soft Selection Strength
- 11 - Break
- 12 - Target Weld
- 13 - Weld Selected
- 14 - Update Map
- 15 - Show Map
- 16 - UV/VW/UW space
- 17 - Properties Dialog
- 18 - Map Drop List
- 19 - U Spinner
- 20 - V Spinner
- 21 - W Spinner
- 22 - Lock Sub Object
- 23 - Hide/Show
- 24 - Freeze/Thaw
- 25 - Filter Selected
- 26 - Mat Ids
- 27 - Pan Mode
- 28 - Zoom Mode
- 29 - Zoom Region Mode
- 30 - Fit Command
- 31 - Snap

show TYPE\_BOOL whether to show or hide this icon

This lets you turn on/off icons in the Unwrap UVW Edit dialog

### **TYPE\_BOOL getSyncSelectionMode**

Returns whether the viewport and the dialog selections are synced

### **TYPE\_VOID setSyncSelectionMode**

sync TYPE\_BOOL

Lets you set whether the viewport and the dialog selections are synced

### **TYPE\_VOID syncTVSelection**

This is a command that syncs the dialog to the viewport

### **TYPE\_VOID syncGeomSelection**

This is a command that syncs the viewport to the dialog

### **TYPE\_POINT3 getBackgroundColor**

returns the color of the background in the dialog

### **TYPE\_VOID setBackgroundColor**

color TYPE\_POINT3

Lets you set the color of the background in the dialog

### **TYPE\_VOID updateMenuBar**

Forces the menu bar to update

### **TYPE\_BOOL getBrightnessAffectsCenterTile**

This returns whether the brightness value affects the center tile

### **TYPE\_VOID setBrightnessAffectsCenterTile**

bright TYPE\_BOOL

This lets you set whether the brightness value affects the center tile

### **TYPE\_BOOL getBlendTileToBackground**

This returns whether the tiled images are blended to the background color or black

### **TYPE\_VOID setBlendTileToBackground**

blend TYPE\_BOOL,

This lets you set whether the tiled images are blended to the background color or black

### **TYPE\_BOOL getPaintSelectMode**

This returns whether you are in paint select mode

**TYPE\_VOID setPaintSelectMode**

paint TYPE\_BOOL,

This lets you set whether you are in paint select mode

**TYPE\_INT getPaintSelectSize**

Returns the size of the paint select brush this is clamped between 1 and 15.

**TYPE\_VOID setPaintSelectSize**

size TYPE\_INT

This lets you set the size of the paint select brush this is clamped between 1 and 15.

**TYPE\_VOID PaintSelectIncSize**

This increments the brush size by one

**TYPE\_VOID PaintSelectDecSize**

This decrements the brush size by one

**TYPE\_INT GetTickSize**

Returns the size of a selected vertex tick

**TYPE\_VOID SetTickSize**

size TYPE\_INT size of the tick

This lets you set the size of a vertex tick

## Class INodeExposure

class INodeExposure: public FPMixinInterface

### Description:

**This class is only available in release 5 or later.**

This interface provides the ability for a node to define whether it is visible in any of max's dialog boxes. This interface will be extended and used by more of 3ds max's core utilities, but **currently ONLY TrackView and the Select Object/HideObject dialog box use this interface.** By default this interface is not available through the default nodes, it needs to be added.

To get a pointer to this interface from a node the following code can be used.

```
INodeExposure* iNE = (INodeExposure*)node->GetInterface(NODEEXPOSURE_INTERFACE_TOAPPEND)
```

This will add a new INodeExposure interface to the node if it is not present. The next time you use this technique it will only return the interface and not create another new interface.

### Data Members:

```
enum {  
    kSelectObjects, kSchematicView, kMaxscript,  
    kMerge, kMergeAnimation, kReplace,  
    kKeyEditor, kCurveEditor, kRangeEditor,  
};
```

This enum provides access to the different supported UI elements. It is used with various methods of the class to get/set the UI flags.

### Methods:

**Prototype:**

**bool IsExposedInTrackView() const**

**Remarks:**

This will return true if it is visible in TrackView or false if it is not. This will return TRUE is the node is exposed in **ANY** of the TrackView states, kKeyEditor, kCurveEditor and kRangeEditor. It will return FALSE if **ALL** are set to false.

**Prototype:**

**void SetExposedInTrackView(bool state)**

**Remarks:**

This allows the state of the TrackView exposure flag to be set by the user. This will set the flag for all three TrackView flags. See comment in IsExposedInTrackView().

**Prototype:**

**bool IsExposedInKeyEditor() const**

**Remarks:**

Specifies whether the node is visible in the Key Editor of TrackView

**Prototype:**

**void SetExposedInKeyEditor(bool state)**

**Remarks:**

This allows the state of the Key Editor of Trackview exposure flag to be set by the user.

**Prototype:**

**bool IsExposedInCurveEditor() const**

**Remarks:**

Specifies whether the node is visible in the Function Curve Editor of Track

View

**Prototype:**

**void SetExposedInCurveEditor(bool state)**

**Remarks:**

This allows the state of the Function Curve Editor of Track view exposure flag to be set by the user.

**Prototype:**

**bool IsExposedInRangeEditor() const**

**Remarks:**

Specifies whether the node is visible in the Key Range Editor of Track View

**Prototype:**

**void SetExposedInRnageEditor(bool state)**

**Remarks:**

This allows the state of the Key Range Editor of Track view exposure flag to be set by the user.

**Prototype:**

**bool IsExposedInSelectObjects() const**

**Remarks:**

This will return true if it is visible in Selected Objects/HideObjects Dialog box otherwise false

**Prototype:**

**void SetExposedInSelectObjects (bool state)**

**Remarks:**

This will set the flag for the exposure in Selected Objects/HideObjects dialog box

**Parameters:**

**bool state**

The value to set the flag

**Prototype:**

**virtual bool IsExposed(int ui) const =0**

**Remarks:**

This will return the exposure state of the UI element being queried

**Parameters:**

**int ui**

The UI flag to query. This should be a value from the UI enum – See data members section

**Prototype:**

**virtual void SetExposed(bool state) const =0**

**Remarks:**

This will set the state of all the UI elements to the state passed into the method

**Parameters:**

**bool state**

The state to set the nodes UI exposure

**Prototype:**

**virtual void SetExposed(bool state, int ui) const =0**

**Remarks:**

This will set the state of the individual UI element to the state passed into the method

**Parameters:**

**bool state**

The state to set the nodes UI exposure

**int ui**

The UI element to set

## Class INodeLayerProperties

```
class INodeLayerProperties : public FPMixinInterface
```

### Description:

**This class is only available in release 5 or later.**

This class defines an interface for accessing a node's global illumination properties.

An instance of this interface can be retrieved using the following line of code (assuming 'node' is of type INode\*):

```
static_cast<INodeGIProperties*>(node-  
>GetInterface(NODELAYERPROPERTIES_INTERFACE))  
#define NODELAYERPROPERTIES_INTERFACE  
Interface_ID(0x44e025f8, 0x6b071e44)
```

```
// Provides access to the nodes layer and bylayer bits
```

```
public:
```

```
virtual ILayerProperties* getLayer (void) = 0;
```

```
virtual void setLayer (FPInterface *) = 0;
```

```
virtual BOOL getDisplayByLayer () = 0;
```

```
virtual void setDisplayByLayer (BOOL) = 0;
```

```
virtual BOOL getRenderByLayer () = 0;
```

```
virtual void setRenderByLayer (BOOL) = 0;
```

```
virtual BOOL getMotionByLayer () = 0;
```

```
virtual void setMotionByLayer (BOOL) = 0;
```

```
virtual BOOL getColorByLayer () = 0;
```

```
virtual void setColorByLayer (BOOL) = 0;
```

```
virtual BOOL getGlobalIlluminationByLayer () = 0;
```

```
virtual void setGlobalIlluminationByLayer (BOOL) = 0;
```

```
};
```

## **Class IAssembly : public FPMixinInterface**

### **Description:**

This interface class allows for setting and retrieving assembly membership information to or from nodes. All methods are implemented by the system (Max). Client code can query an INode for this interface:

```
INode* n;  
IAssembly* a = GetAssemblyInterface(n);
```

### **Methods:**

Notes for Set methods:

Nodes can be both assembly members and heads at the same time.

### **Prototype**

```
virtual void SetAssemblyMember(BOOL b) = 0;
```

### **Remarks:**

Method for setting state of assembly member. To close an assembly member call SetAssemblyMemberOpen(FALSE), as documented below.

### **Parameters:**

**BOOL b**

Specifies a new state for an assembly member.

If TRUE the node is set as an assembly member.

If FALSE removes a closed or open assembly member from membership. An open member will be closed first and then have it's membership flag removed.

**Prototype**

**virtual void SetAssemblyMemberOpen(BOOL b) = 0;**

**Remarks:**

Method for opening or closing an assembly member. It should only be called on members.

**Parameters:**

**BOOL b**

Specifies the state of the assembly member.

If TRUE the assembly member is opened.

If FALSE the assembly member is closed.

**Prototype:**

**virtual void SetAssemblyHead(BOOL b) = 0;**

**Remarks:**

Method to designate an assembly member as the assembly head.

**Parameters:**

**BOOL b**

Specifies the head state of the member.

If TRUE the node is set as the assembly head.

If FALSE an open or closed assembly head becomes a non-head. If the head is open, it is first closed and then the head flag is removed. To close an assembly head call `SetAssemblyHeadOpen(FALSE)`, as documented below.

**Prototype:**

**virtual void SetAssemblyHeadOpen(BOOL b) = 0;**

**Remarks:**

Method for opening or closing an assembly head. It should only be called on an assembly head.

**Parameters:****BOOL b**

Specifies the state of the assembly head.

If TRUE the assembly head is opened.

If FALSE the assembly head is closed.

Notes for Query methods:

To detect closed assembly members or assembly heads, check both the member/head flag and the open member/head flag i.e. `IsAssemblyHead() && !IsAssemblyMemberOpen()`.

**Prototype:**

**virtual BOOL IsAssemblyMember() const = 0;**

**Remarks:**

Method to determine membership in an assembly. It will work with either open or closed members.

**Return Value:**

If TRUE, node is a member the assembly.

If FALSE, node is not a member of the assembly.

**Prototype:**

**virtual BOOL IsAssemblyHead() const = 0;**

**Remarks:**

Method to determine if a node is an assembly head. It works with either open or closed heads.

**Return Value:**

If TRUE, node is an assembly head.

If FALSE, node is not an assembly head.

**Prototype:**

**virtual BOOL IsAssemblyMemberOpen() const = 0;**

**Remarks:**

Method to determine if an assembly member is open.

**Return Value:**

If TRUE, the assembly member is open.

If FALSE, the assembly member is not open.

**Prototype:**

**virtual BOOL IsAssemblyHeadOpen() const = 0;**

**Remarks:**

Method to determine if an assembly head is open.

**Return Value:**

If TRUE, the assembly head is open.

If FALSE, the assembly head is not open.

**Prototype:**

```
virtual BOOL IsAssemblyHeadMemberOf(const IAssembly*  
const assemblyHead) const = 0;
```

**Remarks:**

Method to detect assemblies within assemblies. It checks whether this assembly node is a head node and is also a member of the assembly headed by the node passed in as a parameter.

**Return Value:**

If TRUE, node is both a head node and is a member of another assembly.

If FALSE, node is neither a head node nor a member of another assembly.

**Prototype:**

```
virtual IOResult Save(ISave* isave) = 0;
```

**Remarks:**

| for implementing persistence of the underlying object.

**Parameters:**

**ISave\* isave**

Pointer for write methods.

**Return Value:**

**IO\_OK**, the call succeeded.

**IO\_ERROR**, the call was unsuccessful.

**Prototype:**

**virtual IOResult Load(ILoad\* iload) = 0;**

**Remarks:**

Read method for implementing persistence of the underlying object.

**Parameters:**

**ILoad\* iload**

Pointer for read methods.

**Return Value:**

**IO\_OK**, the call succeeded.

**IO\_ERROR**, the call was unsuccessful.

## **Class IAssembly2 : public IAssembly**

### **Description:**

This new version of the assembly interface extends IAssembly. Developers are encouraged to use this version of the assembly interface.

Client code can query an INode for this interface:

```
INode* n;
```

```
IAssembly2* a = GetAssemblyInterface2(n);
```

### **Methods:**

Notes:

These methods should be called on assembly heads only. Calling them on members will not affect the display of the bounding box. The bounding box is displayed in red (by default) around an open assembly. Turning it off can reduce viewport clutter; it won't affect the functionality of the assembly (the way the assembly works).

Calling these methods on an assembly head, affects the display of the bounding box only on that assembly.

**Prototype:**

```
virtual void SetAssemblyBBoxDisplay(BOOL b) = 0;
```

### **Remarks:**

Implemented by the System. Method to control the display of an assembly's world space bounding box.

### **Parameters:**

**BOOL b**

If TRUE, display the bounding box.

If FALSE, do not display the bounding box.

**Prototype:**

**virtual BOOL GetAssemblyBBoxDisplay() = 0;**

**Remarks:**

Implemented by the system. Method to retrieve the value of the bounding box display flag.

**Return Value:**

**BOOL**

If TRUE, the bounding box display is enabled.

If FALSE, the bounding box display is disabled.

## Class IEditNormalsMod

See Also: [Class MNMESH](#) , [Class MNNormalSpec](#)

```
class IEditNormalsMod : public FPMixinInterface
```

### Description:

This class is available in release 5.0 and later only.

This class is an interface used by the scripiter and the SDK to access the Edit Normals modifier. See the documentation for that modifier for background on the normals and the basic operations like Break and Unify.

All but the last two of these methods are available via the scripiter with commands like:

```
numNormals =  
$.modifiers[#Edit_Normals].EditNormalsMod.GetNumNormals ()  
$.modifiers[#Edit_Normals].EditNormalsMod.SetSelection #  
{1..numNormals}  
$.modifiers[#Edit_Normals].EditNormalsMod.Unify ().
```

### Methods:

.

### Prototype:

```
int EnfnGetSelLevel ();
```

**Remarks:**

"Get" accessor for selection level - one of these values:  
EN\_SL\_OBJECT, EN\_SL\_NORMAL, EN\_SL\_VERTEX,  
EN\_SL\_EDGE, EN\_SL\_FACE

.

**Prototype:**

**int EnfnSetSelLevel (int selLevel);**

**Remarks:**

"Set" accessor for selection level - one of these values:  
EN\_SL\_OBJECT, EN\_SL\_NORMAL, EN\_SL\_VERTEX,  
EN\_SL\_EDGE, EN\_SL\_FACE

.

**Prototype:**

**bool EnfnMove (Point3& offset, TimeValue t);**

**Remarks:**

Moves the ends of currently selected normals by the offset indicated  
- then renormalizes them to unit length.

Note that the time is currently ignored, as the Edit Normals modifier  
is not yet animatable

**Prototype:**

**bool EnfnRotate (Quat & rotation, TimeValue t);**

**Remarks:**

Rotates currently selected normals by the rotation indicated.

Note that the time is currently ignored, as the Edit Normals modifier is not yet animatable

**Prototype:**

**bool EnfnBreakNormals (BitArray \*normalSelection=NULL, INode \*pNode=NULL)**

**Remarks:**

Breaks the indicated normals into separate normals for each face.

**Parameters:**

**BitArray \*normalSelection=NULL**

An optional selection set to use. If NULL, the current selection is used.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first" node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**bool EnfnUnifyNormals (BitArray \*normalSelection=NULL, INode \*pNode=NULL)**

**Remarks:**

Unifies the indicated normals so there's at most one normal per vertex. (Basically causes normals to be shared across faces at a vertex.)

**Parameters:**

**BitArray \*normalSelection=NULL**

An optional selection set to use. If NULL, the current selection is used.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first" node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**bool EnfnResetNormals (BitArray \*normalSelection=NULL, INode \*pNode=NULL)**

**Remarks:**

Makes the indicated normals completely non-explicit and unspecified. Generates a rebuild & computation to determine the topology and direction of the newly unspecified normals.

**Parameters:**

**BitArray \*normalSelection=NULL**

An optional selection set to use. If NULL, the current selection is used.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**bool EnfnSpecifyNormals (BitArray \*normalSelection=NULL, INode \*pNode=NULL)**

**Remarks:**

Specifies the normals indicated to be fixed to the faces they're currently used by.

**Parameters:**

**BitArray \*normalSelection=NULL**

An optional selection set to use. If NULL, the current selection is used.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**bool EnfnMakeNormalsExplicit (BitArray  
\*normalSelection=NULL, INode \*pNode=NULL)**

**Remarks:**

Make the indicated normals explicit, so they won't be based on underlying face normals.

**Parameters:**

**BitArray \*normalSelection=NULL**

An optional selection set to use. If NULL, the current selection is used.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**bool EnfnCopyNormal (int normalID, INode \*pNode=NULL)**

**Remarks:**

Copies the indicated normal into the Edit Normals modifier's copy/paste buffer.

**Parameters:**

**int normalID**

The ID of the normal we want to copy.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first" node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**bool EnfnPasteNormal (BitArray \*normalSelection=NULL, INode \*pNode=NULL)**

**Remarks:**

Pastes the normal currently in the Edit Normals modifier's copy/paste buffer into the normals indicated, making them specified and explicit.

**Parameters:**

**BitArray \*normalSelection = NULL**

An optional selection set to use. If NULL, the current selection is used.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first" node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**BitArray \*EnfnGetSelection (INode \*pNode=NULL)**

**Remarks:**

Returns a pointer to the current selection.

**Parameters:**

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**bool EnfnSetSelection (BitArray & selection, INode \*pNode=NULL)**

**Remarks:**

Sets the normal selection to the selection given.

**Parameters:**

**BitArray & selection**

The desired selection

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this

parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Return Value:**

True if the selection was changed; false if the new selection was the same as the old selection.

**Prototype:**

**bool EnfnSelect (BitArray & selection, bool invert=false, bool select=true, INode \*pNode=NULL)**

**Remarks:**

Selects, deselects, or inverts the selection of the normals indicated.

**Parameters:**

**BitArray & selection**

The normals whose selection we are trying to change

**bool invert=false**

If true, indicates that the normals in <selection> should have their selection status inverted

**bool select=true**

If <invert> is true, this is ignored. Otherwise, if true, the normals indicated should be selected; if false, they should be deselected.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Return Value:**

True if the selection changed, false otherwise.

**Prototype:**

**void EnfnConvertVertexSelection (BitArray & vertexSelection, BitArray & normalSelection, INode \*pNode=NULL)**

**Remarks:**

Converts a vertex selection into a selection of normals, by setting bits on normals based at selected faces.

**Parameters:**

**BitArray & vertexSelection**

The vertex selection we're converting

**BitArray & normalSelection**

The output normal selection

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this

parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Return Value:**

True if the selection changed, false otherwise.

**Prototype:**

**void EnfnConvertEdgeSelection (BitArray & edgeSelection, BitArray & normalSelection, INode \*pNode=NULL)**

**Remarks:**

Converts an edge selection into a selection of normals, by setting bits for normals used on either end and either side of selected edges.

**Parameters:**

**BitArray & edgeSelection**

The edge selection we're converting

**BitArray & normalSelection**

The output normal selection

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate

call

for each node. If NULL, it assumes you want to modify normals in the "first" node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**void EnfnConvertFaceSelection (BitArray & faceSelection, BitArray & normalSelection, INode \*pNode=NULL)**

**Remarks:**

Converts a face selection into a selection of normals, by setting bits on normals used by selected faces.

**Parameters:**

**BitArray & faceSelection**

The face selection we're converting

**BitArray & normalSelection**

The output normal selection

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first" node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**int EnfnGetNumNormals (INode \*pNode=NULL)**

**Remarks:**

Returns the current number of normals.

**Parameters:**

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**Point3 \*EnfnGetNormal (int normalID, INode \*pNode=NULL, TimeValue t=0)**

**Remarks:**

Returns a pointer to the normal indicated.

**Parameters:**

**int normalID**

The index of the normal

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**TimeValue t=0**

This is currently unused - but might be important if we add animation capabilities to Edit Normals in the future.

**Prototype:**

```
void EnfnSetNormal (int normalID, Point3 &direction, INode *pNode=NULL, TimeValue t=0)
```

**Remarks:**

Sets the indicated normal to a specific value. NOTE that this does not set the "explicitness" of this normal. If the normal is not made explicit, it will be restored to its default value the next time non explicit normals are recomputed.

**Parameters:****int normalID**

The index of the normal

**Point3 & direction**

The desired normal direction. If not already normalized to a length of 1, this method will normalize it.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first" node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**TimeValue t=0**

This is currently unused - but might be important if we add animation capabilities to Edit Normals in the future.

**Prototype:**

**bool EnfnGetNormalExplicit (int normalID, INode \*pNode=NULL)**

**Remarks:**

Controls whether a given normal is built from smoothing groups or set to an explicit value

(Also makes the normal specified for all faces using this normal.)

**Parameters:**

**int normalID**

The index of the normal

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**void EnfnSetNormalExplicit (int normID, bool value, INode \*pNode=NULL)**

**Remarks:**

Makes the indicated normal explicit (or not). If setting the normal to explicit, it will also be set to "specified" on all faces using it. If setting it to non-explicit, the modifier recomputes all non-explicit normals to bring it up to date.

**Parameters:**

**int normalID**

The index of the normal

**bool value**

True to make this normal explicit, false to make it non-explicit.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call for each node. If NULL, it assumes you want to modify normals in the "first" node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**int EnfnGetNumFaces (INode \*pNode=NULL)**

**Remarks:**

Returns the number of faces in the normal specification..

**Parameters:**

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call for each node. If NULL, it assumes you want to modify normals in the "first" node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**int EnfnGetFaceDegree (int face, INode \*pNode=NULL)**

**Remarks:**

Returns the degree of the face indicated. (3 for triangle, 4 for quad, etc.)

**Parameters:****int face**

The desired face.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:****int EnfnGetNormalID (int face, int corner, INode \*pNode=NULL)****Remarks:**

Gets the index of the normal in the indicated corner of the indicated face

**Parameters:****int face**

The desired face.

**int corner**

The desired corner, in the range of 0 to `EnfnGetFaceDegree(face)-1`.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**void EnfnSetNormalID (int face, int corner, int normalID, INode \*pNode=NULL)**

**Remarks:**

Sets the index of the normal in the indicated corner of the indicated face

**Parameters:**

**int face**

The desired face.

**int corner**

The desired corner, in the range of 0 to `EnfnGetFaceDegree(face)-1`.

**int normalID**

The index of the desired normal

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**bool EnfnGetFaceNormalSpecified (int face, int corner, INode \*pNode=NULL)**

**Remarks:**

Indicates whether a particular corner of a particular face is specified to use a specific normal or not.

**Parameters:**

**int face**

The desired face.

**int corner**

The desired corner, in the range of 0 to EnfnGetFaceDegree(face)-1.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in

the "first" node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

```
void EnfnSetFaceNormalSpecified (int face, int corner, bool specified, INode *pNode=NULL)
```

**Remarks:**

Controls whether a corner of a face uses a specific normal ID, or builds normals based on smoothing groups. If called to set a corner to unspecified, it generates a rebuild of nonspecified normals and a recomputation of nonexplicit normals at next update.

**Parameters:**

**int face**

The desired face.

**int corner**

The desired corner, in the range of 0 to EnfnGetFaceDegree(face)-1.

**bool specified**

True to specify, false to set as unspecified.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first" node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**int EnfnGetNumVertices (INode \*pNode=NULL)**

**Remarks:**

Returns the number of vertices in the current mesh cache..

**Parameters:**

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first" node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**int EnfnGetVertexID (int face, int corner, INode \*pNode=NULL)**

**Remarks:**

Returns the vertex used in a corner of a face, in the current mesh cache. (Useful for determining the "base" of the normal used in that corner of that face.)

**Parameters:****int face**

The desired face.

**int corner**

The desired corner, in the range of 0 to `EnfnGetFaceDegree(face)-1`.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**Point3 EnfnGetVertex (int vertexID, INode \*pNode=NULL, TimeValue t=0)**

**Remarks:**

Returns the location of the vertex indicated (in the current mesh cache).

**Parameters:**

**int vertexID**

The desired vertex.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**TimeValue t=0**

This is currently unused - but might be important if we add animation capabilities to Edit Normals in the future.

**Prototype:**

**int EnfnGetNumEdges (INode \*pNode=NULL)**

**Remarks:**

Returns the number of edges in the current mesh cache.

**Parameters:**

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**int EnfnGetEdgeID (int faceIndex, int sideIndex, INode \*pNode=NULL)**

**Remarks:**

Returns the index of the edge used on a particular side of a particular face, in the current mesh cache

**Parameters:**

**int faceIndex**

The desired face.

**int side**

The desired side, in the range of 0 to EnfnGetFaceDegree(faceIndex)-1.

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate

call

for each node. If NULL, it assumes you want to modify normals in the "first" node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**int EnfnGetFaceEdgeSide (int faceIndex, int edgeIndex, INode \*pNode=NULL)**

**Remarks:**

Tells you which side of the face a given edge is on. (Can be useful for getting normal and vertex information around the edge.)

**Parameters:**

**int faceIndex**

The desired face.

**int edgeIndex**

The desired edge

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Return Value:**

The side of the face, in the range of 0 to `EnfnGetFaceDegree(faceIndex)-1`, or -1 if the edge was not found on this face

**Prototype:**

```
int EnfnGetEdgeVertex (int edgeIndex, int end, INode *pNode=NULL)
```

**Remarks:**

Returns the vertex at the end of the edge.

**Parameters:**

**int edgeIndex**

The desired edge.

**int end**

The desired end - either 0 or 1

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

```
int EnfnGetEdgeFace (int edgeIndex, int side, INode  
*pNode=NULL) { return 0; }
```

**Remarks:**

Tells you what face is on a particular side of a particular edge.

**Parameters:**

**int edgeIndex**

The index of the edge in the MNMesh's edge array.

**int side**

Indicates which side of the edge you want the face from. (Values: 0 or 1.)

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Return Value:**

The index of the desired face, or -1 if there's an error or if there is no face on that side.

**Prototype:**

**int EnfnGetEdgeNormal (int edgeIndex, int end, int side, INode \*pNode=NULL)**

**Remarks:**

Returns the normal associated with a particular end and side of this edge.

**Parameters:**

**int edgeIndex**

The index of the edge in the MNMesh's edge array.

**int end**

Indicates which end of the edge should be used. (Values: 0 or 1.)

**int side**

Indicates which side of the edge should be used - the edge may have different normals used by the faces on either side. (Values: 0 or 1.)

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Return Value:**

The index of the desired normal..

**Prototype:**

```
void EnfnRebuildNormals (INode *pNode=NULL) { }
```

**Remarks:**

Forces the modifier to rebuild all non-specified normals from the face smoothing groups. Note that this can change the number of normals in some cases, and often changes their order

**Parameters:**

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

```
void EnfnRecomputeNormals (INode *pNode=NULL) { }
```

**Remarks:**

Forces the modifier to recompute all non-explicit normals.

**Parameters:**

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**Prototype:**

**MNMesh \*EnfnGetMesh (INode \*pNode=NULL, TimeValue t=0)**

**Remarks:**

Returns a pointer to the cached copy of the MNMesh held by the EditNormalsModData. This is a "stripped-down" copy of the last mesh that was output by the modifier. It contains no maps, vertex or edge data, or normals. It's mainly used as a temporary "parent" to the localdata's MNNormalSpec in operations such as Display.

**Parameters:**

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this

parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

**TimeValue t=0**

This is currently unused - but might be important if we add animation capabilities to Edit Normals in the future.

**Prototype:**

**MNNormalSpec \*EnfnGetNormals (INode \*pNode=NULL,  
TimeValue t=0)**

**Remarks:**

Returns a pointer to the MNNormalSpec used by the EditNormalsModData.

This MNNormalSpec is not part of any particular MNMesh, rather it's used as the local data of the EditNormalsMod to indicate what normals should be applied to the mesh coming up the pipe. Its "parent" pointer is generally set to NULL, and should be set to a mesh like the one you get from EnfnGetMesh before you do certain operations. (See class MNNormalSpec for details on which methods require an accurate "parent" pointer.

**Parameters:**

**INode \*pNode = NULL**

If the Edit Normals modifier is instanced across several nodes, this parameter can be used to indicate which node you mean to modify normals in.

If you want to modify normals in all nodes, you must make a separate call

for each node. If NULL, it assumes you want to modify normals in the "first"

node. (This is fine if the modifier is only applied to one node, as is usually the case.)

### **TimeValue t=0**

This is currently unused - but might be important if we add animation capabilities to Edit Normals in the future.

## External Icons

See Also: [Class MaxIcon](#), [Class ICustButton](#)

Starting with 3ds max version 4.0 most of the icons used in the software have been externalized, meaning that these alpha-composited background icons now reside as \*.bmp files in the \UIIcons folder and are loaded during startup. Some of the image processing that takes place on these icons will be outlined below.

Resource based icons can be converted effectively to external icons and stored as 24-bit image files with associated 24-bit alpha mask image files. The files follow a fairly standard naming convention so for the following outline the material editor icons and image files will be used as an example. These can be found in the \UIIcons folder as;

**MeditImages\_a.bmp** The 24-bit icon alpha mask

**MeditImages\_i.bmp** The 24-bit icon images

One difference with ordinary icon formats is that these use an alpha mask instead of an XOR mask. An XOR mask needs to be inverted in order to create a proper alpha mask out of it. The process for this is fairly straightforward; copy the images directly to a file (i.e. myicons\_i.bmp), invert the mask file and storing that in the associated file (i.e. myicons\_a.bmp). This process will result in icons which are identical to the XOR masked versions. Of course, you can also tweak the alpha mask to give it fuzzy edges and other effects you might like for your icons to help composite with the background color in a seamless and smooth way.

In the plugin code you will need to create image lists for the icons. Once again, taking the material editor as an example, you can create the image list in the following manner;

```
hMeditImages = ImageList_Create(BUTW, BUTH, ILC_COLOR24 |  
ILC_MASK, 5, 0);  
LoadMAXFileIcon("MeditImages", hMeditImages, kBackground,
```

**FALSE);**

The first thing we do is create an image list with 24-bit images and a mask. Secondly, the call to **LoadMAXFileIcon()** loads the images into the image list. See below for more information on this function;

If you want your icons to respond when the user customizes colors you will need to implement a color change callback to reload the icons. This is not required, but it does make your UI play nicely with the color customization system. You need to create a callback as outlined below;

```
static void ColorChangeNotifyProc(void* param, NotifyInfo* pInfo)
{
    ImageList_RemoveAll(hMeditImages);
    LoadMAXFileIcon("MeditImages", hMeditImages, kBackground,
FALSE);
}
```

Then you will need to register it after you load the icons for the first time;

```
RegisterNotification(ColorChangeNotifyProc, NULL,
NOTIFY_COLOR_CHANGE);
```

This way your buttons will always look correct when the user starts customizing colors.

**Function:**

```
BOOL LoadMAXFileIcon(TCHAR* pFile, HIMAGELIST
hImageList, ColorId color, BOOL disabled);
```

**Remarks:**

This method is available in release 4.0 and later only.

This method will load the images into the image list.

**Parameters:**

**TCHAR\* pFile**

The prefix of the file name for the icon BMP files. The path is not included. The system will look in the UIIcons directory, and append "\_i.bmp" for the image file and "\_a.bmp" for the alpha mask file.

**HIMAGELIST hImageList**

The image list that the icons will be loaded into. It appends the images at the end of the list.

**ColorId color**

The id of the background color used to composite. All the available "ColorId" values are defined in **MAXSDK\INCLUDE\iColorMan.h**. Normally you will use "kBackground" which is the color id for the background color for all MAX controls.

**BOOL disabled**

A boolean that tells the system whether to produce the disabled or enabled versions of the icons. This controls what sort of image processing is done on the icons. We store a set of scale values for the saturation, value and transparency for both enabled and disabled icons. This flag determines which set of values we use when loading the icons. If your original image list contains both enabled and disabled versions of its icons, then you can just pass "FALSE" for this parameter and use the image list as you did before. If you want the system to automatically create the disabled versions of your icons, then you can call this with "TRUE".

**Return Value:**

TRUE if successful, otherwise FALSE.

# RPF Files and the G-Buffer

## Overview

The RPF format is the 3ds max Rich Pixel file Format that supports the ability to include arbitrary image channels.

RPF files replace RLA files as the format of choice for rendering animations requiring further post-production or effects work. Many channels available in RPF files are exclusive to this format. The following is a list of pointers (e.g. a required reading list) to information in the SDK documentation pertaining to the storage type and format used for the RPF format.

### [Class GBuffer](#)

The G-Buffer stores multiple layers at each pixel.

### [List of Image \(G-Buffer\) Channels](#)

This section provides an overview of the image channels available with the GBuffer which relate directly to the multiple layer pixel information stored in the RPF files.

### [List of G-Buffer Channels Indices](#)

This section provides a quick overview of the various data size and channel names relating to the G-Buffer and layered pixel storage in RPF files.

### [List of G-Buffer Channel Types](#)

This section provides the list of channel types and the size associated with these channels per pixel.

### [Structure GBufData](#)

This structure is used by the Class GBufReader and Class GBufWriter.

### [Structure RealPixel](#)

This structure represents an **rgbe** based pixel where **e** is the base 2 exponent of the maximum RGB component while **rgb** are the mantissas of RG and B relative to **e**. This will compress the essential data of a floating point based

color into 32 bits.

The actual RPF file source code can be found in the SDK samples directory under

**\MAXSDK\SAMPLES\IO\RLA\RLA.CPP**

The files still refer to RLA instead of RPF for legacy purposes.

## Class FilterList

class FilterList

### Description:

A class whose sole purpose is for building up a filter list to pass to the Windows API functions **GetSaveFileName()** and **GetOpenFileName()**. It automatically puts in the embedded nulls and two terminating nulls. All methods are implemented by the system.

Example usage:

```
FilterList filterList;  
filterList.Append(_T("MAX files(*.max)"));  
filterList.Append(_T("*.max"));  
ofn.lpstrFilter = filterList;  
GetSaveFileName(&ofn)
```

### Data Members:

```
#define LISTBUFLLEN 2048
```

public:

```
TCHAR buf[LISTBUFLLEN];  
int length;
```

### Methods:

#### Prototype:

```
FilterList();
```

#### Remarks:

Constructor. Sets **buf** to all zeros and sets the **length** to 0.

#### Return Value:

A new FilterList object.

#### Prototype:

```
void Append(TCHAR *name);
```

#### Remarks:

Appends the string passed to **buf**.

**Prototype:**

**operator TCHAR \*()**

**Remarks:**

Returns the address of **buf**.

## Class Expr

See Also: [Class Point3](#), [List of Expression Types](#), [List of Expression Variable Types](#), [List of Expression Return Codes](#), [Character Strings](#).

class Expr

### Description:

This class may be used by developers to parse mathematical expressions. The expression is created as a character string using a straightforward syntax. Expressions consist of operators (+, -, \*, /, etc.), literal constants (numbers like 180, 2.718, etc.), variables (single floating point values or vector (**Point3**) values), and functions (mathematical functions that take one or more arguments and return a result). The return value from the expression may be a floating point value or a vector. There are many built in functions, operators and constants available for use.

All methods of this class are implemented by the system.

Developers wishing to use these APIs should #include **\MAXSDK\INCLUDE\EXPRLIB.H** and should link to **\MAXSDK\LIB\EXPR.LIB**.

Sample code using these APIs is shown below, and is also available as part of the expression controller in **\MAXSDK\SAMPLES\CONTROLLERS\EXPRCTRL.CPP**.

Variables may be defined and used in expressions. Variable names are case sensitive, and must begin with a letter of the alphabet, but may include numbers. They may be any length. To create a named variable, you use the method **defVar()**. This takes a name and returns a register number. Defining the variable creates storage space in a list of variables maintained by the parser, and the register number is used as an array index into the variable value arrays passed into the expression evaluation method (**eval()**).

To use the variable in an expression just use its name. For example if you define a variable named **radius**, you can use it in an expression like: **2\*pi\*radius**. To give the variable a value, you define two arrays of variables and pass them to the evaluation method (**eval()**). There is one array for scalar variables, and one for vector variables. You pass these arrays along with the number of variables in each list. See the sample code below for an example.

The order of calling the methods of this class to evaluate an expression is as

follows:

Declare an expression instance (**Expr expr;**)

Define the expression (**char e1[] = "2\*pi\*radius";**).

Define any variables (**expr.defVar(SCALAR\_VAR, \_T("radius"));**)

Load the expression (**expr.load(e1);**)

Evaluate the expression (**expr.eval(...);**)

There are no restrictions on the use of white space in expressions -- it may be used freely to make expressions more readable. In certain instances, white space should be used to ensure non-ambiguous parsing. For example, the **x** operator is used for to compute the cross product of two vectors. If a developer has several vectors: **Vec**, **Axis** and **xAxis** and wanted to compute the cross product, **VecxAxis** is ambiguous while **Vec x Axis** is not.

All the necessary information to evaluate an expression is completely stored within an expression object. For example, if you are passed a pointer to an expression object for which some variables have been defined that you knew the value of, you could get all the information you needed from the expression object to completely evaluate the expression. This includes the expression string, variable names, variable types, and variable register indices.

For complete documentation of the built in functions please refer to the 3ds max User's Guide under Using Expression Controllers. Below is an overview of the operators, constants and functions that are available:

## **Expression Operators:**

### **Scalar Operators**

Operator Use Meaning

+ p+q addition

- p-q subtraction

- -p additive inverse

\* p\*q multiplication

/ p/q division

^ p^q power (p to the power of q)

\*\* p\*\*q same as p^q

## **Boolean Operators**

= p=q equal to

< p<q less than

> p>q greater than

<= p<=q less than or equal to

>= p>=q greater than or equal to

| p|q logical OR

& p&q logical AND

## **Vector Operators**

+ V+W addition

- V-W subtraction

\* p\*V scalar multiplication

V\*p "

\* V\*W dot product

x VxW cross product

/ V/p scalar division

. V.x first component (X)

. V.y second component (Y)

. V.z third component (Z)

## **Built-In Constants:**

**pi** 3.1415...

**e** 2.7182...

**TPS** 4800 (ticks per second)

## **Expression Functions:**

### **Trigonometric Functions**

The angles are specified and returned in degrees.

**sin(p)** sine

**cos(p)** cosine

**tan(p)** tangent

**asin(p)** arc sine

**acos(p)** arc cosine

**atan(p)** arc tangent

### **Hyperbolic Functions**

**sinh(p)** hyperbolic sine

**cosh(p)** hyperbolic cosine

**tanh(p)** hyperbolic tangent

### **Conversion between Radians and Degrees**

**radToDeg(p)** takes p in radians and returns the same angle in degrees

**degToRad(p)** takes p in degrees and returns the same angle in radians

### **Rounding Functions**

**ceil(p)** smallest integer greater than or equal to p.

**floor(p)** largest integer less than or equal to p.

### **Standard Calculations**

**ln(p)** natural (base e) logarithm

**log(p)** common (base 10) logarithm

**exp(p)** exponential function --  $\exp(e) = e^p$

**pow(p, q)** p to the power of q --  $p^q$

**sqrt(p)** square root

**abs(p)** absolute value

**min(p, q)** minimum -- returns p or q depending on which is smaller

**max(p, q)** maximum -- returns p or q depending on which is larger

**mod(p, q)** remainder of p divided by q

### **Conditional**

**if (p, q, r)** works like the common spreadsheet "if" -- if p is nonzero then "if" returns q, otherwise r.

### **Vector Handling**

**length(V)** the length of V

**unit(V)** returns a unit vector in the same direction as V.

**comp(V, I)** i-th component, where I=0, 1, or 2.

`comp([5,6,7],1) = 6`

## Special Animation Functions

**noise(p, q, r)** 3D noise -- returns a randomly generated position.

p, q, and r are random values used as a seed.

### Sample Code:

The following code shows how the expression parser can be used. This code evaluates several expressions and displays the results in a dialog box. Both scalar and vector variables are used. One expression contains an error to show how error handling is done.

```
void Utility::TestExpr() {  
    // Declare an expression instance and variable storage  
    Expr expr;  
    float sRegs[2]; // Must be at least getVarCount(SCALAR_VAR);  
    Point3 vRegs[2]; // Must be at least getVarCount(VECTOR_VAR);  
    float ans[3];  
    int status;  
  
    // Define a few expressions  
    char e0[] = "2+2";  
    char e1[] = "2.0 * pi * radius";  
    char e2[] = "[1,1,0] + axis";  
    char e3[] = "[sin(90.0), sin(radToDeg(0.5*pi)), axis.z]";  
    char e4[] = "2+2*!@#$$%"; // Bad expression  
  
    // Define variables  
    int radiusReg = expr.defVar(SCALAR_VAR, _T("radius"));  
    int axisReg = expr.defVar(VECTOR_VAR, _T("axis"));  
    // Set the variable values  
    sRegs[radiusReg] = 50.0f;  
    vRegs[axisReg] = Point3(0.0f, 0.0f, 1.0f);  
    // Get the number of each we have defined so far  
    int sCount = expr.getVarCount(SCALAR_VAR);  
    int vCount = expr.getVarCount(VECTOR_VAR);  
  
    // Load and evaluate expression "e0"  
    if (status = expr.load(e0))  
        HandleLoadError(status, expr);
```

```

else {
    status = expr.eval(ans, sCount, sRegs, vCount, vRegs);
    if (status != EXPR_NORMAL)

        MB_ICONINFORMATION|MB_OK);
}

```

**Methods:**

**Prototype:**

**Expr()**

**Remarks:**

Constructor. Internal data structures are initialized as empty.

**Prototype:**

**~Expr()**

**Remarks:**

Destructor. Any currently defined variables are deleted.

**Prototype:**

**int load(char \*s);**

**Remarks:**

This method is used to load an expression for parsing. An error code is returned indicating if the expression was loaded. A successfully loaded expression is then ready for evaluation with the **eval()** method.

**Parameters:**

**char \*s**

The expression to load.

**Return Value:**

See [List of Expression Return Codes](#).

**Prototype:**

**int eval(float \*ans, int sRegCt, float \*sRegs, int vRegCt=0, Point3 \*vRegs=NULL);**

**Remarks:**

This method is used to evaluate the expression loaded using **load()**. It returns either a scalar or vector result.

**Parameters:**

**float \*ans**

The numeric result of the expression is returned here, i.e. the answer . For scalar values this is a pointer to a single float. For vector values, **ans[0] is x, ans[1] = y, ans[2] = z**. You can determine which type of result is returned using the method **getExprType()**.

**int sRegCt**

The number of items in the **sRegs** array of scalar variables.

**float \*sRegs**

Array of scalar variables.

**int vRegCt=0**

The number of items in the **vRegs** array of vector variables.

**Point3 \*vRegs=NULL**

Array of vector variables.

**Return Value:**

See [List of Expression Return Codes](#).

**Prototype:**

**int getExprType();**

**Remarks:**

Returns the type of expression. See [List of Expression Types](#).

**Prototype:**

**TCHAR \*getExprStr();**

**Remarks:**

Returns a pointer to the currently loaded expression string.

**Prototype:**

**TCHAR \*getProgressStr();**

**Remarks:**

If there was an error parsing the expression, this method returns a string showing what portion of the expression was parsed before the error occurred.

**Prototype:**

**int defVar(int type, TCHAR \*name);**

**Remarks:**

Defines a named variable that may be used in an expression.

**Parameters:**

**int type**

The type of variable. See [List of Expression Variable Types](#).

**TCHAR \*name**

The name of the variable. This name must begin with a letter, may include numbers and may be any length.

**Return Value:**

The register number (into the **sRegs** or **vRegs** array passed to **eval()**) of the

variable.

**Prototype:**

**int getVarCount(int type);**

**Remarks:**

This method returns the number of variables defined of the specified type. When you call **eval()** on an expression, you must make sure that the variable arrays (**sRegs** and **vRegs**) are at least the size returned from this method.

**Parameters:**

**int type**

See [List of Expression Variable Types](#).

**Prototype:**

**TCHAR \*getVarName(int type, int i);**

**Remarks:**

Returns the name of the variable whose index is passed, or NULL if the variable could not be found.

**Parameters:**

**int type**

The type the variable. See [List of Expression Variable Types](#).

**int i**

The register number of the variable.

**Prototype:**

**int getVarRegNum(int type, int i);**

**Remarks:**

When you define a variable with **defVar()**, you get a back a register number. If your code is set up in such a way that saving that register number is not convenient in the block of code that defines it, you can use this method later on to find out what that return value had been. For example, one piece of code might have:

```
expr->defVar(SCALAR_VAR, "a"); // not saving return  
value...
```

```
expr->defVar(SCALAR_VAR, "b");
```

and then right before evaluating the expression, you might have some code such as:

```
for(i = 0; i < expr->getVarCount(SCALAR_VAR); i++)  
    if(_tcscmp("a", expr->getVarName(SCALAR_VAR, i) == 0)  
        aRegNum = expr->getVarRegNum(SCALAR_VAR, i);
```

Of course, this is a bit contrived -- most real examples would probably have tables to store the variable names, register numbers, etc. and thus would not need to call this method. It is available however, and this makes the expression object self-contained in that everything you need to evaluate an expression with variables (other than the variable values themselves) is stored by the expression object.

**Parameters:**

**int type**

See [List of Expression Variable Types](#).

**int i**

The variable index returned from the method **defVar()**.

**Return Value:**

The register index for the variable whose type and index are passed.

**Prototype:**

**BOOL deleteAllVars();**

**Remarks:**

Deletes all the variables from the list maintained by the expression.

**Return Value:**

TRUE if the variables were deleted; otherwise FALSE.

**Prototype:**

**BOOL deleteVar(TCHAR \*name);**

**Remarks:**

Deletes the variable whose name is passed from the list maintained by the expression. Register numbers never get reassigned, even if a variable gets deleted. For example, if you delete variables 0-9, and keep variable 10, you're going to need to pass in an array of size at least 11 to the **eval()** method, even though the first 10 slots are unused.

**Parameters:**

**TCHAR \*name**

The name of the variable to delete.

**Return Value:**

TRUE if the variable was deleted; otherwise FALSE (the name was not found).

## Class CommandModeChangedCallback

See Also: [Class Interface](#), [Class CommandMode](#).

class CommandModeChangedCallback

### Description:

This is the callback object for **Interface::RegisterCommandModeChangedCallback()**.

### Methods:

### Prototype:

```
virtual void ModeChanged(CommandMode *oldM,  
    CommandMode *newM)=0;
```

### Remarks:

This method is called when the user changes command modes.

### Parameters:

**CommandMode \*oldM**

The command mode that was replaced.

**CommandMode \*newM**

The new command mode.

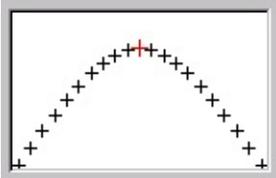

## Class TCBGraphParams

See Also: [Custom Controls](#).

class TCBGraphParams

### Description:

The TCB Graph control displays a tension/continuity/bias graph in the control.

If you are going to use the TCB Graph control you must initialize it by calling

```
void InitTCBGraph(HINSTANCE hInst);
```

from **DLLMain()**

The value to use in the Class field of the Custom Control Properties dialog is:

**TCBGraph**

Send this message to the graph control with **lParam** pointing to a

**TCBGraphParams** structure to set the graph parameters.

**WM\_SETTCBGRAPHPARAMS**

For example:

```
TCBGraphParams gp;
```

```
gp.tens = 0.0f; gp.bias = 0.0f; gp.cont = 0.0f;
```

```
gp.easeFrom = 0.0f; gp.easeTo = 0.0f;
```

```
HWND hGraph = GetDlgItem(hDlg, IDC_TCB_GRAPH);
```

```
EnableWindow(hGraph, TRUE);
```

```
SendMessage(hGraph, WM_SETTCBGRAPHPARAMS, 0,
```

```
(LPARAM)&gp);
```

```
UpdateWindow(hGraph);
```

Note that this control is not derived from **ICustControl** and thus does not have **Enable()**, **Disable()**, etc. methods.

### Data Members:

public:

```
float tens, cont, bias, easeFrom, easeTo;
```

The tension, continuity, bias, ease from and ease to parameters. Each value

may range from 0.0 to 1.0.

## Class AppDataChunk

See Also: [Class Animatable](#), [Class Class\\_ID](#).

```
class AppDataChunk
```

### Description:

This class represents an individual AppData chunk. All methods of this class are implemented by the system.

### Data Members:

public:

**Class\_ID classID;**

The Class\_ID of the owner of this chunk.

**SClass\_ID superClassID;**

The SuperClassID of the owner of this chunk.

**DWORD subID;**

An extra ID that lets the owner identify its sub chunks.

**DWORD length;**

The length of the data in bytes.

**void \*data;**

The chunk data itself.

### Methods:

### Prototype:

```
AppDataChunk(Class_ID cid, SClass_ID sid, DWORD sbid,  
DWORD len, void *d);
```

### Remarks:

Constructor. The data members are initialized to the values passed. Note that the **data** pointer should be allocated with standard **malloc()** since it will be freed using **free()** in the destructor.

### Parameters:

**Class\_ID cid**

The Class\_ID of the owner of this chunk.

**SClass\_ID sid**

The SuperClassID of the owner of this chunk.

**DWORD sbid**

An extra ID that lets the owner identify its sub chunks.

**DWORD len**

The length of the data in bytes.

**void \*d**

The chunk data itself.

**Prototype:**

**AppDataChunk();**

**Remarks:**

Constructor. The length is set to 0 and the data pointer set to NULL.

**Prototype:**

**~AppDataChunk()**

**Remarks:**

Destructor. The AppData is freed using **free(data)**. Since this is how the data is freed, the plug-in must use **malloc()** to allocate the memory.

**Prototype:**

**IOResult Load(ILoad \*iload);**

**Remarks:**

The system implements this method to load the AppDataChunk from disk.

**Prototype:**

**IOResult Save(ISave \*isave);**

**Remarks:**

The system implements this method to save the AppDataChunk to disk.

## Class ObjectDataReaderCallback

See Also: [Class TriObject](#).

class ObjectDataReaderCallback

### Description:

3D Studio DOS allowed developers to store APP\_DATA with objects and nodes in the scene. When the 3DS DOS file is imported into 3ds max, and no plug-in has registered to convert it, then it is just hung off the object (or INode in the case of KXP app data).

A 3ds max plug-in can register itself to read a particular APP\_DATA chunk when a 3DS DOS file is loaded. If a chunk is encountered that matches a registered plug-in, that plug-in will be asked to create an instance of itself based on the contents of the APP\_DATA chunk. The plug-in callback is given an opportunity to read the chunk and create an object other than a **TriObject** based on the contents of the chunk and the original object.

A plug-in that wants to process app data registers a new class derived from this class by calling **void**

**RegisterObjectAppDataReader(ObjectDataReaderCallback \*cb);**

The system then maintains a list of these **ObjectDataReaderCallbacks**.

### Methods:

### Prototype:

**virtual char \*DataName()=0;**

### Remarks:

Implemented by the Plug-In.

Returns the name that identifies the app data chunk. When the 3DS Import plug-in is loading objects, it will look for app data. For each app data chunk that the object has, it will go through the list of registered callbacks and call this method looking for a name match. When it does find a match it will call **ReadData()** on the callback that matched.

### Prototype:

**virtual Object \*ReadData(TriObject \*obj, void \*data, DWORD len)=0;**

**Remarks:**

Implemented by the Plug-In.

This method is called to read the app data and create an instance of an object based on the data and the original mesh object. For example, the 3D Surfer plug-in from 3DS DOS creates a patch object based on the app data parameters and returns a pointer to it.

**Parameters:****TriObject \*obj**

The original mesh object the app data was assigned to. If no callback was registered, this would be the object that would get created.

**void \*data**

Points to the particular app data chunk handled by the registered callback.

**DWORD len**

The length of the app data chunk.

**Return Value:**

The Object created by the plug-in to hold the appdata. This would be the object created to take the place of the TriObject. For example, consider a 3DS object that had appdata embedded in it which represented the patch object from which the mesh was created (like 3D Surfer for example). This method would take that data and created a patch object so that the user could work with the object as a patch object in 3ds max instead of a tri object.

**Prototype:**

**virtual void DeleteThis()=0;**

**Remarks:**

Implemented by the Plug-In.

This method is called to delete this callback object. When the user exits 3ds max, this method is called on each of the registered callbacks. So if the callback was allocated dynamically, it could free itself in this implementation.

**The following functions are not part of any class but are available for use:**

**Prototype:**

**void RegisterObjectAppDataReader(ObjectDataReaderCallback \*cb);**

**Remarks:**

Implemented by the System.

This method allows a plug-in to register a callback that will be called when reading a 3DS file that has a particular appdata chunk. The plug-in callback is given an opportunity to read the chunk and create an object other than a TriObject based on the contents of the chunk and the original object.

**Parameters:**

**ObjectDataReaderCallback \*cb**

The callback to read the chunk and create an object.

**Prototype:**

**Object \*ObjectFromAppData(TriObject \*obj, char \*name, void \*data, DWORD len);**

**Remarks:**

This function is used internally by the 3DS Import plug-in.

Note the following about 3DS App Data. If app data is encountered and no plug-in has registered to convert it, then it is just hung off the object (or INode in the case of KXP app data). For object app data, TriObject's super class and class ID are used to identify the chunk and the sub ID is set to 0. For node app data, INode's super class and class ID are used to identify the chunk and the sub ID is set to 0.

This single 3ds max app data chunk will contain the entire 3DS app data chunk, which may have sub chunks (see the IPAS SDK). The following routines will aid in parsing 3DS app data.

**Prototype:**

**void GetIDStr(char \*chunk, char \*idstring);**

**Remarks:**

This function gets the ID string out of an **XDATA\_ENTRY** chunk and null terminates it.

**Parameters:**

**char \*chunk**

A pointer to the chunk.

**char \*idstring**

The ID string.

**Prototype:**

**int FindAppDataChunk(void \*appd, DWORD len, char \*idstring);**

**Remarks:**

Returns the offset into **appd** of the specified chunk or -1 if it is not found.

**Parameters:**

**void \*appd**

The is the entire app data chunk containing all the sub-chunks.

**DWORD len**

This is the length of the entire app data chunk.

**char \*idstring**

The ID of the chunk to find.

**Return Value:**

The offset into **appd** of the specified chunk or -1 if it is not found.

**Prototype:**

**void \*GetAppDataChunk(void \*appd, DWORD len, char \*idstring);**

**Remarks:**

This function is similar to **FindAppDataChunk()** above, but returns a pointer to the chunk or NULL if it is not found.

**Parameters:**

**void \*appd**

The is the entire app data chunk containing all the sub-chunks.

**DWORD len**

This is the length of the entire app data chunk.

**char \*idstring**

The ID of the chunk to find.

**Return Value:**

A pointer to the chunk or NULL if it is not found.

**Prototype:**

```
int SetAppDataChunk(void **pappd, DWORD &len, void *chunk);
```

**Remarks:**

This function adds the chunk to the appdata chunk, preserving existing chunks. **chunk** should point to the new chunk header followed by its data.

**Parameters:**

**void \*\*pappd**

The is the entire app data chunk containing all the sub-chunks.

**DWORD &len**

This is the length of the entire app data chunk.

**void \*chunk**

A pointer to the new chunk header.

**Return Value:**

Nonzero if the chunk was added; otherwise zero.

**Prototype:**

```
int DeleteAppDataChunk(void **pappd, DWORD &len, char *idstring);
```

**Remarks:**

Deletes a chunk from the appdata while preserving other chunks.

**Parameters:**

**void \*\*pappd**

The is the entire app data chunk containing all the sub-chunks.

**DWORD &len**

This is the length of the entire app data chunk.

**char \*idstring**

The ID of the chunk to delete.

**Return Value:**

Nonzero if the chunk was deleted; otherwise zero.

## List of Class IDs

See Also: [Class Class\\_ID](#), [List of Super Class IDs](#).

These are the Class\_IDs of the standard built-in classes. These IDs are defined in `\MAXSDK\INCLUDE\PLUGAPI.H`.

The following are global instances of several Class\_IDs defined by the system:

**triObjectClassID** - Triangle mesh Objects (TriObjects).

**defObjectClassID** - General deformable object. These are objects that provide points for modification.

**mapObjectClassID** - General texture-mappable object.

**patchObjectClassID** - Patch objects.

**genericShapeClassID** - Generic shapes.

**splineShapeClassID** - Spline shapes.

**linearShapeClassID** - Linear shapes.

**loftObjectClassID** - Loft object.

**derivObjClassID** - Object space derived objects.

**WSMDDerivObjClassID** - World space derived objects.

This Class\_ID is #defined for NURBS objects (**#define EDITABLE\_SURF\_CLASS\_ID Class\_ID(0x76a11646, 0x12a822fb)**):

**EDITABLE\_SURF\_CLASS\_ID** - NURBS objects.

Listed below are the first ULONG of the 8 byte ID. The second ULONG is 0 for all built-in classes (unless noted otherwise). For example a Class\_ID for a TriObject would read:

**Class\_ID(TRIOBJ\_CLASS\_ID, 0);**

Note that only **built-in** classes should have the second ULONG equal to 0. All plug-in developers should use both ULONGs.

The Class\_IDs are organized by their SuperClassIDs.

Subclass of all super classes

**STANDIN\_CLASS\_ID** - Stand-In

Subclasses of **REF\_MAKER\_CLASS\_ID**

**MTL\_LIB\_CLASS\_ID** - Mtl Library.

**MTLBASE\_LIB\_CLASS\_ID** - MtlBase Library.

**THE\_SCENE\_CLASS\_ID** - The Scene.

**MEDIT\_CLASS\_ID** - Materials Editor.

Subclasses of **GEOMOBJECT\_CLASS\_ID**

Built into core

**TRIOBJ\_CLASS\_ID** - TriObject

**PATCHOBJ\_CLASS\_ID** - PatchObject

Primitives

**BOXOBJ\_CLASS\_ID** - Box Primitive.

**SPHERE\_CLASS\_ID** - Sphere Primitive.

**CYLINDER\_CLASS\_ID** - Cylinder Primitive.

**CONE\_CLASS\_ID** - Cone Primitive.

**TORUS\_CLASS\_ID** - Torus Primitive.

**TUBE\_CLASS\_ID** - Tube Primitive.

**HEDRA\_CLASS\_ID** - Hedra Primitive.

**TEAPOT\_CLASS\_ID1** - The teapot is unique in that it uses both  
DWORDs in its class IDs.

**TEAPOT\_CLASS\_ID2** - The teapot is unique in that it uses both  
DWORDs in its class IDs.

**PATCHGRID\_CLASS\_ID** - Patch Grid

Particles

**RAIN\_CLASS\_ID** - Rain Particle System

**SNOW\_CLASS\_ID** - Snow Particle System

Subclasses of Object Snaps

**GRID\_OSNAP\_CLASS\_ID** - Class\_ID(0x62f565d6, 0x110a1f97)

Space Warp Objects

**WAVEOBJ\_CLASS\_ID** - Wave Space Warp Object

Shapes

**SPLINE3D\_CLASS\_ID** - Spline3D Shape

**NGON\_CLASS\_ID** - NGon

**DONUT\_CLASS\_ID** - Donut Shape

**STAR\_CLASS\_ID** - Start Shape

**RECTANGLE\_CLASS\_ID** - Rectangle Shape

**HELIX\_CLASS\_ID** - Hexlix Shape

**ELLIPSE\_CLASS\_ID** - Ellipse Shape

**CIRCLE\_CLASS\_ID** - Circle Shape

The basic lofter class

**LOFTOBJ\_CLASS\_ID** - This is the basic Loft object class

**LOFT\_DEFCURVE\_CLASS\_ID** - This is the class which defines loft object deformation curves. These are the Scale, Twist, Teeter, Bevel and Fit curves which deform the basic loft object mesh.

Standard 3ds max implementation of the lofter

**LOFT\_GENERIC\_CLASS\_ID**

Target objects

**TARGET\_CLASS\_ID** - Light and Camera target objects.

Morph objects

**MORPHOBJ\_CLASS\_ID** - Morph objects.

Subclasses of **CAMERA\_CLASS\_ID**

**SIMPLE\_CAM\_CLASS\_ID** - Free Camera

**LOOKAT\_CAM\_CLASS\_ID** - Target Camera

Subclasses of **LIGHT\_CLASS\_ID**:

**OMNI\_LIGHT\_CLASS\_ID** - Omni Light

**SPOT\_LIGHT\_CLASS\_ID** - Spot Light

**DIR\_LIGHT\_CLASS\_ID** - Directional Light

**FSPOT\_LIGHT\_CLASS\_ID** - Free Spot Light

**TDIR\_LIGHT\_CLASS\_ID** - Target Directional Light

Subclasses of **HELPER\_CLASS\_ID**

**DUMMY\_CLASS\_ID** - Dummy Object

**BONE\_CLASS\_ID** - Bones System

**TAPEHELP\_CLASS\_ID** - Tape Helper

**GRIDHELP\_CLASS\_ID** - Grid Helper

**POINTHELP\_CLASS\_ID** - Point Helper

**PROTHELP\_CLASS\_ID** - Protractor (Angle-Measuring) Helper

Subclasses of **MATERIAL\_CLASS\_ID**

**CMTL\_CLASS\_ID** - Top/Bottom Material.

**MULTI\_CLASS\_ID** - Multi Material

**DOUBLESIDED\_CLASS\_ID** - Double sided Material

**MIXMAT\_CLASS\_ID** - Mix Material

Subclasses of **TEXMAP\_CLASS\_ID**

**CHECKER\_CLASS\_ID** - Checker Texture

**MARBLE\_CLASS\_ID** - Marble 3D Texture

**MASK\_CLASS\_ID** - Mask Texture

**MIX\_CLASS\_ID** - Mix Texture

**NOISE\_CLASS\_ID** - Noise Texture

**GRADIENT\_CLASS\_ID** - Gradient Texture

**TINT\_CLASS\_ID** - Tint texture

**BMTEX\_CLASS\_ID** - Bitmap texture

**ACUBIC\_CLASS\_ID** - Reflect/refract

**MIRROR\_CLASS\_ID** - Flat mirror

**COMPOSITE\_CLASS\_ID** - Composite texture

**RGBMULT\_CLASS\_ID** - RGB Multiply texture

**FALLOFF\_CLASS\_ID** - Falloff texture

**OUTPUT\_CLASS\_ID** - Output texture

**PLATET\_CLASS\_ID** - Plate glass texture

**VCOL\_CLASS\_ID** - Vertex Color texture

Subclasses of **RENDERER\_CLASS\_ID**

**SREND\_CLASS\_ID** - Default scan-line renderer

Default material class (the Standard material)

**DMTL\_CLASS\_ID** - The Standard material, i.e. the default material.

Subclasses of **SOUNDOBJ\_CLASS\_ID**

**DEF\_SOUNDOBJ\_CLASS\_ID** - Default Sound Object

Subclasses of **OSM\_CLASS\_ID**

**SKEWOSM\_CLASS\_ID** - Skew Object Space Modifier

**BENDOSM\_CLASS\_ID** - Bend Object Space Modifier

**TAPEROSM\_CLASS\_ID** - Taper Object Space Modifier

**TWISTOSM\_CLASS\_ID** - Twist Object Space Modifier

**UVWMAPOSM\_CLASS\_ID** - UVW Map Object Space Modifier

**SELECTOSM\_CLASS\_ID** - Volume Selection Object Space Modifier

**MATERIALOSM\_CLASS\_ID** - Material Object Space Modifier

**SMOOTHOSM\_CLASS\_ID** - Smooth Object Space Modifier

**NORMALOSM\_CLASS\_ID** - Normal Object Space Modifier  
**OPTIMIZEOSM\_CLASS\_ID** - Optimize Object Space Modifier  
**EXTRUDEOSM\_CLASS\_ID** - Extrude Object Space Modifier  
**AFFECTREGION\_CLASS\_ID** - Affect Region Object Space Modifier  
**SUB\_EXTRUDE\_CLASS\_ID** - Face Extrude Object Space Modifier  
**TESSELLATE\_CLASS\_ID** - Tessellate Object Space Modifier  
**DELETE\_CLASS\_ID** - Delete Mesh Object Space Modifier  
**MESHSELECT\_CLASS\_ID** - Mesh Select Object Space Modifier  
**UVW\_XFORM\_CLASS\_ID** - UVW XForm Object Space Modifier  
**SURFREVOISM\_CLASS\_ID** - Lathe Object Space Modifier  
**DISPLACEOSM\_CLASS\_ID** - Displace Object Space Modifier  
**DISPLACE\_OBJECT\_CLASS\_ID** - Displace World Space Modifier Object  
**DISPLACE\_WSM\_CLASS\_ID** - Displace World Space Modifier  
**SINEWAVE\_OBJECT\_CLASS\_ID** - Ripple Object Space Modifier  
**SINEWAVE\_CLASS\_ID** - Ripple World Space Modifier Object  
**SINEWAVE\_OMOD\_CLASS\_ID** - Ripple World Space Modifier  
**LINWAVE\_OBJECT\_CLASS\_ID** - Wave Object Space Modifier  
**LINWAVE\_CLASS\_ID** - Wave World Space Modifier Object  
**LINWAVE\_OMOD\_CLASS\_ID** - Wave World Space Modifier  
**GRAVITYOBJECT\_CLASS\_ID** - Gravity World Space Modifier Object  
**GRAVITYMOD\_CLASS\_ID** - Gravity World Space Modifier  
**WINDOBJECT\_CLASS\_ID** - Gravity World Space Modifier Object  
**WINDMOD\_CLASS\_ID** - Gravity World Space Modifier  
**DEFLECTOBJECT\_CLASS\_ID** - Deflect World Space Modifier Object  
**DEFLECTMOD\_CLASS\_ID** - Deflect World Space Modifier  
**BOMB\_OBJECT\_CLASS\_ID** - Bomb World Space Modifier Object  
**BOMB\_CLASS\_ID** - Bomb World Space Modifier

The following are Class\_IDs for various controllers:

**LININTERP\_FLOAT\_CLASS\_ID** - Linear float controller.  
**LININTERP\_POSITION\_CLASS\_ID** - Linear position controller

**LININTERP\_ROTATION\_CLASS\_ID** - Linear rotation controller  
**LININTERP\_SCALE\_CLASS\_ID** - Linear scale controller  
**PRS\_CONTROL\_CLASS\_ID** - Position/Rotation/Scale Controller  
**LOOKAT\_CONTROL\_CLASS\_ID** - Lookat controller  
**HYBRIDINTERP\_FLOAT\_CLASS\_ID** - Bezier float controller.  
**HYBRIDINTERP\_POSITION\_CLASS\_ID** - Bezier position controller  
**HYBRIDINTERP\_ROTATION\_CLASS\_ID** - Bezier rotation controller  
**HYBRIDINTERP\_POINT3\_CLASS\_ID** - Bezier Point3 controller  
**HYBRIDINTERP\_SCALE\_CLASS\_ID** - Bezier scale controller  
**HYBRIDINTERP\_COLOR\_CLASS\_ID** - Bezier color controller  
**TCBINTERP\_FLOAT\_CLASS\_ID** - TCB Float Controller  
**TCBINTERP\_POSITION\_CLASS\_ID** - TCB Position Controller  
**TCBINTERP\_ROTATION\_CLASS\_ID** - TCB Rotation Controller  
**TCBINTERP\_POINT3\_CLASS\_ID** - TCB Point3 Controller  
**TCBINTERP\_SCALE\_CLASS\_ID** - TCB Scale Controller  
**PATH\_CONTROL\_CLASS\_ID** - Path Controller  
**EULER\_CONTROL\_CLASS\_ID** - Euler Angle Controller  
**EXPR\_POS\_CONTROL\_CLASS\_ID** - Expression Position Controller  
**EXPR\_P3\_CONTROL\_CLASS\_ID** - Expression Point3 Controller  
**EXPR\_FLOAT\_CONTROL\_CLASS\_ID** - Expression Float Controller  
**EXPR\_SCALE\_CONTROL\_CLASS\_ID** - Expression Scale Controller  
**EXPR\_ROT\_CONTROL\_CLASS\_ID** - Expression Rotation Controller  
**FLOATNOISE\_CONTROL\_CLASS\_ID** - Noise Float Controller  
**POSITIONNOISE\_CONTROL\_CLASS\_ID** - Noise Position Controller  
**POINT3NOISE\_CONTROL\_CLASS\_ID** - Noise Point3 Controller  
**ROTATIONNOISE\_CONTROL\_CLASS\_ID** - Noise Rotation Controller  
**SCALENOISE\_CONTROL\_CLASS\_ID** - Noise Scale Controller

**SURF\_CONTROL\_CLASSID** - Surface Position Controller

**LINKCTRL\_CLASSID** - Link Inheritance Controller

## List of Super Class IDs

See Also: [List of Class IDs](#).

The following Super Class IDs are defined in

`\MAXSDK\INCLUDE\PLUGAPI.H`: Note: **typedef `ulong` `SClass_ID`;**

**GEOMOBJECT\_CLASS\_ID** - Used by geometric objects.

**CAMERA\_CLASS\_ID** - Used by plug-in cameras.

**LIGHT\_CLASS\_ID** - Used by plug-in lights.

**SHAPE\_CLASS\_ID** - Used by spline shapes.

**HELPER\_CLASS\_ID** - Used by helper objects.

**SYSTEM\_CLASS\_ID** - Used by system plug-ins.

**OSM\_CLASS\_ID** - Used by Object Space Modifiers.

**WSM\_CLASS\_ID** - Used by Space Warp Modifiers (World Space Modifiers).

**WSM\_OBJECT\_CLASS\_ID** - Used by Space Warp Objects (World Space Modifier Objects).

**SCENE\_IMPORT\_CLASS\_ID** - Used by Scene Import plug-ins.

**SCENE\_EXPORT\_CLASS\_ID** - Used by Scene Export plug-ins.

**BMM\_STORAGE\_CLASS\_ID** - Bitmap storage.

**BMM\_FILTER\_CLASS\_ID** - Used by Image Filter plug-ins.

**BMM\_IO\_CLASS\_ID** - Used by Image Loading/Saving plug-ins (IO Modules).

**BMM\_DITHER\_CLASS\_ID** - Bitmap dithering.

**BMM\_COLORCUT\_CLASS\_ID** - Bitmap color cut.

**USERDATATYPE\_CLASS\_ID** - This is obsolete.

**MATERIAL\_CLASS\_ID** - Used by plug-in Materials.

**TEXMAP\_CLASS\_ID** - Used by plug-in Textures.

**UVGEN\_CLASS\_ID** - Used by the UVGen class that handles the UV coordinate interface.

**XYZGEN\_CLASS\_ID** - Used by the XYZGen class.

**TEXOUTPUT\_CLASS\_ID** - Used by the TextureOutput class.

**SOUNDOBJ\_CLASS\_ID** - Used by sound object plug-ins.

**FLT\_CLASS\_ID** - Used by image processing filter plug-ins.

**RENDERER\_CLASS\_ID** - Used by plug-in renderers.

**BEZFONT\_LOADER\_CLASS\_ID** - Used by bezier font loader plug-ins.

**REF\_MAKER\_CLASS\_ID** - These are items such as material libraries, the scene, and medit.

**ATMOSPHERIC\_CLASS\_ID** - Used by atmospheric plug-ins.

**UTILITY\_CLASS\_ID** - Used by utility plug-ins.

**TRACKVIEW\_UTILITY\_CLASS\_ID** - Used by Track View Utility plug-ins.

**FRONTEND\_CONTROL\_CLASS\_ID** - Used by Front End Controller plug-ins.

**MOT\_CAP\_DEV\_CLASS\_ID** - Used by Motion Capture plug-ins.

**MOT\_CAP\_DEVBINDING\_CLASS\_ID** - Used by Motion Capture Device Bindings.

**OSNAP\_CLASS\_ID** - Used by Object Snap plug-ins.

**TEXMAP\_CONTAINER\_CLASS\_ID** - In 3ds max 2.0 and later this new super class has been added. This is used by the Standard material to contain its Texmaps. The track view filter code has been modified so it now looks for this class and will filter it out when maps are being filtered out, instead of having special purpose code for the Standard Material. This will permit plug-in developers to put their Texmaps down in a sub-directory like the Standard material does.

**RENDER\_EFFECT\_CLASS\_ID** - Used by Render Effect plug-ins (R3 and later only).

**FILTER\_KERNEL\_CLASS\_ID** - Used by Anti-Aliasing Filter plug-ins (R3 and later only)

**SHADER\_CLASS\_ID** - Used by Shader plug-ins which plug-in to the Standard2 material (R3 and later only).

**COLPICK\_CLASS\_ID** - Used by color picker plug-ins (R3 and later only)

**SHADOW\_TYPE\_CLASS\_ID** - Used by shadow generators (R3 and later only)

**GUP\_CLASS\_ID** - Used by Global Utility Plug-Ins (R3 and later only)

**LAYER\_CLASS\_ID** - Used by VIZ layer (R3 and later only).

**SCHEMATICVIEW\_UTILITY\_CLASS\_ID** - Used by Schematic View (R3 and later only)

**SAMPLER\_CLASS\_ID** - Used by Sampler plug-ins (R3 and later only)

Super-class ID's used by various controllers

**CTRL\_FLOAT\_CLASS\_ID** - Used by float controllers.

**CTRL\_POINT3\_CLASS\_ID** - Used by Point3 controllers.

**CTRL\_MATRIX3\_CLASS\_ID** - Used by Matrix3 controllers.

**CTRL\_POSITION\_CLASS\_ID** - Used by position controllers.

**CTRL\_ROTATION\_CLASS\_ID** - Used by rotation controllers.

**CTRL\_SCALE\_CLASS\_ID** - Used by scale controllers.

**CTRL\_MORPH\_CLASS\_ID** - Used by morph controllers.

**CTRL\_SHORT\_CLASS\_ID** - This SuperClassID is obsolete.

**CTRL\_POINT2\_CLASS\_ID** - This SuperClassID is obsolete.

**CTRL\_QUAT\_CLASS\_ID** - This SuperClassID is obsolete.

**CTRL\_INTEGER\_CLASS\_ID** - This SuperClassID is obsolete.

**CTRL\_POS\_CLASS\_ID** - This SuperClassID is obsolete.

**CTRL\_COLOR\_CLASS\_ID** - This SuperClassID is obsolete.

**CTRL\_COLOR24\_CLASS\_ID** - This SuperClassID is obsolete.

**CTRL\_USERTYPE\_CLASS\_ID** - This SuperClassID is obsolete.

## Class ChangeForegroundCallback

See Also: [Class CommandMode](#), [Class IScene](#).

class ChangeForegroundCallback

### Description:

The purpose of this callback is to call **INode::FlagForeground()** for any nodes in the scene that are supposed to be in the foreground.

### Methods:

#### Prototype:

**virtual BOOL IsValid()=0;**

#### Remarks:

Implemented by the Plug-In.

Returns TRUE if this foreground callback is valid ; otherwise FALSE. When the system needs to redraw the viewports the system checks to see if the current foreground callback is the same one that was in place the last time. If it is the same the system will call this method to see if the state is valid. If the state is not valid (this method returns FALSE) then the foreground and background are re-built and then the **Validate()** method is called so this foreground callback may note that it is invalid.

#### Prototype:

**virtual void Invalidate()=0;**

#### Remarks:

Implemented by the Plug-In.

The system calls this method of the plug-in when the foreground state is no longer valid. The plug-in should set a flag internally to indicate it is invalid. For example if the current node selection set changes the system calls this method to mark it as invalid so that the next time the system goes to redraw the viewports it can determine that it would need to rebuild the foreground and the background.

#### Prototype:

**virtual void Validate()=0;**

**Remarks:**

Implemented by the Plug-In.

The system calls this method when the foreground state is valid. For example after the foreground and background buffers have been re-built this method is called. The plug-in should set a flag internally to indicate it is valid.

**Prototype:**

**virtual void callback(TimeValue t,IScene \*scene)=0;**

**Remarks:**

Implemented by the Plug-In.

This method is used to enumerate the scene and flag nodes in the scene that need to go in the foreground.

**Parameters:**

**TimeValue t**

The time to flag the nodes.

**IScene \*scene**

This interface pointer provides methods to enumerate all nodes in the scene, or to flag nodes that are selected, animated or dependent on a given node.

## Class FPInterface (and Class FPMixinInterface)

See Also: [Class BaseInterface](#), [Class ClassDesc](#), [Class FPInterfaceDesc](#), [Class Interface\\_ID](#), [Class ActionTable](#), [List of FPStatus Values](#), [Function Publishing System](#).

```
class FPInterface : public BaseInterface
```

### Description:

This class is available in release 4.0 and later only.

The Function Publishing system makes use of this class. Functions are published in one or more Interfaces by a plug-in. Each interface is represented by an instance of a class derived from this base class.

Note that the Function Publishing class hierarchy is as follows:

**FPInterface:** This is the base class for all interfaces, the prime client type for using interfaces.

**FPInterfaceDesc:** This is the class which contains interface metadata.

**FPStaticInterface:** This is the class to use as the base class for defining static or core virtual interface classes.

**FPMixinInterface:** This is for use as the base class for defining object-based mixin interface classes, in this case you also use FPInterfaceDesc for mixin interface descriptors.

### Methods:

public:

### Prototype:

```
virtual FPInterfaceDesc* GetDesc() = 0;
```

### Remarks:

Returns a pointer to the class which contains the interface [= 4\)](#)  
[BSPSPopupOnMouseOver\(event\);">metadata](#).

### Prototype:

```
virtual FPStatus Invoke(FunctionID fid, TimeValue t=0,  
FPParams* params=NULL);
```

### Remarks:

**Parameters:****FunctionID fid**

The function ID of the function to invoke.

**TimeValue t=0**

The timevalue at which to invoke the function.

**FPParams\* params=NULL**

The FPParams to pass.

**Return Value:**

The FPStatus. See the [List of FPStatus Values](#) for details

**Prototype:**

```
virtual inline FPStatus Invoke(FunctionID fid, FPParams*  
params);
```

**Remarks:**

This method will invoke the specified function.

**Parameters:****FunctionID fid**

The function ID of the function to invoke.

**FPParams\* params**

The FPParams to pass.

**Return Value:**

The FPStatus. See the [List of FPStatus Values](#) for details

**Prototype:**

```
virtual FPStatus Invoke(FunctionID fid, TimeValue t, FPValue&  
result, FPParams* params=NULL);
```

**Remarks:**

This method will invoke the specified function.

**Parameters:****FunctionID fid**

The function ID of the function to invoke.

**TimeValue t**

The timevalue at which to invoke the function.

**FPValue& result**

A reference to the resulting FPValue.

**FPParams\* params=NULL**

The FPParams to pass.

**Return Value:**

The FPStatus. See the [List of FPStatus Values](#) for details

**Prototype:**

```
virtual inline FPStatus Invoke(FunctionID fid, FPValue& result,  
FPParams* params=NULL);
```

**Remarks:**

This method will invoke the specified function.

**Parameters:****FunctionID fid**

The function ID of the function to invoke.

**FPValue& result**

A reference to the resulting FPValue.

**FPParams\* params=NULL**

The FPParams to pass.

**Return Value:**

The FPStatus. See the [List of FPStatus Values](#) for details

**Prototype:**

```
virtual FunctionID FindFn(TCHAR* name);
```

**Remarks:**

This method returns a function ID based on the name of the function specified.

**Parameters:****TCHAR\* name**

The name of the function to retrieve the Function ID for.

**Prototype:**

**virtual BOOL IsEnabled(FunctionID actionID);**

**Remarks:**

This method allows you to check whether a specific action function is enabled, in which case the method will return TRUE. If the action function is not enabled FALSE will be returned.

**Parameters:**

**FunctionID actionID**

The function ID of the action you wish to check the enabled state for.

**Prototype:**

**virtual BOOL IsChecked(FunctionID actionID);**

**Remarks:**

This method allows you to check whether a specific action function is checked, in which case the method will return TRUE. If the action function is not checked FALSE will be returned.

**Parameters:**

**FunctionID actionID**

The function ID of the action you wish to check the checked state for.

**Prototype:**

**virtual BOOL IsVisible(FunctionID actionID);**

**Remarks:**

This method allows you to check whether a specific action function is visible, in which case the method will return TRUE. If the action function is not visible FALSE will be returned.

**Parameters:**

**FunctionID actionID**

The function ID of the action you wish to check the visibility state for.

**Prototype:**

**virtual FunctionID GetIsEnabled(FunctionID actionID);**

**Remarks:**

This method will return the isEnabled ID for the specified action function.

**Parameters:****FunctionID actionID**

The function ID of the action you wish to get the isEnabled ID for.

**Prototype:**

```
virtual FunctionID GetIsChecked(FunctionID actionID);
```

**Remarks:**

This method will return the isChecked ID for the specified action function.

**Parameters:****FunctionID actionID**

The function ID of the action you wish to get the isChecked ID for.

**Prototype:**

```
virtual FunctionID GetIsVisible(FunctionID actionID);
```

**Remarks:**

This method will return the isVisible ID for the specified action function.

**Parameters:****FunctionID actionID**

The function ID of the action you wish to get the isVisible ID for.

**Prototype:**

```
virtual bool Acquire(FPInterfaceCallback* fpicb=NULL);
```

**Remarks:**

This method is called when MAXScript makes a reference to this object. Call this method with a non-NULL **FPInterfaceCallback** so the interface can signal deletion (usually a mixin).

**Parameters:****FPInterfaceCallback\* fpicb=NULL**

A pointer to an FPInterfaceCallback class.

**Return Value:**

This method should return TRUE if it needs Release() called.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual void Release(FPInterfaceCallback* fpicb=NULL);
```

**Remarks:**

This method is called when MAXScript deletes a reference to this object.

**Parameters:**

**FPInterfaceCallback\* fpicb=NULL**

A pointer to an FPInterfaceCallback class.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual ActionTable* GetActionTable();
```

**Remarks:**

This method returns a pointer to the ActionTable.

**Default Implementation:**

```
{ return NULL; }
```

**Prototype:**

```
virtual void EnableActions(BOOL onOff);
```

**Remarks:**

This method allows you to enable or disable the entire set of actions in the interface. You might want to use this method if the actions are only to be active during certain periods in the running of 3ds max. Usually, this control is achieved via ActionTable contexts.

**Parameters:**

**BOOL onOff**

TRUE to enable actions, FALSE to disable them.

**Default Implementation:**

**{ }**

## Class FPMixinInterface

See Also: [Class FPInterface](#), [Class FPInterfaceDesc](#), [Function Publishing System](#).

```
class FPMixinInterface : public FPInterface
```

### Description:

This class is available in release 4.0 and later only.

A "Mixin" interface provides a way for a plug-in to expose some of its functionality for use by other plug-ins or MAXScript. The notion of "Mixin" refers to the idea that the interface is a sub-class of the plug-in class and thus "mixed in" with it. Many classes in the SDK now inherit from FPMixinInterface in order to expose some of their functionality.

Developers should see the documentation for [Class FPInterface](#) for reference on this class as well.

For an overview of the Function Publishing System as a whole, see the Advanced Topics section [Function Publishing System](#).

### Methods:

public:

### Prototype:

```
virtual FPInterfaceDesc* GetDescByID(Interface_ID id);
```

### Remarks:

This method is used to directly implement **FPInterface::GetDesc()** in your public virtual base mixin class, like this;

```
FPInterfaceDesc* GetDesc() { return  
GetDescByID(THIS_INTERFACE_ID); }
```

Then implement a GetDescByID() in the implementing class to avoid link export issues.

### Parameters:

**Interface\_ID id**

The unique interface ID by which to get the FPInterfaceDesc.

### Default Implementation:

```
{ return &nullInterface; }
```

**Prototype:**

```
virtual Interface_ID GetID();
```

**Remarks:**

This method overrides GetID() in those interfaces that do not publish metadata but instead have a unique Interface\_ID for quick internal identification in implementation code that might be shared by a bunch of mixin interfaces.

**Return Value:**

The Interface\_ID.

**Default Implementation:**

```
{ return GetDesc()->ID; }
```

## Class FPInterfaceDesc

See Also: [Class FPInterface](#), [= 4\) BSPSPopupOnMouseOver\(event\);">Class ClassDesc](#), [Class Interface\\_ID](#), [Class FPEnum](#), [Class FPFunctionDef](#), [Class FPPropDef](#), [Class ActionTable](#), [Template Class Tab](#), [Function Publishing System](#).

```
class FPInterfaceDesc : public FPInterface
```

### Description:

This class is available in release 4.0 and later only.

This is the Function Publishing interface descriptor. This is usually a static instance of the implementation interface. The constructor for this class uses the same var-args technique used by the ParamBlockDesc2 constructor, enabling descriptive information for all the functions in the interface to be supplied in one constructor call.

The FPInterfaceDesc class, an FPInterface that contains the metadata for an interface, is a distinguished singleton instance per interface kept in a Tab<> in ClassDesc. This class is subclassed typically by static and core interfaces and instantiated by mixins to provide their metadata.

Note the following typedef: **typedef FPInterfaceDesc FPStaticInterface**

### Data Members:

public:

#### **Interface\_ID ID;**

The unique ID of the interface.

#### **TSTR internal\_name;**

The fixed internal name for the interface.

#### **StringResID description;**

The description string resource ID.

#### **ClassDesc\* cd;**

Points to the publishing plug-in's ClassDesc.

#### **USHORT flags;**

The flag bits. One or more of the following values:

#### **FP\_ACTIONS**

Marks this as an Action Interface, holding only UI modal, zero parameter action functions.

### **FP\_MIXIN**

Marks this as a Mixin Interface, it is implemented directly by the plug-in class, so the methods in it are virtual on the plugin's objects.

### **FP\_CORE**

Marks this as a 3ds max Core Interface, available through **GetCOREInterface(Interface\_ID)**.

### **FP\_STATIC\_METHODS**

This interface is used as a static method interface in MAXScript, properties are not directly callable

### **FP\_SCRIPTED\_CLASS**

Internal use only: Belongs to a scripted plug-in class.

### **FP\_TEMPORARY**

Internal use only: Temporary descriptor built during scene load.

### **Tab<FPFunctionDef\*> functions;**

A table of descriptors for individual functions in this interface.

### **Tab<FPPropDef\*> props;**

A Table of descriptors for individual properties in this interface.

### **Tab<FPEnum\*> enumerations;**

A table of any symbolic enums for the interface. This is a Tab<> of pointers to **FPEnum** class instances which themselves contain a Tab<> of name, code pairs.

The following data members are for scripted plug-ins if this interface belongs to a scripted plug-in class.

### **MSPluginClass\* pc;**

The scripted class if non-NULL (gc-protected by the scripted plugin class).

### **Rollout\* rollout;**

The rollout if specified (gc-protected by the scripted plugin class).

### **ActionTable\* action\_table;**

The table published for this action interface.

For more information, see [Class ActionTable](#).

## **Methods:**

public:

**Prototype:**

**FPInterfaceDesc();**

**Remarks:**

Constructor. No initialization is performed.

**Prototype:**

**FPInterfaceDesc(Interface\_ID id, TCHAR\* int\_name,  
StringResID descr, ClassDesc\* cd, ULONG flag, ...);**

**Remarks:**

Constructor.

**Parameters:**

**Interface\_ID id**

The unique ID of the interface.

**TCHAR\* int\_name**

The fixed internal name for the interface.

**StringResID descr**

A string resource ID containing the description for this interface class.

**ClassDesc\* cd**

A pointer to a ClassDesc class descriptor of the publishing plug-in.

**ULONG flag**

The flag bits. One or more of the following values: **FP\_ACTIONS**, **FP\_MIXIN**, **FP\_CORE**, **FP\_STATIC\_METHODS**, **FP\_SCRIPTED\_CLASS**, **FP\_TEMPORARY**. For a description see the data members descriptions.

...

This constructor takes a variable number of arguments representing the 'properties' sections and function definitions. For more information see the advanced topics on [Function Publishing](#).

**Prototype:**

**virtual void Init();**

**Remarks:**

This is a virtual method called by the varargs-based constructors for interface descriptors and static interfaces, so that they have an opportunity to do runtime initialization of any extra state data you add to these interfaces (usually to static interfaces). Since such interfaces are usually constructed with the built-in varargs constructor, there is no way to do custom initialization without a hook like the `Init()` call. Your static interface would provide an implementation of `Init()` to do any special initialization.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
void LoadDescriptor(Interface_ID id, TCHAR* int_name,  
StringResID descr, ClassDesc* cd, ULONG flag, ...);
```

**Remarks:**

This method relates to **`Init()`**. In some cases, you really do need to provide your own constructor or set of constructors for a static interface or descriptor, but you still want to be able to load it with all the interface metadata that the built-in varargs constructor does. You can do this by calling the **`LoadDescriptor()`** method at any point in your own constructors and it takes the same arguments as the built-in varargs constructor.

**Parameters:****Interface\_ID id**

The unique ID of the interface.

**TCHAR\* int\_name**

The fixed internal name for the interface.

**StringResID descr**

A string resource ID containing the description for this interface class.

**ClassDesc\* cd**

A pointer to a `ClassDesc` class descriptor of the publishing plug-in.

**ULONG flag**

The flag bits. One or more of the following values: **`FP_ACTIONS`**, **`FP_MIXIN`**, **`FP_CORE`**, **`FP_STATIC_METHODS`**,

**FP\_SCRIPTED\_CLASS, FP\_TEMPORARY.** For a description see the data members descriptions.

...

This method takes a variable number of arguments representing the 'properties' sections and function definitions. For more information see the advanced topics on [Function Publishing](#).

## Construction Utilities

### Prototype:

```
void SetClassDesc(ClassDesc* i_cd);
```

### Remarks:

This method sets the ClassDesc pointer associated FPInterfaceDesc class. You can only call this method once on a descriptor and then only if it has been constructed initially with a NULL cd. See the notes in the constructor.

### Parameters:

```
ClassDesc* i_cd
```

This points to the ClassDesc class descriptor to set.

### Prototype:

```
va_list check_fn(va_list ap, int id);
```

### Remarks:

This is used internally.

### Prototype:

```
va_list scan_fn(va_list ap, int id, int index);
```

### Remarks:

This is used internally.

### Prototype:

```
va_list check_prop(va_list ap, int id);
```

**Remarks:**

This is used internally.

**Prototype:**

```
va_list scan_prop(va_list ap, int id, int index);
```

**Remarks:**

This is used internally.

**Prototype:**

```
va_list check_enum(va_list ap, EnumID id);
```

**Remarks:**

This is used internally.

**Prototype:**

```
va_list scan_enum(va_list ap, EnumID id, int index);
```

**Remarks:**

This is used internally.

**Metadata Access****Prototype:**

```
FPInterfaceDesc* GetDesc();
```

**Remarks:**

This method returns a pointer to the descriptor for this Function Publishing interface descriptor.

**Default Implementation:**

```
{ return this; }
```

**Prototype:**

```
FPFunctionDef* GetFnDef(FunctionID fid);
```

**Remarks:**

This method returns a pointer to the function definition of a specific function identified by its ID. Calls to this method, given an **FPInterface\***, can be made indirectly through **FPInterface::GetDesc()**. For example;  
**FPFunctionDef\* fd = fpi->GetDesc()->GetFnDef(foo\_move);**

**Parameters:**

**FunctionID fid**

The unique function ID used to identify the function.

**Prototype:**

**ActionTable\* GetActionTable();**

**Remarks:**

This method returns a pointer to the action table.

**Default Implementation:**

**{ return action\_table; }**

## **Global Actions**

**Prototype:**

**void EnableActions(BOOL onOff);**

**Remarks:**

This method allows you to enable or disable the entire set of actions in the interface. You might want to use this method if the actions are only to be active during certain periods in the running of 3ds max. Usually, this control is achieved via ActionTable contexts.

**Parameters:**

**BOOL onOff;**

TRUE to enable actions, FALSE to disable actions.

## **Overridable HInstance and resource access from owning module**

**Prototype:**

**virtual HINSTANCE HInstance();**

**Remarks:**

This method will return a handle to the owning instance.

**Prototype:**

```
virtual TCHAR* GetRsrcString(StringResID id);
```

**Remarks:**

This method returns the string associated with a specified String Resource ID

**Parameters:**

**StringResD id**

The string resource ID for which you want to obtain the string.

## Class Interface\_ID

See Also: [Class FPInterface](#), [Function Publishing System](#).

class Interface\_ID

### Description:

This class is available in release 4.0 and later only.

This class is the interface ID for the Function Publishing System of 3ds max. This class is structurally very similar to a Class\_ID, containing two randomly-chosen longwords to provide a unique global ID. The various constructors assign a value to each of these. There are also methods to assign and retrieve the individual parts and operators to check for equality or inequality.

All the methods of this class are implemented by the system.

### Methods:

public:

### Prototype:

**Interface\_ID();**

### Remarks:

Constructor. The two parts of the ID are initialized to **0xffffffff**.

### Prototype:

**Interface\_ID(const Interface\_ID& iid);**

### Remarks:

Constructor. The two parts of the ID are initialized from the corresponding parts of the Interface\_ID passed.

### Parameters:

**const Interface\_ID& iid**

The ID whose parts are used to initialize this ID.

### Prototype:

**Interface\_ID(ulong aa, ulong bb);**

### Remarks:

Constructor. The two parts of the ID are initialized from the from the parts passed.

**Parameters:**

**ulong aa**

Passed to initialize the first part of the ID.

**ulong bb**

Passed to initialize the second part of the ID.

**Prototype:**

**ULONG PartA();**

**Remarks:**

Returns the first part of the ID.

**Prototype:**

**ULONG PartB();**

**Remarks:**

Returns the second part of the ID.

**Prototype:**

**void SetPartA( ulong aa );**

**Remarks:**

Sets the first part of the ID.

**Parameters:**

**ulong aa**

Passed to set the first part.

**Prototype:**

**void SetPartB( ulong bb );**

**Remarks:**

Sets the second part of the ID.

**Parameters:**

**ulong bb**

Passed to set the second part.

**Prototype:**

**int operator==(const Interface\_ID& iid) const;**

**Remarks:**

Equality operator. Returns nonzero if the two parts of the ID are equal to the ID passed; otherwise zero.

**Parameters:**

**const Interface\_ID& iid**

The ID to check.

**Prototype:**

**int operator!=(const Interface\_ID& iid) const;**

**Remarks:**

Inequality operator. Returns nonzero if either of the parts of the ID are NOT equal to the ID passed; otherwise zero.

**Parameters:**

**const Interface\_ID& iid**

The ID to check.

**Prototype:**

**Interface\_ID& operator=(const Interface\_ID& iid);**

**Remarks:**

Assignment operator.

**Parameters:**

**const Interface\_ID& iid**

The ID to assign from.

## Class FPFunctionDef

See Also: [Class FPInterface](#), [Class FPInterfaceDesc](#), [Class FPActionDef](#), [Class FPParamDef](#), [Template Class Tab](#), [Function Publishing System](#), [List of Param Type Choices](#) , [List of ParamType2 Choices](#).

class FPFunctionDef

### Description:

This class is available in release 4.0 and later only.

This class stores data about a single function of an FPInterface. A table of pointers to these objects is a data member of Class **FPInterfaceDesc**.

### Data Members:

public:

#### **FunctionID ID;**

The interface-local ID (unique to the interface only) used to identify the function in calls.

#### **TSTR internal\_name;**

The fixed internal name for the function.

#### **StringResID description;**

The description string resource.

#### **USHORT flags;**

The internal flag bits. One of more of the following values:

##### **FP\_ACTION**

Indicates this is an action function.

##### **FP\_HAS\_UI**

Indicates the action has UI specified.

##### **FP\_ICONRES**

Indicates icon via resource ID.

##### **FP\_ICONFILE**

Indicates icon via bmp file + index.

##### **FP\_HAS\_SHORTCUT**

Indicates has default keyboard shortcut.

##### **FP\_HAS\_KEYARGS**

Indicates function has some optional keyword args defined.

### **FP\_VAR\_ARGS**

Indicates a variable number of args, pass args directly in a FPParams instance.

### **FP\_NO\_REDRAW**

Do not flag need for viewport redraw when function is invoked, MAXScript defaults to flag redraw.

### **ParamType2 result\_type;**

The type of value returned by the function.

### **EnumID enumID;**

The ID of symbolic enumeration in owning interface if any.

### **FPActionDef\* action\_def;**

The extra metadata if function in an Action interface.

### **Tab<FPParamDef\*> params;**

The descriptors for parameters to this function.

### **Methods:**

public:

### **Prototype:**

**FPFunctionDef();**

### **Remarks:**

Constructor. The data members are initialized as follows:

**flags = 0; description = 0; action\_def = NULL; enumID = FP\_NO\_ENUM;**

## Class FPPropDef

See Also: [Class FPParamOptions](#), [List of Param Type Choices](#)

class FPPropDef

### Description:

This class is available in release 4.0 and later only.

The 'properties' section follows the function definitions. Each property has a single entry defining the function IDs for the getter and setter functions, a fixed internal property name, a descriptor string resource ID and the property type. If the property is read-only and there is no setter function, specify **FP\_NO\_FUNCTION** for the setter ID.

### Data Members:

public:

**FunctionID** **getter\_ID;**

The interface-local ID for getter method.

**FunctionID** **setter\_ID;**

The interface-local ID for setter method.

**TSTR** **internal\_name;**

The fixed, internal name.

**StringResID** **description;**

The description string resource ID.

**USHORT** **flags;**

The flag bits.

**ParamType2** **prop\_type;**

The property type.

**EnumID** **enumID;**

The ID of symbolic enumeration in owning interface if any.

**FPParamOptions\*** **options;**

Present if non-NULL, used for setter param.

### Methods:

public:

### Prototype:

**FPPropDef();**

**Remarks:**

Constructor. The data members are initialized as follows:

**flags = 0; description = 0; getter\_ID = setter\_ID =  
FPS\_NO\_SUCH\_FUNCTION; enumID = FP\_NO\_ENUM; options  
= NULL;**

## Class FPActionDef

See Also: [Class FPInterface](#), [Class FPInterfaceDesc](#), [Class FPActionDef](#), [Class FPParamDef](#), [Template Class Tab](#), [Class MaxIcon](#), [Function Publishing System](#), [List of ControlType2 Choices](#) , [List of ParamType2 Choices](#).

class FPActionDef

### Description:

This class is available in release 4.0 and later only.

FPActionDef, contains extra descriptor info for Action interface functions.

### Data Members:

public:

**TSTR internal\_cat;**

The fixed, internal category name.

**StringResID category;**

The localizable category string resource ID.

**FunctionID isEnabled\_id;**

The interface function IDs for the isEnabled predicate for this action.

**FunctionID isChecked\_id;**

The interface function IDs for the isChecked predicate for this action.

**FunctionID isVisible\_id;**

The interface function IDs for the isVisible predicate for this action.

**ResID icon\_resID;**

The icon as resource ID.

**TSTR icon\_file;**

The icon as UI .bmp filename, index pair, as per CUI icon specifications.

**short icon\_index;**

The index of the icon associated with the action.

**MaxIcon\* icon;**

The MaxIcon class data associated with this action.

**StringResID button\_text;**

The button text string resource ID, defaults to function description.

**StringResID tool\_tip;**

The tooltip string resource ID, defaults to function description.

**StringResID menu\_text;**

The menu item text string resource ID, defaults to buttonText or function description.

**ControlType2 ctrl\_type;**

The type of UI control, if f\_ui specified.

**ResID ctrl\_pbID;**

The control's host parammap pblock ID.

**MapID ctrl\_mapID;**

The control's host parammap map ID within the block.

**int ctrl\_id;**

The control dialog item ID.

**COLORREF ctrl\_hiCol;**

The highlight color if check button.

**ACCEL shortcut;**

The default keyboard shortcut.

**Methods:**

public:

**Prototype:**

**FPActionDef();**

**Remarks:**

Constructor.

This will initialize the members to their empty default values.

**Prototype:**

**~FPActionDef();**

**Remarks:**

Destructor.

## Class FPParamDef

See Also: [List of ParamType2 Choices](#), [Class FPParamOptions](#), [Template Class Tab](#).

```
class FPParamDef
```

### Description:

This class is available in release 4.0 and later only.

This class contains a descriptor for each published function, found in Tab<> in **FPInterface**.

### Data Members:

public:

**TSTR internal\_name;**

The internal name.

**StringResID description;**

The string resource ID of the description.

**ParamType2 type;**

The parameter type. See the [List of ParamType2 Choices](#) for details.

**EnumID enumID;**

ID of symbolic enumeration in owning interface if any.

**USHORT flags;**

The parameter definition flags;

**FPP\_HAS\_RANGE**

Indicates that the parameter definition contains a range.

**FPP\_HAS\_VALIDATOR**

Indicates that the parameter has a validator.

**FPP\_IN\_PARAM**

In flag used by \_BR ref types to decide when to pass in source values or hand back returns.

**FPP\_OUT\_PARAM**

Out flag used by \_BR ref types to decide when to pass in source values or hand back returns.

**FPP\_IN\_OUT\_PARAM**

In-Out flag used by \_BR ref types to decide when to pass in source values

or hand back returns.

### **FPP\_KEYARG**

If p\_keyArgDefault supplied, the client can use keyword args if supported for this param.

### **FPP\_INDEX**

Parameter values used as indexes, always 0-origin internally, allows client to map to other origins.

### **FPPParamOptions\* options;**

Present if non-NULL, a pointer to the parameter options object.

### **Methods:**

public:

### **Prototype:**

**FPPParamDef();**

### **Remarks:**

Constructor.

### **Default Implementation:**

```
{ description = 0; options = NULL; flags = FPP_IN_OUT_PARAM;  
enumID = FP_NO_ENUM; }
```

# Class FParams

See Also: [Class FPValue](#)

class FParams

## Description:

This class is available in release 4.0 and later only.

This parameters class contains a **Tab<>** of **FPValue**'s, being the actual parameters for an FP Function call.

## Data Members:

public:

**Tab<FPValue> params;**

The table of FPValue's contained in this class.

## Methods:

public:

## Prototype:

**FParams();**

## Remarks:

Constructor.

## Default Implementation:

{ }

## Prototype:

**FParams(int count, ...);**

## Remarks:

Constructor.

## Parameters:

**int count**

The number of parameter values to add.

...

This method takes a variable number of arguments representing the parameter

values that will be stored in the **params** table.

**Prototype:**

**~FPParams();**

**Remarks:**

Destructor.

**Prototype:**

**void Load(int count, ...);**

**Remarks:**

This method loads a number of parameter values.

**Parameters:**

**int count**

The number of parameter values to add.

...

This method takes a variable number of arguments representing the parameter values that will be stored in the **params** table.

## Class FPEnum

See Also: [Class FPInterface](#), [Function Publishing System](#)

class FPEnum

### Description:

This class is available in release 4.0 and later only.

This class contains an ID for the enumeration and a table of structures which contains a name and an integer code for each item. This is used by metadata clients to support symbolic values for **TYPE\_ENUM** types (ints).

One or more symbolic enums, similar to C++ enums, can now be added to an FPInterface's metadata, and individual int parameters and/or results for functions in that interface can be defined as **TYPE\_ENUM** and associated with one of the enum lists. Working in a similar manner as MAXScript, this allows metadata clients to support symbolic encodings for these parameters and results.

Enums are defined in the FPInterface descriptor following the function and property definitions as sets of string/code pairs. Each enum list is identified by a unique integer, similar to function IDs, which is used to associated a **TYPE\_ENUM** parameter or result with its enum. IDs for these would normally be defined somewhere near the function IDs for an interface. For example:

```
// function IDs
enum { bmm_getWidth, bmm_getHeight, bmm_getType,
bmm_copyImage, ...};
// enum IDs
enum { bmm_type, bmm_copy_quality, ...};
```

might be some of the IDs for a possible bitmap manager interface. The two enums provide symbolic codes for the bitmap type and copyImage quality defines in the "bitmap.h" SDK header, such as **BMM\_PALETTED**, **BMM\_TRUE\_32**, **COPY\_IMAGE\_RESIZE\_LO\_QUALITY**, etc. In the descriptor for the interface, any enum lists follow the function and property definitions. They are introduced by the special tag, 'enums', as in the following example:

```

static FPInterfaceDesc bmmfpi (
    BMM_INTERFACE, _T("bmm"), IDS_BMMI, NULL,
    FP_CORE,
    ...
    bmm_copyImage, _T("copyImage"), ...
        _T("copyType"), IDS_COPYTYPE, TYPE_ENUM,
    bmm_copy_quality,
    ...
    properties,
        geo_getType, geo_setType, _T("type"), 0, TYPE_ENUM,
    bmm_type,
        enums,
            bmm_type, 7,
                "lineArt", BMM_LINE_ART,
                "paletted", BMM_PALETTED,
                "gray8", BMM_GRAY_8,
                "gray16", BMM_GRAY_16 ,
                "true16", BMM_TRUE_16,
                "true32", BMM_TRUE_32,
                "true24", BMM_TRUE_64,
            bmm_copy_quality, 4,
                "crop", COPY_IMAGE_CROP,
                "resizeLo", COPY_IMAGE_RESIZE_LO_QUALITY,
                "resizeHi", COPY_IMAGE_RESIZE_HI_QUALITY,
                "useCustom", COPY_IMAGE_USE_CUSTOM,
        end
    );

```

In the above example, the enums are listed following the function & property definitions. They are introduced by the 'enums' tag and consist of an enum ID followed by a count of items, followed by that many string and code pairs. By

attaching them to the interface like this, any number of functions and properties in the interface can use them.

The above example also has function and property definitions showing the use of **TYPE\_ENUM**. The **copyImage** function takes a **copyType** parameter which uses the **bmm\_copy\_quality enum** and the type property uses the **bmm\_type enum**. In all situations where TYPE\_xxx types can be supplied in a descriptor, including the new property definitions, **TYPE\_ENUM** can be used to indicate an int by-value type. **TYPE\_ENUM**'s must always be followed by an enum ID. This is the only case in which the type is specified as a pair of values. **TYPE\_ENUM** parameters and results show up in MAXScript as # names. For example, if a bmm interface was in the variable 'bm1' and the bitmap type was **BMM\_GRAY\_16**,

```
bm1.type
```

```
-> #gray16
```

```
bm1.type = #true32 -- set it to #true24 (code is BMM_TRUE_24)
```

```
bm2 = bm1.copyImage #resizeHi
```

the integer **TYPE\_ENUM** codes are translated back-and-forth to symbolic # names by MAXScript using the definitions in the FPInterface descriptor's enums. If you need to access the enum metadata in an **FPInterfaceDesc**, it is available in the 'enumerations' data member. This is a **Tab<>** of pointers to **FPEnum** class instances which themselves contain a **Tab<>** of name, code pairs. See class **FPEnum** in `\MAXSDK\INCLUDE\FnPub.h` for details.

#### **Data Members:**

public:

```
EnumID ID;
```

```
ID for this enumeration
```

```
typedef struct {
```

```
    TCHAR*name;
```

This is the symbolic name for the enum.

**int code;**

This is the equivalent integer code.

**} enum\_code;**

**Tab<enum\_code> enumeration;**

The table of enumeration codes.

## Class FPInterfaceCallback

See Also: [Class FPInterface](#), [Function Publishing System](#)

class FPInterfaceCallback

### Description:

This class is available in release 4.0 and later only.

FPInterfaceCallback class is registered with an interface on Acquire() so that it can be notified when the interface goes away

### Methods:

public:

### Prototype:

**virtual void InterfaceDeleted()=0;**

### Remarks:

This method is called when the interface is deleted.

## Class FPValue

See Also: [List of ParamType2 Choices](#), [Template Class Tab](#).

class FPValue

### Description:

This class is available in release 4.0 and later only.

This class contains a single value used as part of the Function Publishing system. It's capable of holding any of the FnPub supported types. This value is used as a parameter and as a return value.

### Data Members:

public:

#### **ParamType2 type;**

This data member identifies which type of value is stored in the union below.

The following union contains a single value, pointer to a single value, or a pointer to a single table (Tab<>) of values.

#### **union**

{

**int i;**

**float f;**

**int\* iptr;**

**float\* fptr;**

**Point3\* p;**

**TimeValue t;**

};
```

**Methods:**

public:

**Prototype:**

**FPValue();**

**Remarks:**

Constructor

**Default Implementation:**

**{ Init(); }**

**Prototype:**

**FPValue(FPValue& from);**

**Remarks:**

Constructor.

**Parameters:**

**FPValue& from**

A reference to a FPValue to copy from.

**Default Implementation:**

```
{ Init(); *this = from; }
```

**Prototype:**

**FPValue(int type, ...);**

**Remarks:**

Constructor

**Default Implementation:**

```
{va_list ap; va_start(ap, type); ap = Loadva(type, ap);  
va_end(ap);}
```

**Prototype:**

**~FPValue();**

**Remarks:**

Destructor.

**Default Implementation:**

```
{ Free(); }
```

**Prototype:**

**void Free();**

**Remarks:**

This method will free up all memory used by the class.

**Prototype:**

```
void Init();
```

**Remarks:**

This method will Initialize FPValue class.

**Default Implementation:**

```
{ type = (ParamType2)TYPE_INT; s = NULL; }
```

**Prototype:**

```
FPValue& operator=(FPValue& sv);
```

**Remarks:**

Assignment operator.

**Prototype:**

```
inline void Load(int type, ...);
```

**Remarks:**

This method will load the FPValue class with the provided data.

**Parameters:**

```
int type
```

The FPValue parameter type to load.

...

This method takes a variable number of arguments.

**Default Implementation:**

```
{va_list ap; va_start(ap, type); ap = Loadva(type, ap);  
va_end(ap);}
```

**Prototype:**

```
inline void LoadPtr(int type, ...);
```

**Remarks:**

This method will load the FPValue class with the provided data.

**Parameters:**

```
int type
```

The FPValue parameter type to load.

...

This method takes a variable number of arguments.

**Return Value:**

```
{ va_list ap; va_start(ap, type);  
  ap = Loadva(type, ap, true); va_end(ap); }
```

## Class FPParamOptions

See Also: [Class FPValue](#), [List of ParamType2 Choices](#), [Template Class Tab](#).

class FPParamOptions

### Description:

This class is available in release 4.0 and later only.

This class contains the optional parameters holding specific descriptor information.

### Data Members:

public:

**FPValue range\_low;**

The low range if specified.

**FPValue range\_high;**

The high range if specified.

**FPValidator\* validator;**

The validator if specified.

**FPValue keyarg\_default;**

The default if value is optional keyword arg

**BYTE pos\_param\_count;**

The count of positional params in event of keyword arg presence

### Methods:

public:

### Prototype:

**FPParamOptions();**

### Remarks:

Constructor.

## Class FPValidator

See Also: [Class InterfaceServer](#), [Class FPInterfaceDesc](#), [Class FPValue](#), [Class Interface\\_ID](#), [Function Publishing System](#).

```
class FPValidator : public InterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

An interface descriptor may contain validation information for individual parameters, so that clients (such as MAXScript) can validate values given as parameters to FPInterface calls, prior to making the call. The validation information can be in the form of a range of values for int and float types, or more generally, a validator object that is called to validate a parameter value. The validation info is specified in the FPInterface descriptor in optional tagged entries following the parameters to be validated. The two possible tags are **f\_range** and **f\_validator**. An instance of this class is used when **f\_validator** is specified.

Here's an example from a possible mixin interface to Cylinder:

```
static FPInterfaceDesc cylfpi (  
CYL_INTERFACE, _T("cylMixin"), 0, &cylinderDesc, FP_MIXIN,  
...  
cyl_setRadius, _T("setRadius"), 0, TYPE_VOID, 0, 1,  
_T("radius"), 0, TYPE_FLOAT,  
f_range, 0.0, 10000.0,  
cyl_setDirection, _T("setDirection"), 0, TYPE_VOID, 0, 1,  
_T("vector"), 0, TYPE_POINT3,  
f_validator, &cylValidator,  
...  
end  
);
```

The "vector" parameter in the above example has a validator object specified. This must be a pointer to an instance of a class derived from the new class, **FPValidator**, defined in **I\MAXSDK\INCLUDE\iFnPub.h**. This is a

virtual base class, containing a single method, **Validate()**, that is called to validate a prospective value for a parameter. You would typically subclass **FPValidator** in your code and provide an implementation of **Validate()** to do the validation.

**Methods:**

public:

**Prototype:**

**virtual bool Validate(FPInterface\* fpi, FunctionID fid, int paramNum, FPValue& val, TSTR& msg)=0;**

**Remarks:**

This method is called to validate the value **val** passed for the given parameter in the function whose ID is passed in the specified interface passed. If there are many parameters to validate this way, developers can choose to provide a separate subclass for each parameter or a single subclass and switch on the parameter identification supplied.

**Parameters:**

**FPInterface\* fpi**

Points to the interface the function is a part of.

**FunctionID fid**

The ID of the function within the interface above.

**int paramNum**

Identifies which parameter within the function above to validate.

**FPValue& val**

The value to validate.

**TSTR& msg**

Update this string with an error message if needed. The user of the Validator can then display this string.

**Return Value:**

Returns true if the value was valid; false if invalid.

## Class ClassDesc2

See Also: [Class ClassDesc](#), [Class Animatable](#), [Class ParamBlockDesc2](#), [Class IParamMap2](#), [Class IObjParam](#), [Class ParamMap2UserDlgProc](#), [Class IAutoMParamDlg](#).

```
class ClassDesc2 : public ClassDesc
```

### Description:

This class is available in release 3.0 and later only.

A subclass of ClassDesc which you specialize to provide a class descriptor for plug-in classes that will use the ParamBlock2 system. It contains a table of ParamBlockDesc2s for all the parameter blocks used in the plug-in and a number of sets of methods including access to the block descriptors, auto user interface management, auto param block2 construction, and access to any automatically-maintained ParamMap2s.

### Methods:

public:

### Prototype:

```
ClassDesc2();
```

### Remarks:

Constructor. The master ParamDlg and Effect ParamDlg pointers are set to NULL.

### Prototype:

```
~ClassDesc2();
```

### Remarks:

Destructor.

### Prototype:

```
void ResetClassParams(BOOL fileReset);
```

### Remarks:

This method may be called to restore all sticky parameters to their default values.

**Parameters:****BOOL fileReset**

This parameter is not used.

**Prototype:****int NumParamBlockDescs();****Remarks:**

Implemented by the System.

This is a method of the base class ClassDesc. This class provides an implementation of the method used by plug-ins using the ParamBlock2 system.

Returns the number of parameter block2 descriptors used by this plug-in class.

**Prototype:****ParamBlockDesc2\* GetParamBlockDesc(int i);****Remarks:**

Implemented by the System.

This is a method of the base class ClassDesc. This class provides an implementation of the method used by plug-ins using the ParamBlock2 system.

Returns a pointer to the 'i-th' parameter block2 descriptor.

**Parameters:****int i**

The zero based index of the parameter block2 descriptor to return.

**Prototype:****ParamBlockDesc2\* GetParamBlockDescByID(BlockID id);****Remarks:**

Implemented by the System.

This is a method of the base class ClassDesc. This class provides an implementation of the method used by plug-ins using the ParamBlock2 system.

Returns a pointer to the parameter block2 descriptor as specified by its **BlockID**.

Note: **typedef short BlockID;**

**Parameters:**

**BlockID id**

The permanent ID for the parameter block.

**Prototype:**

**ParamBlockDesc2\* GetParamBlockDescByName(TCHAR\* name);**

**Remarks:**

Returns a pointer to the parameter block2 descriptor as specified by the descriptor's internal name.

**Parameters:**

**TCHAR\* name**

The internal name of the parameter block descriptor.

**Prototype:**

**void AddParamBlockDesc(ParamBlockDesc2\* pbd);**

**Remarks:**

Implemented by the System.

This is a method of the base class ClassDesc. This class provides an implementation of the method used by plug-ins using the ParamBlock2 system.

Adds a parameter block2 to the list of those maintained by this class descriptor.

**Parameters:**

**ParamBlockDesc2\* pbd**

Points to the parameter block2 descriptor of the parameter block2 to add.

**Prototype:**

**void ClearParamBlockDescs();**

**Remarks:**

Implemented by the System.

Removes all the parameter block 2 descriptors maintained by this plug-in.

**Prototype:**

```
void BeginEditParams(IObjParam *ip, ReferenceMaker* obj,  
ULONG flags, Animatable *prev);
```

**Remarks:**

Implemented by the System.

This is a method of the base class ClassDesc. This class provides an implementation of the method used by plug-ins using the ParamBlock2 system.

This method is called to handle the beginning of the automatic command panel user interface management provided by the param map 2 system. This method is called by the plug-in from its **Animatable::BeginEditParams()** method. The parameters passed to that method are simply passed along to this method.

**Parameters:**

**IObjParam \*ip**

The interface pointer passed to the plug-in.

**ReferenceMaker\* obj**

Points to the plug-in class calling this method.

**ULONG flags**

The flags passed along to the plug-in in **Animatable::BeginEditParams()**.

**Animatable \*prev**

The pointer passed to the plug-in in **Animatable::BeginEditParams()**.

**Prototype:**

```
void EndEditParams(IObjParam *ip, ReferenceMaker* obj,  
ULONG flags, Animatable *prev);
```

**Remarks:**

Implemented by the System.

This is a method of the base class ClassDesc. This class provides an

implementation of the method used by plug-ins using the ParamBlock2 system.

This method is called to handle the ending of the automatic command panel user interface management provided by the param map 2 system. This method is called by the plug-in from its **Animatable::EndEditParams()** method. The parameters passed to that method are simply passed along to this method.

**Parameters:**

**IObjParam \*ip**

The interface pointer passed to the plug-in.

**ReferenceMaker\* obj**

Points to the plug-in class calling this method.

**ULONG flags**

The flags passed along to the plug-in in **Animatable::EndEditParams()**.

**Animatable \*prev**

The pointer passed to the plug-in in **Animatable::EndEditParams()**.

**Prototype:**

**void InvalidateUI();**

**Remarks:**

Implemented by the System.

This invalidates the entire UI for **every** parameter map of the plug-in.

**Prototype:**

**void InvalidateUI(ParamBlockDesc2\* pbd);**

**Remarks:**

Implemented by the System.

This is a method of the base class ClassDesc. This class provides an implementation of the method used by plug-ins using the ParamBlock2 system.

This is called if the user interface parameters needs to be updated. This invalidates the entire UI managed by the param map whose description is passed.

**Parameters:**

**ParamBlockDesc2\* pbd**

Points to the parameter block descriptor for the rollup.

**Prototype:**

```
void InvalidateUI(ParamBlockDesc2* pbd, ParamID id, int  
tabIndex=-1);
```

**Remarks:**

Implemented by the System.

This is called if a certain user interface parameter of the specified parameter map needs to be updated. The parameter ID of the control is passed. If the parameter is a Tab<> then the index into the table of the parameter is passed.

**Parameters:****ParamBlockDesc2\* pbd**

Points to the parameter block descriptor for the rollup.

**ParamID id**

The permanent parameter ID of the parameter.

**int tabIndex=-1**

If the parameter is a Tab<> then this is the zero based index into the table. The default value of -1 indicates it is not a table.

**Prototype:**

```
void MakeAutoParamBlocks(ReferenceMaker* owner);
```

**Remarks:**

Implemented by the System.

This is a method of the base class ClassDesc. This class provides an implementation of the method used by plug-ins using the ParamBlock2 system.

This method is called to create the parameter blocks for the plug-in.

**Parameters:****ReferenceMaker\* owner**

Points to the plug-in class calling this method.

**Prototype:**

**int NumParamMaps();**

**Remarks:**

Implemented by the System.

This is a method of the base class ClassDesc. This class provides an implementation of the method used by plug-ins using the ParamBlock2 system.

Returns the number of automatically-maintained parameter map2s.

**Prototype:**

**IParamMap2\* GetParamMap(ParamBlockDesc2\* pbd, MapID map\_id = 0);**

**Remarks:**

Implemented by the System.

This is a method of the base class ClassDesc. This class provides an implementation of the method used by plug-ins using the ParamBlock2 system.

Returns a pointer to the parameter map2 as specified by the parameter block2 pointer passed.

**Parameters:**

**ParamBlockDesc2\* pbd**

Points to the parameter block descriptor2 associated with this parameter map.

**MapID map\_id**

This parameter is available in release 4.0 and later only.

Specifies the ID of the map/rollout to get.

**Prototype:**

**IParamMap2\* GetParamMap(ParamBlockDesc2\* pbd);**

**Remarks:**

Implemented by the System.

This is a method of the base class ClassDesc. This class provides an implementation of the method used by plug-ins using the ParamBlock2 system.

Returns a pointer to the parameter map2 as specified by the parameter block2

pointer passed.

**Parameters:**

**ParamBlockDesc2\* pbd**

Points to the parameter block descriptor2 associated with this parameter map.

**Prototype:**

```
void SetUserDlgProc(ParamBlockDesc2* pbd,  
ParamMap2UserDlgProc* proc=NULL);
```

**Remarks:**

Implemented by the System.

This is a method of the base class ClassDesc. This class provides an implementation of the method used by plug-ins using the ParamBlock2 system.

This method allows the developer to provide special handling for controls not processed automatically by the parameter map (or those that need additional processing). The developer provides a dialog proc to process the messages from the controls. This method is used to tell the parameter map that the developer defined method should be called. The given proc will be called after default processing is done.

Note, in version 4.0 and later, this actually maps to a call on the explicit map ID overload of **SetUserDlgProc()** with default map ID of 0.

**Parameters:**

**ParamBlockDesc2\* pbd**

Points to the parameter block descriptor for the parameter map.

**ParamMap2UserDlgProc\* proc=NULL**

Points to the class derived from **ParamMap2UserDlgProc** which handles the controls.

**Prototype:**

```
void SetUserDlgProc(ParamBlockDesc2* pbd, MapID map_id,  
ParamMap2UserDlgProc* proc=NULL);
```

**Remarks:**

This method is available in release 4.0 and later only.

This overload of **SetUserDlgProc()** has a new parameter, **map\_id**, that specifies the ID of the parameter map/rollup to set the user dialog proc for. See original function for the rest of the description.

**Prototype:**

**ParamMap2UserDlgProc\* GetUserDlgProc(ParamBlockDesc2\* pbd, MapID map\_id = 0);**

**Remarks:**

Implemented by the System.

This is a method of the base class ClassDesc. This class provides an implementation of the method used by plug-ins using the ParamBlock2 system.

Returns a pointer to the user dialog proc associated with the parameter map as specified by the parameter block descriptor2 pointer.

**Parameters:**

**ParamBlockDesc2\* pbd**

Points to the parameter block descriptor for the parameter map.

**MapID map\_id**

This parameter is available in release 4.0 and later only.

Specifies the ID of the map/rollout to get the user dialog proc for.

**Prototype:**

**IAutoMParamDlg\* CreateParamDlgs(HWND hwMtlEdit, IMtlParams \*imp, MtlBase\* obj);**

**Remarks:**

Implemented by the System.

This method creates and returns a pointer to the object which handles the automatic processing of the user interface in the materials editor. This method loops over all parameter blocks which specify **AUTO\_UI** and makes the AutoMParamDlgs for them. The first one becomes the master and the others are added to it.

**Parameters:**

**HWND hwMtlEdit**

The window handle of the materials editor.

**IMtlParams \*imp**

The interface pointer provided for calling methods in 3ds max.

**MtlBase\* obj**

Points to the plug-in class calling this method.

**Prototype:**

**IAutoMParamDlg\* CreateParamDlg(BlockID id, HWND hwMtlEdit, IMtlParams \*imp, ReferenceTarget\* obj, MapID map\_id = 0);**

**Remarks:**

Implemented by the System.

This method creates and returns a pointer to the object which handles the automatic processing of the user interface in the materials editor. This method makes an AutoMParamDlg for the specified parameter block.

**Parameters:**

**BlockID id**

The permanent ID of the parameter block.

**HWND hwMtlEdit**

The window handle of the materials editor.

**IMtlParams \*imp**

The interface pointer provided for calling methods in 3ds max.

**MtlBase\* obj**

Points to the plug-in class calling this method.

**MapID map\_id**

This parameter is available in release 4.0 and later only.

Specifies the ID of the map/rollout in the parameter block to create AutoMParamDlg for.

**Prototype:**

**IAutoEParamDlg\* CreateParamDialogs(IRendParams \*ip, SpecialFX\* obj);**

**Remarks:**

Implemented by the System.

This method creates and returns a pointer to the object which handles the automatic processing of the user interface in the rendering effects dialog. This method loops over all parameter blocks which specify **AUTO\_UI** and makes the AutoMParamDlgs for them. The first one becomes the master and the others are added to it.

**Parameters:**

**IRendParams \*ip**

The interface pointer provided for calling methods in 3ds max.

**SpecialFX\* obj**

Points to the plug-in class calling this method. See [Class SpecialFX](#).

**Prototype:**

**IAutoEParamDlg\* CreateParamDialog(BlockID id, IRendParams \*ip, SpecialFX\* obj, MapID mapID=0);**

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

This method creates and returns a pointer to the object which handles the automatic processing of the user interface in the rendering effects dialog. This method makes an AutoEParamDlg for the specified parameter block.

**Parameters:**

**BlockID id**

The permanent ID of the parameter block.

**IRendParams \*ip**

The interface pointer provided for calling methods in 3ds max.

**SpecialFX\* obj**

Points to the plug-in class calling this method. See [Class SpecialFX](#).

**MapID map\_id**

Specifies the ID of the map/rollout in the parameter block to create AutoEParamDlg for.

**Prototype:**

**void MasterDlgDeleted(IAutoMParamDlg\* dlg);**

**Remarks:**

Implemented by the System.

This method is called when an AutoMParamDlg is deleted.

**Parameters:**

**IAutoMParamDlg\* dlg**

Pointer to the object which handles the automatic processing of the user interface in the materials editor.

**Prototype:**

**void MasterDlgDeleted(IAutoEParamDlg\* dlg);**

**Remarks:**

Implemented by the System.

This method is called when an AutoEParamDlg is deleted.

**Parameters:**

**IAutoEParamDlg\* dlg**

Pointer to the object which handles the automatic processing of the user interface in the rendering effects dialog.

**Prototype:**

**IAutoMParamDlg\* GetMParamDlg();**

**Remarks:**

Implemented by the System.

Returns the master dialog processing routine for the materials editor plug-in.

**Prototype:**

**IAutoEParamDlg\* GetEParamDlg();**

**Remarks:**

Implemented by the System.

Returns the master dialog processing routine for the rendering effects plug-in.

**Prototype:**

**void RestoreRolloutState();**

**Remarks:**

This method may be called to restore any saved rollout state (open/closed condition and scrolling position) for any parameter map maintained by the plug-in.

**Prototype:**

**ParamID LastNotifyParamID(ReferenceMaker\* owner,  
IParamBlock2\*& pb);**

**Remarks:**

This method scans all the parameter blocks in the owner and returns the ParamID and parameter block making the most recent change notification.

**Parameters:**

**ReferenceMaker\* owner**

The owner of the parameter blocks.

**IParamBlock2\*& pb**

The parameter block which made the most recent notification.

**Return Value:**

The parameter ID of the parameter which made the most recent notification.

**Prototype:**

**void Reset(ReferenceMaker\* owner, BOOL updateUI = TRUE,  
BOOL callSetHandlers = TRUE);**

**Remarks:**

This method may be called to reset all the parameters of all know parameter blocks to their default values and optionally update the user interface.

**Parameters:**

**ReferenceMaker\* owner**

The owner of this ClassDesc2.

**BOOL updateUI = TRUE**

If TRUE to user inteface is updated. If FALSE it's not.

**BOOL callSetHandlers = TRUE**

TRUE to call **PBAccessor::Set()** for all the parameters; otherwise FALSE.

**Prototype:**

**void GetValidity(ReferenceMaker\* owner, TimeValue t, Interval &valid);**

**Remarks:**

This method updates the validity interval passed with the cumulative validity interval of all the owner's parameter blocks.

**Parameters:**

**ReferenceMaker\* owner**

The owner of this ClassDesc2.

**TimeValue t**

The time about which to compute the interval.

**Interval &valid**

The interval to update.

**The following functions are not part of this class but are available for use.**

**Function:**

**IParamBlock2 \*CreateParameterBlock2(ParamBlockDesc2 \*pdesc, ReferenceMaker\* iowner);**

**Remarks:**

This method is used to create a parameter block2.

**Parameters:**

**ParamBlockDesc2 \*pdesc**

This is an array of parameter block descriptors.

**ReferenceMaker\* iowner**

Points to the owner of the parameter block.

**Return Value:**

A pointer to the created parameter block. On error NULL is returned.

**Function:**

**IParamBlock2\* UpdateParameterBlock2(ParamBlockDescID \*pdescOld, int oldCount, IParamBlock \*oldPB, ParamBlockDesc2\* pdescNew, IParamBlock2\* newPB=NULL);**

**Remarks:**

This function creates a new ParamBlock2, based on an existing ParamBlock of an earlier version. The new parameter block inherits any parameters from the old parameter block whose parameter IDs match. This may also be used to partially update an existing ParamBlock2.

**Parameters:**

**ParamBlockDescID \*pdescOld**

The array of parameter block descriptors which describes each parameter in the old parameter block.

**int oldCount**

The number of elements in the array above.

**IParamBlock \*oldPB**

The old parameter block.

**ParamBlockDesc2\* pdescNew**

Points to the new parameter block 2 descriptor.

**IParamBlock2\* newPB=NULL**

Points to an existing IParamBlock2 indicating that this paramblock should be filled in from the old ParamBlock, rather than creating a new one.

**Return Value:**

The new parameter block2.

**Function:**

**void SetPB2MacroRecorderInterface(MacroRecorder\* mri);**

**Remarks:**

This function for internal use only.

## Class ModContext

See Also: [Class LocalModData](#).

```
class ModContext : public BaseInterfaceServer
```

### Description:

The ModContext stores information about the space the modifier was applied in, and allows the modifier to store data it needs for its operation. All methods are implemented by the system.

### Data Members:

public:

#### **Matrix3 \*tm;**

This matrix represents the space the modifier was applied in. The modifier plug-in uses this matrix when it deforms an object. The plug-in first transforms the points with this matrix. Next it applies its own deformation. Then it transforms the points back through the inverse of this transformation matrix.

#### **Box3 \*box;**

The Bounding Box of the Deformation. This represents the scale of the modifier. For a single object it is the bounding box of the object. If the modifier is being applied to a sub-object selection it represents the bounding box of the sub-object selection. If the modifier is being applied to a selection set of objects, then this is the bounding box of the entire selection set. For a selection set of objects the bounding box is constant. In the case of a single object, the bounding box is not constant.

#### **LocalModData \*localData;**

A pointer to an instance of a class derived from the LocalModData class. This is the part of the ModContext that the plug-in developer controls. It is the place where a modifier may store application specific data.

### Methods:

### Prototype:

```
ModContext();
```

### Remarks:

Constructor. The transformation matrix, bounding box, and local data pointer

are initialized to NULL.

**Prototype:**

**~ModContext();**

**Remarks:**

Destructor. The tm, bounding box and local data are freed.

**Prototype:**

**ModContext(const ModContext& mc);**

**Remarks:**

Constructor. The tm, bounding box and local data are initialized to those of the specified ModContext.

**Parameters:**

**const ModContext& mc**

The ModContext to copy.

**Prototype:**

**ModContext(Matrix3 \*tm, Box3 \*box, LocalModData \*localData);**

**Remarks:**

Constructor. The tm, bounding box, and local data are initialized to those specified.

**Parameters:**

**Matrix3 \*tm**

The transform matrix to copy.

**Box3 \*box**

The bounding box to copy.

**LocalModData \*localData**

The local data that will be cloned.

## Class ObjectState

See Also: [Class Object](#), [Class Matrix3](#).

class ObjectState

### Description:

The ObjectState is the structure that flows up the geometry pipeline. It contains a matrix, a material index, some flags for channels, and a pointer to the object in the pipeline.

### Data Members:

public:

**Object \*obj;**

This is a pointer to the object in the pipeline. The validity interval of the object can be retrieved using **obj->ObjectValidity()**.

### Methods:

#### Prototype:

**ObjectState();**

#### Remarks:

Constructor. The object pointer is initialized to NULL.

#### Prototype:

**ObjectState(Object \*ob);**

#### Remarks:

Constructor. The object pointer is set to the object passed. The tm pointer is set to NULL and the tm and mtl validity intervals are set to **FOREVER**.

#### Parameters:

**Object \*ob**

The object to initialize the object pointer to.

#### Prototype:

**ObjectState(const ObjectState& os);**

#### Remarks:

Constructor. The object state is initialized to the object state passed.

**Parameters:**

**const ObjectState& os**

The object state to initialized to **os**.

**Prototype:**

**~ObjectState();**

**Remarks:**

Destructor. If the **tm** exists, it is deleted.

**Prototype:**

**void OSSetFlag(ulong f);**

**Remarks:**

Call this method to update the object state flags.

**Parameters:**

**ulong f**

The flags to set. The specified flags are ORed into the current state of the flags.

**Prototype:**

**void OSClearFlag(ulong f);**

**Remarks:**

Call this method to clear the specified object state flags.

**Parameters:**

**ulong f**

The flags to clear.

**Prototype:**

**ulong OSTestFlag(ulong f) const;**

**Remarks:**

Call this method to test the specified flags.

**Parameters:**

**ulong f**

The flags to test.

**Return Value:**

Nonzero if the specified flags are all set; otherwise 0.

**Prototype:**

**void OSCopyFlag(ulong f, const ObjectState& fromos);**

**Remarks:**

Copies the specified flag settings from the specified object state to this object state.

**Parameters:**

**ulong f**

The flags to copy.

**const ObjectState& fromos**

The source object state.

**Prototype:**

**Interval tmValid() const**

**Remarks:**

Returns the validity interval of the object state's transformation matrix.

**Prototype:**

**Interval mtlValid() const;**

**Remarks:**

Returns the validity interval of the object state's material.

**Prototype:**

**Interval Validity(TimeValue t) const;**

**Remarks:**

Returns the validity interval of the object state. If the object is not defined, this interval is NEVER. Otherwise it is the intersection of the tm validity interval,

the mtl validity interval and the interval returned from obj->ObjectValidity(t).

**Parameters:**

**TimeValue t**

Specifies the time to retrieve the validity interval.

**Return Value:**

The validity interval of the object state.

**Prototype:**

**int TMIsIdentity() const;**

**Remarks:**

Returns nonzero if the object state's transformation matrix is the identity matrix; otherwise zero.

**Prototype:**

**void SetTM(Matrix3\* mat, Interval iv);**

**Remarks:**

Sets the object state's transformation matrix to the specified Matrix3 and its validity interval to the interval passed. If the specified matrix is NULL, a new Matrix3 is allocated and is initialized to the identity matrix.

**Parameters:**

**Matrix3\* mat**

Specifies the matrix to set.

**Interval iv**

Specifies the validity interval to set.

**Prototype:**

**Matrix3\* GetTM() const;**

**Remarks:**

Returns the object state's transformation matrix.

**Prototype:**

**void SetIdentityTM();**

**Remarks:**

Sets the object state tm to the identity transformation matrix.

**Prototype:**

```
void ApplyTM(Matrix3* mat, Interval iv);
```

**Remarks:**

Applies the specified matrix to the object state tm. The object state tm is multiplied by the specified matrix. The specified interval is intersected with the object state tm validity interval.

**Parameters:**

**Matrix3\* mat**

The matrix to apply.

**Interval iv**

The interval to intersect with the object state's tm validity interval.

**Prototype:**

```
void CopyTM(const ObjectState &fromos);
```

**Remarks:**

Copies the object state tm (and its validity interval) from the specified object state's tm.

**Parameters:**

**const ObjectState &fromos**

The object state whose tm is to be copied.

**Prototype:**

```
void CopyMtl(const ObjectState &fromos);
```

**Remarks:**

Copies the object state material (and its validity interval) from the specified object state's material.

**Parameters:**

**const ObjectState &fromos**

The object state whose material is to be copied.

**Prototype:**

```
void Invalidate(ChannelMask channels, BOOL  
checkLock=FALSE);
```

**Remarks:**

Invalidates the specified channels of the object state's object.

**Parameters:**

**ChannelMask channels**

The channels of the object to invalidate.

**BOOL checkLock=FALSE**

If **checkLock** is TRUE and **OBJ\_CHANNELS** is one of the specified channels, the object the object state points to is not deleted if it is locked; otherwise it is deleted.

**Prototype:**

```
void DeleteObj(BOOL checkLock=FALSE);
```

**Remarks:**

Deletes the object state's object.

**Parameters:**

**BOOL checkLock=FALSE**

If **checkLock** is TRUE, the object the object state points to is not deleted if it is locked; otherwise it is always deleted.

**Operators:****Prototype:**

```
ObjectState& operator=(const ObjectState& os);
```

**Remarks:**

Assignment operator. The object pointer, flags, transformation matrix (and its validity interval), and material (and its validity interval) are copied from the specified object state.

## Class LocalModData

See Also: [Class ModContext](#).

```
class LocalModData : public InterfaceServer
```

### Description:

This class allows a modifier to store application specific data. A reference to a pointer to an instance of this class is passed in to **ModifyObject()** as part of the **ModContext**. The value of the pointer starts out as NULL, but the modifier can set it to point at an actual instance of a derived class. When the mod app is deleted, if the pointer is not NULL, the **LocalModData** will be deleted - the virtual destructor allows this to work.

### Methods:

#### Prototype:

```
virtual ~LocalModData()
```

#### Remarks:

Implemented by the Plug-In.

A plug-in using local data should implement this method to free its local data.

#### Prototype:

```
virtual LocalModData *Clone()=0;
```

#### Remarks:

Implemented by the Plug-In.

This method is called to allow a plug-in to copy its local data. It is called when the system is copying a **ModContext**.

#### Return Value:

The plug-in should return a pointer to a new instance of its LocalModData.

## List of Channel Bits

See Also: [The Geometry Pipeline System](#), [Object Modification](#), [Class Mesh](#), [List of Object Channels](#).

The pipeline is divided into the following channels:

### **GEOM\_CHANNEL**

The vertices of the object. Most modifiers only alter this channel.

### **TOPO\_CHANNEL**

The topology channel, i.e. the face or polygon structures. Smoothing groups and materials are also part of this channel. Edge visibility is also part of this channels since it is an attribute of the face structure.

### **TEXMAP\_CHANNEL**

The texture vertices and procedural mappings.

### **MTL\_CHANNEL**

This is no longer used. Materials are rolled into the Face data structure and are part of the topology channel.

### **SELECT\_CHANNEL**

The sub-object selection channel. An object's selection flows down the pipeline. What the selection is actually comprised of is up to the specific object type. For example, TriObjects have bits for face, edge and vertex selection. This channel is the actual **BitArray** used (like **selLevel** of the **Mesh** class).

### **SUBSEL\_TYPE\_CHANNEL**

This is the current level of selection. Every object that flows down the pipeline is at a certain level that corresponds to the Sub-Object drop down in the 3ds max user interface. This channel indicates which level the object is at. This is also specific to the object type. There are 32 bits to represent the level of selection. When all the bits are 0, the object is at object level selection.

### **DISP\_ATTRIB\_CHANNEL**

These are miscellaneous bits controlling the item's display. These bits are specific to the type of object. For the Mesh object these are the surface normal scale, display of surface normals, edge visibility and display flags.

### **EXTENSION\_CHANNEL**

This channel is available in release 4.0 and later only.

This is the channel used by extension channel objects.

## **VERTCOLOR\_CHANNEL**

This is the color per vertex channel. This is also used for the second texture mapping channel.

## **GFX\_DATA\_CHANNEL**

This channel is used internally by 3ds max for stripping. Plug-In developers don't need to specify this channel as being changed or used in their plug-ins.

## **TM\_CHANNEL**

This is the ObjectState TM that flows down the pipeline. This TM may be modified by modifiers.

## **GLOBMTL\_CHANNEL**

This is no longer used. Materials are rolled into the Face data structure and are part of the topology channel.

The following **#defines** may be used to specify groups of channels:

```
#define OBJ_CHANNELS (TOPO_CHANNEL |  
GEOM_CHANNEL | SELECT_CHANNEL |  
TEXMAP_CHANNEL | MTL_CHANNEL |  
SUBSEL_TYPE_CHANNEL | DISP_ATTRIB_CHANNEL |  
VERTCOLOR_CHANNEL | GFX_DATA_CHANNEL |  
DISP_APPROX_CHANNEL | EXTENSION_CHANNEL)  
#define ALL_CHANNELS  
(OBJ_CHANNELS|TM_CHANNEL|GLOBMTL_CHANNEL)
```

Note: Some of the sample code specifies these channels as **PART\_\*** as opposed to **\*\_CHANNEL**. For example, **PART\_GEOM|PART\_TOPO** instead of **GEOM\_CHANNEL|TOPO\_CHANNEL**. The proper usage is the **\*\_CHANNEL** version.

## List of Viewport Drawing Color Indices

See Also: Advanced Topics section [Getting and Setting User Preferences](#).

The following values may be used to indicate which color is returned by the various APIs for getting and setting user interface drawing colors.

**COLOR\_SELECTION**

**COLOR\_SUBSELECTION**

**COLOR\_FREEZE**

**COLOR\_GRID**

**COLOR\_GRID\_INTENS**

**COLOR\_SF\_LIVE**

**COLOR\_SF\_ACTION**

**COLOR\_SF\_TITLE**

**COLOR\_VP\_LABELS**

**COLOR\_VP\_INACTIVE**

**COLOR\_ARCBALL**

**COLOR\_ARCBALL\_HILITE**

**COLOR\_ANIM\_BUTTON**

**COLOR\_SEL\_BOXES**

**COLOR\_LINK\_LINES**

**COLOR\_TRAJECTORY**

**COLOR\_ACTIVE\_AXIS**

**COLOR\_INACTIVE\_AXIS**

**COLOR\_SPACE\_WARPS**

**COLOR\_DUMMY\_OBJ**

**COLOR\_POINT\_OBJ**

**COLOR\_POINT\_AXES**

**COLOR\_TAPE\_OBJ**

**COLOR\_BONES**

**COLOR\_GIZMOS**

**COLOR\_SEL\_GIZMOS**  
**COLOR\_SPLINE\_VECS**  
**COLOR\_SPLINE\_HANDLES**  
**COLOR\_PATCH\_LATTICE**  
**COLOR\_PARTICLE\_EM**  
**COLOR\_CAMERA\_OBJ**  
**COLOR\_CAMERA\_CONE**  
**COLOR\_CAMERA\_HORIZ**  
**COLOR\_NEAR\_RANGE**  
**COLOR\_FAR\_RANGE**  
**COLOR\_LIGHT\_OBJ**  
**COLOR\_TARGET\_LINE**  
**COLOR\_HOTSPOT**  
**COLOR\_FALLOFF**  
**COLOR\_START\_RANGE**  
**COLOR\_END\_RANGE**  
**COLOR\_VIEWPORT\_BKG**  
**COLOR\_TRAJ\_TICS\_1**  
**COLOR\_TRAJ\_TICS\_2**  
**COLOR\_TRAJ\_TICS\_3**  
**COLOR\_GHOST\_BEFORE**  
**COLOR\_GHOST\_AFTER**  
**COLOR\_12FIELD\_GRID**  
**COLOR\_START\_RANGE1**  
**COLOR\_END\_RANGE1**  
**COLOR\_CAMERA\_CLIP**  
**COLOR\_NURBS\_CV**  
**COLOR\_NURBS\_LATTICE**  
**COLOR\_NURBS\_CP**  
**COLOR\_NURBS\_FP**

**COLOR\_NURBS\_DEP**  
**COLOR\_END\_EFFECTOR**  
**COLOR\_END\_EFFECTOR\_STRING**  
**COLOR\_JOINT\_LIMIT\_SEL**  
**COLOR\_JOINT\_LIMIT\_UNSEL**  
**COLOR\_IK\_TERMINATOR**  
**COLOR\_SF\_USER**

The following indicies are available in R3 and later only.

**COLOR\_VERT\_TICKS**  
**COLOR\_XRAY**  
**COLOR\_GROUP\_OBJ**  
**COLOR\_MANIPULATOR\_X**  
**COLOR\_MANIPULATOR\_Y**  
**COLOR\_MANIPULATOR\_Z**  
**COLOR\_MANIPULATOR\_ACTIVE**  
**COLOR\_VPT\_CLIPPING**  
**COLOR\_DECAY\_RADIUS**  
**COLOR\_VERT\_NUMBERS**  
**COLOR\_CROSSHAIR\_CURSOR**  
**COLOR\_SV\_WINBK**  
**COLOR\_SV\_NODEBK**  
**COLOR\_SV\_SELNODEBK**  
**COLOR\_SV\_NODE\_HIGHLIGHT**  
**COLOR\_SV\_MATERIAL\_HIGHLIGHT**  
**COLOR\_SV\_MODIFIER\_HIGHLIGHT**  
**COLOR\_SV\_PLUGIN\_HIGHLIGHT**  
**COLOR\_SV\_SUBANIM\_LINE**  
**COLOR\_SV\_CHILD\_LINE**  
**COLOR\_SV\_FRAME**  
**COLOR\_SV\_SELTEXT**

**COLOR\_SV\_TEXT**  
**COLOR\_UNSEL\_TAB**  
**COLOR\_ATMOS\_APPARATUS**  
**COLOR\_SUBSELECTION\_HARD**  
**COLOR\_SUBSELECTION\_MEDIUM**  
**COLOR\_SUBSELECTION\_SOFT**  
**COLOR\_SV\_UNFOLD\_BUTTON**  
**COLOR\_SV\_GEOMOBJECT\_BK**  
**COLOR\_SV\_LIGHT\_BK**  
**COLOR\_SV\_CAMERA\_BK**  
**COLOR\_SV\_SHAPE\_BK**  
**COLOR\_SV\_HELPER\_BK**  
**COLOR\_SV\_SYSTEM\_BK**  
**COLOR\_SV\_CONTROLLER\_BK**  
**COLOR\_SV\_MODIFIER\_BK**  
**COLOR\_SV\_MATERIAL\_BK**

# Class HitRecord

See Also: [Class HitLog](#), [Class HitData](#).

class HitRecord

## Description:

This class provides a data structure used during sub-object hit-testing.

## Friend Class:

class HitLog

## Data Members:

public:

**Inode \*nodeRef;**

Points the node that was hit.

**ModContext \*modContext;**

Points to the ModContext of the modifier.

**DWORD distance;**

The 'distance' of the hit. To classify as a hit, the sub-object component must be within some threshold distance of the mouse. This distance is recorded in the hit record so that the closest of all the hits can be identified. What the distance actually represents depends on the rendering level of the viewport. For wireframe modes, it refers to the distance in the screen XY plane from the mouse to the sub-object component. In a shaded mode, it refers to the Z depth of the sub-object component. In both cases, smaller values indicate that the sub-object component is 'closer' to the mouse cursor.

**ulong hitInfo;**

A general unsigned long value. Most modifiers will just need this to identify the sub-object element. The edit mesh modifier uses the value to store the index of the vertex or face that was hit for example.

**HitData \*hitData;**

In case 4 bytes is not enough space to identify the sub-object element, this pointer is available. To use this, a developer would define a class derived from HitData that would contain the necessary data. The HitData class has one member function, a virtual destructor, so the derived class can be properly deleted when the HitRecord instance is deleted.

**Methods:**

**Prototype:**

**HitRecord();**

**Remarks:**

Constructor. The following initialization is performed: **next = NULL;**  
**modContext = NULL; distance = 0; hitInfo = 0; hitData = NULL;**

**Prototype:**

**HitRecord(INode \*nr, ModContext \*mc, DWORD d, long inf,  
HitData \*hitdat)**

**Remarks:**

Constructor. The data members are initialized to the data passed.

**Prototype:**

**HitRecord \*Next();**

**Remarks:**

Implemented by the System.

Each **HitRecord** maintains a pointer to another **HitRecord**. This method returns the next hit record.

**Prototype:**

**~HitRecord();**

**Remarks:**

Implemented by the System.

Destructor. If **HitData** has been allocated, it is deleted as well.

# Class HitRegion

See Also: [Data Types](#).

class HitRegion

## Description:

This class describes the properties of a region used for built-in hit testing of items in the interactive renderer.

## Data Members:

public:

### int type;

The region type. One of the following values:

#### **POINT\_RGN**

A single point.

#### **RECT\_RGN**

A rectangular region.

#### **CIRCLE\_RGN**

A circular region.

#### **FENCE\_RGN**

An arbitrary multi-point polygon region.

### int crossing;

If nonzero, elements that are contained within **or cross** the region boundary are hit. If zero, only those elements **entirely within** the boundary are hit. This is not used for point hit testing.

### int epsilon;

Specifies the distance in pixels outside the pick point within which elements may be and still be hit. This is not used for rect, circle, or fence hit testing.

### union {

**POINT** pt;

**RECT** rect;

**CIRCLE** circle;

**POINT** \*pts;

};

The storage for the region.

## Class HitLog

See Also: [Class HitRecord](#), [Class HitData](#).

class HitLog

### Description:

This class provides a data structure for keeping a log of hits during sub-object hit-testing. It provides a list of **HitRecords** that may be added to and cleared. A developer may also request the 'closest' hit record in the list.

### Methods:

#### Prototype:

**HitLog();**

#### Remarks:

Constructor. The list of HitRecords is set to NULL.

#### Prototype:

**~HitLog();**

#### Remarks:

Destructor. Clears the hit log.

#### Prototype:

**void Clear();**

#### Remarks:

Clears the log of hits by deleting the list of HitRecords.

#### Prototype:

**HitRecord\* First();**

#### Remarks:

Implemented by the System.

Returns the first **HitRecord**.

#### Prototype:

## **HitRecord\* ClosestHit();**

### **Remarks:**

Implemented by the System.

Returns the **HitRecord** that was 'closest' to the mouse position when hit testing was performed. This is the **HitRecord** with the minimum **distance**.

### **Prototype:**

```
void LogHit(INode *nr, ModContext *mc,  
            DWORD dist, ulong info, HitData *hitdat = NULL);
```

### **Remarks:**

Implemented by the System.

This method is called to log a hit. It creates a new **HitRecord** object using the data passed and adds it to the hit log.

### **Parameters:**

#### **INode \*nr**

The node that was hit.

#### **ModContext \*mc**

The ModContext of the modifier.

#### **DWORD dist**

The 'distance' of the hit. What the distance actually represents depends on the rendering level of the viewport. For wireframe modes, it refers to the distance in the screen XY plane from the mouse to the sub-object component. In a shaded mode, it refers to the Z depth of the sub-object component. In both cases, smaller values indicate that the sub-object component is 'closer' to the mouse cursor.

#### **ulong info**

Identifies the sub-object component that was hit.

#### **HitData \*hitdat = NULL**

If the info field is insufficient to indicate the sub-object component that was hit, pass an instance of the **HitData** class that contains the needed information.

# Class Light

See Also: [Data Types](#).

```
class Light : public BaseInterfaceServer
```

## Description:

This class describes the lights used in the interactive renderer. All methods of this class are implemented by the system.

## Methods:

## Prototype:

```
Light();
```

## Remarks:

Class constructor. Sets the default values of the light.

```
type = OMNI_LGT;  
attenType = NO_ATTEN;  
atten = (float)0.0;  
intensity = (float)1.0;  
angle = (float)30.0;  
color[0] = (float)1.0;  
color[1] = (float)1.0;  
color[2] = (float)1.0;
```

## Data Members:

public:

```
LightType type;
```

One of the following values:

```
OMNI_LGT
```

Omni-directional.

```
SPOT_LGT
```

Spot light.

```
DIRECT_LGT
```

Directional light.

```
AMBIENT_LGT
```

Ambient light - global illumination.

**Point3 color;**

The color of the light. Individual values are from 0.0 to 1.0 with 1.0 as white.

**Attenuation attenType;**

Attenuation is not currently implemented. A developer should pass **NO\_ATTEN**.

**float atten;**

Note: Attenuation is not currently implemented.

Light attenuation factor.

**float intensity;**

Light multiplier factor.

**float angle;**

Angle of cone for spot and cone lights in degrees.

**int shape;**

One of the following values:

**GW\_SHAPE\_RECT** - Rectangular spotlights.

**GW\_SHAPE\_CIRCULAR** - Circular spotlights.

**float aspect;**

The aspect ratio of the light.

**int overshoot;**

Nonzero indicates the light supports overshoot; otherwise 0.

**BOOL affectDiffuse;**

This data member is available in release 2.0 and later only.

This defaults to TRUE, but if the user set it to FALSE in the light modifier panel, then the

light is not supposed to illuminate the diffuse component of an object's material.

**BOOL affectSpecular;**

This data member is available in release 2.0 and later only.

This defaults to TRUE, but if the user set it to FALSE in the light modifier panel, then the

light is not supposed to illuminate the specular component of an object's material.

# Class Interval

See Also: Advanced Topics sections on [Intervals](#) and [Time](#).

class Interval

## Description:

An Interval is a class that represents a length of time. It has two private data members, start and end that are each TimeValues. A TimeValue is a single instant in time. For more explanation see the Advanced Topics section on [Intervals](#). All the methods of this class are implemented by the system.

Definitions:

```
#define FOREVER Interval(TIME_NegInfinity,  
TIME_PosInfinity)  
#define NEVER Interval(TIME_NegInfinity, TIME_NegInfinity)
```

## Methods:

### Prototype:

```
Interval(TimeValue s, TimeValue e )
```

### Remarks:

Constructor that assigns both the start and end times of the interval. If TimeValue **e** is less than TimeValue **s** the values are swapped before they are assigned.

### Parameters:

**TimeValue s**

Specifies the start time.

**TimeValue e**

Specifies the end time.

### Prototype:

```
Interval()
```

### Remarks:

Constructor that returns an **EMPTY** interval, i.e. having a start and end time equal to **TIME\_NegInfinity**

**Prototype:****int InInterval(const TimeValue t);****Remarks:**

Return Nonzero if the TimeValue passed is greater than or equal to the start value and less than or equal to the end value and not equal to **TIME\_NegInfinity**. Returns 0 otherwise.

**Parameters:****const TimeValue t****Return Value:**

Nonzero if the TimeValue passed is greater than or equal to the start value and less than or equal to the end value and not equal to **TIME\_NegInfinity**; otherwise 0.

**Prototype:****int InInterval(const Interval interval)****Remarks:**

Returns nonzero if the interval passed is contained within the interval; otherwise 0.

```
return InInterval( interval.Start() ) && InInterval( interval.End() );
```

**Parameters:****const Interval interval**

The interval to check.

**Return Value:**

Returns nonzero if the interval passed is contained within the interval; otherwise 0.

**Prototype:****int Empty()****Remarks:**

Returns 1 if the interval is **EMPTY**, i.e. has a start and end time equal to **TIME\_NegInfinity**. Returns 0 otherwise.

**Prototype:**

**void Set(TimeValue s, TimeValue e)**

**Remarks:**

Sets the start and end times for the interval.

**Parameters:**

**TimeValue s**

Start time for the interval.

**TimeValue e**

End time for the interval.

**Prototype:**

**void SetStart(TimeValue s)**

**Remarks:**

Sets the start value only.

**Parameters:**

**TimeValue s**

Start time for the interval.

**Prototype:**

**void SetEnd(TimeValue e)**

**Remarks:**

Sets the end value only.

**Parameters:**

**TimeValue e**

End time for the interval.

**Prototype:**

**void SetEmpty()**

**Remarks:**

Sets the interval to be **EMPTY**, i.e. having a start and end time equal to **TIME\_NegInfinity**.

**Prototype:**

**void SetInfinite()**

**Remarks:**

Sets the interval to be **FOREVER**, i.e. have a start time equal **TIME\_NegInfinity** and end time equal to **TIME\_PosInfinity**.

**Prototype:**

**void SetInstant(const TimeValue t)**

**Remarks:**

Sets both the start and end times to the time passed.

**Prototype:**

**TimeValue Start()**

**Remarks:**

Returns the start time of the interval.

**Prototype:**

**TimeValue End()**

**Remarks:**

Returns the end time of the interval.

**Prototype:**

**TimeValue Duration()**

**Remarks:**

Implemented by the System.

Returns the duration of the interval (end points included).

**Operators:**

**Prototype:**

**int operator==(const Interval& i)**

**Remarks:**

Checks for equality between two Intervals.

**Return Value:**

Nonzero if the intervals are equal; otherwise 0.

**Prototype:**

**Interval operator&(const Interval i) const;**

**Remarks:**

Intersects **Interval** and i. The interval will have a start time of the greater of the two interval start times, and an end value which is the lesser of the two end values. If the end time is less than the start time, both the start and end times are set to **TIME\_NegInfinity**.

**Return Value:**

An Interval that is the intersection of the intervals.

**Prototype:**

**Interval& operator&=(const Interval i)**

**Remarks:**

This updates the invoking interval so it will have a start time of the greater of the two interval start times, and an end value which is the lesser of the two end values.

**return (\*this = (\*this&i));**

**Prototype:**

**Interval& operator+=(const TimeValue t)**

**Remarks:**

Expands the **Interval** to include the TimeValue.

**if (t<start) start=t; if (t>end) end=t; return \*this;**

## Class IKChainActions

See Also: : [Class IKCmdOps](#), [Class IIKChainControl](#)

class IKChainActions : public FPStaticInterface

### Description:

**This class is only available in release 5 or later.**

The program interface to actions on IK chain nodes, which **IKCmdOps::CreateIKChain()** returns. An macro is defined to obtain a pointer to the interface:

```
IKChainActions* ikchainAction =  
GET_IKCHAIN_FP_INTERFACE;
```

It should be a valid pointer provided the IK system is successfully loaded.

The methods are mainly designed to connect to the UI and script. However, they can be called programmatically as well. The action methods, those that return **FPStatus**, assume that a unique IK chain node is currently selected and apply action to it. Before an action method is called, **IsSnapEnabled()** must be called to test whether a unique IK chain node is being selected. Such as:

```
if (ikchainAction->IsSnapEnabled())  
    ikchainAction->SetPreferredAngles();
```

### Methods:

#### Prototype:

```
virtual FPStatus SetPreferredAngles()
```

#### Remarks:

It sets the preferred angles of all bones on the chain to the corresponding joint

angles currently in force, which can be FK or IK depending the state of Enabled.

**Prototype:**

**virtual FPStatus IKSnapAction()**

**Remarks:**

Applies IK Snapping, which sets IK goal and other parameters, such as the swivel angle, according to the current state of the bone chain. Moreover, it invokes **SetPreferredAngles()**.

**Prototype:**

**virtual FPStatus FKSnapAction()**

**Remarks:**

Applies FK Snapping, which assigns the currently active joint angles to the corresponding FK angles. Moreover, it invokes **SetPreferredAngles()**.

**Prototype:**

**virtual FPStatus SnapAction()**

**Remarks:**

It applies **IKSnapAction()** if IK Enabled is currently off, and **FKSnapAction()** if IK Enabled is on.

**Prototype:**

**virtual FPStatus ToggleEnabled()**

**Remarks:**

Toggles IK Enabled state. If the AutoSnap parameter of the IK chain is true, it will invoke **SnapAction()** before toggling the Enabled state.

**Prototype:**

**virtual FPStatus AssumePreferredAngles()**

**Remarks:**

It assigns the preferred angles to the corresponding FK angles and then turn off IK Enabled.

## Class IKSolver

See Also: [Class BaseInterfaceServer](#), [Class ZeroPlaneMap](#), [Class LinkChain](#), [Inverse Kinematics](#)

```
class IKSolver : public BaseInterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

This class represents the base class that IK Solver plugins should derive from.

The IK solver is a pure mathematical function and does not hold state, but instead just solves a given, self-contained, mathematical problem, e.g. the plugin solver does not have influence on when IK is invoked and what an IK problem is (what is the goal and what are the joints, etc.), but contributes to IK by providing an answer on how to solve. Structurally, it is independent of the SDK and, hence, can be built independently, except for some theoretically independent math library. See the Inverse Kinematics section for more detailed information.

### Methods:

public:

### Prototype:

```
virtual ~IKSolver();
```

### Remarks:

Destructor.

## Class Identity

### Prototype:

```
virtual SClass_ID SuperClassID();
```

### Remarks:

Plugins derived from this class are supposed to have

**IK\_SOLVER\_CLASS\_ID** as their super class ID. This method should not be overridden.

### Default Implementation:

```
{ return IK_SOLVER_CLASS_ID; }
```

**Prototype:**

```
virtual Class_ID ClassID() = 0;
```

**Remarks:**

Implemented by the plug-in.

Returns the class ID of the IK Solver plugin.

**Prototype:**

```
virtual void GetClassName(TSTR& s);
```

**Remarks:**

Implemented by the plug-in.

This method returns the class name of the IK Solver plugin. This name will appear in the solver list from which users can pick or assign IK chains.

**Parameters:**

**TSTR& s**

The class name string.

**Default Implementation:**

```
{ s = TSTR(_T("IKSolver")); }
```

## Solver Traits

**Prototype:**

```
virtual bool IsInteractive() const = 0;
```

**Remarks:**

Implemented by the plug-in.

This method indicates whether the IK Solver is a controller or an interactive manipulation tool. In the former, the relationship between the goal and the joints are permanent: joints are completely controlled by the goal. In the latter, the relationship is transient, existing only during interactive manipulation. In the end, IK solutions are registered at each joint, mostly likely as key-frames, and it no longer matters how joints have got their joint angles. Only non-

interactive, or controller, IK solvers are supported in R4. Note that Interactive solvers do not need an initial pose, instead it needs a current pose.

**Return Value:**

TRUE if the IK Solver is an interactive tool, otherwise FALSE.

**Prototype:**

**virtual bool IsHistoryDependent() const = 0;**

**Remarks:**

Implemented by the plug-in.

At a specific point in time, the history dependent solver will reach solutions not only based the state of the goal at the time, but also its previous states (i.e. history dependent). On the contrary, the history independent solver does its job based on the state of the goal just at the time. The procedural implication is that, when the goal is changed at time t, the IK system would have to invalidate joints at time t for the history independent solver, and at all times that are greater or equal to t for the history dependent solver. In R4, only history dependent solvers are used by the IK system.

**Return Value:**

TRUE if the IK Solver is history dependent, otherwise FALSE.

**Prototype:**

**virtual bool UseSlidingJoint() const = 0;**

**Remarks:**

Implemented by the plug-in.

This method indicates whether the IK Solver intends to use the sliding joint (translational degrees of freedom) of the IK chain.

**Return Value:**

TRUE if the sliding joint of the IK chain is used, otherwise FALSE.

**Prototype:**

**virtual bool UseSwivelAngle() const = 0;**

**Remarks:**

Implemented by the plug-in.

This method indicates whether the IK Solver intends to use the swivel angle parameter of the IK chain.

**Return Value:**

TRUE if the swivel angle of the IK chain is used, otherwise FALSE.

**Prototype:**

**virtual bool DoesOneChainOnly() const = 0;**

**Remarks:**

Implemented by the plug-in.

When two IK chains overlap, i.e., there is a joint belonging to both IK chains, some solvers are able to negotiate between the possibly contending goals and some are not. This method indicates if the IK Solver does a single chain only. For those IK Solvers that can only solve one chain at a time, the IK system will pass to the solvers one chain at a time in a definitive order. In R4, only solvers that "do one chain only" are used.

**Return Value:**

TRUE if the IK Solver does only one chain, otherwise FALSE.

**Prototype:**

**virtual bool IsAnalytic() const;**

**Remarks:**

Implemented by the plug-in.

This method determines whether the IK Solver is analytic or needs to go through iterations. Solutions of an analytic IK Solver are not dependent on position and rotation thresholds or a maximum number of iterations.

**Return Value:**

TRUE if the IK Solver is analytic, otherwise FALSE.

**Default Implementation:**

**{ return false; }**

**Prototype:**

**virtual bool DoesRootJointLimits() const;**

**Remarks:**

Implemented by the plug-in.

This method determines whether the IK Solver handles root joint limits. If the IK Solver does not do joint limits, the result will be simply clamped into joint limits by the IK system.

**Return Value:**

TRUE if the IK Solver does root joint limits, otherwise FALSE.

**Default Implementation:**

```
{ return false;}
```

**Prototype:**

```
virtual bool DoesJointLimitsButRoot () const;
```

**Remarks:**

Implemented by the plug-in.

This method determines whether the IK Solver handles joint limits. If the IK Solver does not do joint limits, the result will be simply clamped into joint limits by the IK system.

**Return Value:**

TRUE if the IK Solver does joint limits, otherwise FALSE.

**Default Implementation:**

```
{ return false;}
```

**Prototype:**

```
virtual bool SolveEERotation() const = 0;
```

**Remarks:**

Implemented by the plug-in.

This method determines whether the rotational part of the goal node will be used.

**Return Value:**

TRUE if the rotational part of the goal node will be used, otherwise FALSE to indicate that only the position of the goal node is taken as the IK goal while the rotation threshold will be irrelevant.

## Solution Parameters

### Prototype:

```
virtual const IKSys::ZeroPlaneMap* GetZeroPlaneMap(const Point3& a0, const Point3& n0) const;
```

### Remarks:

Implemented by the plug-in.

IK Solvers may have their own Zero Plane Map. If so, they must override this method. The IK system will need it to perform IK snapping, which is setting the swivel angle based on the current pose so that the pose is consistent with the swivel angle. A Zero-Plane map can depend on the initial pose, which is when the joint angles take into account the respective preferred angles. In this method, **a0** is to be substituted for by the end effector axis, which is a unit vector, and **n0** by the solver plane normal, also a unit vector, when the chain is at the initial pose. The IK system will call this function using **IIKChainControl::InitEEAxis()** and **IIKChainControl::InitPlane()** for the two arguments.

### Parameters:

**const Point3& a0**

The end effector axis unit vector.

**const Point3& n0**

The solver plane normal.

### Return Value:

A pointer to the ZeroPlaneMap.

### Default Implementation:

```
{ return NULL; }
```

### Prototype:

```
virtual float GetPosThreshold() const = 0;
```

### Remarks:

This method allows you to retrieve the position threshold.

**Prototype:**

**virtual float SetPosThreshold(float) const = 0;**

**Remarks:**

This method allows you to set the position threshold.

**Parameters:**

**float**

The position threshold value.

**Prototype:**

**virtual float GetRotThreshold() const = 0;**

**Remarks:**

This method allows you to retrieve the rotation threshold.

**Prototype:**

**virtual float SetRotThreshold(float) const = 0;**

**Remarks:**

This method allows you to set the rotation threshold.

**Parameters:**

**float**

The rotation threshold value.

**Prototype:**

**virtual unsigned GetMaxIteration() const = 0;**

**Remarks:**

This method allows you to retrieve the maximum number of iterations.

**Prototype:**

**virtual void SetMaxIteration(unsigned) = 0;**

**Remarks:**

This method allows you to set the maximum number of iterations.

**Parameters:**

## **unsigned**

The maximum number of iterations.

## **Solving IK**

### **Prototype:**

```
virtual ReturnCondition Solve(IKSys::LinkChain&) = 0;
```

### **Remarks:**

Implemented by the plug-in.

This is the method that the IK system will call when it's the time to update the joints according to the IK goal and other parameters. The derived class should override this method if **DoesOneChainOnly()** returns TRUE and **HistoryDependent()** returns FALSE. Note that the solver is not designed to be invoked recursively. The recursion logic existing among the IK chains is taken care of by the 3ds max IK (sub-)System. The data structure passed to the Solver is transient and thus will be discarded once the solution is copied back to the joints. If the return condition indicates failure, (i.e. > 0xff) the result will not be copied back to the joint nodes in the 3ds max scene database.

### **Parameters:**

**IKSys::LinkChain&**

A reference to the Link Chain.

### **Return Value:**

The ReturnCondition bit-set with one or more of the following flags;

**bLimitReached**

The limit is reached.

**bLimitClamped**

The limit is clamped.

**bMaxIterationReached**

The maximum number of iterations is reached.

**bGoalTooCloseToEE**

The goal is too close to the end effector.

**bInvalidArgument**

An invalid argument is passed.

## **bInvalidInitialValue**

An invalid initial value is passed.

## Class IIKChainControl

See Also: : [Class IKCmdOps](#), [Class IKChainActions](#)

### Description:

**This class is only available in release 5 or later.**

The interface class to TM controller that the IK chain node employs. Suppose node is an IK chain node, following code obtains the interface pointer

```
IIKChainControl* ikchain = (IIKChainControl*) node->GetTMController()->GetInterface(I_IKChainControl);
```

From this pointer, we can get all properties pertinent to an IK Chain.

### Methods:

#### Prototype:

```
virtual INode* StartJoint() const
```

#### Remarks:

The start joint, end joint of the chain, and the node to that this IK chain controller belongs.

#### Prototype:

```
virtual INode* EndJoint() const
```

#### Remarks:

Please refer to StartJoint().

#### Prototype:

```
virtual INode* GetNode() const
```

**Remarks:**

Please refer to StartJoint().

**Prototype:**

**virtual Point3 ChainNormal(TimeValue t, Interval& valid)**

**Remarks:**

Preferred angles are used to start the IK iteration. Hence, the pose when joint angles assume the preferred angles is also called the Initial Pose in the context of IK. It is animatable, meaning that at different time, IK may start iteration from different poses.

Let's call the plane that the joints of an IK chain the (IK) solver plane.

**InitPlane()** and **InitEEAxis()** returns the normal to the solver plane and the axis from the start joint to the end joint (end-effector axis) at the initial (preferred angle) pose, at time of input argument. They are represented in the parent space of the start joint. **ChainNormal()** returns the normal in the object space, as

**InitPlane() == ChainNormal() \* startIKCont->PrefRotation()**

where

**startIKCont = (IIKControl\*)StartJoint()->GetController()->GetInterface(I\_IKControl);**

Furthermore, **ChainNormal()** takes as an input argument a validity interval that will be intersected by the validity interval of the chain normal.

**Prototype:**

**virtual Point3 InitPlane(TimeValue)**

**Remarks:**

Please refer to ChainNormal().

**Prototype:**

**virtual Point3 InitEEAxis(TimeValue)**

**Remarks:**

Please refer to ChainNormal().

**Prototype:**

**virtual float InitChainLength(TimeValue)**

**Remarks:**

Please refer to ChainNormal().

**Prototype:**

**virtual float SwivelAngle(TimeValue t, Interval& valid)**

The swivel angle at time. The validity interval, valid, will be intersected.

**Prototype:**

**virtual const IKSys::ZeroPlaneMap\*  
DefaultZeroPlaneMap(TimeValue)**

The zero plane is the plane that, at each "start joint to end joint" axis, is used as a reference plane with regard to that the swivel angle is defined. The zero plane map maps an axis to a plane normal. The IK system offers as a possible default via **DefaultZeroPlaneMap()**.

**Prototype:**

**virtual SAParentSpace SwivelAngleParent() const**

Whether the zero plane is defined in the parent space of the start joint, **kSAInStartJoint**, or in the space of the IK goal, **kSAInGoal**.

**Prototype:**

**virtual Solver() const**

The solver that is assigned to this chain.

**Prototype:**

**virtual bool SolverEnabled(TimeValue, Interval& valid)**

Whether the solver is enabled (IK mode) or not (FK mode).

**Prototype:**

**virtual bool CanAutoEnable() const**

When the chain is in the FK mode, IK can still be invoked when the goal is moved interactively if **CanAutoEnabled()** is true. It is a PB2 parameter of index **kAutoEnable**. It is not animatable.

**Prototype:**

**virtual bool AutoEnableSet() const**

It is a transient state that is alive only at the time when joint angles are to be updated. Being true means that the Enabled state of the chain is off the IK is turned on by interactive manipulation.

**Prototype:**

**virtual bool Valid() const**

Whether this chain is a valid one. It is valid if it is assigned a proper IK solver and it has valid start joint and end joint.

**Prototype:**

**virtual Interface\_ID GoalInterfaceID()**

What IK goal interface this chain is prepared for. For now, there are two

interfaces: HI IK goal (**IHIKGoal**) and Spline IK goal (**ISplineIKGoal**). An IK chain will admit of plugin solvers that support this goal interface (**IKSolver::ExpectGoal()**).

**Prototype:**

**virtual BaseInterface\* AcquireGoal(TimeValue, Interval& valid, const Matrix3& parent\_of\_start\_joint)**

It returns an interface to the goal at the time. Validity interval is reconciled. The parent matrix of the start joint is also returned in the third argument.

## Class IIKControl

See Also: [Class INode](#), [Class Control](#), [Class Point2](#), [Class Point3](#), [Class Interval](#), [Inverse Kinematics](#)

class IIKControl

### Description:

This class is available in release 4.0 and later only.

This class represents the TM controller for IK Chains and is used for nodes that serve as IK joints. This class is closely knit together with the Class

**IIKChainControl** and form the IK system. An interface pointer to the **IKControl** class can be obtained by using

**Animatable::GetInterface(I\_IKCONTROL)**. See the Inverse Kinematics section for more detailed information.

### Methods:

public:

## Degrees of Freedom

### Prototype:

```
virtual bool DofActive(DofAxis) const = 0;
```

### Remarks:

This method allows you to determine which degrees of freedom are active and inactive for the translational and rotational axes.

### Parameters:

#### DofAxis

The DOF axis to check, which is one of the following **IKSys::TransX**, **IKSys::TransY**, **IKSys::TransZ**, **IKSys::RotX**, **IKSys::RotY**, **IKSys::RotZ**.

### Return Value:

TRUE if the specified DOF axis is active, otherwise FALSE.

### Prototype:

**virtual DofSet ActiveTrans() const = 0;**

**Remarks:**

This method allows you to determine which degrees of freedom are active and inactive for the translational axes. The returned DofSet can be tested for **IKSys::DofX**, **IKSys::DofY**, and **IKSys::DofZ**.

**Return Value:**

A DofSet structure containing the translational axes.

**Prototype:**

**virtual DofSet ActiveRot() const = 0;**

**Remarks:**

This method allows you to determine which degrees of freedom are active and inactive for the rotational axes. The returned DofSet can be tested for **IKSys::DofX**, **IKSys::DofY**, and **IKSys::DofZ**.

**Return Value:**

A DofSet structure containing the translational axes.

**Prototype:**

**virtual DofSet ActiveDofs() const = 0;**

**Remarks:**

This method allows you to determine which degrees of freedom are active and inactive for the translational and rotational axes. The returned DofSet can be tested for **IKSys::TransX**, **IKSys::TransY**, **IKSys::TransZ**, **IKSys::RotX**, **IKSys::RotY**, **IKSys::RotZ**.

**Return Value:**

A DofSet structure containing the translational and rotational axes.

## **IK Chains**

**Prototype:**

**virtual INodeTab IKChains(JointType) const = 0;**

**Remarks:**

This method returns a list of IK Chain nodes. Note that an IK chain starts at the rotational joint of the Start Joint and ends at the sliding joint of the End Joint.

**Parameters:**

**JointType**

The joint type, either **IKSys::SlidingJoint** or **IKSys::RotationalJoint**.

**Return Value:**

The node table of IK Chain nodes.

**Prototype:**

**virtual bool IKBound(TimeValue t, JointType jt) = 0;**

**Remarks:**

The parameter that decides whether an individual degree of freedom is active is not animatable. There is an animatable variable of IK chain that decides whether the goal defined in the IK chain actually affects the joints it covers at a specific time. This method allows you to query that.

**Parameters:**

**TimeValue t**

The time at which to test the joint type.

**JointType jt**

The joint type, either **IKSys::SlidingJoint** or **IKSys::RotationalJoint**.

**Return Value:**

TRUE if bound, otherwise FALSE.

## **Joint Limits**

**Prototype:**

**virtual bool DofLowerLimited(DofAxis) const = 0;**

**Remarks:**

This method allows you to check if a specific DOF axis has its lower bounds limited.

**Parameters:**

### **DofAxis**

The DOF axis to check, which is one of the following **IKSys::TransX**, **IKSys::TransY**, **IKSys::TransZ**, **IKSys::RotX**, **IKSys::RotY**, **IKSys::RotZ**.

#### **Return Value:**

TRUE if limited, otherwise FALSE.

#### **Prototype:**

```
virtual bool DofUpperLimited(DofAxis) const = 0;
```

#### **Remarks:**

This method allows you to check if a specific DOF axis has its upper bounds limited.

#### **Parameters:**

##### **DofAxis**

The DOF axis to check, which is one of the following **IKSys::TransX**, **IKSys::TransY**, **IKSys::TransZ**, **IKSys::RotX**, **IKSys::RotY**, **IKSys::RotZ**.

#### **Return Value:**

TRUE if limited, otherwise FALSE.

#### **Prototype:**

```
virtual Point2 DofLimits(DofAxis) const = 0;
```

#### **Remarks:**

This method allows you to check if a specific DOF axis has its upper and lower bounds limited.

#### **Parameters:**

##### **DofAxis**

The DOF axis to check, which is one of the following **IKSys::TransX**, **IKSys::TransY**, **IKSys::TransZ**, **IKSys::RotX**, **IKSys::RotY**, **IKSys::RotZ**.

#### **Return Value:**

A Point2 where X and Y are the lower and upper limits, respectively.

**Prototype:**

**virtual Point3 TransLowerLimits() const = 0;**

**Remarks:**

This method allows you to retrieve the translation lower limits.

**Return Value:**

A Point3 where X, Y, and Z represents the actual limits.

**Prototype:**

**virtual Point3 TransUpperLimits() const = 0;**

**Remarks:**

This method allows you to retrieve the translation upper limits.

**Return Value:**

A Point3 where X, Y, and Z represents the actual limits.

**Prototype:**

**virtual Point3 RotLowerLimits() const = 0;**

**Remarks:**

This method allows you to retrieve the rotational lower limits.

**Return Value:**

A Point3 where X, Y, and Z represents the actual limits.

**Prototype:**

**virtual Point3 RotUpperLimits() const = 0;**

**Remarks:**

This method allows you to retrieve the rotational upper limits.

**Return Value:**

A Point3 where X, Y, and Z represents the actual limits.

## **FK Sub-Controller Access**

**Prototype:**

**virtual Control\* FKSubController() const = 0;**

**Remarks:**

This method allows you to obtain a pointer to the Forward Kinematics sub-controller. Note that the IK controller is not designed to be instanced. It is expected to have a unique node.

**Prototype:**

**virtual INode\* GetNode() const = 0;**

**Remarks:**

This method allows you to obtain a pointer to the node that holds the Forward Kinematics TM controller.

## **Preferred Angles**

**Prototype:**

**virtual Point3 PrefPosition(TimeValue t, Interval& validityInterval) = 0;**

**Remarks:**

This method allows you to retrieve the preferred angle of translation. Note that the angles are constant with regard to animation time.

**Parameters:**

**TimeValue t**

The time at which to retrieve the preferred angle.

**Interval& validityInterval**

The validity interval.

**Return Value:**

The X, Y, and Z, preferred angles.

**Prototype:**

**virtual Point3 PrefRotation(TimeValue t, Interval& validityInterval) = 0;**

**Remarks:**

This method allows you to retrieve the preferred angle of rotation. Note that the angles are constant with regard to animation time.

**Parameters:**

**TimeValue t**

The time at which to retrieve the preferred angle.

**Interval & validityInterval**

The validity interval.

**Return Value:**

The X, Y, and Z, preferred angles.

**Prototype:**

**virtual void SetPrefTrans(const Point3& val, TimeValue t = 0) = 0;**

**Remarks:**

A solver may start off the solution process with joint angles being set to special values, preferred angles. This method allows you to set the preferred angles of the translational joints.

**Parameters:**

**const Point3& val**

The preferred angles you wish to set.

**TimeValue t = 0**

The time at which to set them.

**Prototype:**

**virtual void SetPrefRot(const Point3& val, TimeValue t = 0) = 0;**

**Remarks:**

A solver may start off the solution process with joint angles being set to special values, preferred angles. This method allows you to set the preferred angles of the rotational joints.

**Parameters:**

**const Point3& val**

The preferred angles you wish to set.

**TimeValue t = 0**

The time at which to set them.

**Prototype:**

**virtual void SetPrefTR(const Point3& trans, const Point3& rot, TimeValue t = 0) = 0;**

**Remarks:**

A solver may start off the solution process with joint angles being set to special values, preferred angles. This method allows you to set the preferred angles of both the translational and rotational joints.

**Parameters:**

**const Point3& trans**

The preferred translational angles you wish to set.

**const Point3& rot**

The preferred rotational angles you wish to set.

**TimeValue t = 0**

The time at which to set them.

## Joint Angles

**Prototype:**

**virtual Point3 TransValues(TimeValue, Interval\* = 0) = 0;**

**Remarks:**

This method returns the angles of sliding joints at a specific time.

**Parameters:**

**TimeValue**

The time at which to retrieve the values.

**Interval\* = 0**

The validity interval. If non-null the validity interval will be updated.

**Prototype:**

**virtual Point3 RotValues(TimeValue, Interval\* = 0) = 0;**

**Remarks:**

This method returns the angles of rotational joints at a specific time.

**Parameters:**

**TimeValue**

The time at which to retrieve the values.

**Interval\* = 0**

The validity interval. If non-null the validity interval will be updated.

**Prototype:**

**virtual void AssignTrans(const Point3&, const Interval&) = 0;**

**Remarks:**

This method allows you to set the angles of translational joints. Note that this method does not adjust the validity interval.

**Parameters:**

**const Point3&**

The joint angles.

**const Interval&**

The validity interval

**Prototype:**

**virtual void AssignRot(const Point3&, const Interval&) = 0;**

**Remarks:**

This method allows you to set the angles of rotational joints. Note that this method does not adjust the validity interval.

**Parameters:**

**const Point3&**

The joint angles.

**const Interval&**

The validity interval

**Prototype:**

**virtual void AssignActiveTrans(const Point3&, const Interval&) = 0;**

**Remarks:**

This method allows you to set the angles of translational joints. Note that this method will skip those degrees of freedom that are not active and that this method will not adjust the validity interval.

**Parameters:**

**const Point3&**

The joint angles.

**const Interval&**

The validity interval

**Prototype:**

**virtual void AssignActiveTrans(const DofSet&, const float[], const Interval&) = 0;**

**Remarks:**

This method allows you to set the angles of translational joints. The active DOF's are given as the first argument of type DofSet and the new values are supplied as a float array whose size should be the same as the DofSet [DofSet::Count()]. Note that this method does not adjust the validity interval.

**Parameters:**

**const DofSet&**

The degrees of freedom.

**const float[]**

The new angles you wish to set.

**const Interval&**

The validity interval

**Prototype:**

**virtual void AssignActiveRot(const Point3&, const Interval&) = 0;**

**Remarks:**

This method allows you to set the angles of rotational joints. Note that this method will skip those degrees of freedom that are not active and that this method does not adjust the validity interval.

**Parameters:**

**const Point3&**

The joint angles.

**const Interval&**

The validity interval

**Prototype:**

**virtual void AssignActiveRot(const DofSet&, const float[], const Interval&) = 0;**

**Remarks:**

This method allows you to set the angles of rotational joints. The active DOF's are given as the first argument of type DofSet and the new values are supplied as a float array whose size should be the same as the DofSet [DofSet::Count()]. Note that this method does not adjust the validity interval.

**Parameters:**

**const DofSet&**

The degrees of freedom.

**const float[]**

The new angles you wish to set.

**const Interval&**

The validity interval

**Prototype:**

**virtual void SetTransValid(const Interval& valid) = 0;**

**Remarks:**

This method allows you to set the validity interval for translational joint angles.

**Parameters:**

**const Interval& valid**

The validity interval.

**Prototype:**

**virtual void SetRotValid(const Interval& valid) = 0;**

**Remarks:**

This method allows you to set the validity interval for rotational joint angles.

**Parameters:**

**const Interval& valid**

The validity interval.

**Prototype:**

**virtual void SetTRValid(const Interval& valid) = 0;**

**Remarks:**

This method allows you to set the validity interval for both translational and rotational joint angles.

**Parameters:**

**const Interval& valid**

The validity interval.

## Class ZeroPlaneMap

See Also: [Class Point3](#), [Inverse Kinematics](#)

class ZeroPlaneMap

### Description:

This class is available in release 4.0 and later only.

This class is defined in **IKHierarchy.h** and provides the functionality that, given a unit axis, which is to be substituted by the end effector (EE) Axis, produces a unit vector, which will be interpreted as the normal to a plane. For more details see the section on Inverse Kinematics.

### Methods:

public:

### Prototype:

**virtual ~ZeroPlaneMap()**

### Remarks:

Destructor.

### Default Implementation:

{ }

### Prototype:

**virtual Point3 operator()(const Point3& EEAxis) const = 0;**

### Remarks:

The ZeroPlaneMap call operator.

### Parameters:

**const Point3& EEAxis**

The end effector axis.

### Return Value:

The unit vector described above.

## Class RootLink

See Also: [Class LinkChain](#), [Class Link](#), [Class Matrix3](#), [Class Point3](#), [Inverse Kinematics](#)

class RootLink

### Description:

This class is available in release 4.0 and later only.

A RootLink consists of a rotation plus a rigidExtend. It transforms like this:

**To\_Coordinate\_Frame = rigidExtend \* rotXYZ \*  
From\_Coordinate\_Frame**

where **rotXYZ = Rot\_x(rotXYZ[0]) \* Rot\_y(rotXYZ[1]) \*  
Rot\_z(rotXYZ[2])**.

Note that not all the x, y, and z, are degrees of freedom. Only Active() ones are. We put the whole rotation here so that some solver may choose to use it as a full rotation and then clamp the result to the permissible range.

### Data Members:

public:

**Point3 rotXYZ;**

The xyz rotation.

**Point3 initXYZ;**

Corresponds to the **PrefRotation()** of the Start Joint.

**Point3 llimits;**

The lower limits.

**Point3 ulimits;**

The upper limits.

**Matrix3 rigidExtend;**

The rigid extents.

private:

**unsigned flags;**

The root link flags.

### Methods:

public:

**Prototype:**

**RootLink():flags(7)**

**Remarks:**

Constructor.

**Default Implementation:**

```
{ }
```

**Prototype:**

**bool GetActive(unsigned i) const;**

**Remarks:**

This method informs the Solver whether a particular component is active.

**Parameters:**

**unsigned i**

The component, 0 through 3 for x, y, and z, respectively.

**Return Value:**

TRUE if the specified component is active, otherwise FALSE.

**Default Implementation:**

```
{ return flags&(1<<i)?true:false; }
```

**Prototype:**

**void SetActive(unsigned i, bool s);**

**Remarks:**

This method allows you to activate or deactivate a particular component.

**Parameters:**

**unsigned i**

The component, 0 through 3 for x, y, and z, respectively.

**bool s**

TRUE to activate, FALSE to deactivate.

**Prototype:**

**bool GetLLimited(unsigned i) const;**

**Remarks:**

This method informs the Solver whether a particular component has its lower limits active.

**Parameters:****unsigned i**

The component, 0 through 3 for x, y, and z, respectively.

**Return Value:**

TRUE if the specified component is active, otherwise FALSE.

**Default Implementation:**

```
{ return flags&(1<<(i+3))?true:false; }
```

**Prototype:**

```
bool SetLLimited(unsigned i, bool s) const;
```

**Remarks:**

This method allows you to activate or deactivate a particular component's lower limits.

**Parameters:****unsigned i**

The component, 0 through 3 for x, y, and z, respectively.

**bool s**

TRUE to activate, FALSE to deactivate.

**Prototype:**

```
bool GetULimited(unsigned i) const;
```

**Remarks:**

This method informs the Solver whether a particular component has its upper limits active.

**Parameters:****unsigned i**

The component, 0 through 3 for x, y, and z, respectively.

**Return Value:**

TRUE if the specified component is active, otherwise FALSE.

**Default Implementation:**

```
{ return flags&(1<<(i+6))?true:false; }
```

**Prototype:**

```
bool SetULimited(unsigned i, bool s) const;
```

**Remarks:**

This method allows you to activate or deactivate a particular component's upper limits.

**Parameters:**

**unsigned i**

The component, 0 through 3 for x, y, and z, respectively.

**bool s**

TRUE to activate, FALSE to deactivate.

**Prototype:**

```
Matrix3& RotateByAxis(Matrix3& mat, unsigned i) const;
```

**Remarks:**

This method will pre-apply the rotation about the x, y, or z axis. Therefore, starting with the identity matrix **mat**,

```
ApplyLinkMatrix(  
    RotateByAxis(  
        RotateByAxis(  
            RotateByAxis(mat, 2),  
            1),  
        0),  
    false)
```

should equal to **LinkMatrix(true)**.

**Parameters:**

**unsigned i**

The component, 0 through 3 for x, y, and z, respectively.

**Prototype:**

**Matrix3 LinkMatrix(bool include\_rot) const;**

**Remarks:**

This method returns the link matrix just defined if the argument is TRUE.

**Parameters:**

**bool include\_rot**

TRUE to return the link matrix, FALSE to return **RigidExtend**.

**Return Value:**

The link matrix, otherwise it simply returns **RigidExtend**.

**Prototype:**

**Matrix3& ApplyLinkMatrix(Matrix3& mat, bool include\_rot) const;**

**Remarks:**

This methods applies the LinkMatrix() to the input matrix, or **mat = mat \* LinkMatrix(include\_rot)**

**Parameters:**

**Matrix3& mat**

The input matrix.

**bool include\_rot**

When applying the DOF part, or rotation part, to a matrix, this will take place one at a time by calling **RootLink::RotateByAxis()**. If you want to apply the whole link, while already having applied the rotation part, you would need to set this flag to FALSE.

**Return Value:**

The reference to the input matrix, **mat**.

## Class Link

See Also: [Class LinkChain](#), [Class RootLink](#), [Class Matrix3](#), [Class Point3](#), [Inverse Kinematics](#)

class Link

### Description:

This class is available in release 4.0 and later only.

This class represents a single link in the link chain. A Link is a single degree of freedom rotation followed by a rigidExtend. The DOF axis is specified by dofAxis. It is always active.

### Data Members:

public:

#### **DofAxis dofAxis;**

The variable part of a Link is of one degree of freedom. It can be translational or rotational. One of the following; **TransX**, **TransY**, **TransZ**, **RotX**, **RotY**, or **RotZ**.

#### **float dofValue;**

The current value with regard to the degree of freedom.

#### **float initValue;**

The initial value.

#### **Point2 limits;**

The constrained lower and upper limits. [0] for the lower limit and [1] for the upper limit.

private:

#### **Matrix3 rigidExtend;**

The rigid extents.

#### **byte llimited : 1;**

Lower limit flag.

#### **byte ulimited : 1;**

Upper limit flag.

### Methods:

public:

**Prototype:**

**Link():rigidExtend(0),dofAxis(RotZ);**

**Remarks:**

Constructor.

**Default Implementation:**

**{ }**

**Prototype:**

**~Link();**

**Remarks:**

Destructor.

**Default Implementation:**

**{ if (rigidExtend) delete rigidExtend; rigidExtend = 0; }**

**Prototype:**

**bool NullLink() const;**

**Remarks:**

This method checks whether the link is a null-link. When TRUE, the rigid extend is logically an identity matrix.

**Default Implementation:**

**{ return rigidExtend?false:true; }**

**Prototype:**

**bool ZeroLength();**

**Remarks:**

This method checks whether the link has no length. When TRUE, it is a pure rotation matrix.

**Prototype:**

**bool LLimited() const;**

**Remarks:**

This method checks whether the degree of freedom is further constrained by lower limits. TRUE if constrained, otherwise FALSE.

**Default Implementation:**

```
{ return limited?true:false; }
```

**Prototype:**

```
bool ULimited() const;
```

**Remarks:**

This method checks whether the degree of freedom is further constrained by upper limits. TRUE if constrained, otherwise FALSE.

**Default Implementation:**

```
{ return ulimited?true:false; }
```

**Prototype:**

```
Matrix3 DofMatrix() const;
```

**Remarks:**

This method returns the matrix contribution by the degrees of freedom. Either it is a pure rotation or a pure translation, of one axis. The following identity holds;

```
LinkMatrix(true) ° LinkMatrix(false) * DofMatrix()
```

**Prototype:**

```
Matrix3& DofMatrix(Matrix3& mat) const;
```

**Remarks:**

This method allows you to apply a matrix, **mat**, by the **DofMatrix()** so that **mat = mat \* DofMatrix()**.

**Parameters:**

```
Matrix3& mat
```

The matrix to multiply by the DOF matrix.

**Return Value:**

A reference to the matrix argument.

**Prototype:**

**Matrix3 LinkMatrix(bool include\_dof = true) const;**

**Remarks:**

This method returns the link matrix just defined if the argument is TRUE.

**Parameters:**

**bool include\_dof = true**

TRUE to return the link matrix, FALSE to return **RigidExtend**.

**Return Value:**

The link matrix, otherwise it simply returns **RigidExtend**.

**Prototype:**

**Matrix3& ApplyLinkMatrix(Matrix3& mat, bool include\_dof = true) const;**

**Remarks:**

This methods applies the LinkMatrix() to the input matrix.

**Parameters:**

**Matrix3& mat**

The input matrix.

**bool include\_dof = true**

When applying the DOF part, or rotation part, to a matrix, this will take place one at a time by calling **RootLink::RotateByAxis()**. If you want to apply the whole link, while already having applied the rotation part, you would need to set this flag to FALSE.

**Return Value:**

The reference to the input matrix, **mat**.

**Prototype:**

**void SetLLimited(bool s) const;**

**Remarks:**

This method allows you to activate or deactivate the lower limits.

**Parameters:**

**bool s**

TRUE to activate, FALSE to deactivate.

**Prototype:**

**void SetULimited(bool s) const;**

**Remarks:**

This method allows you to activate or deactivate the upper limits.

**Parameters:**

**bool s**

TRUE to activate, FALSE to deactivate.

**Prototype:**

**void SetRigidExtend(const Matrix3& mat);**

**Remarks:**

This method allows you to set the RigidExtend matrix.

**Parameters:**

**const Matrix3& mat**

The rigid extend matrix you wish to set.

# Class LinkChain

## Description:

**This class is only available in release 5 or later.**

This class abstracts the data structure that the IK system pass to the plugin solver. With it, an IK problem becomes a pure mathematical one to the plugin solver.

A **LinkChain** starts with a **rootLink**, followed by a number of 1D link. The rootLink has a whole rotation (c.f. class **RootLink** in ikHierarch.h), as represented by Euler angles of order XYZ, rotXYZ. These angles may be marked as active or not. The **RootLink** exposes the whole rotation to allow the solver to handle the start joint specially.

The next 1D link is to be pivoted and aligned at the reference frame that is offset from the rotation of the **RootLink** by "**rigidExtend**".

## Methods:

### Prototype:

**Matrix3** parentMatrix

### Remarks:

This **LinkChain** is originally cut off from a transformation space quantified by this matrix. Specifically, it is the matrix that accumulates all transformations from the root of the world to the position component of the start joint.

### Prototype:

**unsigned LinkCount()** const

### Remarks:

The number of 1D links following the rootLink.

**Prototype:**

**const Link& LinkOf(unsigned i) const**

**Remarks:**

The i-th 1D link. The next link is pivoted and aligned at

**LinkOf(i).LinkMatrix(true) \* LinkOf(i-1).LinkMatrix(true) ... \*  
LinkOf(0).LinkMatrix(true) \* rootLink.LinkMatrix(true)**

This is the extremity after the i-th link. The position of the end effector, in particular, is the extremity of the last link.

**Prototype:**

**Link& LinkOf(unsigned i)**

**Remarks:**

Please refer to the above entry for full explanation.

**Prototype:**

**int PreBone(unsigned i) const**

**Remarks:**

A 1D link comprises a degree of freedom, which can be rotational or prismatic (sliding), and an offset transformation, "rigidExtend". If the length of "rigidExtend" is zero, the next 1D link comes from same joint of this link. PreBone(i) returns the first link that precedes the i-th link that has non-zero "rigidExtend." In other words, LinkOf(PreBone(i) + 1) starts a new joint that includes i-th link as one of its degrees of freedom. PreBone(i) is always less than i.

**Prototype:**

**unsigned Bone(unsigned i) const**

**Remarks:**

**Bone(i)** returns the first index,  $j$ , such that  $j \geq i$  and **LinkOf(j).ZeroLength()** false. This is the last link of the bone that includes  $i$ -th link as a degree of freedom.

**Prototype:**

**BaseInterface\* GetIKGoal()**

**Remarks:**

Returns an interface pointer to the goal. The actual type of goal can be queried from the interface. (They are documented separately.)

**Prototype:**

**void SetIKGoal(BaseInterface\*)**

**Remarks:**

They are used to set and release the goal. The plugin solver should not worried about it. The IK system will use them to the set and release the goal.

**Prototype:**

**void ReleaseIKGoal()**

**Remarks:**

Please refer to **SetIKGoal()** for full explanation.

## Class IKCmdOps

See Also: : [Class IKChainActions](#), [Class IKChainControl](#)

```
class IKCmdOps : public FPStaticInterface
```

### Description:

**This class is only available in release 5 or later.**

The program interface to functions of the IK system. To obtain a pointer to the interface, use

```
IKCmdOps* iksys = GetCoreInterface(IK_FP_INTERFACE_ID);
```

It should be non-null if the plugin of the IK system is loaded.

### Methods:

#### Prototype:

```
virtual INode* CreateIKChain(INode* start, INode* end, const  
TCHAR* solver);
```

#### Remarks:

This method assigns an IK solver from nodes start to end. To be successful, following conditions have to be met:

1. Start must be an ancestor of end in the node hierarchy;
2. All TM controllers along the chain must be replaceable;
3. The 3rd argument, solver, must be a name of a plugin solver.

Upon success, it will create an IK chain node that contains these pieces of information plus the IK goal and returns a pointer to it. Returning non-null

pointer indicates failure.

Example:

```
INode* ikchainNode = iksys->CreateIKChain(bone1, bone4,  
_T("HIIKSolver"));
```

**Prototype:**

```
virtual int SolverCount() const;
```

**Remarks:**

**Returns the number of IK solvers that have been loaded in.**

**Prototype:**

```
virtual TSTR SolverName(int i) const;
```

**Remarks:**

Returns the internal name of the i-th solver. This name is used in **CreateIKChain()** or the script.

**Prototype:**

```
virtual TSTR SolverUIName(int i) const;
```

**Remarks:**

Returns the UI name of the i-th solver. The UI names appear in the solver list on the Motion Panel, or the Animation menu. They are localized.

## Class ITCBFloatKey

See Also: [Class ITCBKey](#).

```
class ITCBFloatKey : public ITCBKey
```

### **Description:**

This class stores a Tension Continuity and Bias (TCB) floating point key.

### **Data Members:**

public:

**float val;**

The value of the key.

## Class ITCBPoint3Key

See Also: [Class ITCBKey](#), [Class Point3](#).

```
class ITCBPoint3Key : public ITCBKey
```

### **Description:**

This class stores a Tension Continuity and Bias (TCB) Point3 key.

### **Data Members:**

public:

**Point3 val;**

The value of the key.

## Class ITCBRotKey

See Also: [Class ITCBKey](#), [Class AngAxis](#).

```
class ITCBRotKey : public ITCBKey
```

### **Description:**

This class stores a Tension Continuity and Bias (TCB) rotation key.

### **Data Members:**

public:

**AngAxis val;**

The value of the key.

## Class ITCBScaleKey

See Also: [Class ITCBKey](#), [Class ScaleValue](#).

```
class ITCBScaleKey : public ITCBKey
```

### **Description:**

This class stores a Tension Continuity and Bias (TCB) Scale key.

### **Data Members:**

public:

**ScaleValue val;**

The value of the key.

## Class IBezFloatKey

See Also: [Class IKey](#).

```
class IBezFloatKey : public IKey
```

### Description:

This class stores a Bezier floating point key.

### Data Members:

public:

**float intan;**

The in tangent value.

**float outtan;**

The out tangent value.

**float val;**

The value of the key.

**float inLength;**

The in length of the horizontal handle.

**float outLength;**

The out length of the horizontal handle.

## Class IBezPoint3Key

See Also: [Class IKey](#), [Class Point3](#).

```
class IBezPoint3Key : public IKey
```

### Description:

This class stores a Bezier Point3 key.

The value of the intan and outtan values of IBezPoint3Key returned from GetKey is actually the tangent of the angle that is spanned between the horizontal axis and the tangent. In order to get the actual handle of the tangent it is important to know that the horizontal (time) distance from the handle to the key value is dependent on the previous (for intan) or next (for outtan) point. The horizontal distance is basically a third of the total distance between the current key and the previous (or next) key :

```
Control *c = node->GetTMController()->GetPositionController();  
dt = (c->GetKeyTime(PreviousIdx)-c->GetKeyTime(CurrentIdx)) /  
3.0f;
```

since the value in IBezPoint3Key pos\_key.intan.x is the tan(alpha), you can easily get the vertical location of the handle by calculating :

```
tan(alpha) = pos_key.intan.x = dy/dt -> dy = pos_key.intan.x * dt
```

dt is the horizontal coordinate of the tangent handle relative to the key value.

dy is the vertical coordinate of the tangent handle relative to the key value.

### Data Members:

public:

#### **Point3 intan;**

The incoming tangent vector. This can be thought of as the tangent handle of a 3D spline. The value is relative to **val**.

#### **Point3 outtan;**

The outgoing tangent vector. This can be thought of as the tangent handle of a 3D spline. The value is relative to **val**.

#### **Point3 val;**

The value of the key.

#### **Point3 inLength;**

The in length of the horizontal handle.

**Point3 outLength;**

The out length of the horizontal handle.

## Class IBezQuatKey

See Also: [Class IKey](#), [Class Quat](#).

```
class IBezQuatKey : public IKey
```

### **Description:**

This class stores a Bezier quaternion key.

### **Data Members:**

public:

#### **Quat val;**

The value of the key.

## Class IBezScaleKey

See Also: [Class IKey](#), [Class Point3](#), [Class ScaleValue](#).

```
class IBezScaleKey : public IKey
```

### Description:

This class stores a Bezier scale key.

### Data Members:

public:

**Point3 intan;**

The int tangent vector.

**Point3 outtan;**

The out tangent vector.

**ScaleValue val;**

The value of the key.

**Point3 inLength;**

The in length of the horizontal handle.

**Point3 outLength;**

The out length of the horizontal handle.

## Class ILinFloatKey

See Also: [Class IKey](#).

```
class ILinFloatKey : public IKey
```

### **Description:**

This class stores a Linear floating point key.

### **Data Members:**

public:

**float val;**

The value of the key.

## Class ILinPoint3Key

See Also: [Class IKey](#), [Class Point3](#).

```
class ILinPoint3Key : public IKey
```

### **Description:**

This class stores a Linear Point3 key.

### **Data Members:**

public:

#### **Point3 val;**

The value of the key.

## Class ILinRotKey

See Also: [Class IKey](#), [Class Quat](#).

```
class ILinRotKey : public IKey
```

### **Description:**

This class stores a Linear rotation key.

### **Data Members:**

public:

**Quat val;**

The value of the key.

## Class ILinScaleKey

See Also: [Class IKey](#), [Class ScaleValue](#).

```
class ILinScaleKey : public IKey
```

### **Description:**

This class stores a Linear scale key.

### **Data Members:**

public:

**ScaleValue val;**

The value of the key.

## Class AppSave

See Also: [Class AppLoad](#), [Class AppDataChunk](#), [Character Strings](#).

```
class AppSave
```

### Description:

This class is available in release 2.0 and later only.

This class is a general chunk-ifying code useful for writing hierarchical data structures to a linear stream, such as an AppData block.

All methods of this class are implemented by the system.

AppSave will write hierarchical chunks into a private buffer, enlarging it as needed. When completed, use the methods **BufferPtr()** and **NBytesWritten()** to get at this buffer. (**AppSave** will delete the buffer in its **DeleteThis()** method, so you need to copy the buffer to save the data.)

The chunk hierarchy should always have a single highest level chunk. Chunks can be nested to any depth.

A Chunk can contain either sub-chunks, or data, but not both.

### Sample Code:

```
AppSave *asave = NewAppSave(1000);
asave->BeginChunk(MAIN_CHUNK);
asave->BeginChunk(CHUNK1);
    // .. write data
asave->EndChunk();

asave->BeginChunk(CHUNK2);
    // .. write data
asave->EndChunk();

asave->BeginChunk(CHUNK3);
    // .. write data
asave->EndChunk();
asave->EndChunk(); // end MAIN_CHUNK
```

### Prototype:

**AppSave \*NewAppSave(int initBufSize);**

**Remarks:**

This global function create a new **AppSave** instance.

**Parameters:**

**int initBufSize**

Specifies the initial size the internal buffer is allocated to. It will be enlarged if necessary.

**Methods:**

**Prototype:**

**virtual void DeleteThis()=0;**

**Remarks:**

This method deletes the **AppSave** instance.

**Prototype:**

**virtual BYTE \*BufferPtr()=0;**

**Remarks:**

This method is used after saving to get a pointer to the buffer created.

**Prototype:**

**virtual int NBytesWritten()=0;**

**Remarks:**

This method returns the number of bytes that were written in the buffer.

**Prototype:**

**virtual void BeginChunk(USHORT id)=0;**

**Remarks:**

This method is used to begin a chunk. The ID passed need only be unique within the plug-ins data itself.

**Parameters:**

**USHORT id**

The id for the chunk.

**Prototype:**

**virtual void EndChunk()=0;**

**Remarks:**

This method is used to end a chunk, and back-patch the length.

**Prototype:**

**virtual int CurChunkDepth()=0;**

**Remarks:**

This method is used internally for checking balanced BeginChunk/EndChunk.

**Prototype:**

**virtual IOResult Write(const void \*buf, ULONG nbytes, ULONG \*nwrit)=0;**

**Remarks:**

This method writes a block of bytes.

**Parameters:**

**const void \*buf**

The buffer to write.

**ULONG nbytes**

The number of bytes to write.

**ULONG \*nwrit**

The number of bytes actually written.

**Return Value:**

**IO\_OK** - The write was acceptable - no errors.

**IO\_ERROR** - This is returned if an error occurred.

**Prototype:**

**virtual IOResult WriteWString(const char \*str)=0;**

**Remarks:**

This method is used to write wide character strings.

**Parameters:**

**const char \*str**

The string to write.

**Return Value:**

**IO\_OK** - The write was acceptable - no errors.

**IO\_ERROR** - This is returned if an error occurred.

**Prototype:**

**virtual IOResult WriteWString(const wchar\_t \*str)=0;**

**Remarks:**

This method is used to write wide character strings.

**Parameters:**

**const wchar\_t \*str**

The string to write.

**Return Value:**

**IO\_OK** - The write was acceptable - no errors.

**IO\_ERROR** - This is returned if an error occurred.

**Prototype:**

**virtual IOResult WriteCString(const char \*str)=0;**

**Remarks:**

This method is used to write single byte character strings.

**Parameters:**

**const char \*str**

The string to write.

**Return Value:**

**IO\_OK** - The write was acceptable - no errors.

**IO\_ERROR** - This is returned if an error occurred.

**Prototype:**

**virtual IOResult WriteCString(const wchar\_t \*str)=0;**

**Remarks:**

This method is used to write single byte character strings.

**Parameters:**

**const wchar\_t \*str**

The string to write.

**Return Value:**

**IO\_OK** - The write was acceptable - no errors.

**IO\_ERROR** - This is returned if an error occurred.

# Class AppLoad

See Also: [Class AppSave](#), [Class AppDataChunk](#).

class AppLoad

## Description:

This class takes a chunk-ified data stream (as written by Class AppSave), and provides routines for decoding it.

This class is available in release 2.0 and later only.

All methods of this class are implemented by the system.

## Prototype:

**AppLoad \*NewAppLoad(BYTE \*buf, int bufSize);**

## Remarks:

This global function creates a new AppLoad instance for reading chunks out of **buf**:

## Parameters:

**BYTE \*buf**

The buffer to read.

**int bufSize**

Specifies the number of bytes that are valid in **buf**.

## Methods:

### Prototype:

**virtual void DeleteThis()=0;**

### Remarks:

This method deletes the instance of AppLoad.

### Prototype:

**virtual IOResult OpenChunk()=0;**

### Remarks:

This method is used to open a chunk. If **OpenChunk()** returns **IO\_OK**, use the following 3 functions to get the information about the chunk. If it returns **IO\_END** this indicates there are no more chunks at this level.

**Return Value:**

**IO\_OK** - The result was acceptable - no errors.

**IO\_END** - This is returned when the end of the chunks at a certain level have been reached. It is used as a signal to terminate the processing of chunks at that level.

**IO\_ERROR** - This is returned if an error occurred.

**Prototype:**

**virtual USHORT CurChunkID()=0;**

**Remarks:**

This method returns the ID of the most recently opened chunk.

**Prototype:**

**virtual ChunkType CurChunkType()=0;**

**Remarks:**

This method returns the type of the most recently opened chunk. This may be one of the following values:

**NEW\_CHUNK**

**CONTAINER\_CHUNK**

**DATA\_CHUNK**

**Prototype:**

**virtual ULONG CurChunkLength()=0;**

**Remarks:**

This method returns the chunk length **not** including the header.

**Prototype:**

**virtual int CurChunkDepth()=0;**

**Remarks:**

This method is used internally for checking for balanced OpenChunk/CloseChunk pairs.

**Prototype:**

**virtual IOResult CloseChunk()=0;**

**Remarks:**

This method is used to close the currently opened chunk, and position at the next chunk.

**Parameters:****Return Value:**

A return value of **IO\_ERROR** indicates there is no open chunk to close; otherwise **IO\_OK**.

**Prototype:**

**virtual USHORT PeekNextChunkID()=0;**

**Remarks:**

This method returns the ID of the next chunk without opening it. It returns 0 if there are no more chunks.

**Prototype:**

**virtual IOResult Read(void \*buf, ULONG nbytes, ULONG \*nread)=0;**

**Remarks:**

This method is used to read a block of bytes.

**Parameters:**

**void \*buf**

A pointer to the buffer to read.

**ULONG nbytes**

The number of bytes to read.

**ULONG \*nread**

The number of bytes that were read.

**Return Value:**

A return value of **IO\_ERROR** indicates an error occurred, otherwise **IO\_OK**.

**Prototype:**

**virtual IOResult ReadWStringChunk(char\*\* buf)=0;**

**Remarks:**

This method read a string that was stored as Wide characters. Note: This method reads a string from a string chunk. It is assumed the chunk is already open, it will NOT close the chunk.

**Parameters:**

**char\*\* buf**

A pointer to an array of characters.

**Return Value:**

A return value of **IO\_ERROR** indicates an error occurred, otherwise **IO\_OK**.

**Prototype:**

**virtual IOResult ReadWStringChunk(wchar\_t\*\* buf)=0;**

**Remarks:**

This method read a string that was stored as Wide characters. Note: This method reads a string from a string chunk. It is assumed the chunk is already open, it will NOT close the chunk.

**Parameters:**

**wchar\_t\*\* buf**

A pointer to an array of wide characters.

**Return Value:**

A return value of **IO\_ERROR** indicates an error occurred, otherwise **IO\_OK**.

**Prototype:**

**virtual IOResult ReadCStringChunk(char\*\* buf)=0;**

**Remarks:**

This method reads a string that was stored as single byte characters.

**Parameters:**

**char\*\* buf**

A pointer to an array of single byte characters.

**Return Value:**

A return value of **IO\_ERROR** indicates an error occurred, otherwise **IO\_OK**.

**Prototype:**

**virtual IOResult ReadCStringChunk(wchar\_t\*\* buf)=0;**

**Remarks:**

This method read a string that was stored as Wide chars. Note: This method reads a string from a string chunk. It is assumed the chunk is already open, it will NOT close the chunk.

**Parameters:**

**wchar\_t\*\* buf**

A pointer to an array of wide characters.

**Return Value:**

A return value of **IO\_ERROR** indicates an error occurred, otherwise **IO\_OK**.

## Class BigMatrix

See Also: [Class Matrix3](#).

class BigMatrix

### Description:

This class is available in release 2.0 and later only.

This class implements an  $m \times n$  matrix for situations & calculations where the usual 4x3 Matrix3 class is not adequate. BigMatrix implements several useful matrix operations, including matrix multiplication and inversion, but is not guaranteed to be especially efficient. All methods are implemented by the system.

### Data Members:

public:

**int m, n**

The dimensions of the matrix. There are **m** rows and **n** columns.

**float \*val**

The elements of the matrix.  $val[i*n+j]$  is the value in the  $i$ 'th row and the  $j$ 'th column.

### Methods:

#### Prototype:

**BigMatrix();**

#### Remarks:

Initializer. Sets m and n to zero, and val to NULL.

#### Prototype:

**BigMatrix(int mm, int nn);**

#### Remarks:

Initializer. Sets the dimensions of the matrix to mm by nn, and allocates space for the contents. The total size of the matrix,  $mm*nn$ , cannot exceed 10,000.

#### Prototype:

**BigMatrix(const BigMatrix & from);**

**Remarks:**

Initializer. Sets this BigMatrix equal to **from**.

**Prototype:**

**~BigMatrix();**

**Remarks:**

Destructor. Frees the internal arrays.

**Prototype:**

**void Clear();**

**Remarks:**

Frees the internal arrays and sets the matrix's size to 0x0.

**Prototype:**

**int SetSize(int mm, int nn);**

**Remarks:**

Sets the matrix's size to mm by nn, and allocates space for the contents.

**Return Value:**

Returns the total size of the matrix (mm \* nn) or -1 if there's an error.

**Prototype:**

**float \*operator[](int i) const;**

**Remarks:**

Returns a pointer to the i'th row in the matrix. Thus for a BigMatrix A, A[i][j] is the value in the i'th row and the j'th column.

**Prototype:**

**BigMatrix & operator=(const BigMatrix & from);**

**Remarks:**

Sets this BigMatrix equal to from.

**Prototype:**

**void SetTranspose(BigMatrix & trans) const;**

**Remarks:**

Sets trans to be the transpose of this BigMatrix.

**Prototype:**

**float Invert();**

**Remarks:**

Inverts this matrix. Note that this only works if this matrix is "square", i.e. if  $m = n$ . This algorithm is CUBIC in the number of rows, so be careful!

**Return Value:**

The determinant of the matrix (before inversion) is returned. If the return value is 0, the matrix could not be inverted.

**Prototype:**

**void Identity();**

**Remarks:**

If  $m$  and  $n$  are equal, this method sets this matrix to the identity. If  $m$  and  $n$  are not equal, it does nothing.

**Prototype:**

**void Randomize(float scale);**

**Remarks:**

This method is available in release 2.5 or later only.

Creates a random matrix for testing purposes. Reseeds the random number generator with the current system time, for a non-reproducible result. Values of the matrix are set to anything in the range  $(-scale, scale)$ .

**Prototype:**

**void MNDebugPrint();**

**Remarks:**

This method is available in release 2.5 or later only.

This method prints the contents of the BigMatrix to the IDE debugging window using DebugPrints.

# Class INodeTransformed

See Also: [Class INode](#), [Modifier Stack Branching](#)

## Description:

This class provides a layer that will add in a transformation to the node's objectTM. Most methods pass through to the INode, except for the objectTM methods which pre-multiply in the given matrix. The methods of this class are the same as INode. See [Class INode](#) for details. Specifically see the methods related to INodeTransformed in [INode - INodeTransformed methods](#). All methods of this class are implemented by the system.

## Data Members:

public:

**INode \*node;**

The original INode pointer.

**Matrix3 tm;**

The additional transformation.

**BOOL deleteMe;**

If set to FALSE this **INodeTransformed** will not get deleted. This may be used if the object is not allocated dynamically. If you create an

**INodeTransformed** on the stack you'll want to set **deleteMe** to FALSE.

## Methods:

### Prototype:

**void DisposeTemporary();**

### Remarks:

Deletes this **INodeTransformed**.

### Prototype:

**INode \*GetActualINode()**

### Remarks:

Returns the actual **INode** pointer of this **INodeTransformed**.

These functions are not part of this class but are available for use:  
INodeTransformed can be allocated on the stack, but if you need to create one dynamically, use these methods to create and delete them.

**Prototype:**

**INodeTransformed \*CreateINodeTransformed(INode \*n, Matrix3 tm, BOOL dm=TRUE);**

**Remarks:**

Creates an INodeTransformed on the heap.

**Parameters:**

**INode \*n**

The original INode pointer.

**Matrix3 tm**

The additional transformation matrix.

**BOOL dm=TRUE**

If TRUE this item will be deleted; otherwise it is left alone.

**Return Value:**

A pointer to the INodeTransformed created.

**Prototype:**

**void DeleteINodeTransformed(INodeTransformed \*n);**

**Remarks:**

Deletes the INodeTransformed passed.

**Parameters:**

**INodeTransformed \*n**

The INodeTransformed to delete.

## Class MaxNetManager

See Also: [Class MaxNet](#), [Class MaxNetCallBack](#), [Structure ManagerInfo](#), [Structure ClientInfo](#), [Structure JobsList](#), [Structure Job](#), [Class CJobText](#), [Structure HSERVER](#), [Structure JOBFRAMES](#), [Structure JobServer](#), [Structure ServerList](#), [Structure WeekSchedule](#), [Structure NetworkStatus](#)

```
class MaxNetManager: public MaxNet
```

### Description:

This class is available in release 4.0 and later only.

The MaxNetManager class provides all the methods to interact with the network rendering functions provided and acts as your primary interface. The API provided through the MaxNetManager allows clients to connect to the Network Rendering Manager and perform any and all functions available. It encapsulates all the networking details leaving the client code to concentrate on whatever it needs to do. The API handles all networking code and the intricacies of the communication protocols used by the lower layers. This class is derived from the MaxNet class which is solely used for exception handling as shown below.

### Sample Code:

```
try {  
    // the code being tried  
} catch (MaxNet* maxerr) {  
    // handle the error  
    // do NOT delete maxerr  
    // use maxerr->GetErrorText() to get the error description  
    // use maxerr->GetError() to get the error code  
}
```

### Methods Groups:

Construction and Destruction

Callback Methods

Session Methods

Queue Control

Client Related Methods  
Job Related Methods  
Server Methods  
Server Group Methods  
Network Archiving Functions

## **Construction and Destruction**

The following global functions are not part of class MaxNetManager but are available for use:

### **Function:**

**MaxNetManager\* CreateManager();**

### **Remarks:**

This method will create and return a new instance of the MaxNetManager class.

### **Function:**

**void DestroyManager(MaxNetManager\* mgr);**

### **Remarks:**

This method will destroy an instance of the MaxNetManager class.

### **Parameters:**

**MaxNetManager\* mgr**

Points to the MaxNetManager object to destroy.

### **Methods:**

## **Callback Methods**

### **Prototype:**

**void SetCallBack(MaxNetCallBack\* cb);**

### **Remarks:**

Sets a callback method to receive information updates about various

asynchronous events from the MaxNet API. It is not required to set up this callback.

**Parameters:**

**MaxNetCallBack\* mgr**

Points to a MaxNetCallBack object.

## Session Methods

**Prototype:**

```
bool FindManager(short port, char* manager, char* netmask = "255.255.255.0" );
```

**Remarks:**

This method will broadcast a message to the local area network in order to look for a Manager. If a Manager is found, the method returns its name in **manager**.

**Parameters:**

**short port**

Specifies which port will be used to access the Manager. Unless there is a specific reason to use a particular port, use the default **DF\_MGRPORT**.

**char\* manager**

A string representing the name of the Manager will be put into this variable. The variable itself should be **MAX\_PATH** in size.

**char\* netmask**

Specifies which local area network mask should be used for the scope of the broadcast. The default of 255.255.255.0 should work for most networks that are not divided into subnets.

**Return Value:**

TRUE if a Manager is found, otherwise FALSE.

**Prototype:**

```
void Connect(short port, char* manager, bool enable_callback = false );
```

**Remarks:**

This method allows you to connect to a Network Rendering Manager.

**Parameters:****short port**

Specifies which port will be used to access the Manager. Unless there is a specific reason to use a particular port, use the default **DF\_MGRPORT**.

**char\* manager**

A string representing the name or IP number of the Manager you want to connect to. The network name requires the network to have some form of name to address translation. It is recommended to use the name provided by **MaxNetManager::FindManager()**.

**bool enable\_callback = false**

This parameter enables or disables asynchronous messages from the Manager. If you connect to the Manager in order to collect information about the network queue then it is recommended to enable (set to true) this parameter in order to keep your lists updated. Otherwise you have to poll the Manager at various times to check for changes. When enabled calls will be received through the **MaxNetCallback** mechanism informing you whenever a new job has been completed, an error has occurred, a Server has changed, etc.

**Prototype:**

```
void Disconnect();
```

**Remarks:**

This method will cause a disconnect from the currently connected Manager.

**Prototype:**

```
void GetManagerInfo(ManagerInfo* info);
```

**Remarks:**

This method allows basic information about the Manager to be collected.

**Parameters:****ManagerInfo\* info**

A pointer to the Manager information.

**Prototype:****bool KillManager();****Remarks:**

This method will shut down the Manager and shut off the entire system.

**Return Value:**

TRUE if successful, otherwise FALSE. A reason for failure might be because this method is called without having the proper Manager rights such as operating in read only mode. Further explanation can be found in the **TakeManagerControl()** method.

**Prototype:****void EnableUpdate(bool enable);****Remarks:**

This method toggles updates from the Manager. For this method to function you will need to enable the **enable\_callback** in **MaxNetManager::Connect()**. The use of this method allows you to temporarily disable updates from the Manager which might be useful in a situation when you are submitting many jobs at once or executing any other large number of changes. Instead of receiving updates for all changes, you would temporarily disable the callbacks so you could execute your many changes and when done, re-enable the callbacks.

**Parameters:****bool enable**

TRUE or FALSE to enable or disable, respectively.

## Queue Control

**Prototype:****bool QueryManagerControl(bool wait);****Remarks:**

This method queries the Manager to check if you can take control of the queue. If no one has the queue control, it will immediately return true. If someone else has control, the Manager will ask the controlling client if it

wants to relinquish control. If relinquished, the method returns true, if control is not relinquished the method will return false.

**Parameters:**

**bool wait**

This parameter can be set to true in order to wait for an answer in case someone has control over the queue, causing this method not to return until it receives an answer from the controlling client. If there is no response from the controlling client, the method will time out in 10 seconds after which it will return true to allow a request for queue control.

**Return Value:**

TRUE if allowed to request queue control, otherwise FALSE.

**Prototype:**

**bool TakeManagerControl();**

**Remarks:**

This method allows the acquisition of control of the queue.

**Return Value:**

TRUE if control is granted, otherwise FALSE.

**Prototype:**

**void GrantManagerControl(bool grant);**

**Remarks:**

This method allows you to issue a grant or deny response to a MaxNetCallBack message. If you are the controlling client while another client wants control of the queue by calling the **QueryManagerControl()** method you will receive a message through the **MaxNetCallBack** mechanism. If you do not respond, control will be taken away from you automatically after 10 seconds and granted to the requesting client.

**Parameters:**

**bool grant**

This parameter allows you to respond TRUE to relinquish control of the queue or FALSE if you do not want to relinquish control.

**Prototype:****bool LockControl(bool lock);****Remarks:**

This method allows you to temporarily lock the queue control when performing a series of changes and don't want to get interrupted. While the queue control is locked, no queries are made. They all return false to prevent anyone from taking control of the queue. This method can only be called if you already have queue control. Please, do not forget to unlock the queue control after you are done performing your changes.

**Parameters:****bool lock**

Set this parameter to TRUE if you want to lock the queue or FALSE if you want to unlock the queue.

**Return Value:**

TRUE if queue control could be locked, otherwise FALSE.

**Client Related Methods****Prototype:****int GetClientCount();****Remarks:**

This method returns the number of clients currently connected to the Manager.

**Prototype:****int ListClients(int start, int end, ClientInfo\* clientList);****Remarks:**

This method allows you to list all the clients currently connected to the Manager.

**Parameters:****int start**

The first client in the list to return.

**int end**

The last client in the list to return. If you want the entire list of clients at once set the **start** and **end** to 0 and -1, respectively.

### **ClientInfo\* clientList**

The array to receive the list of clients. This array should be large enough to receive the number of clients requested.

#### **Return Value:**

The actual number of clients inserted in **clientList**. This could be either equal to the amount requested or less (if some client disconnected from the Manager).

## **Job Related Methods**

#### **Prototype:**

**int GetJobCount();**

#### **Remarks:**

This method returns the number of jobs in the queue.

#### **Prototype:**

**int ListJobs(int start, int end, JobList\* jobList);**

#### **Remarks:**

This method allows you to list all the jobs in the queue.

#### **Parameters:**

##### **int start**

The first job in the list to return.

##### **int end**

The last job in the list to return. If you want the entire list of jobs at once set the **start** and **end** to 0 and -1, respectively.

##### **JobList\* jobList**

The array to receive the list of jobs. This array should be large enough to receive the number of jobs requested.

#### **Return Value:**

The actual number of jobs inserted in **jobList**. This could be either equal to

the amount requested or less.

**Prototype:**

**void GetJob(HJOB hJob, Job\* job);**

**Remarks:**

This method allows you to get an individual job description structure.

**Parameters:**

**HJOB hJob**

The job handle.

**Job\* job**

A pointer to a Job structure for the received job.

**Prototype:**

**void GetJob(HJOB hJob, JobList\* jobList);**

**Remarks:**

This method allows you to get a single record for the jobList given the specified job handle.

**Parameters:**

**HJOB hJob**

The job handle.

**JobList\* jobList**

A pointer to a JobList structure for the received job.

**Prototype:**

**void GetJobText(HJOB hJob, CJobText& jobText, int count);**

**Remarks:**

Use this method to request the CJobText for a particular job. (See the CJobText class description for an explanation). Some job information are random both in number as they are in size. The job description structure (Job) will only show static elements. In order to get dynamic elements or elements with variable length, the CJobText class is used.

**Parameters:**

**HJOB hJob**

The job handle.

**CJobText& jobText**

A reference to a CJobText class to receive the information.

**int count**

The number of elements you are interested in receiving. The number of elements can be found in Job.jobtextcount.

**Prototype:**

```
void SetJob(HJOB hJob, Job* job, CJobText& jobText, bool  
reset);
```

**Remarks:**

This method submits changes to an existing job. Once you collect a job, you can change settings in both the Job structure as in the CJobText elements and send it back so the changes can be applied.

Note that you must use a **Getjob()** and **SetJob()** combination in order to make sure all the elements are correct. The Manager will automatically complete some of the structure members. It is not possible to create a new structure, fill in the data, and submit it. You can only do that when submitting a new job, which is then handled by a different set of methods.

**Parameters:****HJOB hJob**

The job handle.

**Job\* job**

A pointer to the job description.

**CJobText& jobText**

A reference to a CJobText class with the description of elements.

**bool reset**

This flag indicates whether or not the job is started from scratch. If set to FALSE it will continue from the current stage.

**Prototype:**

```
int GetJobPriority(HJOB hJob);
```

**Remarks:**

This method returns the job priority value for the specified Job.

**Parameters:****HJOB hJob**

The handle to the job for which to obtain its priority

**Prototype:**

**bool SetJobPriority(HJOB hJob, int priority);**

**Remarks:**

This method allows you to set the priority of a specified job.

**Parameters:****HJOB hJob**

The handle to the job for which to obtain its priority

**int priority**

The priority value you want to assign to the job.

**Return Value:**

TRUE if the priority as set successfully, otherwise FALSE

**Prototype:**

**void SetJobOrder(HJOB\* hJob, DWORD count);**

**Remarks:**

This method allows you to set the job order for a specific job.

**Parameters:****HJOB hJob**

The handle to the job for which to obtain its priority

**DWORD count**

The job order index.

**Prototype:**

**void DeleteJob(HJOB hJob);**

**Remarks:**

This method will delete a job from the queue permanently and remove all files

related to the job.

**Parameters:**

**HJOB hJob**

The job handle.

**Prototype:**

**void SuspendJob(HJOB hJob);**

**Remarks:**

This method will suspend a specific job. This method is the opposite of **ActivateJob()**.

**Parameters:**

**HJOB hJob**

The job handle

**Prototype:**

**void ActivateJob(HJOB hJob);**

**Remarks:**

This method will activate a specific job. This method is the opposite of **SuspendJob()**.

**Parameters:**

**HJOB hJob**

The job handle

**Prototype:**

**int GetJobServersCount(HJOB hJob);**

**Remarks:**

This method will return the number of Servers assigned to a given job.

**Parameters:**

**HJOB hJob**

The job handle

**Prototype:**

```
int GetJobServers(int start, int end, HJOB hJob, JobServer* servers);
```

**Remarks:**

This method will return a list of the Servers assigned to a given job.

**Parameters:****int start**

The first Server in the list to return.

**int end**

The last Server in the list to return. If you want the entire list of servers at once set the **start** and **end** to 0 and -1, respectively.

**HJOB hJob**

The job handle.

**JobServer\* servers**

The array to receive the list of Servers. This array should be large enough to receive the number of Servers requested.

**Return Value:**

The actual number of Servers inserted in **servers**. This could be either equal to the amount requested or less.

**Prototype:**

```
void GetJobServerStatus(HJOB hJob, HSERVER hServer, TCHAR* status_text);
```

**Remarks:**

This method allows you to obtain the textual status of a specific Server for a given job. The JobServer structure return by **GetJobServers()** will only describe the status of a Server using a flag. If the flag shows the Server status is "Error", you can use this method to receive a more descriptive text message, like "Could not write to d:/path/file.tga".

**Parameters:****HJOB hJob**

The job handle.

**HSERVER hServer**

The Server handle.

**TCHAR\* status\_text**

A pointer to a string to receive the message. This string should be **MAX\_PATH** long.

**Prototype:**

**void SuspendJobServer(HJOB hJob, HSERVER hServer);**

**Remarks:**

This method will suspend a specific Server for a given job. The Server will stop working with the given job and start working on another one, provided another job exists. Use the **AssignJobServer()** to reactive it.

**Parameters:**

**HJOB hJob**

The job handle.

**HSERVER hServer**

The Server handle.

**Prototype:**

**void AssignJobServer(HJOB hJob, HSERVER hServer);**

**Remarks:**

This method can be used to assign a Server to a given job.

**Parameters:**

**HJOB hJob**

The job handle.

**HSERVER hServer**

The Server handle.

**Prototype:**

**int GetJobFramesCount(HJOB hJob);**

**Remarks:**

This method will return the number of frames for a given job.

**Parameters:**

## **HJOB hJob**

The job handle.

### **Prototype:**

```
int GetJobFrames(int start, int end, HJOB hJob, JOBFAMES* frames);
```

### **Remarks:**

This method will return a list of frames for a given job.

### **Parameters:**

#### **int start**

The first frame in the list to return.

#### **int end**

The last frame in the list to return. If you want the entire list of frames at once set the **start** and **end** to 0 and -1, respectively.

#### **HJOB hJob**

The job handle.

#### **JOBFAMES\* frames**

The array to receive the list of frames with information for each individual frame. This array should be large enough to receive the number of frames requested.

### **Return Value:**

The actual number of frames inserted in **frames**. This could be either equal to the amount requested or less.

### **Prototype:**

```
int GetJobLog(int start, int count, HJOB hJob, TCHAR** buffer);
```

### **Remarks:**

This method will return the log file for a given job.

### **Parameters:**

#### **int start**

The first log file line to return (base zero, 0 is the first line).

**int count**

The number of lines (rows) to return. If you want the whole file at once, set **start** to 0 and **count** to -1. Alternatively, if you want any lines added since the last time you call, set **start** to the last line you collected + 1 and **count** to -1.

**HJOB hJob**

The job handle.

**TCHAR\*\* buffer**

A pointer to a TCHAR array to receive the lines of the log file. The buffer will be allocated so it will accommodate the incoming data. This array should be freed using **LocalFree()** when you are finished.

**Return Value:**

The size of the allocated buffer. This is the size of the entire buffer including the last NULL terminating byte. If **GetJobLog()** returns 0, it means there are no new log file lines available.

**Prototype:**

**bool CheckOutputVisibility(TCHAR\* output, TCHAR\* err);**

**Remarks:**

When submitting a job, you can use this method to find out if the Manager can write a given output image file. This is usually the case when you have the output image file set to a local drive. The other participants in the network rendering may not be able to "see" this path and they will eventually fail. This test is not guaranteed as the Servers may have a different set of rights than the Manager, in which case the Manager might fail the write test while the Servers would have no problem otherwise.

**Parameters:****TCHAR\* output**

The output image file name you want to check. This is the full path and filename (i.e. d:/badpath/file.tga).

**TCHAR\* err**

A TCHAR string to receive the error message if one exists. This will explain why the test failed (such as path not found, access denied, etc.)

**Return Value:**

TRUE if the Manager could write to the given path, otherwise FALSE.

**Prototype:**

```
void AssignJob(Job* job, TCHAR* archive, HSERVER* servers,  
CJobText& jobtext, DWORD blocksize = 0);
```

**Remarks:**

This method allows you to assign a new job to the network queue.

**Parameters:**

**Job\* job**

The job structure containing the information about the job. See the Job structure description for an explanation.

**TCHAR\* archive**

The full path and filename of the archive containing the job files. This is the "\*.maz" file created by the **Maz()** function in the API.

**HSERVER\* servers**

An array containing the Servers assigned to this job. If the job flag is set to "use all Servers" and **job.servercount** is zero, this argument can be NULL (ignored). Otherwise it should be an array **job.servercount \* sizeof(HSERVERS)** long with the list of Servers to assign to this job.

**CJobText& jobtext**

A reference to a CJobText class with the proper elements.

**DWORD blocksize**

An optional alternate block size to use for network transfers. If **blocksize** is set to zero, the API will use the default **DF\_READCHUNK**. You may want to set this to something smaller if you are running over slow connections such as a modem connection. You may want to make it larger if you have a high performance network. This number will determine how large of a block of data to send at once to the Manager.

## **Server Methods**

**Prototype:**

```
int GetServerCount();
```

**Remarks:**

This method will return the number of Servers registered with the Manager.

**Prototype:**

```
int ListServers(int start, int end, ServerList* serverList);
```

**Remarks:**

This method allow you to list the Servers registered with the Manager.

**Parameters:****int start**

The first Server to return.

**int end**

The last Server to return. If you want the whole list at once, set **start** to 0 and **end** to -1.

**ServerList\* serverList**

The array to receive the list of Servers. This array should be large enough to receive the number of Servers requested.

**Return Value:**

The actual number of Servers inserted in **serverList**. This could be either equal to the amount requested or less.

**Prototype:**

```
void GetServer(HSERVER hServer, ServerList* serverList);
```

**Remarks:**

This method allows you to get a Server and retrieve a single record in the serverList given the Server handle.

**Parameters:****HSERVER hServer**

The handle to the Server.

**ServerList\* serverList**

A pointer to the ServerList in which to retrieve the Server.

**Prototype:****bool DeleteServer(HSERVER hServer);****Remarks:**

This method allows you to delete a Server from the Manager's Server list. You can not delete an active Server (i.e. a Server which is currently working on a job).

**Parameters:****HSERVER\* hServer**

The Server handle.

**Return Value:**

TRUE if the server is successfully deleted, otherwise FALSE.

**Prototype:****bool ResetServerIndex(HSERVER hServer);****Remarks:**

The Manager keeps a performance index for each Server. This index is computed based on the Server performance while rendering frames. All factors are taken into consideration such as the time it takes to load a job, the time it takes to process requests, the time it takes to render a frame, the memory and CPU load, etc. This index is in turn used internally to determine the best distribution of workload. You can use this method to reset a Server's performance index.

**Parameters:****HSERVER\* hServer**

The Server handle.

**Return Value:**

TRUE if resetting the Server's performance index was successful, otherwise FALSE.

**Prototype:****void GetWeekSchedule(HSERVER hServer, WeekSchedule\* schedule);****Remarks:**

This method allows you to obtain a given Server's weekly schedule structure.

**Parameters:**

**HSERVER\* hServer**

The Server handle.

**WeekSchedule\* schedule**

A pointer to a WeekSchedule structure to receive the schedule.

**Prototype:**

```
void SetWeekSchedule(HSERVER hServer, WeekSchedule*  
schedule);
```

**Remarks:**

This method allows you to set a given Server's weekly schedule structure.

**Parameters:**

**HSERVER\* hServer**

The Server handle.

**WeekSchedule\* schedule**

A pointer to a WeekSchedule structure with the new weekly schedule.

**Prototype:**

```
void GetServerNetStat(HSERVER hServer, NetworkStatus*  
net_stat);
```

**Remarks:**

This method allows you to obtain the network status for a given server. This method mostly serves as means to check network diagnostics.

**Parameters:**

**HSERVER\* hServer**

The Server handle.

**NetworkStatus\* net\_stat**

A pointer to a NetworkStatus structure to receive the status data.

## **Server Group Methods**

**Prototype:**

**int GetServerGroupCount();**

**Remarks:**

This method will return the number of Server groups.

**Prototype:**

**int GetServerGroupXCount(int group);**

**Remarks:**

This method will return the number of Servers for a given Server group.

**Parameters:**

**int group**

The zero based index into the Server group list.

**Prototype:**

**int GetServerGroup(int group, int count, HSERVER\* grplist,  
TCHAR\* name);**

**Remarks:**

This method allows you to obtain a Server group.

**Parameters:**

**int group**

The zero based index into the Server group list.

**int count**

The number of Servers to send, in order to define the size of the **grplist**.

**HSERVER\* grplist**

The array in which the list of Servers will be returned. This array should be large enough to accommodate **count** Servers.

**TCHAR\* name**

The name of the Server group. This string must be at least **MAX\_PATH** long.

**Return Value:**

The number of Servers collected.

**Prototype:**

```
void NewServerGroup(int count, HSERVER* grplist, TCHAR* name);
```

**Remarks:**

This method allows you to submit (create) a new Server group.

**Parameters:**

**int count**

The number of Servers in the list.

**HSERVER\* grplist**

The array containing **count** Servers.

**TCHAR\* name**

The name of the server group.

**Prototype:**

```
void DeleteServerGroup(int group);
```

**Remarks:**

This method allows you to delete a given Server group.

**Parameters:**

**int group**

The zero based index of the Server group to delete.

## **Network Archiving Functions**

The following global functions are not part of class MaxNetManager but are available for use:

**Function:**

```
bool Maz(TCHAR* archivename, TCHAR* file_list, DWORD* filesize = 0);
```

**Remarks:**

This function creates a Network Rendering archive. This is the archive sent to the manager when submitting a new job. Note that even though you can use whatever name you feel like, the Manager and Servers will look for a

"jobname.maz" file.

**Parameters:**

**TCHAR\* archivename**

The full path and filename of the archive you want to create.

**TCHAR\* file\_list**

A list of NULL terminated filenames to include in the archive. You should provide a full path and filename. However, only the file names will be saved in the archive and all files are going to be un-archived in the same directory.

An example: `file_list[] = {"c:\\path\\file.maz\0c:\\anotherpath\\maps.tga\0\0"};`

**DWORD\* filesize**

Optional pointer to a variable to receive the accumulated size of all files included in the archive. This is the "uncompressed" size. You can use this to compute the disk space necessary to uncompress the archive.

**Return Value:**

TRUE if the archive was successfully created, otherwise FALSE.

**Function:**

**bool UnMaz(TCHAR\* archivename, TCHAR\* output\_path);**

**Remarks:**

This function is the opposite of **Maz()** and will un-archive the given archive into the specified directory.

**Parameters:**

**TCHAR\* archivename**

The full path and filename of the archive you want to un-archive.

**TCHAR\* output\_path**

The path you want the files extracted to.

**Return Value:**

TRUE if the archive was successfully extracted, otherwise FALSE.

**Function:**

**void jobSetJobDefaults(Job\* job);**

**Remarks:**

This function will set the default values for the given Job structure. You can use this function to prevent frequent resetting of the structure and its default fields such as size, version, etc.

**Parameters:**

**Job \*job**

The job structure containing the information about the job. See the Job structure description for an explanation.

**Function:**

**bool jobReadMAXProperties(char\* filename, Job\* job, CJobText& jobText);**

**Remarks:**

This function will initialize a job structure using the data read from a specified 3ds max scene file. If you would want to submit a job based on a 3ds max file alone, you would call this function passing it to the file specified. This function takes care of filling all the fields so you can turn around and just send the job to the queue. An example of this can be found in the SDK under **\MAXSDK\SAMPLES\NETRENDER\JOBASSIGN**.

**Parameters:**

**char\* filename**

The filename of the 3ds max scene file (\*.max).

**Job\* job**

A pointer to an empty job structure which will be initialized by the method. Because the function will initialize the structure any values present prior to calling this method will be reset.

**CJobText& jobText**

A reference to an empty CJobText class which will be initialized by the function. Just like the job structure, any values present prior to calling this function will be reset.

**Return Value:**

TRUE if reading the properties was successful, otherwise FALSE.

## Class MaxNet

See Also: [Class MaxNetManager](#), [List of MaxNet Errors](#)

class MaxNet

### Description:

This class is available in release 4.0 and later only.

The MaxNet class serves as the base class for MaxNetManager and should be treated as the exception handler when using the Network Rendering API.

### Methods:

#### Prototype:

**MaxNet();**

#### Remarks:

Constructor

#### Prototype:

**maxnet\_error\_t GetError();**

#### Remarks:

This method returns the MaxNet error. See the list of MaxNet error codes for details.

#### Prototype:

**int GetGError();**

#### Remarks:

This method returns the MaxNet error. See the list of MaxNet error codes for details.

#### Prototype:

**const TCHAR\* GetErrorText();**

#### Remarks:

This method returns the MaxNet error description string.

## List of Parameter Block IDs

See Also: Class [Base Object](#) (method **GetParamBlockIndex()**).

Interfaces into some of the standard plug-ins that ship with 3ds max. These are from the file `\MAXSDK\INCLUDE\ISTDPLUG.H`.

The following are parameter block IDs for procedural objects:

### **Obj/Mod ID Data Type**

Arc **ARC\_RADIUS** float

**ARC\_FROM** float

**ARC\_TO** float

**ARC\_PIE** int

**ARC\_REVERSE** int

Box **BOXOBJ\_LENGTH** float

**BOXOBJ\_WIDTH** float

**BOXOBJ\_HEIGHT** float

**BOXOBJ\_WSEGS** int

**BOXOBJ\_LSEGS** int

**BOXOBJ\_HSEGS** int

**BOXOBJ\_GENUVS** int

Circle **CIRCLE\_RADIUS** float

Cone **CONE\_RADIUS1** float

# Class Deformer

See Also: [Class Object](#), [Class Point3](#).

class Deformer

## Description:

This is the callback object used by modifiers to deform "Deformable" objects.

## Methods:

## Prototype:

**virtual Point3 Map(int i, Point3 p) = 0;**

## Remarks:

Implemented by the Plug-In.

This is the method that is called to deform or alter a single point. Note that this method needs to be thread safe. A problem may occur when a non-local variable is modified inside of Map(). Since two versions of Map() could be executing at the same time, they could both end up modifying the same variable simultaneously which usually causes problems. See the Advanced Topics section [Thread Safe Plug-Ins](#) for more details.

## Parameters:

### int i

The index of the point to be altered. Note: An index of -1 may be passed. This indicates that the deformer is not being applied to a regular object but instead points that are generated on the fly for display purposes.

### Point3 p

The point to be altered.

## Return Value:

The altered point.

## Class GPort

See Also: Advanced Topics on [Palettes](#), [Class Color](#), [Class GammaMgr](#), [COLORREF](#).

class GPort

### Description:

A useful utility class for managing user interface colors. This class has several purposes:

- Maintain the default 3ds max palette for doing 256 color graphics.

- Provides a mechanism for allocating "animated color slots" in the default palette for use in the user interface.

- Provide various functions for doing dithered graphics using the default 3ds max palette.

All methods of this class are implemented by the system.

The following global function is used to get a pointer that may be used to call the methods of this class:

### Prototype:

```
GPort* GetGPort();
```

### Remarks:

There is only a single global instance of this class, and this method returns a pointer to it. A developer may use this pointer to call the methods of **GPort**.

### Sample Code:

```
int animColSlot = GetGPort()->GetAnimPalSlot();
```

### Methods:

#### Prototype:

```
virtual int GetAnimPalSlot()=0;
```

### Remarks:

Returns a slot number if available, -1 if not. Typically this is called in **WM\_INITDIALOG** processing code for as many slots as you need (the total number available is 8).

### Return Value:

A slot number if available; otherwise -1.

**Prototype:**

**virtual int AnimPalIndex(int i)=0;**

**Remarks:**

Retrieves the palette index associated with the 'i-th' slot.

**Parameters:**

**int i**

Specifies the slot.

**Prototype:**

**virtual void ReleaseAnimPalSlot(int i)=0;**

**Remarks:**

Releases the specified animated palette slot. Typically this is called in the **WM\_DESTROY** code for each slot obtained with **GetAnimPalSlot()**.

**Parameters:**

**int i**

The palette slot to release.

**Prototype:**

**virtual void SetAnimPalEntry(int i, COLORREF cr)=0;**

**Remarks:**

Sets the color associated with the 'i-th' animated slot.

**Parameters:**

**int i**

The slot index.

**COLORREF cr**

The color to set.

**Prototype:**

**virtual void AnimPalette(HDC hdc)=0;**

**Remarks:**

After several calls to **SetAnimPalEntry()**, call this to affect the HDC's palette. This puts the palette into the **HDC** so it will take effect.

**Parameters:****HDC hdc**

The handle of the device context.

**Prototype:****virtual HPALETTE PlugPalette(HDC hdc)=0;****Remarks:**

This method puts the standard 3ds max palette into the palette for the HDC, handing back a handle to the old palette.

**Parameters:****HDC hdc**

The device context.

**Return Value:**

The handle of the old palette.

**Prototype:****virtual void RestorePalette(HDC hDC,HPALETTE hOldPal)=0;****Remarks:**

This method puts the previous 3ds max palette (returned from **PlugPalette()**) into the palette for the HDC.

**Parameters:****HDC hDC**

The handle of the device context.

**HPALETTE hOldPal**

The palette to restore.

**Prototype:****virtual HBRUSH MakeAnimBrush(int slotNum, COLORREF col)=0;**

**Remarks:**

This method creates a brush for drawing with the specified animated palette slot color.

**Parameters:****int slotNum**

The animated palette slot.

**COLORREF col**

The color to use.

**Return Value:**

The handle of the brush created.

**Prototype:**

```
virtual int UpdateColors(HDC hdc)=0;
```

**Remarks:**

This method calls the Windows API **UpdateColors()** on the specified device context handle **hdc**. Call this when you get a **WM\_PALETTECHANGED** message.

**Parameters:****HDC hdc**

The handle of the device context.

**Return Value:**

Nonzero if it changed screen pixel values; otherwise zero.

**Prototype:**

```
virtual void MapPixels(UBYTE* inp, UBYTE *outp, int x, int y,  
int width)=0;
```

**Remarks:**

This method maps a single row of pixels in 24 bit color to indices into the current GPort palette, applying a dither pattern. This routine does NOT do gamma correction.

Note that **x** and **y** are necessary to establish the dither pattern alignment. The dither pattern covers the entire map, and if you want to just dither part of it, you need to tell this method where you are within the pattern.

**Parameters:****UBYTE\* inp**

Points to an array of width BGR triples. This is a sequence of bytes structured as B,G,R,B,G R, etc. The first pixel is B,G,R then the next pixel is B,G,R, etc.

**UBYTE \*outp**

The result - the color indices into the GPort palette. This array is **width** bytes in length.

**int x**

The x alignment position.

**int y**

The y alignment position.

**int width**

The number of items in the arrays above.

**Prototype:**

```
virtual void DisplayMap(HDC hdc, Rect& drect, int xsrc, int ysrc,  
UBYTE *map, int bytesPerRow)=0;
```

**Remarks:**

Display an array of 24 bit colors in the HDC. If the current display is 8 bit it will display it (with dither) using in the GPort palette, otherwise it will just blit to the screen. This method does NOT do gamma correction.

**Parameters:****HDC hdc**

The handle of the device context.

**Rect& drect**

The destination rectangle in the hdc.

**int xsrc**

The X position within this source raster of the upper left corner of the rectangle to be copied.

**int ysrc**

The Y position within this source raster of the upper left corner of the rectangle to be copied.

**UBYTE \*map**

Points to an array of BGR triples.

**int bytesPerRow**

The number of bytes per row on each scanline of **map**.

**Prototype:**

```
virtual void DisplayMap(HDC hdc, Rect& dest, Rect& src,  
    UBYTE *map, int bytesPerRow)=0;
```

**Remarks:**

This version of **DisplayMap()** stretches the image if the source rectangle is not the same size as the destination rectangle. **src** should be the size of the image.

**Parameters:**

**HDC hdc**

The handle of the device context.

**Rect& dest**

The destination rectangle in the **hdc**.

**Rect& src**

The source rectangle in **map**.

**UBYTE \*map**

Points to an array of RGB triples.

**int bytesPerRow**

The number of bytes per row on each scanline of **map**.

**Prototype:**

```
virtual void DitherColorSwatch(HDC hdc, Rect& r, Color c)=0;
```

**Remarks:**

This method first gamma corrects **Color c** using the current display gamma. In paletted modes, it will fill rectangle **r** with a dithered pattern approximating **Color c**. In 24 bit modes it just fills the rectangle with **Color c**.

**Parameters:**

**HDC hdc**

The handle of the device context.

**Rect& r**

The rectangle to fill.

**Color c**

The color to approximate (8 bit) or fill with (24 bit).

**Prototype:**

**virtual void PaintAnimPalSwatch(HDC hdc, DWORD col, int slot, int left, int top, int right, int bottom)=0;**

**Remarks:**

This method attempts to use the animated color slot indicated by "slot" to paint a rectangular color swatch. If slot is -1, it will uses **DitherColorSwatch()**. This method does handle gamma correction.

**Parameters:****HDC hdc**

The handle of the device context.

**DWORD col**

The color to paint. The format is the same as [COLORREF](#).

**int slot**

Specifies the slot to use. If -1 then **DitherColorSwatch()** is used.

**int left**

The left coordinate of the rectangular area to paint.

**int top**

The top coordinate of the rectangular area to paint.

**int right**

The right coordinate of the rectangular area to paint.

**int bottom**

The bottom coordinate of the rectangular area to paint.

**Prototype:**

**virtual HPALETTE GetPalette()=0;**

**Remarks:**

Returns the current GPort palette.

**The following functions are not part of class GPort but are available for use**

**Prototype:**

**static inline void gammaCorrect(COLORREF& c)**

**Remarks:**

Gamma corrects the specified color using the display gamma setting.

**Parameters:**

**COLORREF& c**

The color to gamma correct.

**Prototype:**

**static inline void deGammaCorrect(COLORREF& c)**

**Remarks:**

Reverses the effect of gamma correction on the specified color.

**Parameters:**

**COLORREF& c**

The color to de-gamma.

# Class ParamDimension

See Also: [Class ParamDimensionBase](#), [List of Dimension Types](#).

## Description:

Any parameter that can be controlled by a controller has a dimension. This dimension can be considered a unit of measure. It describes its type and its order of magnitude. When a controller needs to display the parameter values (for example in the function curve editor) it converts the value using its parameter dimension Convert() function. It can also convert back using the Unconvert() function.

Some parameters are stored over one range of values and displayed in another. For example parameter that use **stdAngleDim** store their parameters in radians but display them in degrees. By using **stdAngleDim** the value is converted to the proper format for display. Some parameter dimensions do not perform any conversion, for example **stdWorldDim**.

There are several default parameter dims implemented. Listed with each one is the type, convert functions and range of values usually stored (these are not enforced in any way).

If the type of parameter for your plug-in does not fit within any of the dimensions listed here you may simply use **defaultDim**. This performs no conversions and has no range.

### **ParamDimension \*defaultDim;**

Convert() is original value.

UnConvert() is original value.

Range: None.

### **ParamDimension \*stdWorldDim;**

The DimType is **DIM\_WORLD**

Convert() return original value.

UnConvert() returns original value.

### **ParamDimension \*stdAngleDim;**

The DimType is **DIM\_ANGLE**.

Convert() is RadToDeg()

UnConvert() is DegToRad()

### **ParamDimension \*stdColorDim;**

The DimType is **DIM\_COLOR**  
Convert() return original value.  
UnConvert() returns original value.  
Range: 0-1

**ParamDimension \*stdColor255Dim;**

The DimType is **DIM\_COLOR255**  
Convert() is value \* 255.0f  
UnConvert() is value / 255.0f  
Range: 0-255

**ParamDimension \*stdPercentDim;**

The DimType is **DIM\_PERCENT**  
Convert() is value \* 100.0f  
UnConvert() is value / 100.0f  
Range: 0-100

**ParamDimension \*stdNormalizedDim;**

The DimType is **DIM\_NORMALIZED**  
Convert() is original value.  
UnConvert() is original value.  
Range: 0-1

**ParamDimension \*stdSegmentsDim;**

The DimType is **DIM\_SEGMENTS**  
Convert() is original value.  
UnConvert() is original value.

**ParamDimension \*stdTimeDim;**

The DimType is **DIM\_TIME**  
Convert() is value/GetTicksPerFrame()  
UnConvert() is value\*GetTicksPerFrame() (see the section [Time](#) for details).

**Methods:**

If the DimType is custom than the methods below must be implemented. Note: This class is derived from ParamDimensionBase which provides methods **DimensionType()**, **Convert()** and **Unconvert()**.

**Prototype:**

**virtual float GetDimScale();**

**Remarks:**

Implemented by the Plug-In.

Returns the dimension scale.

**Prototype:**

**virtual void SetDimScale();**

**Remarks:**

Implemented by the Plug-In.

Sets the dimension scale.

**Prototype:**

**virtual TCHAR \*DimensionName();**

**Remarks:**

Implemented by the Plug-In.

Returns the name of the dimension.

## Class GetParamName

See Also: [ParamDimension](#).

### Description:

This class is used to hold a parameter name. When a client of a parameter block receives the **REFMSG\_GET\_PARAM\_NAME** message, the partID field is set to point at one of these structures. The client should fill in the parameter name.

### Data Members:

**TSTR name;**

Assign the parameter name to this variable.

**int index;**

Index of the parameter in the parameter block.

### Methods:

### Prototype:

**GetParamName(TSTR n, int i)**

### Remarks:

Constructor.

## Class GetParamDim

See Also: [ParamDimension](#).

### Description:

This class is used to store a parameter dimension. When a client of a parameter block receives the **REFMSG\_GET\_PARAM\_DIM** message, the **partID** field is set to point at one of these structures. The client should set **dim** to point at its dim descriptor.

### Data Members:

**ParamDimension \*dim;**

Assign the dimension to this variable.

**int index;**

Index of the parameter in the parameter block.

### Methods:

### Prototype:

**GetParamDim(int i)**

### Remarks:

Constructor.

## Class ParamBlockDescID

See Also: [Class ParamBlockDesc](#).

```
class ParamBlockDescID
```

### Description:

The parameter block descriptor describes each parameter in a parameter block. This version has an ID used to identify each parameter.

```
class ParamBlockDescID {  
    public:  
        ParamType type;  
        UserType *user;  
        BOOL animatable;  
        DWORD id;  
};
```

### Data Members:

#### **ParamType type**

The parameter type. See [List of Parameter Types](#).

#### **UserType \*user**

This value is not currently used -- it must always be passed as NULL.

#### **BOOL animatable**

This is a flag indicating if the parameter may be animated or not. Pass TRUE if the value may be animated and FALSE if it is constant.

#### **DWORD id**

This is an ID used to identify this parameter. This provides a solution to the problem of backwards compatibility. If you alter the parameter structure of your plug-in in the future (by adding or deleting parameters for example) previously saved 3ds max files will be incompatible. You can however use a mechanism which uses these IDs to convert older versions to the current version. See the Advanced Topics section on [Parameter Maps](#) for more detail on how this is done.

## Class ParamUIDesc

See Also: [Class IParamMap](#), [Parameter Maps](#).

### Description:

The ParamUIDesc class is used in conjunction with the parameter maps mechanism. It is used for creating descriptors that define the properties of a user interface control such as its type (spinner, radio button, check box, etc.), which resource ID it refers to, and which index into the virtual array of parameters it uses. See the Advanced Topics section on [Parameter Maps](#) for an overview of how these descriptors are used.

### Methods

### Prototype:

```
ParamUIDesc(int index,  
             EditSpinnerType spinType,int idEdit,int idSpin,  
             float lowLim,float highLim,float scale,  
             ParamDimension *dim=defaultDim);
```

### Remarks:

Constructor. This constructor is used for a float or int controlled by a single spinner control:

### Parameters:

#### **int index**

This is the index into the IParamArray virtual array of this UI control.

#### **EditSpinnerType spinType**

This parameter specifies the type of value which may be entered. The valid types (listed in **CUSTCONT.H**) are:

- **EDITTYPE\_INT** - Any integer value.
- **EDITTYPE\_FLOAT** - Any floating point value.
- **EDITTYPE\_UNIVERSE** - This is a value in world space units. It respects the systems unit settings (for example feet and inches).
- **EDITTYPE\_POS\_INT** - Any integer  $\geq 0$
- **EDITTYPE\_POS\_FLOAT** - Any floating point value  $\geq 0.0$
- **EDITTYPE\_POS\_UNIVERSE** - This is a positive value in world space units. It respects the systems unit settings (for example feet and inches) .

· **EDITTYPE\_TIME** - This is a time value. It respects the system time settings (SMPTE for example).

**int idEdit, int idSpin**

These are the resource IDs the edit control and the spinner control.

**float lowLim**

This is the minimum value the spinner can take on.

**float highLim**

This is the maximum value the spinner can take on.

**float scale**

This is the increment or decrement value used when the user uses the up or down arrow buttons of the spinner control. You may also pass the value **SPIN\_AUTOSCALE**. This causes 3ds max to automatically adjust the value used to increment or decrement based on the current value being edited. This allows the spinner to cover a wider range of values with less mouse movement or button clicking from the user.

**Prototype:**

```
ParamUIDesc(int index,ControlType type,int *ctrlIDs,  
int count,int *vals=NULL);
```

**Remarks:**

Constructor. This constructor is used for an **int** controlled by n radio buttons where

**vals[i]** represents the value if **ctrlIDs[i]** is checked. If **vals=NULL** then **ctrlIDs[i]** represents a value of i.

Or it may be used for:

An **int** controlled by multiple check boxes where each check boxes controls a single bit.

**vals[i]** specifies which bit **ctrlIDs[i]** controls. If **vals=NULL** then **ctrlIDs[i]** controls the i-th bit.

**Parameters:**

**int index**

This is the index into the IParamArray virtual array of this UI control.

**ControlType type**

This specifies the type of control to use. The available control are:

- **TYPE\_RADIO** - Radio Buttons.
- **TYPE\_MULTICHECKBOX** - Multiple Check Boxes. Note: This option is not currently supported.

**int \*ctrlIDs**

An array of control IDs. See the Remarks above.

**int count**

This is the number of control IDs in the array above.

**int \*vals=NULL**

An array of values. See the Remarks above.

**Prototype:**

**ParamUIDesc(int index,ControlType type,int id);**

**Remarks:**

Constructor. This version is used for an int controlled by a single check box (BOOL) or a Point3 controlled by a color swatch.

**Parameters:**

**int index**

This is the index into the IParamArray virtual array of this UI control.

**ControlType type**

This specifies the type of control to use. The available control types (defined in IPARAM.H) are:

- **TYPE\_SPINNER** - Spinner Control.
- **TYPE\_RADIO** - Radio Button.
- **TYPE\_SINGLECHECKBOX** - Single Check Box.
- **TYPE\_MULTICHECKBOX** - Multiple Check Boxes. Note: This option is not currently supported.
- **TYPE\_COLORSWATCH** - Color Swatch.

**int id**

This is the resource ID of the control.

**Prototype:**

**ParamUIDesc(int index,EditSpinnerType spinType,int idEdit1,**

```
int idSpin1,int idEdit2,int idSpin2,int idEdit3,  
int idSpin3,float lowLim,float highLim,float scale,  
ParamDimension *dim=defaultDim);
```

**Remarks:**

Implemented by the System.

This version is for a Point3 controlled by 3 spinners

**Parameters:**

**int index**

This is the index into the IParamArray virtual array of this UI control.

**EditSpinnerType spinType**

This parameter specifies the type of value which may be entered. The valid types (listed in **CUSTCONT.H**) are:

- **EDITTYPE\_INT** - Any integer value.
- **EDITTYPE\_FLOAT** - Any floating point value.
- **EDITTYPE\_UNIVERSE** - This is a value in world space units. It respects the systems unit settings (for example feet and inches).
- **EDITTYPE\_POS\_INT** - Any integer  $\geq 0$
- **EDITTYPE\_POS\_FLOAT** - Any floating point value  $\geq 0.0$
- **EDITTYPE\_POS\_UNIVERSE** - This is a positive value in world space units. It respects the systems unit settings (for example feet and inches) .
- **EDITTYPE\_TIME** - This is a time value. It respects the system time settings (SMPTE for example).

**int idEdit1,int idSpin1**

These are the resource IDs of the first edit and spinner controls.

**int idEdit2,int idSpin2**

These are the resource IDs of the second edit and spinner controls.

**int idEdit3,int idSpin3**

These are the resource IDs of the third edit and spinner controls.

**float lowLim**

This is the minimum value the spinner can take on.

**float highLim**

This is the maximum value the spinner can take on.

**float scale**

This is the increment or decrement value used when the user uses the up or down arrow buttons of the spinner control. You may also pass the value **SPIN\_AUTOSCALE**. This causes 3ds max to automatically adjust the value used to increment or decrement based on the current value being edited. This allows the spinner to cover a wider range of values with less mouse movement or button clicking from the user.

**ParamDimension \*dim=defaultDim**

This parameter represents the type and magnitude of the parameter. See [ParamDimension](#).

## Class ParamMapUserDlgProc

See Also: [IParamMap](#).

### Description:

This class is used with parameter maps. If there is some custom handling required by a particular control, the client can derive a class from **ParamMapUserDlgProc** and set it as the parameter map's user callback (usually using **SetUserDialogProc()**).

### Methods:

### Prototype:

```
virtual BOOL DlgProc(TimeValue t,IParamMap *map,HWND  
hWnd,UINT msg,WPARAM wParam,LPARAM lParam)=0;
```

### Remarks:

Implemented by the Plug-In.

This is the dialog proc that will be called to process the control messages. This proc will be called after the default processing is complete.

### Parameters:

#### **TimeValue t**

This is the current time.

#### **IParamMap \*map**

This is a pointer to the parameter map.

#### **HWND hWnd**

This is the handle to the dialog.

#### **UINT msg**

This is the message that should be processed by the dialog proc.

#### **WPARAM wParam**

This is a parameter that holds message specific information.

#### **LPARAM lParam**

This is a parameter that holds message specific information.

### Return Value:

This is essentially the equivalent of a normal Windows dialog proc, so it should return whatever value a normal dialog proc returns for the message. An

exception is that the value **REDRAW\_VIEWS** may be returned to cause the viewports to be redrawn.

**Prototype:**

**virtual void DeleteThis()=0;**

**Remarks:**

Implemented by the Plug-In.

If the DlgProc is non-NULL when the ParamMap is deleted the DeleteThis() method will be called. This method is usually implemented as follows: **void DeleteThis() {delete this;}**

**Prototype:**

**virtual void Update(TimeValue t);**

**Remarks:**

This method is available in release 2.0 and later only.

This method is called whenever the dialog is being updated. If the parameter map is invalidated, 3ds max will update the user interface. When it does, this method is called so a developer may do anything they need to on each update.

**Parameters:**

**TimeValue t**

The time at which the update is taking place.

**Default Implementation:**

**{}**

See Also: For more information on Dialog Procs see the Advanced Topics section on [Custom Controls](#).

## Class ParamBlockPLCB

See Also: [Class ParamVersionDesc](#).

### Description:

This is a handy post load call back for fixing up parameter blocks. This will look up the version of the loaded callback and fix it up so it matches the current version. NOTE: this deletes itself when its done. See [Parameter Maps](#) for more details.

### Methods:

### Prototype:

```
ParamBlockPLCB(ParamVersionDesc *v,int  
cnt,ParamVersionDesc *c,ReferenceTarget *t,int refNum);
```

### Remarks:

Constructor.

### Parameters:

**ParamVersionDesc \*v**

This is an array of ParamVersionDescs.

**int cnt**

This is the number of elements in the array specified above.

**ParamVersionDesc \*c**

This is a pointer to the current version of the ParamVersionDesc.

**ReferenceTarget \*t**

This is a pointer to a reference target. This is usually the **this** pointer of the object.

**int refNum**

This is the reference index of the parameter block.

See Also: Advanced Topics section under [Parameter Maps](#) for an explanation of how this is used.

## Class RefEnumProc

See Also: Advanced Topics section on [References](#).

class RefEnumProc

### Description:

This class is available in release 2.0 and later only.

This is the callback object for the global function

**EnumRefHierarchy(ReferenceMaker \*rm, RefEnumProc &proc);**

This classes **proc()** method is called for each element in the reference hierarchy.

### Methods:

#### Prototype:

**virtual void proc(ReferenceMaker \*rm)=0;**

### Remarks:

Implemented by the Plug-In.

This method is called once for each element in the reference hierarchy.

### Parameters:

**ReferenceMaker \*rm**

A pointer to the reference maker to this item.

## List of Animatable Flags

The following flags are bits of the aflag data member of class Animatable. See methods **Animatable::ClearAFlag()**, **SetAFlag()** and **TestAFlag()** to work with these flags.

### **A\_EVALUATING**

This is used internally.

### **A\_NOTIFYDEP**

This is used internally.

### **A\_CHILD\_TREE\_OPEN**

This indicates the item is a node and its children are opened up in the track view.

### **A\_SUBANIM\_TREE\_OPEN**

This indicates the sub-anim of the item are opened up in the track view.

### **A\_OBJECT\_REDUCED**

This is used internally.

**The following flags depends on the various sub-classes:**

**Atmospheric flags**

**A\_ATMOS\_DISABLED**

The atmosphere effect is disabled.

**Object flags**

**A\_OBJ\_CREATING**

The object is being created. It doesn't want to snap to itself.

**Modifier flags**

**A\_MOD\_DISABLED**

The modifier is disabled.

**A\_MOD\_BEING\_EDITED**

The modifier is being edited.

**A\_MOD\_USE\_SEL**

This is not used any longer.

**ModApp flags**

**A\_MODAPP\_DISABLED**

This is used internally.

**A\_MODAPP\_BEING\_EDITED**

This is used internally.

**A\_MODAPP\_SELECTED**

This is used internally.

**A\_MODAPP\_DISPLAY\_ACTIVE**

This is used internally.

**A\_MODAPP\_DYNAMIC\_BOX**

This is used internally.

**Derived Object Flags**

**A\_DERIVEDOBJ\_DONTDELETE**

This is used internally.

**Control flags**

**A\_ORT\_MASK**

This is used internally.

### **A\_ORT\_BEFORESHIFT**

Bits 5, 6 and 7.

### **A\_ORT\_AFTERSHIFT**

Bits 8, 9, 10.

### **A\_CTRL\_DISABLED**

This is used internally.

### **A\_ORT\_DISABLED**

Indicates that the out of range type is disabled.

### **Inode flags**

#### **A\_INODE\_IK\_TERMINATOR**

Terminates the top of an IK chain

#### **A\_INODE\_IK\_POS\_PINNED**

The position is pinned.

#### **A\_INODE\_IK\_ROT\_PINNED**

The rotation is pinned.

### **ToneOperator flags**

#### **A\_TONEOP\_DISABLED**

The exposure control is disabled.

#### **A\_TONEOP\_PROCESS\_BG**

The exposure control processes the background.

**Flags for Hold and Restore logic, for "lazy holding", to avoid multiple holding.**

**A\_HELD**

Typically a plug-in would not hold unless this flag was not set. Then set it once it has held something, then clear it once EndHold() is called on the RestoreObj. This will keep it from putting multiple restore objects in one cycle. See [Undo/Redo](#) for more details.

**A\_SET**

This is similar to above except this is used by controllers.

**A\_IS\_DELETED**

This is used internally.

**A\_BEING\_AUTO\_DELETED**

This is used internally.

**Reserved for superclass use**

**A\_SUPERCLASS1**

This is used internally.

**A\_SUPERCLASS2**

This is used internally.

**These are reserved for use by plug-ins for any purpose they need. No other plug-in will set these flags.**

**A\_PLUGIN1**

**A\_PLUGIN2**

**A\_PLUGIN3**

**A\_PLUGIN4**

**A\_DEPENDENCY\_TEST**

This is used internally.

**A\_LOCK\_TARGET**

Setting this flag will keep an item from being deleted when you delete a reference to it. For example, if you need to swap references for two items. For instance, say you have two nodes and two objects and you want to swap the object reference of the nodes. If you simply call ReplaceReference() on one node with the other node's object, the old object will get deleted because nothing else is referencing it anymore. By setting this flag temporarily you can keep it from being deleted and perform the swap.

The following work flags may be used by plug-ins but it is not guaranteed that they will remain unaltered by someone else. Therefore they are only used for temporary storage.

**A\_WORK1**

**A\_WORK2**

**A\_WORK3**

**A\_WORK4**

## Class IRenderElementMgr

See Also: [Class IRenderElement](#), [Class FPMixinInterface](#), [Class ReferenceTarget](#), [Render Elements](#)

```
class IRenderElementMgr : public FPMixinInterface
```

### Description:

This class is available in release 4.0 and later only.

This class represents the interface for the Render Element Manager. A sample plugin of a Render Element can be found in the SDK samples;  
`\MAXSDK\SAMPLES\RENDER\RENDERELEMENTS.`

### Methods:

public:

### Prototype:

```
virtual BOOL AppendMergedRenderElement(IRenderElement  
*pRenderElement)=0;
```

### Remarks:

This method gets called by the system to add a Render Element when it is merged from another file.

### Parameters:

**IRenderElement \*pRenderElement**  
A pointer to the Render Element to add.

### Return Value:

TRUE if the merging was successful, FALSE if it was not.

### Prototype:

```
virtual BOOL AppendMergedRenderElement(ReferenceTarget  
*pRenderElement)=0;
```

### Remarks:

This method gets called by the system to add a Render Element when it is merged from another file and ensures that the Reference Target is a Render Element.

**Parameters:**

**ReferenceTarget \*pRenderElement**

A pointer to the Render Element to add.

**Return Value:**

TRUE if the merging was successful, FALSE if it was not.

**Prototype:**

**virtual BOOL AddRenderElement(IRenderElement  
\*pRenderElement)=0;**

**Remarks:**

This method adds an IRenderElement instance to the manager's list.

**Parameters:**

**IRenderElement \*pRenderElement**

A pointer to the Render Element to add.

**Return Value:**

TRUE if the addition was successful, FALSE if it was not.

**Prototype:**

**virtual BOOL AddRenderElement(ReferenceTarget  
\*pRenderElement)=0;**

**Remarks:**

This method adds an IRenderElement instance to the manager's list and ensures that the Reference Target is a Render Element.

**Parameters:**

**ReferenceTarget \*pRenderElement**

A pointer to the Render Element to add.

**Return Value:**

TRUE if the addition was successful, FALSE if it was not.

**Prototype:**

**virtual BOOL RemoveRenderElement(ReferenceTarget  
\*pRenderElement)=0;**

**Remarks:**

This method removes an IRenderElement instance from the manager's list and ensures that the Reference Target is a Render Element.

**Parameters:**

**ReferenceTarget \*pRenderElement**

A pointer to the Render Element to remove.

**Return Value:**

TRUE if the addition was successful, FALSE if it was not.

**Prototype:**

**virtual void RemoveAllRenderElements()=0;**

**Remarks:**

This method will remove all the IRenderElement instances from the manager's list.

**Prototype:**

**virtual int NumRenderElements()=0;**

**Remarks:**

This method returns the number of Render Elements contained in the manager's list.

**Prototype:**

**virtual IRenderElement \*GetRenderElement(int index)=0;**

**Remarks:**

This method returns a pointer to a specific Render Element in manager's list.

**Parameters:**

**int index**

The index of the Render Element in the manager's list.

**Return Value:**

A pointer to the specific Render Element or NULL if the index is invalid.

**Prototype:**

**virtual void SetElementsActive(BOOL elementsActive)=0;**

**Remarks:**

This method sets whether the Render Elements List should be active during a render.

**Parameters:**

**BOOL elementsActive**

TRUE to activate the Render Elements List, FALSE to deactivate.

**Prototype:**

**virtual BOOL GetElementsActive() const = 0;**

**Remarks:**

This method checks if the Render Elements List is active during a render and will return TRUE if it is or FALSE if it is not.

**Prototype:**

**virtual void SetDisplayElements(BOOL displayElements)=0;**

**Remarks:**

This method sets whether the Render Elements should be displayed in their own (VFB) viewer window.

**Parameters:**

**BOOL displayElements**

TRUE to display in their own viewer, FALSE if you do not want to.

**Prototype:**

**virtual BOOL GetDisplayElements() const = 0;**

**Remarks:**

This method checks whether the Render Elements are displayed in their own (VFB) viewer window and will return TRUE if they are or FALSE if they are not.

**Prototype:**

**virtual void SetCombustionOutputEnabled(BOOL**

**combustionOutEnabled)=0;**

**Remarks:**

This method sets whether the Render Element List should be exported to a Combustion format file.

**Parameters:**

**BOOL combustionOutEnabled**

TRUE to enable Combustion format file output.

**Prototype:**

**virtual BOOL GetCombustionOutputEnabled() const = 0;**

**Remarks:**

This method checks whether the Render Element List will be exported to a Combustion format file and will return TRUE if they are or FALSE if they are not.

**Prototype:**

**virtual void SetCombustionOutputPath(const TCHAR  
\*combustionOutputPath)=0;**

**Remarks:**

This method allows you to set the output path for a Combustion format output file.

**Parameters:**

**const TCHAR \*combustionOutputPath**

The path string.

**Prototype:**

**virtual void SetCombustionOutputPath(const TSTR&  
combustionOutputPath)=0;**

**Remarks:**

This method allows you to set the output path for a Combustion format output file.

**Parameters:**

## **const TSTR& combustionOutputPath**

The path string.

### **Prototype:**

```
virtual const TSTR& GetCombustionOutputPath() const = 0;
```

### **Remarks:**

This method returns the output path for a Combustion format file.

### **Prototype:**

```
virtual const TCHAR* GetCombustionOutputPathPtr() const = 0;
```

### **Remarks:**

This method returns the output path for a Combustion format file.

## Class IRenderElement

See Also: [Class SpecialFX](#), [Class PBitmap](#), [Class ISave](#), [Class ILoad](#), [List of Reference Messages](#), [Render Elements](#)

```
class IRenderElement : public SpecialFX
```

### Description:

This class is available in release 4.0 and later only.

This is the interface that must be supported by all render elements whether they support the 3ds max renderer or some other renderer. The UI in the render dialog uses this interface exclusively to control the element.

The methods are almost all state-setting methods, with ones that are settable by the UI provided by both sets and gets. A sample plugin of a Render Element can be found in the SDK samples;

**\MAXSDK\SAMPLES\RENDER\RENDERELEMENTS.**

### Methods:

public:

### Prototype:

```
virtual void SetEnabled(BOOL enabled)=0;
```

### Remarks:

This method enables or disables the Render Element.

### Parameters:

**BOOL enabled**

Set to TRUE in order to enable the Render Element. FALSE to disable it.

### Prototype:

```
virtual BOOL IsEnabled() const = 0;
```

### Remarks:

This method returns TRUE if the Render Element is enabled, otherwise FALSE.

### Prototype:

**virtual void SetFilterEnabled(BOOL filterEnabled)=0;**

**Remarks:**

Each active render element has the option of either using the current AA filter or simple blending within the pixel. This method will set the internal filter enable to the value of parameter **filterEnabled**.

**Parameters:**

**BOOL filterEnabled**

Set to TRUE in order to enable. FALSE to disable it.

**Prototype:**

**virtual BOOL IsFilterEnabled() const = 0;**

**Remarks:**

This method returns the current state of whether the AA filter is enabled.

**Parameters:**

This method returns TRUE if filters for the Render Element are enabled, otherwise FALSE.

**Prototype:**

**virtual BOOL BlendOnMultipass() const =0;**

**Remarks:**

This method returns whether this element type should be blended during multipass effects.

When multipass camera effects such as depth of field are used in a rendering, each of the separate elements may be blended into a final bitmap like the composite color, or they may be "frozen" after the first pass. Blending is not appropriate for some elements, like z-depth. This is typically a query only, it is unlikely that this will need to be turned on & off.

**Return Value:**

TRUE if blending during multipass effects, otherwise FALSE.

**Prototype:**

**virtual void SetApplyAtmosphere(BOOL applyAtmosphere)=0;**

**Remarks:**

This method enables or disables the Apply Atmosphere flag for the Render Element.

**Parameters:****BOOL applyAtmosphere**

Set to TRUE in order to enable the atmospheric effects for the Render Element. FALSE to disable it.

**Prototype:**

**virtual BOOL AtmosphereApplied() const = 0;**

**Remarks:**

This method returns TRUE if atmospheric effects for the Render Element are enabled, otherwise FALSE.

**Prototype:**

**virtual void SetApplyShadows(BOOL applyShadows)=0;**

**Remarks:**

This method enables or disables the Apply Shadows flag for the Render Element.

**Parameters:****BOOL applyShadows**

Set to TRUE in order to enable the shadows for the Render Element. FALSE to disable it.

**Prototype:**

**virtual BOOL ShadowsApplied() const = 0;**

**Remarks:**

This method returns TRUE if shadows for the Render Element are enabled, otherwise FALSE.

**Prototype:**

**virtual void SetElementName(TCHAR\* newName)=0;**

**Remarks:**

This method sets the Render Element's name as it appears in the render dialog.

**Parameters:**

**TCHAR\* newName;**

The name for the Render Element.

**Prototype:**

**virtual const TCHAR\* ElementName() const = 0;**

**Remarks:**

This method returns a string representing the Render Element's name as it appears in the render dialog.

**Prototype:**

**virtual void SetPBBitmap(PBBitmap\* &pPBBitmap) const = 0;**

**Remarks:**

This method allows you to set the bitmapinfo/bitmap to use for the Render Element.

Each render element has an output bitmap. We use the pb2 style bitmap as it contains the pathname as well as the bitmap & bitmapInfo structures needed by windows. The bitmap is created by the render element manager, then held by the element until it's not needed. These are the calls that set & get the elements bitmap.

**Parameters:**

**PBBitmap\* &pPBBitmap**

The pointer to the PBBitmap reference.

**Prototype:**

**virtual void GetPBBitmap(PBBitmap\* &pPBBitmap) const = 0;**

**Remarks:**

This method allows you to get the bitmapinfo/bitmap that is used for the Render Element.

**Parameters:**

## **PBBitmap\* &pPBBitmap**

The pointer to the PBBitmap reference which was retrieved.

### **Prototype:**

```
virtual IRenderElementParamDlg  
*CreateParamDialog(IRendParams *ip);
```

### **Remarks:**

Each render element may define a rollup that will be displayed in the render dialog when that element is selected. Most current render elements do not provide their own rollups, but some like z-depth and blend do. This method creates the elements parameter rollup and return it's pointer to the system. If no rollup is supported, NULL should be returned.

### **Parameters:**

**IRendParams \*ip**

A pointer to the IRendParams data.

### **Default Implementation:**

```
{ return NULL; }
```

### **Prototype:**

```
virtual BOOL SetDlgThing(IRenderElementParamDlg* dlg);
```

### **Remarks:**

Implement this method if you are using the ParamMap2 [AUTO\\_UI](#) system and the IRenderElement has secondary dialogs that don't have the IRenderElement as their 'thing'. Called once for each secondary dialog, for you to install the correct 'thing'. This method will set the "thing" of a secondary dialog.

### **Parameters:**

**IRenderElementParamDlg\* dlg**

The pointer to the parameter dialog.

### **Return Value:**

TRUE if you process the dialog, otherwise FALSE.

### **Default Implementation:**

```
{ return FALSE; };
```

**Prototype:**

```
IOResult Save(ISave *iSave)
```

**Remarks:**

This method handles saving the plugin data. it is critical for merging that this code is called at the start of a plug-in's save and load methods. SpecialFX's base implementation saves/loads SpecialFX::name, which is used to populate the 'Merge Render Elements' dialog box. if a plugin re-implements this function, it should first call **RenderElement::Save(iSave)** or **IRenderElement::Load(iLoad)**

**Parameters:**

```
ISave *iSave
```

You may use this pointer to call methods of ISave to write data.

**Return Value:**

One of the following values: **IO\_OK**, **IO\_ERROR**.

**Default Implementation:**

```
{  
  name = ElementName();  
  return SpecialFX::Save(iSave);  
}
```

**Prototype:**

```
IOResult Load(ILoad *iLoad)
```

**Remarks:**

This method handles loading the plugin data. It is critical for merging that this code is called at the start of a plug-in's save and load methods. SpecialFX's base implementation saves/loads SpecialFX::name, which is used to populate the 'Merge Render Elements' dialog box. if a plugin re-implements this function, it should first call **RenderElement::Save(iSave)** or **IRenderElement::Load(iLoad)**

**Parameters:**

## **ILoad \*iLoad**

You may use this pointer to call methods of ILoad to read data.

### **Return Value:**

One of the following values: **IO\_OK**, **IO\_ERROR**.

### **Default Implementation:**

```
{ return SpecialFX::Load(iLoad); }
```

### **Prototype:**

```
virtual RefResult NotifyRefChanged(Interval changeInt,  
RefTargetHandle hTarget, PartID& partID, RefMessage  
message);
```

### **Remarks:**

A plug-in which makes references must implement this method to receive and respond to messages broadcast by its dependents.

### **Parameters:**

#### **Interval changeInt**

This is the interval of time over which the message is active. Currently, all plug-ins will receive **FOREVER** for this interval.

#### **RefTargetHandle hTarget**

This is the handle of the reference target the message was sent by. The reference maker uses this handle to know specifically which reference target sent the message.

#### **PartID& partID**

This contains information specific to the message passed in. Some messages don't use the **partID** at all. See the section [List of Reference Messages](#) for more information about the meaning of the **partID** for some common messages.

#### **RefMessage message**

The message parameters passed into this method is the specific message which needs to be handled. See [List of Reference Messages](#).

### **Return Value:**

The return value from this method is of type **RefResult**. This is usually **REF\_SUCCEEDED** indicating the message was processed. Sometimes, the

return value may be **REF\_STOP**. This return value is used to stop the message from being propagated to the dependents of the item.

**Default Implementation:**

```
{ return REF_SUCCEED; }
```

**Prototype:**

```
SClass_ID SuperClassID();
```

**Remarks:**

This method returns the plugin's SuperClass ID.

**Default Implementation:**

```
{ return RENDER_ELEMENT_CLASS_ID; }
```

**Prototype:**

```
virtual void* GetInterface(ULONG id)=0;
```

**Remarks:**

This method is being used as a general extension method in 3dw max. The Render Elements use it to get the interface for a specific renderer's element interface. The renderer will call this method to see if an IRenderElement is compatible with it. By asking for a specific renderer interface, the element can either provide the interface, or return **NULL**. If **NULL** is returned, then this element will not be available for this renderer. Note that this strategy allows a single render element to support more than one renderer. The max default renderer iid is in **\MAXSDK\INCLUDE\renderElements.h** and is defined as **0xeffeefe**, accessed through **MaxRenderElement::IID**.

**Parameters:**

**ULONG id**

Currently this is not used and is reserved for future use.

**Prototype:**

```
virtual void ReleaseInterface(ULONG id, void *i)=0;
```

**Remarks:**

This method is not currently used. It is reserved for future use. Its purpose is

for releasing an interface created with **GetInterface()**.

## Class IRenderElementCompatible

See Also: [Class IRenderElement](#) , [Render Elements](#)

class IRenderElementCompatible

### Description:

This class is available in release 4.0 and later only.

The system will ask a Renderer for this interface by calling

**Renderer::GetInterface (IRenderElementCompatible::IID)**. If the

Renderer returns a pointer to this interface, it is implied that the Renderer supports render elements. The system will then call

**IRenderElementCompatible::IsCompatible()** to determine if an IRenderElement instance is compatible with it. To determine compatibility, the

Renderer can call **IRenderElement::GetInterface()** (inherited from class Animatable), passing in an interface ID that a compatible IRenderElement would understand. If the Renderer receives a valid interface pointer, it can return TRUE to **IRenderElementCompatible::IsCompatible()**.

### Methods:

public:

### Prototype:

```
virtual BOOL IsCompatible(IRenderElement  
*pIRenderElement)=0;
```

### Remarks:

This method determines if the specified IRenderElement instance is compatible with the renderer.

### Parameters:

**IRenderElement \*pIRenderElement**

A pointer to the IRenderElement to check for compatibility.

### Return Value:

TRUE if the RenderElement is compatible, FALSE if it is not.

## Class MaxRenderElement

See Also: [Class IRenderElement](#), [Class ShadeContext](#), [Class IllumParams](#) , [Render Elements](#)

```
class MaxRenderElement : public IRenderElement
```

### Description:

This class is available in release 4.0 and later only.

This is the RenderElement base class for 3ds max' default scanline renderer. RenderElement plugins that utilize ShadeContext and IllumParams should subclass from here. . All render elements that support the max renderer should derive from this class. The class implements a handler for the ShadeOutputIndex of the elements value in the ShadeOutput array. Access to the elements value is accomplished within PostIllum or PostAtmosphere by:

```
AColor myColor;  
// ... do some computation  
sc.out.elementVals[ mShadeOutputIndex ] = myColor;  
// ... or  
sc.out.elementVals[ ShadeOutputIndex() ] = myColor;
```

A sample plugin of a Render Element can be found in the SDK samples;  
**\MAXSDK\SAMPLES\RENDER\RENDERELEMENTS.**

### Data Members:

protected:

```
int mShadeOutputIndex;
```

The index into element value array in shadeOutput class.

### Methods:

public:

### Prototype:

```
void SetShadeOutputIndex(int shadeOutputIndex);
```

### Remarks:

This method sets the index into the element array in the ShadeOutput class. This method is implemented by this base class & need not be re-implemented by derivative classes. Derivative classes access the index either through the interface or directly as mShadeOutputIndex. Set is used by the system to assign an index to each element. This index persists throughout a single rendering.

**Parameters:**

**int shadeOutputIndex**

The shadeOutput index.

**Prototype:**

**int ShadeOutputIndex();**

**Remarks:**

This method gets the index into the element array in the ShadeOutput class. This method is implemented by this base class & need not be re-implemented by derivative classes. Derivative classes access the index either through the interface or directly as mShadeOutputIndex. Set is used by the system to assign an index to each element. This index persists throughout a single rendering.

**Prototype:**

**virtual void Update(TimeValue timeValue)**

**Remarks:**

This method will update the element to time **timeValue**. Note that most elements don't care.

Update is called to communicate the time to the element. It will be called on each element before the call to **PostIllum()** is executed. No current render element uses this, but it could prove useful someday. This class provides a default stub implementation, so this need not be implemented unless needed.

**Parameters:**

**TimeValue timeValue**

The timevalue at which the update gets called.

**Prototype:**

```
virtual void PostIllum(ShadeContext& sc, IllumParams& ip)=0;
```

**Remarks:**

This method is used to compute the element and store the result in the ShadeContext's ShadeOutput.

This is the first of the actual computation methods for the render element.

**PostIllum()** is called by the material just after an illumination is computed for a fragment. Some materials, like the multi-materials don't compute illumination themselves but mix illuminations from other leaf materials. Such materials do not call **PostIllum()**, but need to consider the elements when blending the shadeoutputs from the leaf materials. The ShadeContext is the same shadecontext passed into the material's shade method, & contains the member variable 'out', which is the current output from the full pixel shading and the storage place for renderElement values.

The other param, **IllumParams**, contains detailed information about the shading process. Specifically, the component-wise output from the shading process is available in the **IllumParams**. Also the illumParams passed in are dependent on whether the element has requested shadows or not. The standard material keeps two sets of these and supplies the one requested. This method must be implemented, tho some elements merely stub it out or clear the output element value. It should put it's output is in

**sc.out.elementVals[ShadeOutputIndex() ]**. Even if you do not need this function, it is a good idea to clear the element val.

**Parameters:**

**ShadeContext& sc**

A reference to the ShadeContext.

**IllumParams& ip**

A reference to the IllumParams.

**Prototype:**

```
virtual void PostAtmosphere(ShadeContext& sc, float z, float prevZ)=0;
```

**Remarks:**

This is the second computation method and is only called if the elements has

atmospheres applied. If it is applied, then the element value is retrieved from the shadeContext, the atmosphere is applied to it & and the output from the atmosphere is left in **sc.out.c** and **sc.out.t**. Last, PostAtmosphere is called with the shadeContext, and the 2 z values used by the atmosphere to compute it. If the point is directly visible to the camera, then **prevZ** will be 0.0f, otherwise it is the z of the next closest obscuring transparent fragment in front of the fragment being shaded. It is up to the render element to process the output in **sc.out.c** and save the result in **sc.out.elementVals[ShadeOutputIndex() ]**. Note that when PostAtmosphere is called the original value set by PostIllum is saved in the element val. This can be overwritten or used in some computation. For example, to separate atmosphere from the composite color, **sc.out.c** and **sc.out.elementVals[ShadeOutputIndex() ]** can be differenced.

**Parameters:**

**ShadeContext& sc**

A reference to the ShadeContext.

**float z**

The first depth value.

**float prevZ**

The previous depth value.

**Prototype:**

**virtual void\* GetInterface(ULONG id)=0;**

**Remarks:**

The renderer will call this method to see if IRenderElement is compatible with it This is used for future expansion in interface classes. When the 3ds max development team needs to add additional functionality to an interface class this method provides a way to do that without breaking the API. If the 3ds max developers would add methods to an existing class it would invalidate the plug-ins that used the class. Using this method allows additional functionality to be added to the interface class without breaking the API.

**Parameters:**

**ULONG id**

Currently this is not used and is reserved for future use.

**Prototype:**

**virtual void ReleaseInterface(ULONG id, void \*i)=0;**

**Remarks:**

This method is not currently used. It is reserved for future use. Its purpose is for releasing an interface created with **GetInterface()**.

## Class IOsnapManager

See Also: [Class OsnapHit](#), [Class INode](#), [Class ViewExp](#), [Class Matrix3](#), The Advanced Topics section on [Snapping](#).

```
class IOsnapManager
```

### Description:

This class is available in release 2.0 and later only.

This class provides an interface to the OsnapManager. Developers who implement osnaps need to record hits with the osnap manager. Developers implementing command modes are responsible for getting the snap preview done and may be responsible for initializing and closing point sequences. See the Advanced Topics section on [Snapping](#) for more details.

### Methods:

#### Prototype:

```
virtual BOOL getactive() const=0;
```

#### Remarks:

This method is used internally but may be called to determine if the **OsnapManager** is currently on.

#### Prototype:

```
virtual BOOL getAxisConstraint()=0;
```

#### Remarks:

This method is used internally but may be called to determine if the **OsnapManager** will use the system level axis constraints when performing translation.

#### Prototype:

```
virtual void RecordHit(OsnapHit* somehit)=0;
```

#### Remarks:

When a plugin osnap finds a hit, it should call this method to record it with the manager. This will enter the hit in a stack which is sorted based on proximity to the cursor position. When multiple hits are recorded with the manager, the

user has the ability to cycle through the stack.

**Parameters:**

**OsnapHit\* somehit**

A pointer to the hit to record. The Osnap plugin should instantiate the hits and the manager is responsible for freeing them.

**Prototype:**

**virtual BOOL OKForRelativeSnap()=0;**

**Remarks:**

Some snaps only make sense relative to a reference point. Consider, for example, the tangent snap which looks for points of tangency on splines. You can only find a tangent point relative to a second point. As objects are created and manipulated, the OsnapManager maintains a list of the Points that have been input to the current command mode. This method tells you if the first point has been recorded.

**Prototype:**

**virtual BOOL RefPointWasSnapped()=0;**

**Remarks:**

This method tells you if the point on the top of the reference stack was actually snapped.

**Prototype:**

**virtual Point3 GetRefPoint(BOOL top = TRUE)=0;**

**Remarks:**

This method retrieves the Point on the top of the reference stack. The point returned is in world space. Note that calling this method when the stack is empty will crash the program. Remember to call **OKForRelativeSnap()** first. Here are the first few lines of the tangent snap's main method.

```
void ShapeSnap::Snap(Object* pObj, IPoint2 *p, TimeValue t) {  
    if(!theman->OKForRelativeSnap())  
        return;  
    //Get the reference point
```

**Point3 relpoint(theman->GetRefPoint());//the last point the user clicked.**

**//transform the reference point into the node's coordinate system**

**Matrix3 tm = theman-> GetObjectTM();**

**relpoint = Inverse(tm) \* relpoint;**

**...**

**Parameters:**

**BOOL top = TRUE**

The default is to return the top of the stack, i.e. the last point which was input to the command mode. If you pass FALSE, the bottom of the stack will be returned.

**Prototype:**

**virtual BOOL IsHolding()=0;**

**Remarks:**

This method is used internally. This method tells if the any hits were recorded with the OsnapManager during the last scene traversal.

**Prototype:**

**virtual OsnapHit &GetHit()=0;**

**Remarks:**

This method is used internally. It returns the current hit i.e. the hit which the manager is currently displaying.

**Prototype:**

**virtual ViewExp \*GetVpt()=0;**

**Remarks:**

Returns a pointer to a **ViewExp**. This is only valid for the duration of the current scene traversal. It is guaranteed to be valid while in a plugin's **Snap()** method.

**Prototype:**

**virtual INode \*GetNode()=0;**

**Remarks:**

Returns a pointer to the node which is currently being snapped.

**Prototype:**

**virtual int GetSnapStrength()=0;**

**Remarks:**

Returns the current snap strength. This is the radius of a circular area about the cursor. It is the plugin's responsibility to determine if any "interesting" parts of the object lie within this area. For testing points, see the method

**OsnapManager::CheckPotentialHit()**.

**Prototype:**

**virtual Matrix3 GetObjectTM()=0;**

**Remarks:**

Returns the object transformation matrix of the node which is currently being snapped.

**Prototype:**

**virtual TimeValue GetTime()=0;**

**Remarks:**

Returns the animation time of the current scene traversal.

**Prototype:**

**virtual void wTranspoint(Point3 \*inpt, IPoint3 \*outpt)=0;**

**Remarks:**

This method is not currently used. The method transforms a point in the current node's object space into screen space.

**Parameters:**

**Point3 \*inpt**

A pointer to the object space point.

**IPoint3 \*outpt**

A pointer to storage for the screen space point.

**Prototype:**

**virtual void Reset()=0;**

**Remarks:**

This method may be called to clear out the OsnapManager's reference point stack. Typically this is handled internally. However, objects which implement their own creation processes may need to call this method upon completion of a creation cycle.

# Class HitMesh

See Also: [Class Osnap](#), The Advanced Topics section on [Snapping](#)..

```
class HitMesh
```

## Description:

This class is available in release 2.0 and later only.

This is a class to hold a list of object space points for highlighting the geometry associated with a hit. One oddity of this class is that you need to allocate one point more than the number of points you actually need. This additional storage is used for clipping against the viewport at display time. For example the "endpoint" snap would allocate a three-point hitmesh to highlight the edge which was hit (See the example below) .

The class has data members for the number of points and a pointer to the actual **Point3** list.

In practice, developers need only use the first two methods shown below.

## Methods:

### Prototype:

```
HitMesh(int n);
```

### Remarks:

Constructor. The number of vertices is set to the value **n** passed and the points array is allocated with that size. This is the constructor that plugin developers will typically use in conjunction with the **setVert()** method described below.

### Parameters:

```
int n
```

The number of points to allocate.

### Prototype:

```
void setVert(int i, const Point3 &xyz);
```

### Remarks:

Sets the 'i-th' vertex to the specified value.

### Parameters:

```
int i
```

The vertex to set.

```
const Point3 &xyz
```

The value to set.

**In practice, developers need only use the two previous methods. The following code segment from the mesh snap exemplifies their use.**

```
//add the hit points based on the active subsnaps
```

```
if(GetActive(EDGE_SUB)
```

```
)// The edge snapping is active and we have a hit on the edge  
defined by from and to.
```

```
{
```

```
    HitMesh *hitmesh = new HitMesh(3); //Allocate one more than we  
need.
```

```
    hitmesh->setVert(0, from);
```

```
    hitmesh->setVert(1, to);
```

```
    float dap = Length(cursor - sf2);
```

```
    assert(Length(st2 - sf2)>=0.0f);
```

```
    float pct = (float)sqrt(fabs(dap*dap - distance*distance)) /  
Length(st2 - sf2);
```

```
    Point3 cand;
```

```
    float pctout = gw->interpWorld(&xyz[0],&xyz[1],pct,&cand);
```

```
    theman->RecordHit(new EdgeHit(cand, this, EDGE_SUB,  
hitmesh, ifrom, ito, pct));
```

```
}
```

**Prototype:**

```
    HitMesh();
```

**Remarks:**

Constructor. The number of points is set to zero and the point list is set to NULL.

**Prototype:**

**HitMesh(const HitMesh& h);**

**Remarks:**

Constructor. The number of points and the points are initialized from the **HitMesh** passed.

**Parameters:**

**const HitMesh& h**

The **HitMesh** to init from.

**Prototype:**

**~HitMesh();**

**Remarks:**

Destructor. If point list is allocated it is freed.

**Prototype:**

**int getNumVerts();**

**Remarks:**

Returns the number of points in this **HitMesh**.

**Prototype:**

**void setNumVerts(int n);**

**Remarks:**

Sets the number of vertices. This frees any existing verts and allocates new ones.

**Parameters:**

**int n**

The number of points to allocate.

**Prototype:**

**Point3& getVert(int i);**

**Remarks:**

Returns the 'i-th' vertex.

**Prototype:**

**Point3\* getVertPtr();**

**Remarks:**

Returns a pointer to the array of points.

**Operators:**

**Prototype:**

**Point3 operator[](int i);**

**Remarks:**

Access operator. Return the 'i-th' point.

**Parameters:**

**int i**

Specifies the point to return.

## Class OsnapHit

See Also: [Class IOsnapManager](#), [Class Osnap](#), [Class HitMesh](#), [Class Point3](#), [Class IPoint3](#), The Advanced Topics section on [Snapping](#).

```
class OsnapHit : public BaseInterfaceServer
```

### Description:

This class is available in release 2.0 and later only.

This class encapsulates the data required to record a snapped point. Typically a plug-in creates instances of this class and records them with the **OsnapManager**. The manager is responsible for freeing the memory associated with recorded hits. All the methods of this class are implemented by the system. If a snap plugin needs to record additional data for its hits, it should derive from this class and provide a clone method which copies this additional data and calls the base classes clone method.

### Friend Classes:

```
friend class OsnapManager;
```

```
friend class Osnap;
```

### Methods:

### Prototype:

```
OsnapHit(Point3 p3, Osnap* s, int sub, HitMesh *m);
```

### Remarks:

Constructor. The data members are initialized to the values passed.

### Parameters:

**Point3 p3**

The point that was hit in object space.

**Osnap\* s**

Points to the Osnap instance which made this hit.

**int sub**

The sub-snap index which made this hit.

**HitMesh \*m**

Points to the mesh used to hilite the topology that was hit.

**Prototype:**

**OsnapHit(const OsnapHit& h);**

**Remarks:**

Constructor. The data members are initialized from the **OsnapHit** passed.

**Parameters:**

**const OsnapHit& h**

The data members are copied from this **OsnapHit**.

**Prototype:**

**virtual ~OsnapHit();**

**Remarks:**

Destructor. If a **HitMesh** was allocated it is deleted.

**Prototype:**

**virtual OsnapHit\* clone();**

**Remarks:**

Returns a pointer to a new instance of the **OsnapHit** class and initializes it with this instance. Developers deriving from this class should override this method.

**Prototype:**

**void setscreendata(IPoint3 screen3, int len);**

**Remarks:**

This method is used internally. Sets the data members associated with screen hit data.

**Parameters:**

**IPoint3 screen3**

The hit location in screen space.

**int len**

The distance from the cursor.

**Prototype:**

**boolean display(ViewExp \*vpt, TimeValue t, Point3 color, int markersize, boolean markers = TRUE, boolean hilite = TRUE);**

**Remarks:**

This display method is implemented by the system and used internally.

**Parameters:**

**ViewExp \*vpt**

The viewport to display in.

**TimeValue t**

The current time.

**Point3 color**

The color to draw it in.

**int markersize**

The relative size of the icon.

**boolean markers = TRUE**

Controls whether or not the hit icon is drawn.

**boolean hilite = TRUE**

Controls whether or not the mesh part of the hit is drawn.

**Prototype:**

**void erase(ViewExp \*vpt, TimeValue t) const;**

**Remarks:**

This method is not currently used.

**Prototype:**

**void GetViewportRect(TimeValue t, ViewExp \*vpt, Rect \*rect, int marksize) const;**

**Remarks:**

Implemented by the system.

This method determines the damage rectangle for this hit.

**Parameters:**

**TimeValue t**

The time at which to compute the rectangle.

**ViewExp \*vpt**

The viewport in which to compute the rectangle.

**Rect \*rect**

Points to storage for the computed result.

**int marksize**

The size of the icon.

**Prototype:****Point3 GetHitpoint();****Remarks:**

Returns the hit location in object space.

**Prototype:****Point3 GetWorldHitpoint();****Remarks:**

Returns the hit location in world space.

**Prototype:****IPoint3 GetHitscreen();****Remarks:**

Returns the hit location in screen space. **IPoint3.z** is the depth in screen space.

**Prototype:****int GetSubsnap();****Remarks:**

Returns the sub-snap index which made this hit.

**Prototype:**

**INode \*GetNode();**

**Remarks:**

Returns a pointer to the node which got hit.

**Prototype:**

**void Update(TimeValue t);**

**Remarks:**

This method is not currently implemented.

**Prototype:**

**Point3 ReEvaluate(TimeValue t);**

**Remarks:**

Implemented by the System.

This method updates the internal data to reflect a change in time. For example, if a hit is recorded on the endpoint of a particular edge of a mesh, the node moving would invalidate the hit data and a call to this method would be required before using its data.

**Parameters:**

**TimeValue t**

The time at which to reevaluate it.

**Return Value:**

The updated point in world space.

**Prototype:**

**void Dump()const;**

**Remarks:**

This method is used internally for debugging and is not implemented for plug-in use.

**Operators:**

**Prototype:**

**virtual OsnapHit& operator=(const OsnapHit& h);**

**Remarks:**

Assignment operator.

**Parameters:**

**const OsnapHit& h**

The **OsnapHit** to assign.

**Prototype:**

**BOOL operator<(OsnapHit& hit);**

**Remarks:**

This comparison operator is used in sorting.

**Parameters:**

**OsnapHit& hit**

The **OsnapHit** to compare.

**Return Value:**

TRUE if the distance from the cursor is less than **hit**; otherwise checks if the depth in Z space is less than **hit**. If so TRUE; otherwise FALSE.

**Prototype:**

**BOOL operator>(OsnapHit& hit);**

**Remarks:**

This comparison operator is used in sorting.

**Parameters:**

**OsnapHit& hit**

The **OsnapHit** to compare.

**Return Value:**

TRUE if the distance from the cursor is less than **hit**; otherwise checks if the depth in Z space is less than **hit**. If so TRUE; otherwise FALSE.

## Class OsnapMarker

See Also: [Class Osnap](#), [Class IOsnapManager](#), [Class GraphicsWindow](#), [Class IPoint3](#).

```
class OsnapMarker
```

### Description:

This class is available in release 2.0 and later only.

This class is used for drawing Osnap markers in the viewports. The marker is drawn as a polyline. The class maintains a cache of the points for the polyline. There are constructors used to initialize the cache and a **display()** method to draw the marker in the specified viewport.

The Osnap class must implement the **GetMarkers()** method which typically returns pointers to these static instances.

### Methods:

#### Prototype:

```
OsnapMarker();
```

#### Remarks:

Constructor. The cache of marker points is set to NULL and the number of points is set to 0.

#### Prototype:

```
OsnapMarker(int n, IPoint3 *ppt, int *pes);
```

#### Remarks:

Constructor. This initializes the cache with the points and edge flags passed.

#### Parameters:

**int n**

The number of points in the marker polyline.

**IPoint3 \*ppt**

The array of points for the polyline.

**int \*pes**

The edge state array. This is an array that indicates if the 'n-th' edge is one of three state:

### **GW\_EDGE\_SKIP**

Nonexistent - totally invisible.

### **GW\_EDGE\_VIS**

Exists and is solid.

### **GW\_EDGE\_INVIS**

Exists and is hidden - shown as a dotted line.

You may pass NULL for this array and the method will assume that the edges are all solid.

#### **Prototype:**

**OsnapMarker(const OsnapMarker& om);**

#### **Remarks:**

Constructor. The marker data is initialized from the **OsnapMarker** passed.

#### **Parameters:**

**const OsnapMarker& om**

The settings are copied from this **OsnapMarker**.

#### **Prototype:**

**~OsnapMarker();**

#### **Remarks:**

Destructor. If any marker points have been allocated for the cache they are freed.

#### **Prototype:**

**void display(IPoint3 xyz, int markersize, GraphicsWindow \*gw);**

#### **Remarks:**

This is method is used internally to display the marker cache at the specified size in the specified viewport. Plugin developers need not call this method.

#### **Operators:**

#### **Prototype:**

**OsnapMarker& operator=(const OsnapMarker& om);**

**Remarks:**

Assignment operator.

**Parameters:**

**const OsnapMarker& om**

The OsnapMarker to assign.

## Structure SnapInfo

See Also: [List of Snap Flags](#), [Class ViewExp](#).

This structure describes the snap settings used for an operation.

**typedef struct {**

**int snapType;**

One of the following values:

**SNAP\_2D**

2-D Snap.

**SNAP\_25D**

2 1/2-D Snap.

**SNAP\_3D**

3-D Snap.

**int strength;**

Maximum snap distance.

**int vertPriority;**

Geometry vertex priority.

**int edgePriority;**

Geometry edge priority.

**int gIntPriority;**

Grid intersection priority.

**int gLinePriority;**

Grid line priority.

**DWORD flags;**

See [List of Snap Flags](#).

**Matrix3 plane;**

Plane to use for snap computations.

**Point3 bestWorld;**

Best snap point in world space.

**Point2 bestScreen;**

Best snap point in screen space.

**int bestDist;**

Best snap point distance.

```
int priority;  
    Best point's priority.  
} SnapInfo;
```

## Class XFormModes

See Also: [List of Standard Sub-Object Modes](#).

class XFormModes

### Description:

This class contains a set of six command mode pointers that make up the XForm modes. Plug-in developers can specify these for their sub-object types. See the method **ActivateSubobjSel** in [class BaseObject](#) or [class Control](#) for more details.

### Data Members:

public:

**CommandMode \*move;**

Standard command mode to process Move.

**CommandMode \*rotate;**

Standard command mode to process Rotate.

**CommandMode \*scale;**

Standard command mode to process Non-Uniform Scale.

**CommandMode \*uscale;**

Standard command mode to process Uniform Scale.

**CommandMode \*squash;**

Standard command mode to process Squash.

**CommandMode \*select;**

Standard command mode to process Selection.

### Methods:

### Prototype:

**XFormModes();**

### Remarks:

Constructor. All the data members are set to NULL.

### Prototype:

**XFormModes(CommandMode \*move,CommandMode**

**\*rotate,CommandMode \*scale,CommandMode  
\*uscale,CommandMode \*squash,CommandMode \*select)**

**Remarks:**

Constructor. The data members are set to the command modes passed.

## List of Standard Sub-Object Modes

Below is a list of the standard sub-object selection command modes. These classes are ready to be instantiated - no derived classes need to be defined. The constructors are shown along with their intended use.

The following modes are appropriate for any object or modifier in the pipeline that needs to implement its sub-object selection modes. While these modes are named **...ModBox...** they are used by objects as well (for example the boolean object and the loft object) - so despite their name they are not just for use by modifiers.

```
MoveModBoxCMode( BaseObject *o, IObjParam *i )  
RotateModBoxCMode( BaseObject *o, IObjParam *i )  
UScaleModBoxCMode( BaseObject *o, IObjParam *i )  
NUScaleModBoxCMode( BaseObject *o, IObjParam *i )  
SquashModBoxCMode( BaseObject *o, IObjParam *i )  
SelectModBoxCMode( BaseObject *o, IObjParam *i )
```

When controllers implement their sub-object selection the following modes may be used:

```
MoveCtrlApparatusCMode( Control *c, IObjParam *i )  
RotateCtrlApparatusCMode( Control *c, IObjParam *i )  
NUScaleCtrlApparatusCMode( Control *c, IObjParam *i )  
SquashCtrlApparatusCMode( Control *c, IObjParam *i )  
SquashCtrlApparatusCMode( Control *c, IObjParam *i )  
SelectCtrlApparatusCMode( Control *c, IObjParam *i )
```

For working with modifier and sub-object selection, two classes are defined that the developer may use. These are **GenModSelectionProcessor** and **SubModSelectionProcessor**.

See the Advanced Topics section on [Sub-Object Selection](#) for more information on the use of these modes.

## Class SubObjAxisCallback

See Also: [Class BaseObject](#), [Class Control](#).

class SubObjAxisCallback

### Description:

The callback is used by the two methods **GetSubObjectCenters()** and **GetSubObjectTMs()** found in the classes **BaseObject** and **Control**.

### Methods:

#### Prototype:

```
virtual void Center(Point3 c,int id)=0;
```

#### Remarks:

Implemented by the System.

This method is called to specify the individual coordinate system center for the axes whose **id** is passed.

#### Parameters:

**Point3 c**

The center point.

**int id**

The id of the axis.

#### Prototype:

```
virtual void TM(Matrix3 tm,int id)=0;
```

#### Remarks:

Implemented by the System.

This method is called to specify the individual coordinate system transformation for the axes whose **id** is passed.

#### Parameters:

**Matrix3 tm**

The transformation matrix.

**int id**

The id of the axis.

**Prototype:**

```
virtual int Type()=0;
```

**Remarks:**

Implemented by the System.

The user has three options for center of the coordinate system, center of the selection set, or pivot. For center of the coordinate system the system does not need to call **GetSubObjCenters()**. The plug-in may call this method to determine which center option it is returning the Centers and TMs for.

**Return Value:**

One of the following values:

**SO\_CENTER\_SELECTION**

**SO\_CENTER\_PIVOT**

## Time Function Reference

See Also: Advanced Topic [Intervals](#), [Class Interval](#).

This section documents the API functions related to time. For an overview of these functions see the Advanced Topics section [Time](#).

**Function:**

**int GetTicksPerFrame();**

**Remarks:**

Returns the number of ticks per frame.

**Function:**

**void SetTicksPerFrame(int ticks);**

**Remarks:**

Sets the number of ticks per frame.

**Parameters:**

**int ticks**

The number of ticks per frame.

**Function:**

**int GetFrameRate();**

**Remarks:**

Retrieves the current frame rate used by 3ds max. This is the Frames Per Second (FPS) setting in the Time Configuration dialog.

**Return Value:**

The current frame rate in frames per second.

**Function:**

**void setFrameRate(int rate);**

**Remarks:**

Sets the current frame rate used by 3ds max. This is the Frames Per Second (FPS) setting in the Time Configuration dialog. Note: This call is simply another way to adjust the ticks per frame setting.

**Parameters:****int rate**

The rate in frames per second.

**Function:****TimeDisp GetTimeDisplayMode();****Remarks:**

Returns the display mode in use for time values.

**Return Value:**

One of the following values:

**DISPTIME\_FRAMES**

Frame display format.

**DISPTIME\_SMPTE**

SMPTE time code format.

**DISPTIME\_FRAMETICKS**

Frame:Ticks format.

**DISPTIME\_TIMETICKS**

MM:SS:Ticks format.

**Function:****void SetTimeDisplayMode(TimeDisp m);****Remarks:**

Sets the display mode for time values. When this setting is changed a notification is sent to automatically update any UI controls containing time values (including plug-in custom controls).

**Parameters:****TimeDisp m**

The time display mode. This may be one of the following values:

**DISPTIME\_FRAMES**

Frame display format.

**DISPTIME\_SMPTE**

SMPTE time code format.

## **DISPTIME\_FRAMETICKS**

Frame:Ticks format.

## **DISPTIME\_TIMETICKS**

MM:SS:Ticks format.

### **Function:**

```
void TimeToString(TimeValue t,TSTR &string);
```

### **Remarks:**

Formats a time value into a string based on the current frame rate, ticks per frame and display mode.

### **Parameters:**

#### **TimeValue t**

The time to format.

#### **TSTR &string**

The string to store the result.

### **Function:**

```
void StringToTime(TSTR string,TimeValue &t);
```

### **Remarks:**

Parses the specified time string using the current time settings (frame rate, ticks per frame, and time format) and converts it to a TimeValue.

### **Parameters:**

#### **TSTR string**

The string to convert.

#### **TimeValue &t**

The TimeValue to store the result.

**The following #defines are useful when working with time (from \MAXSDK\INCLUDE\MAXTYPES.H).**

```
#define TIME_TICKSPERSEC 4800
```

```
#define TicksToSec( ticks ) ((float)
```

```
(ticks)/(float)TIME_TICKSPERSEC)
```

```
#define SecToTicks( secs ) ((TimeValue)  
(secs*TIME_TICKSPERSEC))  
#define TicksSecToTime( ticks, secs ) ( (TimeValue)  
(ticks)+SecToTicks(secs) )  
#define TimeToTicksSec( time, ticks, secs ) { (ticks) =  
(time)%TIME_TICKSPERSEC; (secs) =  
(time)/TIME_TICKSPERSEC ; }  
#define TIME_PosInfinity 0x7fffffff  
#define TIME_NegInfinity 0x80000000  
typedef int TimeValue;
```

## List of Screen-Time-Value Macros

The following macros are available for use when working with Track View. These are used to scale into and out of screen space.

**#define TimeToScreen(t,scale,scroll)**

**(int(floor((t)\*(scale)+0.5)) - (scroll))**

Given a TimeValue t, if you have the time scale and time scroll factors, this macro returns the screen space X for that time.

**#define ScreenToTime(s,scale,scroll)**

**((int)floor((s)/(scale) + (scroll)/(scale)+0.5))**

Given a screen coordinate s, if you have the scale and scroll factors, this macro will return a TimeValue for that screen position.

**#define ValueToScreen(v,h,scale,scroll)**

**(h-int(floor((v)\*(scale)+0.5)) - (scroll))**

Given a Value v, if you have the value scale and value scroll factors, this macro returns the screen space Y for that value.

**#define ScreenToValue(s,h,scale,scroll)**

**((float(h)-(float(s)+float(scroll)))/(scale))**

Given a screen coordinate s, if you have the scale and scroll factors, this macro will return a value for that screen position.

## Class ActionCallback

See Also: [Class BaseInterfaceServer](#), [Class ActionTable](#), [Class ActionItem](#), [Class ActionContext](#), [Class IActionManager](#), [Class DynamicMenu](#), [Class DynamicMenuCallback](#), [Class Interface](#).

```
class ActionCallback : public BaseInterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

An important part of implementing an ActionTable is creating a sub-class of this class. This is an abstract class with a virtual method called ExecuteAction(int id). Developers need to sub-class this class and pass an instance of it to the system when they activate an ActionTable. Then when the system wants to execute an action the ExecuteAction() method is called.

All methods of this class are implemented by the plug-in.

### Data Members:

private:

```
ActionTable *mpTable;
```

Points to the table that uses this ActionCallback.

### Methods:

public:

### Prototype:

```
virtual BOOL ExecuteAction(int id) = 0;
```

### Remarks:

This method is called to actually execute the action.

### Parameters:

```
int id
```

The ID of the item to execute.

### Return Value:

This returns a BOOL that indicates if the action was actually executed. If the item is disabled, or if the table that owns it is not activated, then it won't execute, and returns FALSE. If it does execute then TRUE is returned.

**Default Implementation:**

```
{ return FALSE; }
```

**Prototype:**

```
virtual IMenu* GetDynamicMenu(int id, HWND hwnd, IPoint2&  
m);
```

**Remarks:**

This method is called when an action item says it is a dynamic menu. This returns a pointer to the menu itself.

**Parameters:****int id**

The item ID which is passed to the

**DynamicMenuCallback::MenuItemSelected()****HWND hwnd**

If the menu is requested by a right-click quad menu, then hwnd is the window where the click occurred. If the item is used from a menu bar, then hwnd will be NULL.

**IPoint2& m**

If the menu is requested by a right-click quad menu, then this will be the point in the window where the user clicked.

**Default Implementation:**

```
{ return NULL; }
```

**Prototype:**

```
ActionTable* GetTable();
```

**Remarks:**

Returns a pointer to the ActionTable the callback uses.

**Default Implementation:**

```
{ return mpTable; }
```

**Prototype:**

```
void SetTable(ActionTable* pTable);
```

**Remarks:**

Sets the ActionTable the callback uses.

**Parameters:**

**ActionTable\* pTable**

Points to the ActionTable the callback uses.

**Default Implementation:**

```
{ mpTable = pTable; }
```

## Class ActionContext

See Also: [Class ActionTable](#), [Class ActionItem](#), [Class ActionCallback](#), [Class IActionManager](#), [Class DynamicMenu](#), [Class DynamicMenuCallback](#), [Class Interface](#).

class ActionContext

### Description:

This class is available in release 4.0 and later only.

Every ActionTable also has an ActionContextId associated with it. This ActionContextId can be shared with other tables.

When assigning keyboard shortcuts to items in an ActionTable, tables that share a unique context id are forced to have unique shortcuts. Tables with different context ids can have overlapping keyboard shortcut assignments.

An ActionContext is an identifier of a group of keyboard shortcuts. Examples are the Main 3ds max UI, Track View, and the Editable Mesh. They are registered using **IActionManager::RegisterActionContext()**.

Note: **typedef DWORD ActionContextId;**

### Methods:

public:

### Prototype:

**ActionContext(ActionContextId contextId, TCHAR \*pName);**

### Remarks:

Constructor. The context ID and the name are initialized from the data passed.

### Parameters:

**ActionContextId contextId**

The ID for the ActionContext.

**TCHAR \*pName**

The name for the ActionContext.

### Prototype:

**TCHAR\* GetName();**

### Remarks:

Returns the name of this ActionContext.

**Prototype:**

**ActionContextId GetContextId();**

**Remarks:**

Returns the ID of this ActionContext.

**Prototype:**

**bool IsActive();**

**Remarks:**

Returns true if this ActionContext is active; otherwise false. An active ActionContext means that it uses its keyboard accelerators. This corresponds to the "Active" checkbox in the keyboard customization UI.

**Prototype:**

**void SetActive(bool active);**

**Remarks:**

Sets the active state of this ActionContext.

**Parameters:**

**bool active**

Pass true for active; false for inactive.

## Class IActionManager

See Also: [Class ActionTable](#), [Class ClassDesc](#), [Class ActionItem](#), [Class ActionCallback](#), [Class ActionContext](#), [Class DynamicMenu](#), [Class DynamicMenuCallback](#), [Class Interface](#).

class IActionManager

### Description:

This class is available in release 4.0 and later only.

The ActionManager manages a set of ActionTables, callbacks and ActionContexts. The manager handles the keyboard accelerator tables for each ActionTable as well. You get a pointer to this class using

**Interface::GetActionManager()**.

### Methods:

public:

### Prototype:

**virtual void RegisterActionTable(ActionTable\* pTable) = 0;**

### Remarks:

Register an action table with the manager. Note that most plug-ins will not need this method. Instead, plug-ins export action table with the methods in ClassDesc. See [ClassDesc Action Table Methods](#).

### Parameters:

**ActionTable\* pTable**

Points to the Action Table to register.

### Prototype:

**virtual int NumActionTables() = 0;**

### Remarks:

Returns the number of ActionTables.

### Prototype:

**virtual ActionTable\* GetTable(int i) = 0;**

### Remarks:

Returns a pointer to the 'i-th' ActionTable.

**Parameters:**

**int i**

The zero based index of the table.

**Prototype:**

**virtual int ActivateActionTable(ActionCallback\* pCallback,  
ActionTableId id) = 0;**

**Remarks:**

This method is called to activate the action table. Some plug-ins (for instance Modifiers or Geometric Objects) may only want to activate the table when they are being edited in the command panel (between BeginEditParams() and EndEditParams()). Others, for instance Global Utility Plug-ins, may wish to do so when they are initially loaded so the actions are always available.

Note that if this method is called multiple times, only the callback from the last call will be used.

**Parameters:**

**ActionCallback\* pCallback**

Points to the callback object which is responsible for executing the action.

**ActionTableId id**

This is the ID of the table to activate.

**Return Value:**

TRUE if the action table was activated. FALSE if the table is already active or doesn't exist.

**Prototype:**

**virtual int DeactivateActionTable(ActionCallback\* pCallback,  
ActionTableId id) = 0;**

**Remarks:**

This method is called to deactivate the action table. After the table is deactivated (for example in EndEditParams()) the callback object can be deleted. Tables are initially active, please do not call this method without a preceding call to **ActivateActionTable()**.

**Parameters:****ActionCallback\* pCallback**

Points to the callback object responsible for executing the action. Pass the same callback that was originally passed to **ActivateActionTable()** and do not set this to NULL.

**ActionTableId id**

The ID of the table to deactivate.

**Return Value:**

TRUE if the action table was deactivated. FALSE if the table was already deactivated or doesn't exist.

**Prototype:**

```
virtual ActionTable* FindTable(ActionTableId id) = 0;
```

**Remarks:**

This method returns a pointer to the action table as specified by its ID.

**Parameters:****ActionTableId id**

The ID of the table to find.

**Prototype:**

```
virtual BOOL GetShortcutString(ActionTableId tableId, int  
commandId, TCHAR* buf) = 0;
```

**Remarks:**

Retrieves the string that describes the keyboard shortcut for the operation.

**Parameters:****ActionTableId tableId**

The ID of the action table.

**int commandId**

The ID of the command for the action.

**TCHAR\* buf**

Points to storage for the string.

**Return Value:**

TRUE if found; FALSE if not found.

**Prototype:**

```
virtual BOOL GetActionDescription(ActionTableId tableId, int  
commandId, TCHAR* buf) = 0;
```

**Remarks:**

Retrieves a string that describes the specified operation from the action table whose ID is passed.

**Parameters:**

**ActionTableId tableId**

The ID of the action table.

**int commandId**

The ID of the command.

**TCHAR\* buf**

Points to storage for the description string.

**Return Value:**

TRUE if the string was returned; FALSE if not.

**Prototype:**

```
virtual BOOL RegisterActionContext(ActionContextId contextId,  
TCHAR* pName) = 0;
```

**Remarks:**

Register the specified action context with the system. This is called when you create the action table that uses this context.

**Parameters:**

**ActionContextId contextId**

The context ID.

**TCHAR\* pName**

The name for the action context.

**Return Value:**

If the specified action context is already registered FALSE is returned; otherwise TRUE is returned.

**Prototype:**

**virtual int NumActionContexts() = 0;**

**Remarks:**

Returns the number of ActionContexts.

**Prototype:**

**virtual ActionContext\* GetActionContext(int i) = 0;**

**Remarks:**

Returns a pointer to the 'i-th' ActionContext.

**Parameters:**

**int i**

The zero based index of the ActionContext.

**Prototype:**

**virtual ActionContext\* FindContext(ActionContextId contextId) = 0;**

**Remarks:**

Returns a pointer to the ActionContext based on it's ID. If not found NULL is returned.

**Parameters:**

**ActionContextId contextId**

The ID whose context is found.

**Prototype:**

**virtual BOOL IsContextActive(ActionContextId contextId) = 0;**

**Remarks:**

Returns TRUE if the specified context is active; otherwise FALSE.

**Parameters:**

**ActionContextId contextId**

Specifies the context to check.

## Class DynamicMenu

See Also: [Class DynamicMenuCallback](#), [Class IMenu](#), [Class ActionTable](#), [Class ActionItem](#), [Class ActionCallback](#), [Class ActionContext](#), [Class IActionManager](#), [Class Interface](#).

class DynamicMenu

### Description:

This class is available in release 4.0 and later only.

This class provides a simple way for plug-ins to produce the menu needed in the **ActionItem::GetDynamicMenu()** method. The constructor of this class is used to create the menu and the GetMenu() method returns the appropriate IMenu pointer.

### Methods:

public:

### Prototype:

**DynamicMenu(DynamicMenuCallback\* pCallback);**

### Remarks:

Constructor.

### Parameters:

**DynamicMenuCallback\* pCallback**

Points to the instance of the DynamicMenuCallback class that handles the menu selection.

### Prototype:

**IMenu\* GetMenu();**

### Remarks:

Returns a pointer to the IMenu. This method may be called after menu creation to get a pointer to the IMenu created. This is the required value to return from **ActionItem::GetDynamicMenu()**.

### Prototype:

**void AddItem(DWORD flags, UINT itemId, TCHAR\* pItemTitle);**

**Remarks:**

This method adds an item to the dynamic menu.

**Parameters:**

**DWORD flags**

One or more of the following values:

**kDisabled**

Item is disabled (can't be selected)

**kChecked**

Item has a check mark beside it.

**kSeparator**

Item is a separator between the previous menu item and the next one.

**UINT itemId**

The ID for the menu item.

**TCHAR\* pItemTitle**

The name to appear for the menu item.

**Prototype:**

**void BeginSubMenu(TCHAR\* pTitle);**

**Remarks:**

This begins a new sub menu. Items added after this call will appear as sub choices of this one until **EndSubMenu()** is called.

**Parameters:**

**TCHAR\* pTitle**

The name to appear for the sub menu item.

**Prototype:**

**void EndSubMenu();**

**Remarks:**

This ends a sub menu. Items added after this call will appear as they did prior to calling **BeginSubMenu()**.

## Structure ActionDescription

See Also: [Class ActionTable](#), [Class ActionItem](#), [Class ActionCallback](#).

### Description:

This structure is available in release 4.0 and later only.

This is a helper structure used for building ActionTables. A static array of these descriptors is passed to the ActionTable constructor.

### **struct ActionDescription {**

#### **int mCmdID;**

A unique identifier for the command (must be unique per table). When an action is executed this is the command ID passed to

**ActionCallback::ExecuteAction()**.

#### **int mDescriptionResourceID;**

A string resource id that describes the command.

#### **int mShortNameResourceID;**

A string resource ID for a short name for the action. This name appears in the list of Actions in the Customize User Interface dialog.

#### **int mCategoryResourceID;**

A string resource ID for the category of an operation. This name appears in the Category drop down list in the Customize User Interface dialog.

**};**

## Class DynamicMenuCallback

See Also: [Class DynamicMenu](#), [Class IMenu](#), [Class ActionTable](#), [Class ActionItem](#), [Class ActionCallback](#), [Class ActionContext](#), [Class IActionManager](#), [Class Interface](#).

```
class DynamicMenuCallback
```

### Description:

This class is available in release 4.0 and later only.

This is the callback object for a dynamic menu. When a user makes a selection from a dynamic menu the **MenuItemSelected()** method of this class is called to process that selection.

### Methods:

public:

### Prototype:

```
virtual void MenuItemSelected(int itemId) = 0;
```

### Remarks:

This method is called to process the user's menu selection.

### Parameters:

**int itemId**

The ID of the item selected.

## Class ActionItem

See Also: [Class ActionTable](#), [Class ActionCallback](#), [Structure ActionDescription](#), [Class ActionContext](#), [Class IActionManager](#), [Class DynamicMenu](#), [Class DynamicMenuCallback](#), [Class MAXIcon](#), [Class Interface](#).

```
class ActionItem : public InterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

The class ActionItem is used to represent the operation that live in ActionTables. ActionItem is an abstract class with operations to support various UI operations. The system provides a default implementation of this class that works when the table is build with the **ActionTable::BuildActionTable()** method. However, developers may want to specialize this class for more special-purpose applications. For example, MAXScript does this to export macroScripts to an ActionTable. Methods that are marked as internal should not be used.

### Data Members:

protected:

```
ActionTable* mpTable;
```

Points to the table that owns the action.

### Methods:

public:

### Prototype:

```
virtual int GetId() = 0;
```

### Remarks:

This method retrieves the unique identifier for the action. This action must be unique in the table, but not does not have to be unique between tables.

### Prototype:

```
virtual BOOL ExecuteAction() = 0;
```

### Remarks:

Calling ExecuteAction causes the item to be run. This returns a BOOL that

indicates if the action was actually executed. If the item is disabled, or if the table that owns it is not activated, then it won't execute, and returns FALSE.

**Return Value:**

TRUE if the action is executed; otherwise FALSE.

**Prototype:**

**virtual void GetButtonText(TSTR& buttonText) = 0;**

**Remarks:**

This method retrieves the text that will be used when the ActionItem is on a text button. The text is stored into the buttonText parameter.

**Parameters:**

**TSTR& buttonText**

Storage for the retrieved text.

**Prototype:**

**virtual void GetMenuText(TSTR& menuText) = 0;**

**Remarks:**

This method retrieves the text to use when the item is on a menu (either Quad menu or main menu bar). This can be different from the button text. This method is called just before the menu is displayed, so it can update the text at that time. For example, the "Undo" menu item in 3ds max's main menu adds the name of the command that will be undone.

**Parameters:**

**TSTR& menuText**

Storage for the retrieved text.

**Prototype:**

**virtual void GetDescriptionText(TSTR& descText) = 0;**

**Remarks:**

This method gets the text that will be used for tool tips and menu help. This is also the string that is displayed for the operation in all the lists in the customization dialogs.

**Parameters:**

**TSTR& descText**

Storage for the retrieved text.

**Prototype:**

**virtual void GetCategoryText(TSTR& catText) = 0;**

**Remarks:**

This method retrieves the text for the category of the operation. This is used in the customization dialog to fill the "category" drop-down list.

**Parameters:**

**TSTR& catText**

Storage for the retrieved text.

**Prototype:**

**virtual BOOL IsChecked() = 0;**

**Remarks:**

This method determines if the action is in a "Checked" state. For menus, this means that a check mark will appear next to the item, if this returns TRUE. If the item is on a button, this is used to determine if the button is in the "Pressed" state. Note that button states are automatically updated on selection change and command mode changes. If your plug-in performs an operation that requires the CUI buttons to be redrawn, you need to call the method **CUIFrameMgr::SetMacroButtonStates(TRUE)**.

**Prototype:**

**virtual BOOL IsItemVisible() = 0;**

**Remarks:**

This method determines if an item is visible on a menu. If it returns FALSE, then the item is not included in the menu. This can be used to create items that are context sensitive. For example, you may want an item to appear on a menu only when the selected object is of a particular type. To do this, you have this method check the class id of the current selection.

**Prototype:**

```
virtual BOOL IsEnabled() = 0;
```

**Remarks:**

This method determines if the operation is currently available. If it is on a menu, or button, the item is grayed out if this method returns FALSE. If it assigned to a keyboard shortcut, then it will not execute the operation if invoked. . If your plug-in performs an operation that requires the CUI buttons to be redrawn, you need to call the method

```
CUIFrameMgr::SetMacroButtonStates(TRUE).
```

**Return Value:**

TRUE for enabled; FALSE for disabled.

**Prototype:**

```
virtual MaxIcon* GetIcon() = 0;
```

**Remarks:**

If you've provided an icon for this operation, you return it with this method. If no icon is available, this returns NULL. The icon is used on CUI buttons, and in the list of operations in the customization dialogs.

**Prototype:**

```
virtual void DeleteThis() = 0;
```

**Remarks:**

Called to delete the ActionItem. This normally happens when the table that owns it is deleted.

**Prototype:**

```
ActionTable* GetTable();
```

**Remarks:**

This returns a pointer to the table that owns the ActionItem. An item can only be owned by a single table.

**Default Implementation:**

```
{ return mpTable; }
```

**Prototype:**

```
void SetTable(ActionTable* pTable);
```

**Remarks:**

Sets the table that owns the item. Used internally. May be used if you implement a custom sub-class of ActionItem.

**Parameters:**

```
ActionTable* pTable
```

Points to the table to set.

**Default Implementation:**

```
{ mpTable = pTable; }
```

**Prototype:**

```
TCHAR* GetShortcutString();
```

**Remarks:**

Returns the string that describes all the keyboard shortcuts associated with the item. This will look something like "Alt+A" or "C, Shift+Alt+Q". This returns NULL if no keyboard shortcut is associated with the item.

**Prototype:**

```
virtual MacroEntry* GetMacroScript();
```

**Remarks:**

Returns the representation of the macroScript for the item, if it's implemented by a macroScript, it returns NULL otherwise.

**Default Implementation:**

```
{ return NULL; }
```

**Prototype:**

```
virtual BOOL IsDynamicMenu();
```

**Remarks:**

Determines if a menu is created or if an action takes place. If this method returns TRUE, then the ActionItem creates a menu. If it returns FALSE then

an action is performed.

**Default Implementation:**

```
{ return FALSE; }
```

**Prototype:**

```
virtual void SetIsDynamicMenu();
```

**Remarks:**

This method may be called after an action item is created to tell the system that it is a dynamic menu action. Note: Dynamic menus may be added to the quad menus programmatically (via the IMenuManager API) or 'manually'.

**Prototype:**

```
virtual IMenu* GetDynamicMenu(HWND hwnd, IPoint2& m);
```

**Remarks:**

If the ActionItem does produce a menu, this method is called to return a pointer to the menu. See [Class DynamicMenu](#) for an easy way to produce these menus.

**Parameters:**

**HWND hwnd**

If the menu is requested by a right-click quad menu, then this hwnd is the handle of the window where the click occurred. If the item is used from a menu bar, this hwnd will be NULL.

**IPoint2& m**

If the menu is requested by a right-click quad menu, then this parameter is the point in the window where the user clicked.

**Return Value:**

A pointer to the menu.

**Default Implementation:**

```
{ return NULL; }
```

## Units of Measurement Reference

This section documents the API structures and functions related to units of measurement. For overview information see the Advanced Topics section [Units of Measurement](#).

### Structures:

See [Structure DispInfo](#).

### Function:

**double GetMasterScale(int type);**

### Remarks:

Retrieves the master scale in terms of the specified unit type. For example: **GetMasterScale(UNITS\_INCHES)** returns the number of inches per unit. Returns -1.0 if an invalid unit type is supplied.

### Parameters:

**int type**

Supported unit types:

**UNITS\_INCHES**

**UNITS\_FEET**

**UNITS\_MILES**

**UNITS\_MILLIMETERS**

**UNITS\_CENTIMETERS**

**UNITS\_METERS**

**UNITS\_KILOMETERS**

### Return Value:

The master scale in terms of the specified unit type.

### Function:

**void GetMasterUnitInfo(int \*type, float \*scale);**

### Remarks:

Retrieves the master unit settings in effect. These are the unit type (Inches, Feet, Meters, etc.) and the master scale setting.

### Parameters:

**int \*type**

Retrieves the unit type in effect. This may be one of the following values:

Supported unit types:

**UNITS\_INCHES**  
**UNITS\_FEET**  
**UNITS\_MILES**  
**UNITS\_MILLIMETERS**  
**UNITS\_CENTIMETERS**  
**UNITS\_METERS**  
**UNITS\_KILOMETERS**

**float \*scale**

The master scale setting. This is the value the user entered in the  
1 Unit = XXX field of the General Page in the Preference Settings dialog box.

**Function:**

**int SetMasterUnitInfo(int type,float scale);**

**Remarks:**

Set the master unit settings. These are the unit type (Inches, Feet, Meters, etc.)  
and the master scale setting.

**Parameters:****int \*type**

Specifies the unit type to use. This may be one of the following values:

Supported unit types:

**UNITS\_INCHES**  
**UNITS\_FEET**  
**UNITS\_MILES**  
**UNITS\_MILLIMETERS**  
**UNITS\_CENTIMETERS**  
**UNITS\_METERS**  
**UNITS\_KILOMETERS**

**float \*scale**

The master scale setting.

**Return Value:**

Nonzero if the information was set; 0 if invalid values were specified and nothing was stored.

**Function:**

**void GetUnitDisplayInfo(DispInfo \*info);**

**Remarks:**

Retrieves the current unit display information.

**Parameters:**

**DispInfo \*info**

Points to storage for the display information. See [Structure DispInfo](#).

**Function:**

**int SetUnitDisplayInfo(DispInfo \*info);**

**Remarks:**

Sets the unit display information used by 3ds max.

**Parameters:**

**DispInfo \*info**

Points to display information. See [Structure DispInfo](#).

**Return Value:**

Nonzero if the information was set; 0 if invalid values were specified and nothing was stored.

**Function:**

**int GetUnitDisplayType();**

**Remarks:**

Returns the current unit display type.

**Return Value:**

One of the following values:

**UNITDISP\_GENERIC**

**UNITDISP\_METRIC**

**UNITDISP\_US**

**UNITDISP\_CUSTOM**

**Function:****int SetUnitDisplayType(int type);****Remarks:**

Sets the current unit display type.

**Parameters:****int type**

One of the following values:

**UNITDISP\_GENERIC****UNITDISP\_METRIC****UNITDISP\_US****UNITDISP\_CUSTOM****Return Value:**

Nonzero if the value was set. Zero if an improper value was specified.

**Function:****TCHAR \*FormatUniverseValue(float value);****Remarks:**

This function converts the specified value to an ASCII representation according to the current unit scale. Note that this can cause a string overflow, especially when the units are set to miles or kilometers. If an overflow occurs the function returns a null string (i.e. `_T("")`). Thus developers can check for this condition using something like `if (buf[0] == '\0')` to see if an overflow occurred.

**Parameters:****float value**

The input value to convert.

**Function:****float DecodeUniverseValue(TCHAR \*string, BOOL \*valid = NULL);****Remarks:**

This method parses the specified string using the current unit settings and

converts it to a floating point value. If an error occurs in the parsing then valid is set to FALSE.

**Parameters:**

**TCHAR \*string**

The input string to convert.

**BOOL \*valid = NULL**

TRUE if the string was converted correctly; FALSE on error.

## Class RestoreObj

See Also: [Class Hold](#), [Undo and Redo](#).

```
class RestoreObj : public InterfaceServer
```

### Description:

This class is the restore object used in the undo / redo system of 3ds max.

### Methods:

#### Prototype:

```
virtual void Restore(int isUndo)=0;
```

#### Remarks:

Implemented by the Plug-In.

The developer implements this method to restore the state of the database to as it was when **theHold.Put()** was called with this restore object.

#### Parameters:

**int isUndo**

Nonzero if **Restore()** is being called in response to the Undo command; otherwise zero. If **isUndo** is nonzero, the developer needs to save whatever data they need to allow the user to redo the operation.

#### Prototype:

```
virtual void Redo()=0;
```

#### Remarks:

Implemented by the Plug-In.

This method is called when the user selects the Redo command. The developer should restore the database to the state prior to the last Undo command.

#### Prototype:

```
virtual int Size()
```

#### Remarks:

Implemented by the Plug-In.

Returns the size of the restore object in bytes. This size does not need to be

exact but should be close. This is used to make sure all the accumulated restore objects do not grow beyond a manageable size.

**Default Implementation:**

```
{ return 1; }
```

**Return Value:**

The size of the restore object in bytes.

**Prototype:**

```
virtual void EndHold()
```

**Remarks:**

Implemented by the Plug-In.

This method is called when **theHold.Accept()** or **theHold.Cancel()** is called. This means the restore object is no longer held, it was either tossed out or sent to the undo system. The developer may then call **ClearAFlag(A\_HELD)** to indicate the restore object is no longer being held.

**Prototype:**

```
virtual TSTR Description()
```

**Remarks:**

Implemented by the Plug-In.

This method is used internally to 3ds max in debugging only. It is used to display a symbolic name for the restore object.

**Return Value:**

The name of the restore object.

**Default Implementation:**

```
{ return TSTR(_T("---")); }
```

**Prototype:**

```
virtual INT_PTR Execute(int cmd, ULONG_PTR arg1=0,  
    ULONG_PTR arg2=0, ULONG_PTR arg3=0);
```

**Remarks:**

This method is available in release 4.0 and later only.

This is a general purpose function that allows the API to be extended in the future. The 3ds max development team can assign new **cmd** numbers and continue to add functionality to this class without having to 'break' the API.

This is reserved for future use.

**Default Implementation:**

```
{return -1;}
```

## Class Hold

See Also: [Class RestoreObj](#), [Undo and Redo](#).

```
class Hold : public BaseInterfaceServer
```

### Description:

The undo / redo system of 3ds max uses a global instance of this class called **theHold**. Developers call methods of **theHold** object to participate in the undo / redo system.

### Methods:

#### Prototype:

```
void Begin();
```

#### Remarks:

Implemented by the System.

When a developer is about to modify the database they should check to see if **theHold** is 'holding'. This indicates that the **Begin()** method has been called. This signifies the beginning of a potential undo/redo operation. If **theHold** is not holding, they should call **Begin()**. After **Begin()** has been called the system is ready to accept restore objects.

In certain cases the system may already be 'holding' when the plug-in is about to begin its modification to the database. For example controllers would normally not call **Begin()** because it usually has been called already. A procedural object will normally call **Begin()** because there is no other part of the system that may alter a procedural object so **Begin()** would not have been called.

#### Example:

```
theHold.Begin();
```

#### Prototype:

```
int Holding();
```

#### Remarks:

Implemented by the System.

This indicates if **theHold.Begin()** has been called. Any operation that

modifies the database checks to see if **theHold** is currently in a holding state. If the undo system is 'holding' it is ready to accept restore objects. For more details see the Advanced Topics section on [Undo / Redo](#).

**Return Value:**

Nonzero if **theHold** is holding; otherwise 0.

**Example:**

```
if ( theHold.Holding() ) {  
    ...  
}
```

**Prototype:**

```
int Restoring(int& isUndo);
```

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

Returns nonzero if the system is restoring and zero if not.

**Parameters:**

**int& isUndo**

This parameter is updated to indicate if the restore is coming from an undo. It's assigned nonzero if it is; zero if not.

**Prototype:**

```
int Redoing();
```

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

Returns nonzero if the system is redoing and zero if not.

**Prototype:**

```
int RestoreOrRedoing();
```

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

Returns nonzero if the system is restoring or redoing and zero if not.

**Prototype:**

**void Accept(int nameID);**

**Remarks:**

Implemented by the System.

Leaves the database in its modified state and registers an undo object with the undo system. This will allow the user to undo the operation.

**Parameters:**

**int nameID**

The resource ID of the string to appear in the Edit menu next to Undo or Redo.

**Example:**

**theHold.Accept(IDS\_MOVE);**

**Prototype:**

**void Accept(TCHAR \*name);**

**Remarks:**

Implemented by the System.

Leaves the database in its modified state and registers an undo object with the undo system. This will allow the user to undo the operation.

**Parameters:**

**TCHAR \*name**

The string to appear in the Edit menu next to Undo or Redo.

**Prototype:**

**void Cancel();**

**Remarks:**

Implemented by the System.

Restores the database to its previous state and throws out the restore object. This cancels the operation.

**Prototype:**

```
void End();
```

**Remarks:**

Implemented by the System.

This method is used internally to 3ds max and should not be called by a plug-in developer. It leaves the database in its modified state but throws out the restore object.

**Prototype:**

```
void Put(RestoreObj *rob);
```

**Remarks:**

Implemented by the System.

The developer calls this method to register a new restore object with the system. Once this object is registered the developer should set the **A\_HELD** flag of **Animatable**, i.e. call **SetAFlag(A\_HELD)**. This indicates that a restore object is registered with the system.

**Parameters:**

```
RestoreObj *rob
```

The restore object to register.

**Example:**

Example code from **EDMREST.CPP**

```
if ( theHold.Holding() ) {  
    theHold.Put(new MeshSelectRestore(meshData,this));  
}
```

**Prototype:**

```
void Suspend();
```

**Remarks:**

Implemented by the System.

This is used internally. It temporarily suspends holding.

**Prototype:**

**void Resume();**

**Remarks:**

Implemented by the System.

This is used internally. It resumes holding if it was suspended.

**Prototype:**

**void EnableUndo();**

**Remarks:**

Implemented by the System.

This is used internally. Plug-In developers should not call this method. Allows Undo when **Accept()** is called.

**Prototype:**

**void DisableUndo();**

**Remarks:**

Implemented by the System.

This is used internally. Plug-In developers should not call this method. Prevents Undo when **Accept()** is called.

**Prototype:**

**void Restore();**

**Remarks:**

Implemented by the System.

This method will call Restore() on all the restore objects registered since the last **Begin()**. This restores the database to the state it was in when **Begin()** was called. The restore objects are NOT deleted.

**Prototype:**

**void Release();**

**Remarks:**

Implemented by the System.

This tosses out the restore objects since the last **Begin()** but still continues

holding.

Group several Begin-End lists into a single Super-group.

**Prototype:**

**void SuperBegin();**

**Remarks:**

Implemented by the System.

Normally this is NOT needed but in special cases this can be useful. This allows a developer to group a set of Begin()/Accept() sequences to be undone in one operation.

Consider the case of the user using the Shift-Move command to create a new node in the scene. There are two parts to this process. First the node must be cloned and second the position must be tracked as the user moves the mouse to place the new node in the scene. Naturally if the user wanted to Undo this operation, they would expect a single selection of the Undo command would accomplish it. However the process was not a single operation. There was the initial cloning of the node, and then the iterative process of moving the node in the scene, restoring its position, moving it again, restoring it again, etc. Cases like this are handled using methods of **theHold** named **SuperBegin()**, **SuperAccept()** and **SuperCancel()**. These allow the developer to group several restore objects together so that they may be undone via a single selection of Undo. Note that in this example it is only necessary to use **SuperBegin()** and **SuperAccept()** because the move was restoring interactively. Normally a developer does NOT need to use these methods even if they have several operations that modify the database. The undo system will automatically register all the restore objects needed as part of the undo object when **theHold.Accept()** is called and these may be undone using a single UNDO command.

**Sample Code:**

See the sample program

**\MAXSDK\SAMPLES\OBJECTS\BONES.CPP.**

**Prototype:**

**void SuperAccept(int nameID);**

**Remarks:**

Implemented by the System.

When a developer has used **SuperBegin()**, this method is used to Accept. This leaves the database in its modified state and registers the restore object with the undo system. This will allow the user to undo the operation.

**Parameters:**

**int nameID**

The resource ID of the string to appear in the Edit menu next to Undo or Redo.

**Sample Code:**

See the sample program

**\MAXSDK\SAMPLES\OBJECTS\BONES.CPP.**

**Prototype:**

**void SuperAccept(TCHAR \*name);**

**Remarks:**

Implemented by the System.

When a developer has used **SuperBegin()**, this method is used to Accept. This leaves the database in its modified state and registers the restore object with the undo system. This will allow the user to undo the operation.

**Parameters:**

**TCHAR \*name**

The string to appear in the Edit menu next to Undo or Redo.

**Prototype:**

**void SuperCancel();**

**Remarks:**

Implemented by the System.

When a developer has used **SuperBegin()**, this method is used to Cancel. This restores the database to its previous state and throws out the restore object. This cancels the operation.

**Sample Code:**

See the sample program

**\MAXSDK\SAMPLES\OBJECTS\BONES.CPP.**

**Prototype:**

**int GetGlobalPutCount();**

**Remarks:**

This method is available in release 2.0 and later only.

Returns the number of times **Put()** has been called in the current session of 3ds max.

## Class BitmapStorage

See Also: [Class BitmapManager](#), [Class BitmapInfo](#), [Class Bitmap](#), [Class BitmapIO](#), [List of Bitmap Error Codes](#).

```
class BitmapStorage : public BaseInterfaceServer
```

### Description:

When an image is loaded the buffer that will hold it is an instance of this class. This class provides methods that allow developers to access the image data in a uniform manner even though the underlying storage might be 1-bit, 8-bit, 16-bit, 32-bit or 64-bit. Standard methods are available for getting / putting pixels:

**Get/PutPixels()**, **Get/Put16Gray()**, **Get/Put64Pixels()**,  
**Get/PutTruePixels()**, **Get/PutIndexPixels()**, etc.

Since a developer accesses the storage through this standard interface, certain plug-in types may not need to allocate memory for the storage. For example, an image loader that creates an image from scratch (such as a gradient generator). This plug-in would simply derive a new type of **BitmapStorage** and provide the pixels through the common methods, creating them as requested.

Note: The "**Get/PutPixels()**" methods of this class access the image a single scanline at a time.

Also note: The following global function may be used by image loader/saver plug-ins to create an instance of **BitmapStorage**:

### Function:

```
BitmapStorage *BMMCreateStorage(BitmapManager *manager,  
UINT type);
```

### Remarks:

This global function will create a new instance of the specified storage type and return a pointer to it.

### Parameters:

**BitmapManager \*manager**

The bitmap manager used for this storage.

**UINT type**

The type of storage to create. One of the following values:

**BMM\_LINE\_ART**  
**BMM\_PALETTED**  
**BMM\_GRAY\_8**  
**BMM\_GRAY\_16**  
**BMM\_TRUE\_16**  
**BMM\_TRUE\_32**  
**BMM\_TRUE\_64**

**Return Value:**

The bitmap storage instance created or NULL if the specified type could not be created.

**Data Members:**

protected:

**int openMode;**

The mode the storage was opened in. See [Bitmap Open Mode Types](#).

**UINT usageCount;**

The number of bitmaps using this storage.

**BitmapManager \*manager;**

The bitmap manager associated with this storage.

**int flags;**

See [List of Bitmap Flags](#).

**int type;**

See [List of Bitmap Types](#).

**BMM\_Color\_48 palette[256];**

The palette entries (256 max). See [Structure BMM\\_Color\\_48](#).

**int paletteSlots;**

The number of palette slots used.

**UWORD \*gammaTable;**

The gamma correction table.

**RenderInfo \*rendInfo;**

A pointer to an instance of RenderInfo. See [Class RenderInfo](#).

public:

**BitmapInfo bi**

Describes the properties of the bitmap associated with this storage.

**Methods:**

**Prototype:**

**inline BitmapManager \*Manager()**

**Remarks:**

Implemented by the System.

Returns the bitmap manager for the storage.

**Prototype:**

**float SetGamma(float gam)**

**Remarks:**

Implemented by the System.

Sets the gamma setting to the value passed.

**Parameters:**

**float gam**

The gamma setting to set.

**Prototype:**

**inline int HasGamma()**

**Remarks:**

Implemented by the System.

Returns nonzero if the gamma table has been allocated; otherwise 0.

**Prototype:**

**void SetHasGamma(BOOL onOff)**

**Remarks:**

Implemented by the System.

This method allocates or deallocates the gamma table.

**Parameters:**

**BOOL onOff**

If TRUE the gamma table is allocated; otherwise it is deleted.

**Prototype:**

**UWORD \*GetInputGammaTable()**

**Remarks:**

Implemented by the System.

This methods returns a pointer to a gamma table that can be used for converting pixels using whatever gamma value is appropriate for the storage. It is typically called inside of the **GetLinearPixels()** method of the particular **BitmapStorage** subclasses which then use the gamma table to convert pixel values to linear values. Plug-In developers in most cases will not need to call this method directly.

**Prototype:**

**inline int OpenMode()**

**Remarks:**

Implemented by the System.

Returns the mode the storage was opened in. See [Bitmap Open Mode Types](#).

**Prototype:**

**inline int Width()**

**Remarks:**

Implemented by the System.

Returns the width (horizontal dimension) of the storage's BitmapInfo instance (**bi.Width()**).

**Prototype:**

**inline int Height()**

**Remarks:**

Implemented by the System.

Returns the height (vertical dimension) of the storage's BitmapInfo instance (**bi.Height()**).

**Prototype:**

## **inline float Aspect()**

### **Remarks:**

Implemented by the System.

Returns the aspect ratio of the storage's BitmapInfo instance (**bi.Aspect()**).

### **Prototype:**

## **inline float Gamma()**

### **Remarks:**

Implemented by the System.

Returns the gamma setting of the storage's BitmapInfo instance (**bi.Gamma()**).

### **Prototype:**

## **inline int Paletted()**

### **Remarks:**

Implemented by the System.

Determines if the image is paletted. If the image has a palette (indexed color), the number of palette slots used is returned; otherwise zero.

### **Prototype:**

## **inline int IsDithered()**

### **Remarks:**

Implemented by the System.

Returns the dithered state of the image. If the image is dithered nonzero is returned; otherwise 0,

### **Prototype:**

## **inline int PreMultipliedAlpha()**

### **Remarks:**

Implemented by the System.

Determines if the image has pre-multiplied alpha. If the image has pre-multiplied alpha nonzero is returned; otherwise 0.

**Prototype:**

**inline int HasAlpha()**

**Remarks:**

Implemented by the System.

Determines if the image has an alpha channel. If the image has an alpha channel nonzero is returned; otherwise 0.

**Prototype:**

**inline void UseScaleColors(int on);**

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

Set whether colors are scaled (on) or clamped (off) when converting from **BMM\_Color\_fl** to **BMM\_Color\_64**.

**Prototype:**

**inline int ScaleColors();**

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

Returns the last value set by **UseScaleColors**.

**Prototype:**

**inline static void ClampColor(BMM\_Color\_64& out, const BMM\_Color\_fl& in);**

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

Converts in to out clamping the RGB components to 0 to 65535. The alpha component is not copied.

**Parameters:**

**BMM\_Color\_64& out**

The result of the conversion.

**BMM\_Color\_fl& in**

The value to convert.

**Prototype:**

**inline static void ClampColorA(BMM\_Color\_64& out, const BMM\_Color\_fl& in);**

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

Converts in to out clamping the RGB components to 0 to 65535.

**Parameters:**

**BMM\_Color\_64& out**

The result of the conversion.

**BMM\_Color\_fl& in**

The value to convert.

**Prototype:**

**inline void ScaleColor (BMM\_Color\_64& out, BMM\_Color\_fl in);**

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

Converts in to out clamping the RGB components to 0 to 65535. The alpha component is not copied.

**Parameters:**

**BMM\_Color\_64& out**

The result of the conversion.

**BMM\_Color\_fl& in**

The value to convert.

**Prototype:**

**inline void ScaleColorA(BMM\_Color\_64& out, const**

**BMM\_Color\_fl& in);**

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

Converts in to out clamping the RGB components to 0 to 65535.

**Parameters:**

**BMM\_Color\_64& out**

The result of the conversion.

**BMM\_Color\_fl& in**

The value to convert.

**Prototype:**

**inline void ClampScaleColor (BMM\_Color\_64& out, const  
BMM\_Color\_fl& in);**

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

Converts in to out, using the value of **ScaleColors()** to determine the clamping or scaling. The alpha component is not copied.

**Parameters:**

**BMM\_Color\_64& out**

The result of the conversion.

**BMM\_Color\_fl& in**

The value to convert.

**Prototype:**

**inline void ClampScaleColorA (BMM\_Color\_64& out, const  
BMM\_Color\_fl& in);**

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

Converts in to out, using the value of **ScaleColors()** to determine the

clamping or scaling.

**Parameters:**

**BMM\_Color\_64& out**

The result of the conversion.

**BMM\_Color\_fl& in**

The value to convert.

**Prototype:**

**inline int UsageCount()**

**Remarks:**

Implemented by the System.

Returns the number of times this image is being used in the system.

**Prototype:**

**inline int Type()**

**Remarks:**

Implemented by the System.

Returns the type of bitmap managed by this storage. See [List of Bitmap Types](#).

**Prototype:**

**inline int Flags()**

**Remarks:**

Implemented by the System.

Returns the bitmap flags. See [List of Bitmap Flags](#).

**Prototype:**

**inline void SetFlags(DWORD f)**

**Remarks:**

Implemented by the System.

Sets the specified flag bits. See [List of Bitmap Flags](#).

**Parameters:**

## **DWORD f**

The flags to set.

### **Prototype:**

**virtual int MaxRGBLevel() = 0;**

### **Remarks:**

This method returns the number of bits per pixel for each color component. For example a 24-bit TARGA has a **MaxRGBLevel()** of 8 (8 red, 8 green, and 8 blue).

### **Prototype:**

**virtual int MaxAlphaLevel() = 0;**

### **Remarks:**

Returns the number of bits per pixel in the alpha channel.

### **Prototype:**

**virtual int IsHighDynamicRange() = 0;**

### **Remarks:**

This method is available in release 4.0 and later only.

Returns nonzero if this storage uses high dynamic range data; otherwise zero. See the Advanced Topics section [Working With Bitmaps](#) for details on High Dynamic Range bitmaps.

### **Prototype:**

**virtual void \*GetStoragePtr(int \*type)**

### **Remarks:**

Implemented by the Plug-In.

This method is used to get a pointer to the beginning of the image storage. Not all storage types can return a valid pointer. In those cases, this method will set the passed **type** to **BMM\_NO\_TYPE** and return NULL.

### **Parameters:**

**int \*type**

The type of storage is returned here. See [List of Bitmap Types](#).

**Default Implementation:**

```
{ *type = BMM_NO_TYPE; return (NULL); }
```

**Prototype:**

```
virtual void *GetAlphaPtr(int *type);
```

**Remarks:**

This method is available in release 2.0 and later only.

This method will attempt to get a pointer to the beginning of the image alpha storage. Not all storage types can return a valid pointer. In those cases, this call will fail and the user should use some other method described below.

**Parameters:**

**int \*type**

The type of storage is returned here. See [List of Bitmap Types](#).

**Default Implementation:**

```
{ *type = BMM_NO_TYPE; return (NULL); }
```

Below are the standard methods for accessing image pixels. Important Note: The following "GetPixels()" methods operate on a single scanline of the image at a time. Thus the number of pixels+x must be less than the width of the image.

**Prototype:**

```
virtual int Get16Gray(int x, int y, int pixels, WORD *ptr) = 0;
```

**Remarks:**

Implemented by the System.

Retrieves the specified 16 bit grayscale pixels from the storage. This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Source x location.

**int y**

Source y location.

**int pixels**

Number of pixels to retrieve.

**WORD \*ptr**

Pointer to storage for the retrieved pixels.

**Return Value:**

Nonzero if pixels were retrieved; otherwise 0.

**Prototype:**

**virtual int Put16Gray( int x, int y, int pixels, WORD \*ptr) = 0;**

**Remarks:**

Implemented by the System.

Stores the 16 bit grayscale pixels to the specified location in the storage. This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Destination x location.

**int y**

Destination y location.

**int pixels**

Number of pixels to store.

**WORD \*ptr**

Pointer to storage for the pixels.

**Return Value:**

Nonzero if pixels were stored; otherwise 0.

**Prototype:**

**virtual int Get16Gray(int x, int y, int pixels, float \*ptr) = 0;**

**Remarks:**

Implemented by the System.

Retrieves the specified 16 bit grayscale pixels from the storage. This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Source x location.

**int y**

Source y location.

**int pixels**

Number of pixels to retrieve.

**float \*ptr**

Pointer to storage for the retrieved pixels.

**Return Value:**

Nonzero if pixels were retrieved; otherwise 0.

**Prototype:**

**virtual int Put16Gray( int x, int y, int pixels, float \*ptr) = 0;**

**Remarks:**

Implemented by the System.

Stores the 16 bit grayscale pixels to the specified location in the storage. This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Destination x location.

**int y**

Destination y location.

**int pixels**

Number of pixels to store.

**float \*ptr**

Pointer to storage for the pixels.

**Return Value:**

Nonzero if pixels were stored; otherwise 0.

**Prototype:**

**virtual int GetLinearPixels(int x,int y,int pixels,BMM\_Color\_64 \*ptr) = 0;**

**Remarks:**

Implemented by the Plug-In.

This method retrieves the specified 64 bit true color pixels from the storage. Pixels returned from this method are NOT gamma corrected. These have linear gamma (1.0). This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Source x location.

**int y**

Source y location.

**int pixels**

Number of pixels to store.

**BMM\_Color\_64 \*ptr**

Pointer to storage for the pixels.

**Return Value:**

Nonzero if pixels were retrieved; otherwise 0.

**Prototype:**

**inline int GetPixels(int x,int y,int pixels,BMM\_Color\_64 \*ptr)**

**Remarks:**

Retrieves the specified 64-bit pixel values from the bitmap. Note: This method provides access to pixel data one scanline at a time.

**Parameters:**

**int x**

Source x location.

**int y**

Source y location.

**int pixels**

Number of pixels to retrieve.

**BMM\_Color\_64 \*ptr**

Pointer to storage for the retrieved pixel values. See [Structure BMM\\_Color\\_64](#).

**Return Value:**

Returns nonzero if pixels were retrieved; otherwise 0. If storage has not been

allocated 0 is returned.

**Prototype:**

**int PutPixels(int x,int y,int pixels,BMM\_Color\_64 \*ptr)**

**Remarks:**

Stores the specified 64-bit pixel values into the bitmap's own local storage. The pointer you pass to this method may be freed or reused as soon as the function returns. Note: This method provides access to pixel data one scanline at a time.

**Parameters:**

**int x**

Destination x location.

**int y**

Destination y location.

**int pixels**

Number of pixels to store.

**BMM\_Color\_64 \*ptr**

Pixel values to store. See [Structure BMM\\_Color\\_64](#).

**Return Value:**

Returns nonzero if pixels were stored; otherwise 0. If storage has not been allocated 0 is returned.

**Prototype:**

**virtual int GetLinearPixels(int x,int y,int pixels,BMM\_Color\_fl \*ptr) = 0;**

**Remarks:**

Implemented by the Plug-In.

This method retrieves the specified 64 bit true color pixels from the storage. Pixels returned from this method are NOT gamma corrected. These have linear gamma (1.0). This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Source x location.

**int y**

Source y location.

**int pixels**

Number of pixels to store.

**BMM\_Color\_fl \*ptr**

Pointer to storage for the pixels.

**Return Value:**

Nonzero if pixels were retrieved; otherwise 0.

**Prototype:**

**inline int GetPixels(int x,int y,int pixels,BMM\_Color\_fl \*ptr)**

**Remarks:**

Retrieves the specified 64-bit pixel values from the bitmap. Note: This method provides access to pixel data one scanline at a time.

**Parameters:**

**int x**

Source x location.

**int y**

Source y location.

**int pixels**

Number of pixels to retrieve.

**BMM\_Color\_fl \*ptr**

Pointer to storage for the retrieved pixel values.

**Return Value:**

Returns nonzero if pixels were retrieved; otherwise 0. If storage has not been allocated 0 is returned.

**Prototype:**

**int PutPixels(int x,int y,int pixels,BMM\_Color\_fl \*ptr)**

**Remarks:**

Stores the specified 64-bit pixel values into the bitmap's own local storage.

The pointer you pass to this method may be freed or reused as soon as the function returns. Note: This method provides access to pixel data one scanline at a time.

**Parameters:**

**int x**

Destination x location.

**int y**

Destination y location.

**int pixels**

Number of pixels to store.

**BMM\_Color\_fl \*ptr**

Pixel values to store.

**Return Value:**

Returns nonzero if pixels were stored; otherwise 0. If storage has not been allocated 0 is returned.

**Prototype:**

```
virtual int GetIndexPixels(int x, int y, int pixels, unsigned char *ptr) = 0;
```

**Remarks:**

Implemented by the System.

Retrieves the specified index color pixels from the storage. This is used to retrieve pixels from a paletted image. This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Source x location.

**int y**

Source y location.

**int pixels**

Number of pixels to retrieve.

**unsigned char \*ptr**

Pointer to storage for the pixels.

**Return Value:**

Nonzero if pixels were retrieved; otherwise 0.

**Prototype:**

```
virtual int PutIndexPixels(int x, int y, int pixels, unsigned char  
*ptr) = 0;
```

**Remarks:**

Implemented by the System.

Stores the index color pixels to the specified location in the storage. This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Destination x location.

**int y**

Destination y location.

**int pixels**

Number of pixels to store.

**unsigned char \*ptr**

Pointer to the pixels to store.

**Return Value:**

Nonzero if pixels were stored; otherwise 0.

**Prototype:**

```
virtual int CropImage(int width,int height,BMM_Color_64  
fillcolor) = 0;
```

**Remarks:**

Implemented by the Plug-In.

Adjusts the bitmap size to the specified dimensions. The image is not resized to fit; it is cropped or filled with **fillcolor** pixels to accommodate the new size.

**Parameters:**

**int width**

The new horizontal size for the bitmap.

**int height**

The new vertical size for the bitmap.

**BMM\_Color\_64 fillcolor**

If the bitmap's new size is bigger than its current size, this is the color used to fill the new pixels. See [Structure BMM\\_Color\\_64](#).

**Return Value:**

Nonzero if the image was cropped; otherwise 0.

**Prototype:**

**virtual int CropImage(int width, int height, int fillindex) = 0;**

**Remarks:**

Implemented by the Plug-In.

Adjusts the bitmap size to the specified dimensions. The image is not resized to fit; it is cropped or filled with **fillindex** pixels to accommodate the new size.

**Parameters:**

**int width**

The new horizontal size for the bitmap.

**int height**

The new vertical size for the bitmap.

**int fillindex**

If the bitmap's new size is bigger than its current size, this is the color used to fill the new pixels.

**Return Value:**

Nonzero if the image was cropped; otherwise 0.

**Prototype:**

**virtual int ResizeImage(int width,int height,int newpalette) = 0;**

**Remarks:**

Implemented by the Plug-In.

This method is no longer used.

**Prototype:**

**virtual int CopyImage(Bitmap \*from, int operation,  
BMM\_Color\_64 fillcolor)**

**Remarks:**

Implemented by the Plug-In.

Copies the specified bitmap to this storage. The image is cropped or resized as specified.

**Parameters:**

**Bitmap \*from**

The source bitmap.

**int operation**

The type of copy to perform:

**COPY\_IMAGE\_CROP**

Copy image to current map size using cropping if necessary.

**COPY\_IMAGE\_RESIZE\_LO\_QUALITY**

Resize the source image to the destination map size (draft quality).

**COPY\_IMAGE\_RESIZE\_HI\_QUALITY**

Resize source image to the destination map size (final quality).

**COPY\_IMAGE\_USE\_CUSTOM**

Resize based on the Image Input Options (BitmapInfo \*).

**BMM\_Color\_64 fillcolor**

Vacant areas of the bitmap are filled with **fillcolor** pixels if the operation specified is **COPY\_IMAGE\_CROP** and one of the source bitmap dimensions is less than the size of this bitmap. See [Structure BMM\\_Color\\_64](#).

**Return Value:**

Nonzero if the copy was performed; otherwise 0.

**Prototype:**

**virtual int CopyImage(Bitmap \*from, int operation,  
BMM\_Color\_64 fillcolor, BitmapInfo \*bi = NULL) = 0;**

**Remarks:**

Implemented by the Plug-In.

Copies the specified bitmap to this storage. The image is cropped or resized as specified.

**Parameters:**

**Bitmap \*from**

The source bitmap.

**int operation**

The type of copy to perform:

**COPY\_IMAGE\_CROP**

Copy image to current map size using cropping if necessary.

**COPY\_IMAGE\_RESIZE\_LO\_QUALITY**

Resize the source image to the destination map size (draft quality).

**COPY\_IMAGE\_RESIZE\_HI\_QUALITY**

Resize source image to the destination map size (final quality).

**COPY\_IMAGE\_USE\_CUSTOM**

Resize based on the Image Input Options (BitmapInfo \*).

**BMM\_Color\_64 fillcolor**

Vacant areas of the bitmap are filled with **fillcolor** pixels if the operation specified is **COPY\_IMAGE\_CROP** and one of the source bitmap dimensions is less than the size of this bitmap. See [Structure BMM\\_Color\\_64](#).

**BitmapInfo \*bi**

When using custom options (resize to fit, positioning, etc.) this is how the flags are passed down to the Bitmap Manager. This is an optional argument -- for simple copy operations, **\*bi** can default to NULL. If present, the code checks the option flags and acts accordingly.

**Return Value:**

Nonzero if the copy was performed; otherwise 0.

**Prototype:**

```
virtual int CopyImage(Bitmap *from, int operation,  
BMM_Color_fl fillcolor, BitmapInfo *bi = NULL) = 0;
```

**Remarks:**

Implemented by the Plug-In.

Copies the specified bitmap to this storage. The image is cropped or resized as

specified.

**Parameters:**

**Bitmap \*from**

The source bitmap.

**int operation**

The type of copy to perform:

**COPY\_IMAGE\_CROP**

Copy image to current map size using cropping if necessary.

**COPY\_IMAGE\_RESIZE\_LO\_QUALITY**

Resize the source image to the destination map size (draft quality).

**COPY\_IMAGE\_RESIZE\_HI\_QUALITY**

Resize source image to the destination map size (final quality).

**COPY\_IMAGE\_USE\_CUSTOM**

Resize based on the Image Input Options (BitmapInfo \*).

**BMM\_Color\_fl fillcolor**

Vacant areas of the bitmap are filled with **fillcolor** pixels if the operation specified is **COPY\_IMAGE\_CROP** and one of the source bitmap dimensions is less than the size of this bitmap. See [Structure BMM\\_Color\\_fl](#).

**BitmapInfo \*bi**

When using custom options (resize to fit, positioning, etc.) this is how the flags are passed down to the Bitmap Manager. This is an optional argument -- for simple copy operations, **\*bi** can default to NULL. If present, the code checks the option flags and acts accordingly.

**Return Value:**

Nonzero if the copy was performed; otherwise 0.

**Prototype:**

**virtual int CopyImage( Bitmap \*from,int operation,int fillindex)**

**Remarks:**

Implemented by the Plug-In.

Copies the specified bitmap to this storage.

**Parameters:**

**Bitmap \*from**

The source bitmap.

**int operation**

The type of copy to perform.

**COPY\_IMAGE\_CROP**

Copy image to current map size using cropping if necessary.

**COPY\_IMAGE\_RESIZE\_LO\_QUALITY**

Resize the source image to the destination map size (draft quality).

**COPY\_IMAGE\_RESIZE\_HI\_QUALITY**

Resize source image to destination map size (final quality).

**COPY\_IMAGE\_USE\_CUSTOM**

Resize based on the Image Input Options (BitmapInfo \*).

**int fillindex**

Vacant areas of the bitmap are filled with **fillindex** pixels if the operation specified is **COPY\_IMAGE\_CROP** and one of the source bitmap dimensions is less than the size of this bitmap.

**Return Value:**

Nonzero if the copy was performed; otherwise 0.

**Prototype:**

**virtual int CopyCrop(Bitmap \*from, BMM\_Color\_64 fillcolor);**

**Remarks:**

Implemented by the Plug-In.

Copies the specified bitmap to this storage. The image is cropped to fit.

**Parameters:****Bitmap \*from**

The bitmap to copy to this bitmap.

**BMM\_Color\_64 fillcolor**

The color to use if the source image is smaller than the destination image. See [Structure BMM\\_Color\\_64](#).

**Return Value:**

Nonzero if the copy/crop was performed; otherwise zero.

**Prototype:**

```
virtual int CopyScaleLow(Bitmap *from);
```

**Remarks:**

Implemented by the System.

This method copies the specified bitmap to this storage. The source bitmap is scaled to fit using a lower quality but faster algorithm than

**CopyScaleHigh()**. This is an internal function implemented within BMM.DLL for copying bitmaps back and forth. If a developer creates new storage type, they will automatically get these copy functions as these are implemented in the base class.

**Parameters:**

**Bitmap \*from**

The source bitmap.

**Return Value:**

Nonzero if the copy/scale was performed; otherwise zero.

**Prototype:**

```
virtual int CopyScaleHigh(Bitmap *from, HWND hWnd,  
BMM_Color_64 **buf = NULL, int w=0, int h=0);
```

**Remarks:**

Implemented by the System.

This method copies the specified bitmap to this storage. The source bitmap is scaled to fit using a higher quality but slower algorithm than

**CopyScaleLow()**. This is an internal function implemented within BMM.DLL for copying bitmaps back and forth. If a developer creates new storage type, they will automatically get these copy functions as these are implemented in the base class.

**Prototype:**

```
virtual int CopyScaleHigh(Bitmap *from, HWND hWnd,  
BMM_Color_fl **buf = NULL, int w=0, int h=0);
```

**Remarks:**

Implemented by the System.

This method copies the specified bitmap to this storage. The source bitmap is scaled to fit using a higher quality but slower algorithm than **CopyScaleLow()**. This is an internal function implemented within BMM.DLL for copying bitmaps back and forth. If a developer creates new storage type, they will automatically get these copy functions as these are implemented in the base class.

**Prototype:**

```
virtual int GetPalette(int start,int count,BMM_Color_48 *ptr) = 0;
```

**Remarks:**

Implemented by the Plug-In.

Retrieves the specified portion of the palette of this storage.

**Parameters:**

**int start**

Zero based index of the first palette entry to retrieve.

**int count**

Number of palette entries to retrieve.

**BMM\_Color\_48 \*ptr**

Points to storage for the palette values. See [Structure BMM\\_Color\\_48](#).

**Return Value:**

Nonzero if the palette was retrieved; otherwise 0.

**Prototype:**

```
virtual int SetPalette(int start, int count, BMM_Color_48 *ptr) = 0;
```

**Remarks:**

Implemented by the Plug-In.

Sets the specified portion of the palette for this storage.

**Parameters:**

**int start**

First palette index entry to store.

**int count**

Number of palette entries to store.

**BMM\_Color\_48 \*ptr**

Points to storage for the palette values. See [Structure BMM\\_Color\\_48](#).

**Return Value:**

Nonzero if the palette was stored; otherwise 0.

**Sample Code:**

See **Load()** in `\MAXSDK\SAMPLES\IO\BMP\BMP.CPP`.

**Prototype:**

```
virtual int GetFiltered(float u, float v, float du, float dv,  
BMM_Color_64 *ptr) = 0;
```

**Remarks:**

Implemented by the Plug-In.

This method uses summed area table or pyramidal filtering to compute an averaged color over a specified area.

**Parameters:**

**float u, float v**

The location in the bitmap to filter. These values go from 0.0 to 1.0 across the size of the bitmap.

**float du, float dv**

The size of the rectangle to sample. These values go from 0.0 to 1.0 across the size of the bitmap.

**BMM\_Color\_64 \*ptr**

The result is returned here - the average over the specified area. See [Structure BMM\\_Color\\_64](#).

**Prototype:**

```
virtual int GetFiltered(float u,float v,float du,float  
dv,BMM_Color_fl *ptr) = 0;
```

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the Plug-In.

This method uses summed area table or pyramidal filtering to compute an averaged color over a specified area and outputs to a floating point color structure.

**Parameters:**

**float u, float v**

The location in the bitmap to filter. These values go from 0.0 to 1.0 across the size of the bitmap.

**float du, float dv**

The size of the rectangle to sample. These values go from 0.0 to 1.0 across the size of the bitmap.

**BMM\_Color\_fl \*ptr**

The result is returned here - the average over the specified area.

**Prototype:**

```
virtual int Allocate(BitmapInfo *bi, BitmapManager *manager,  
int openMode) = 0;
```

**Remarks:**

Implemented by the System.

This method is called to allocate image storage.

**Parameters:**

**BitmapInfo \*bi**

Points to an instance of the BitmapInfo class describing the properties of the bitmap.

**BitmapManager \*manager**

Points to the BitmapManager for the bitmap.

**int openMode**

See [Bitmap Open Mode Types](#).

**Return Value:**

Nonzero if storage was allocated; otherwise 0.

**Prototype:**

```
virtual void Scale( float *, int, float *, int );
```

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

This method is used internally.

**Prototype:**

**virtual BOOL GetSRow( float \*, int, float \*, int );**

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

This method is used internally.

**Prototype:**

**virtual BOOL PutSRow( float \*, int, float \*, int );**

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

This method is used internally.

**Prototype:**

**virtual BOOL GetSCol( float \*, float \*, int, int );**

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

This method is used internally.

**Prototype:**

**virtual BOOL PutSCol( float \*, float \*, int, int );**

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

This method is used internally.

**Prototype:**

```
virtual BOOL ScaleY( Bitmap *, BMM_Color_fl *, float *, float *,  
HWND, int cw = 0, int ch = 0 );
```

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

This method is used internally.

**Prototype:**

```
virtual BOOL ScaleX( Bitmap *, BMM_Color_fl *, float *, float *,  
HWND, int cw = 0, int ch = 0 );
```

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the System.

This method is used internally.

**Prototype:**

```
virtual int CropImage(int width,int height, BMM_Color_fl  
fillcolor) = 0;
```

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the Plug-In.

Adjusts the bitmap size to the specified dimensions. The image is not resized to fit; it is cropped or filled with **fillcolor** pixels to accommodate the new size.

**Parameters:****int width**

The new horizontal size for the bitmap.

**int height**

The new vertical size for the bitmap.

**BMM\_Color\_fl fillcolor**

If the bitmap's new size is bigger than its current size, this is the color used to fill the new pixels. See [Structure BMM\\_Color\\_fl](#).

**Return Value:**

Nonzero if the image was cropped; otherwise 0.

**Prototype:**

**virtual int CopyCrop(Bitmap \*from, BMM\_Color\_fl fillcolor) = 0;**

**Remarks:**

This method is available in release 4.0 and later only.

Implemented by the Plug-In.

Copies the specified bitmap to this storage. The image is cropped to fit.

**Parameters:****Bitmap \*from**

The bitmap to copy to this bitmap.

**BMM\_Color\_fl fillcolor**

The color to use if the source image is smaller than the destination image. See [Structure BMM\\_Color\\_fl](#).

**Return Value:**

Nonzero if the copy/crop was performed; otherwise zero.

## G-Buffer Methods.

### Prototype:

**virtual void \*GetChannel(ULONG channelID, ULONG& chanType)**

### Remarks:

Implemented by the Plug-In.

Returns a pointer to specified geometry/graphics buffer channel, and determines its pixel depth.

### Parameters:

#### **ULONG channelID**

The channel to return a pointer to. See [List of G-Buffer Channels](#).

#### **ULONG& chanType**

The type of the returned channel. One of the following values:

#### **BMM\_CHAN\_TYPE\_UNKNOWN**

Channel not of a known type.

#### **BMM\_CHAN\_TYPE\_1**

1 bit per pixel

#### **BMM\_CHAN\_TYPE\_8**

1 byte per pixel

#### **BMM\_CHAN\_TYPE\_16**

1 word per pixel

#### **BMM\_CHAN\_TYPE\_32**

2 words per pixel

#### **BMM\_CHAN\_TYPE\_48**

3 words per pixel

#### **BMM\_CHAN\_TYPE\_64**

4 words per pixel

#### **BMM\_CHAN\_TYPE\_96**

6 words per pixel

### Default Implementation:

```
{ return NULL;}
```

**Prototype:**

**GBuffer \*GetGBuffer();**

**Remarks:**

Returns a pointer to the G-Buffer associated with this storage.

**Prototype:**

**virtual ULONG CreateChannels(ULONG channelIDs)**

**Remarks:**

Implemented by the Plug-In.

Create the specified channels.

**Parameters:**

**ULONG channelIDs**

Specifies the channels to create. See [List of G-Buffer Channels](#).

**Return Value:**

The channels that are present.

**Default Implementation:**

```
{ return 0;}
```

**Prototype:**

**virtual void DeleteChannels(ULONG channelIDs)**

**Remarks:**

Implemented by the Plug-In.

Delete the specified channels.

**Parameters:**

**ULONG channelIDs**

Specifies the channels to delete. See [List of G-Buffer Channels](#).

**Prototype:**

**virtual ULONG ChannelsPresent()**

**Remarks:**

Implemented by the Plug-In.

Returns the channels that are present. See [List of G-Buffer Channels](#).

**Default Implementation:**

```
{ return 0; }
```

**Prototype:**

```
RenderInfo* AllocRenderInfo();
```

**Remarks:**

Implemented by the Plug-In.

Output bitmaps can get an instance of the class **RenderInfo**, which is written by the renderer. This method will allocate an instance only if a **RenderInfo** doesn't yet exist.

**Return Value:**

A pointer to a **RenderInfo**. See [Class RenderInfo](#).

**Prototype:**

```
RenderInfo* GetRenderInfo();
```

**Remarks:**

Implemented by the Plug-In.

Returns a **RenderInfo** pointer. See [Class RenderInfo](#).

## List of Bitmap Types

See Also: [Class BitmapStorage](#), [Class Color](#), [Class AColor](#), [Structure LogLUV32Pixel](#), [Structure LogLUV24Pixel](#), [Structure RealPixel](#).

The following are the valid types of bitmaps:

This type indicates 'no type' yet.

### **BMM\_NO\_TYPE**

Bitmap has not been allocated yet.

The types below may be both read from or written to:

### **BMM\_LINE\_ART**

1 bit monochrome image.

### **BMM\_PALETTED**

8 bit paletted image. Each pixel value is an index into the color table.

### **BMM\_GRAY\_8**

8 bit grayscale bitmap.

### **BMM\_GRAY\_16**

16 bit grayscale bitmap.

### **BMM\_TRUE\_16**

16 bit true color image.

### **BMM\_TRUE\_32**

32 bit color: 8 bits each for Red, Green, Blue, and Alpha.

### **BMM\_TRUE\_64**

64 bit color: 16 bits each for Red, Green, Blue, and Alpha.

### **BMM\_LOGLUV\_32**

This option is available in release 4.0 and later only.

This format uses a logarithmic encoding of luminance and U' and V' in the CIE perceptively uniform space. It spans 38 orders of magnitude from  $5.43571 \times 10^{-20}$  to  $1.84467 \times 10^{19}$  in steps of about 0.3% luminance steps. It includes both positive and negative colors. A separate 16 bit channel is kept for alpha values.

### **BMM\_LOGLUV\_24**

This option is available in release 4.0 and later only.

This format is similar to **BMM\_LOGLUV\_32** except it uses smaller values to give a span of 5 order of magnitude from 1/4096 to 16 in 1.1%

luminance steps. A separate 8 bit channel is kept for alpha values.

### **BMM\_LOGLUV\_24A**

This option is available in release 4.0 and later only.

This format is identical to **BMM\_LOGUV\_24**, except the 8 bit alpha value is kept with the 24 bit color value in a single 32 bit word.

### **BMM\_REALPIX\_32**

This option is available in release 4.0 and later only.

The "Real Pixel" format.

The following types may be read from, but NOT written to (thus these should not be used when creating bitmaps that you intend to write to or save):

### **BMM\_TRUE\_24**

24 bit color: 8 bits each for Red, Green, and Blue.

### **BMM\_TRUE\_48**

48 bit color: 16 bits each for Red, Green, and Blue.

### **BMM\_YUV\_422**

This is the YUV format - CCIR 601.

### **BMM\_BMP\_4**

4 bit Windows BMP 16 color bitmap

### **BMM\_PAD\_24**

Padded 24 bit (in a 32 bit register).

## Structure BMM\_Color\_fl

See Also: [Class Bitmap](#), [Class BitmapStorage](#), [Class BitmapManager](#), [Working With Bitmaps](#).

### Description:

This structure is available in release 4.0 and later only.

The High Dynamic Range bitmaps introduced in R4 make use of this class to store color information using floating point values.

```
typedef struct {  
    float r,g,b,a;
```

Storage for the floating point color information.

### Prototype:

```
operator float*();
```

### Remarks:

Returns the address of the floating point values.

### Prototype:

```
operator const float*() const;
```

### Remarks:

Returns the address of the floating point values.

### Prototype:

```
static WORD clipColor(float c);
```

### Remarks:

Returns the specified color **c** clipped (limited to) the range 0 to 65535.

```
} BMM_Color_fl;
```

## Structure LogLUV32Pixel

See Also: [Class Color](#).

```
struct LogLUV32Pixel
```

### Description:

This structure is available in release 4.0 and later only.

This structure is a 32 bit pixel format that stores 1 bit for sign, 15 bits for the log of the luminance, and 16 bits of chroma.

This class stores colors in XYZ space. XYZ color space is the space define by the CIE by the red (X), green (Y) and blue (Z) response curves of the eye. So to calculate a color in XYZ space, you take the incoming light, multiply it by each response curvey and integrate the result over the visible spectrum. There are several RGB spaces, all depending on what XYZ coordinates get assigned to the red, green and blue primaries of the space. The transformations between XYZ and RGB space are all linear and can be represented as 3 by 3 matrices.

The mapping used by XYZtoRGB and RGBtoXYZ is for CCIR-709 primaries and was taken from the code in the tiff reader for the LogLUV32 format. Both XYZ and RGB methods are supplied, so developers can supply different XYZ to RGB transforms, if desired.

This transform is important, because in the LogLUV32 format the log is taken of the Y coordinate in XYZ space. So, it is important that Y not be 0. The transform helps guarantee this. In fact, Y is zero only when r, g and b are all 0.

### Methods:

public:

### Data Members:

#### **DWORD32 value;**

Storage for the pixel value.

### Prototype:

**operator Color() const;**

### Remarks:

Returns this pixel format as a Color.

**Prototype:**

```
LogLUV32Pixel& operator=(const float c[3]) { SetRGB(c); return *this; };
```

**Remarks:**

Assignment operator.

**Parameters:**

**const float c[3]**

The array of color values to assign in RGB order.

**Prototype:**

```
void GetRGB(float rgb[3]) const;
```

**Remarks:**

Retrieves the RGB space values.

**Parameters:**

**float rgb[3]**

The results are stored here.

**Prototype:**

```
void SetRGB(const float rgb[3]);
```

**Remarks:**

Sets the RGB space values.

**Parameters:**

**const float rgb[3]**

The values to set.

**Prototype:**

```
void GetXYZ(float xyz[3]) const;
```

**Remarks:**

Retrieves the XYZ space values.

**Parameters:**

**const float xyz[3]**

The results are stored here.

**Prototype:**

**void SetXYZ(const float xyz[3]);**

**Remarks:**

Sets the XYZ space values.

**Parameters:**

**const float xyz[3]**

The values to set.

**Prototype:**

**static void XYZtoRGB(const float xyz[3], float rgb[3]);**

**Remarks:**

This method converts from XYZ space to RGB space.

**Parameters:**

**const float xyz[3]**

The input values to convert.

**float rgb[3]**

The output values are stored here.

**Prototype:**

**static void RGBtoXYZ(const float rgb[3], float xyz[3]);**

**Remarks:**

This method converts from RGB space to XYZ space.

**Parameters:**

**const float rgb[3]**

The input values to convert.

**float xyz[3]**

The output values are stored here.

## Structure LogLUV24Pixel

See Also: [Class Color.](#), [Structure LogUV32Pixel](#)

```
struct LogLUV24Pixel
```

### Description:

This class is available in release 4.0 and later only.

This structure is a 24 bit pixel format that stores 10 bits for log of luminance and 14 bits of chroma.

### Data Members:

**unsigned char value[3];**

Storage for the pixel value.

### Methods:

public:

### Prototype:

**operator Color() const;**

### Remarks:

This method will return the pixel format as a Color.

### Prototype:

**LogLUV24Pixel& operator=(const float c[3]);**

### Remarks:

Assignment operator.

### Parameters:

**const float c[3]**

The array of color values to assign in RGB order.

### Prototype:

**void GetRGB(float rgb[3]) const;**

### Remarks:

This method will return the RGB space values.

**Parameters:**

**float rgb[3]**

The results are stored in this array.

**Prototype:**

**void SetRGB(const float rgb[3]);**

**Remarks:**

This method allows you to set the RGB space values.

**Parameters:**

**const float rgb[3]**

The values to set.

**Prototype:**

**void GetXYZ(float xyz[3]) const;**

**Remarks:**

This method will return the XYZ space values.

**Parameters:**

**float xyz[3]**

The values are stored in this array.

**Prototype:**

**void SetXYZ(const float xyz[3]);**

**Remarks:**

This method allows you to set the XYZ space values.

**Parameters:**

**const float xyz[3]**

The values to set.

**Prototype:**

**static void XYZtoRGB(const float xyz[3], float rgb[3]);**

**Remarks:**

This method will convert from XYZ space to RGB space.

**Parameters:**

**const float xyz[3]**

The input values to convert.

**float rgb[3]**

The output values are stored in this array.

**Prototype:**

**static void RGBtoXYZ(const float rgb[3], float xyz[3]);**

**Remarks:**

This method will convert from RGB space to XYZ space.

**Parameters:**

**const float rgb[3]**

The input values to convert.

**float xyz[3]**

The output values are stored in this array.

## Class BitmapStorageLDR

See Also: [Class BitmapStorage](#).

```
class BitmapStorageLDR : public BitmapStorage
```

### Description:

This class is available in release 4.0 and later only.

This is the base class for the development of plug-in Bitmap Storage plug-ins that don't use High Dynamic Range bitmaps.

Note that **bVirtual** is actually a shortcut macro for **BMMExport virtual**.

All methods of this class are implemented by the System.

### Methods:

public:

### Prototype:

```
bVirtual int IsHighDynamicRange();
```

### Remarks:

This method returns 0 if the bitmap is not a high dynamic range bitmap or 1 if it is.

### Default Implementation:

```
{ return(0); }
```

### Prototype:

```
bVirtual int StraightCopy(Bitmap *from);
```

### Remarks:

Implemented by the System.

This method does a straightforward copy from the specified bitmap.

### Parameters:

**Bitmap \*from**

The bitmap to copy from.

**Prototype:**

**bVirtual int Get16Gray(int x,int y,int pixels,float \*ptr);**

**Remarks:**

Implemented by the System.

Retrieves the specified 16 bit grayscale pixels from the storage. This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Source x location.

**int y**

Source y location.

**int pixels**

Number of pixels to retrieve.

**float \*ptr**

Pointer to the storage for the retrieved pixels.

**Return Value:**

Nonzero if pixels were retrieved; otherwise 0.

**Prototype:**

**bVirtual int Put16Gray(int x,int y,int pixels,float \*ptr);**

**Remarks:**

Implemented by the System.

Stores the 16 bit grayscale pixels to the specified location in the storage. This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Destination x location.

**int y**

Destination y location.

**int pixels**

Number of pixels to store.

**float \*ptr**

Pointer to the storage for the pixels.

**Return Value:**

Nonzero if pixels were stored; otherwise 0.

**Prototype:**

**bVirtual int GetLinearPixels(int x,int y,int pixels,BMM\_Color\_fl \*ptr);**

**Remarks:**

Implemented by the Plug-In.

This method retrieves the specified 64 bit true color pixels from the storage. Pixels returned from this method are NOT gamma corrected. These have linear gamma (1.0). This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Source x location.

**int y**

Source y location.

**int pixels**

Number of pixels to retrieve.

**BMM\_Color\_fl \*ptr**

Pointer to the storage for the retrieved pixels.

**Return Value:**

Nonzero if pixels were retrieved; otherwise 0.

**Prototype:**

**bVirtual int GetPixels(int x,int y,int pixels,BMM\_Color\_fl \*ptr);**

**Remarks:**

Retrieves the specified 64-bit pixel values from the bitmap. Note: This method provides access to pixel data one scanline at a time.

**Parameters:**

**int x**

Source x location.

**int y**

Source y location.

**int pixels**

Number of pixels to retrieve.

**BMM\_Color\_fl \*ptr**

Pointer to the storage for the retrieved pixels.

**Return Value:**

Returns nonzero if pixels were retrieved; otherwise 0. If storage has not been allocated 0 is returned.

**Prototype:**

**bVirtual int PutPixels(int x,int y,int pixels,BMM\_Color\_fl \*ptr);**

**Remarks:**

Stores the specified 64-bit pixel values into the bitmap's own local storage. The pointer you pass to this method may be freed or reused as soon as the function returns. Note: This method provides access to pixel data one scanline at a time.

**Parameters:**

**int x**

Destination x location.

**int y**

Destination y location.

**int pixels**

Number of pixels to store.

**BMM\_Color\_fl \*ptr**

The pixels values to store.

**Return Value:**

Returns nonzero if pixels were stored; otherwise 0. If storage has not been allocated 0 is returned.

**Prototype:**

**bVirtual int GetIndexPixels(int x,int y,int pixels,unsigned char**

**\*ptr) = 0;**

**Remarks:**

Implemented by the System.

Retrieves the specified index color pixels from the storage. This is used to retrieve pixels from a paletted image. This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Source x location.

**int y**

Source y location.

**int pixels**

Number of pixels to retrieve.

**unsigned char \*ptr**

Pointer to the storage for the pixels.

**Return Value:**

Nonzero if pixels were retrieved; otherwise 0.

**Prototype:**

**bVirtual int PutIndexPixels(int x,int y,int pixels,unsigned char \*ptr) = 0;**

**Remarks:**

Implemented by the System.

Stores the index color pixels to the specified location in the storage. This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Destination x location.

**int y**

Destination y location.

**int pixels**

Number of pixels to store.

**unsigned char \*ptr**

The pixels values to store.

**Return Value:**

Nonzero if pixels were stored; otherwise 0.

**Prototype:**

**bVirtual int CropImage(int width,int height,BMM\_Color\_fl  
fillcolor);**

**Remarks:**

Implemented by the Plug-In.

Adjusts the bitmap size to the specified dimensions. The image is not resized to fit; it is cropped or filled with fillcolor pixels to accommodate the new size.

**Parameters:**

**int width**

The new horizontal size for the bitmap.

**int height**

The new vertical size for the bitmap.

**BMM\_Color\_fl fillcolor**

If the bitmap's new size is bigger than its current size, this is the color used to fill the new pixels.

**Return Value:**

Nonzero if the image was cropped; otherwise 0.

**Prototype:**

**bVirtual int CopyCrop(Bitmap \*from, BMM\_Color\_64 fillcolor);**

**Remarks:**

Implemented by the Plug-In.

Copies the specified bitmap to this storage. The image is cropped to fit.

**Parameters:**

**Bitmap \*from**

The bitmap to copy to this bitmap.

**BMM\_Color\_64 fillcolor**

The color to use if the source image is smaller than the destination image.

**Return Value:**

Nonzero if the copy/crop was performed; otherwise zero.

**Prototype:**

**bVirtual int CopyCrop(Bitmap \*from, BMM\_Color\_fl fillcolor);**

**Remarks:**

Implemented by the Plug-In.

Copies the specified bitmap to this storage. The image is cropped to fit.

**Parameters:**

**Bitmap \*from**

The bitmap to copy to this bitmap.

**BMM\_Color\_fl fillcolor**

The color to use if the source image is smaller than the destination image.

**Return Value:**

Nonzero if the copy/crop was performed; otherwise zero.

**Prototype:**

**bVirtual int CopyScaleLow(Bitmap \*from);**

**Remarks:**

Implemented by the System.

This method copies the specified bitmap to this storage. The source bitmap is scaled to fit using a lower quality but faster algorithm than

**CopyScaleHigh()**. This is an internal function implemented within

BMM.DLL for copying bitmaps back and forth. If a developer creates new storage type, they will automatically get these copy functions as these are implemented in the base class.

**Parameters:**

**Bitmap \*from**

The bitmap to copy to this bitmap.

**Return Value:**

Nonzero if the copy/scale was performed; otherwise zero.

**Prototype:**

```
bVirtual int CopyScaleHigh(Bitmap *from, HWND hWnd,  
BMM_Color_64 **buf = NULL, int w=0, int h=0);
```

**Remarks:**

Implemented by the System.

This method copies the specified bitmap to this storage. The source bitmap is scaled to fit using a higher quality but slower algorithm than

**CopyScaleLow()**. This is an internal function implemented within BMM.DLL for copying bitmaps back and forth. If a developer creates new storage type, they will automatically get these copy functions as these are implemented in the base class.

**Prototype:**

```
bVirtual int CopyScaleHigh(Bitmap *from, HWND hWnd,  
BMM_Color_fl **buf = NULL, int w=0, int h=0);
```

**Remarks:**

Implemented by the System.

This method copies the specified bitmap to this storage. The source bitmap is scaled to fit using a higher quality but slower algorithm than

**CopyScaleLow()**. This is an internal function implemented within BMM.DLL for copying bitmaps back and forth. If a developer creates new storage type, they will automatically get these copy functions as these are implemented in the base class.

**Prototype:**

```
bVirtual int CopyImage(Bitmap *from,int  
operation,BMM_Color_64 fillcolor, BitmapInfo *bi = NULL);
```

**Remarks:**

Implemented by the Plug-In.

Copies the specified bitmap to this storage. The image is cropped or resized as specified.

**Parameters:**

**Bitmap \*from**

The source bitmap.

### **int operation**

The type of copy to perform:

#### **COPY\_IMAGE\_CROP**

Copy image to current map size using cropping if necessary.

#### **COPY\_IMAGE\_RESIZE\_LO\_QUALITY**

Resize the source image to the destination map size (draft quality).

#### **COPY\_IMAGE\_RESIZE\_HI\_QUALITY**

Resize source image to the destination map size (final quality).

#### **COPY\_IMAGE\_USE\_CUSTOM**

Resize based on the Image Input Options (BitmapInfo \*).

### **BMM\_Color\_64 fillcolor**

Vacant areas of the bitmap are filled with fillcolor pixels if the operation specified is **COPY\_IMAGE\_CROP** and one of the source bitmap dimensions is less than the size of this bitmap.

### **BitmapInfo \*bi = NULL**

When using custom options (resize to fit, positioning, etc.) this is how the flags are passed down to the Bitmap Manager. This is an optional argument -- for simple copy operations, **\*bi** can default to NULL. If present, the code checks the option flags and acts accordingly.

### **Return Value:**

Nonzero if the copy was performed; otherwise 0.

### **Prototype:**

```
bVirtual int CopyImage(Bitmap *from,int  
operation,BMM_Color_fl fillcolor, BitmapInfo *bi = NULL);
```

### **Remarks:**

Implemented by the Plug-In.

Copies the specified bitmap to this storage.

### **Parameters:**

#### **Bitmap \*from**

The source bitmap.

#### **int operation**

The type of copy to perform:

**COPY\_IMAGE\_CROP**

Copy image to current map size using cropping if necessary.

**COPY\_IMAGE\_RESIZE\_LO\_QUALITY**

Resize the source image to the destination map size (draft quality).

**COPY\_IMAGE\_RESIZE\_HI\_QUALITY**

Resize source image to the destination map size (final quality).

**COPY\_IMAGE\_USE\_CUSTOM**

Resize based on the Image Input Options (BitmapInfo \*).

**BMM\_Color\_fl fillcolor**

Vacant areas of the bitmap are filled with fillcolor pixels if the operation specified is **COPY\_IMAGE\_CROP** and one of the source bitmap dimensions is less than the size of this bitmap.

**BitmapInfo \*bi = NULL**

When using custom options (resize to fit, positioning, etc.) this is how the flags are passed down to the Bitmap Manager. This is an optional argument -- for simple copy operations, **\*bi** can default to NULL. If present, the code checks the option flags and acts accordingly.

**Return Value:**

Nonzero if the copy was performed; otherwise 0.

**Prototype:**

**bVirtual int CopyImage(Bitmap \*from,int operation,int fillindex);**

**Remarks:**

Implemented by the Plug-In.

Copies the specified bitmap to this storage.

**Parameters:**

**Bitmap \*from**

The source bitmap.

**int operation**

The type of copy to perform:

**COPY\_IMAGE\_CROP**

Copy image to current map size using cropping if necessary.

**COPY\_IMAGE\_RESIZE\_LO\_QUALITY**

Resize the source image to the destination map size (draft quality).

**COPY\_IMAGE\_RESIZE\_HI\_QUALITY**

Resize source image to the destination map size (final quality).

**COPY\_IMAGE\_USE\_CUSTOM**

Resize based on the Image Input Options (BitmapInfo \*).

**int fillindex**

Vacant areas of the bitmap are filled with fillcolor pixels if the operation specified is **COPY\_IMAGE\_CROP** and one of the source bitmap dimensions is less than the size of this bitmap.

**Return Value:**

Nonzero if the copy was performed; otherwise 0.

**Prototype:**

**bVirtual int GetFiltered(float u,float v,float du,float dv,BMM\_Color\_fl \*ptr);**

**Remarks:**

Implemented by the Plug-In.

This method uses summed area table or pyramidal filtering to compute an averaged color over a specified area.

**Parameters:**

**float u, float v**

The location in the bitmap to filter. These values go from 0.0 to 1.0 across the size of the bitmap.

**float du, float dv**

The size of the rectangle to sample. These values go from 0.0 to 1.0 across the size of the bitmap.

**BMM\_Color\_fl \*ptr**

The result is returned here - the average over the specified area.

# Class BitmapStorageHDR

See Also: [Class BitmapStorage](#).

```
class BitmapStorageHDR : public BitmapStorage
```

## Description:

This class is available in release 4.0 and later only.

This is the base class for the development of plug-in Bitmap Storage plug-ins that use High Dynamic Range bitmaps.

All methods of this class are implemented by the System.

## Methods:

public:

## Prototype:

```
bVirtual int IsHighDynamicRange();
```

## Remarks:

Implemented by the System.

This method returns 0 if the bitmap is not a high dynamic range bitmap or 1 if it is.

## Default Implementation:

```
{ return(1); }
```

## Prototype:

```
bVirtual int StraightCopy(Bitmap *from);
```

## Remarks:

Implemented by the System.

This method does a straightforward copy from the specified bitmap.

## Parameters:

```
Bitmap *from
```

The bitmap to copy from.

## Prototype:

**bVirtual int Get16Gray(int x,int y,int pixels,WORD \*ptr);**

**Remarks:**

Implemented by the System.

Retrieves the specified 16 bit grayscale pixels from the storage. This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Source x location.

**int y**

Source y location.

**int pixels**

Number of pixels to retrieve.

**WORD \*ptr**

Pointer to the storage for the retrieved pixels.

**Return Value:**

Nonzero if pixels were retrieved; otherwise 0.

**Prototype:**

**bVirtual int Put16Gray(int x,int y,int pixels,WORD \*ptr);**

**Remarks:**

Implemented by the System.

Stores the 16 bit grayscale pixels to the specified location in the storage. This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Destination x location.

**int y**

Destination y location.

**int pixels**

Number of pixels to store.

**WORD \*ptr**

Pointer to the storage for the pixels.

**Return Value:**

Nonzero if pixels were stored; otherwise 0.

**Prototype:**

```
bVirtual int GetLinearPixels(int x,int y,int pixels,BMM_Color_64 *ptr);
```

**Remarks:**

Implemented by the Plug-In.

This method retrieves the specified 64 bit true color pixels from the storage. Pixels returned from this method are NOT gamma corrected. These have linear gamma (1.0). This method operates on a single scanline of the image at a time.

**Parameters:**

**int x**

Source x location.

**int y**

Source y location.

**int pixels**

Number of pixels to retrieve.

**BMM\_Color\_64 \*ptr**

Pointer to the storage for the retrieved pixels.

**Return Value:**

Nonzero if pixels were retrieved; otherwise 0.

**Prototype:**

```
bVirtual int GetPixels(int x,int y,int pixels,BMM_Color_64 *ptr);
```

**Remarks:**

**int x**

Source x location.

**int y**

Source y location.

**int pixels**

Number of pixels to retrieve.

**BMM\_Color\_fl \*ptr**

Pointer to the storage for the retrieved pixels.

**Return Value:**

Returns nonzero if pixels were retrieved; otherwise 0. If storage has not been allocated 0 is returned.

**Prototype:**

**bVirtual int PutPixels(int x,int y,int pixels,BMM\_Color\_64 \*ptr);**

**Remarks:**

Stores the specified 64-bit pixel values into the bitmap's own local storage. The pointer you pass to this method may be freed or reused as soon as the function returns. Note: This method provides access to pixel data one scanline at a time.

**Parameters:****int x**

Destination x location.

**int y**

Destination y location.

**int pixels**

Number of pixels to store.

**BMM\_Color\_fl \*ptr**

The pixels values to store.

**Return Value:**

Returns nonzero if pixels were stored; otherwise 0. If storage has not been allocated 0 is returned.

**Prototype:**

**bVirtual int CropImage(int width,int height,BMM\_Color\_64 fillcolor);**

**Remarks:**

Implemented by the Plug-In.

Adjusts the bitmap size to the specified dimensions. The image is not resized to fit; it is cropped or filled with fillcolor pixels to accommodate the new size.

**Parameters:****int width**

The new horizontal size for the bitmap.

**int height**

The new vertical size for the bitmap.

**BMM\_Color\_64 fillcolor**

If the bitmap's new size is bigger than its current size, this is the color used to fill the new pixels.

**Return Value:**

Nonzero if the image was cropped; otherwise 0.

**Prototype:**

**bVirtual int CropImage(int width,int height,int fillindex);**

**Remarks:**

Implemented by the Plug-In.

Adjusts the bitmap size to the specified dimensions. The image is not resized to fit; it is cropped or filled with fillcolor pixels to accommodate the new size.

**Parameters:****int width**

The new horizontal size for the bitmap.

**int height**

The new vertical size for the bitmap.

**int fillindex**

If the bitmap's new size is bigger than its current size, this is the color used to fill the new pixels.

**Return Value:**

Nonzero if the image was cropped; otherwise 0.

**Prototype:**

**bVirtual int CopyCrop(Bitmap \*from, BMM\_Color\_64 fillcolor);**

**Remarks:**

Implemented by the Plug-In.

Copies the specified bitmap to this storage. The image is cropped to fit.

**Parameters:**

**Bitmap \*from**

The bitmap to copy to this bitmap.

**BMM\_Color\_64 fillcolor**

The color to use if the source image is smaller than the destination image.

**Return Value:**

Nonzero if the copy/crop was performed; otherwise zero.

**Prototype:**

**bVirtual int CopyCrop(Bitmap \*from, BMM\_Color\_fl fillcolor);**

**Remarks:**

Implemented by the Plug-In.

Copies the specified bitmap to this storage. The image is cropped to fit.

**Parameters:**

**Bitmap \*from**

The bitmap to copy to this bitmap.

**BMM\_Color\_fl fillcolor**

The color to use if the source image is smaller than the destination image.

**Return Value:**

Nonzero if the copy/crop was performed; otherwise zero.

**Prototype:**

**bVirtual int CopyScaleLow(Bitmap \*from);**

**Remarks:**

Implemented by the System.

This method copies the specified bitmap to this storage. The source bitmap is scaled to fit using a lower quality but faster algorithm than

**CopyScaleHigh()**. This is an internal function implemented within BMM.DLL for copying bitmaps back and forth. If a developer creates new storage type, they will automatically get these copy functions as these are implemented in the base class.

**Parameters:**

**Bitmap \*from**

The bitmap to copy to this bitmap.

**Return Value:**

Nonzero if the copy/scale was performed; otherwise zero.

**Prototype:**

```
bVirtual int CopyScaleHigh(Bitmap *from, HWND hWnd,  
BMM_Color_64 **buf = NULL, int w=0, int h=0);
```

**Remarks:**

Implemented by the System.

This method copies the specified bitmap to this storage. The source bitmap is scaled to fit using a higher quality but slower algorithm than

**CopyScaleLow()**. This is an internal function implemented within BMM.DLL for copying bitmaps back and forth. If a developer creates new storage type, they will automatically get these copy functions as these are implemented in the base class.

**Prototype:**

```
bVirtual int CopyScaleHigh(Bitmap *from, HWND hWnd,  
BMM_Color_fl **buf = NULL, int w=0, int h=0);
```

**Remarks:**

Implemented by the System.

This method copies the specified bitmap to this storage. The source bitmap is scaled to fit using a higher quality but slower algorithm than

**CopyScaleLow()**. This is an internal function implemented within BMM.DLL for copying bitmaps back and forth. If a developer creates new storage type, they will automatically get these copy functions as these are implemented in the base class.

**Prototype:**

```
bVirtual int CopyImage(Bitmap *from,int  
operation,BMM_Color_64 fillcolor, BitmapInfo *bi = NULL);
```

**Remarks:**

Implemented by the Plug-In.

Copies the specified bitmap to this storage. The image is cropped or resized as specified.

**Parameters:****Bitmap \*from**

The source bitmap.

**int operation**

The type of copy to perform:

**COPY\_IMAGE\_CROP**

Copy image to current map size using cropping if necessary.

**COPY\_IMAGE\_RESIZE\_LO\_QUALITY**

Resize the source image to the destination map size (draft quality).

**COPY\_IMAGE\_RESIZE\_HI\_QUALITY**

Resize source image to the destination map size (final quality).

**COPY\_IMAGE\_USE\_CUSTOM**

Resize based on the Image Input Options (BitmapInfo \*).

**BMM\_Color\_64 fillcolor**

Vacant areas of the bitmap are filled with fillcolor pixels if the operation specified is **COPY\_IMAGE\_CROP** and one of the source bitmap dimensions is less than the size of this bitmap.

**BitmapInfo \*bi = NULL**

When using custom options (resize to fit, positioning, etc.) this is how the flags are passed down to the Bitmap Manager. This is an optional argument -- for simple copy operations, **\*bi** can default to NULL. If present, the code checks the option flags and acts accordingly.

**Return Value:**

Nonzero if the copy was performed; otherwise 0.

**Prototype:**

```
bVirtual int CopyImage(Bitmap *from,int  
operation,BMM_Color_fl fillcolor, BitmapInfo *bi = NULL);
```

**Remarks:**

Implemented by the Plug-In.

Copies the specified bitmap to this storage.

**Parameters:**

**Bitmap \*from**

The source bitmap.

**int operation**

The type of copy to perform:

**COPY\_IMAGE\_CROP**

Copy image to current map size using cropping if necessary.

**COPY\_IMAGE\_RESIZE\_LO\_QUALITY**

Resize the source image to the destination map size (draft quality).

**COPY\_IMAGE\_RESIZE\_HI\_QUALITY**

Resize source image to the destination map size (final quality).

**COPY\_IMAGE\_USE\_CUSTOM**

Resize based on the Image Input Options (BitmapInfo \*).

**BMM\_Color\_fl fillcolor**

Vacant areas of the bitmap are filled with fillcolor pixels if the operation specified is **COPY\_IMAGE\_CROP** and one of the source bitmap dimensions is less than the size of this bitmap.

**BitmapInfo \*bi = NULL**

When using custom options (resize to fit, positioning, etc.) this is how the flags are passed down to the Bitmap Manager. This is an optional argument -- for simple copy operations, **\*bi** can default to NULL. If present, the code checks the option flags and acts accordingly.

**Return Value:**

Nonzero if the copy was performed; otherwise 0.

**Prototype:**

**bVirtual int CopyImage(Bitmap \*from,int operation,int fillindex);**

**Remarks:**

Implemented by the Plug-In.

Copies the specified bitmap to this storage.

**Parameters:**

## **Bitmap \*from**

The source bitmap.

## **int operation**

The type of copy to perform:

### **COPY\_IMAGE\_CROP**

Copy image to current map size using cropping if necessary.

### **COPY\_IMAGE\_RESIZE\_LO\_QUALITY**

Resize the source image to the destination map size (draft quality).

### **COPY\_IMAGE\_RESIZE\_HI\_QUALITY**

Resize source image to the destination map size (final quality).

### **COPY\_IMAGE\_USE\_CUSTOM**

Resize based on the Image Input Options (BitmapInfo \*).

## **int fillindex**

Vacant areas of the bitmap are filled with fillcolor pixels if the operation specified is **COPY\_IMAGE\_CROP** and one of the source bitmap dimensions is less than the size of this bitmap.

## **Return Value:**

Nonzero if the copy was performed; otherwise 0.

## **Prototype:**

```
bVirtual int GetFiltered(float u,float v,float du,float dv,BMM_Color_64 *ptr);
```

## **Remarks:**

Implemented by the Plug-In.

This method uses summed area table or pyramidal filtering to compute an averaged color over a specified area.

## **Parameters:**

### **float u, float v**

The location in the bitmap to filter. These values go from 0.0 to 1.0 across the size of the bitmap.

### **float du, float dv**

The size of the rectangle to sample. These values go from 0.0 to 1.0 across the size of the bitmap.

**BMM\_Color\_fl \*ptr**

The result is returned here - the average over the specified area.

## Class AColor

See Also: [Class Color](#), [Structure BMM\\_Color\\_24](#), [Structure BMM\\_Color\\_32](#), [Structure BMM\\_Color\\_48](#), [Structure BMM\\_Color\\_64](#), [Structure BMM\\_Color\\_fl](#), [Structure RealPixel](#).

class Acolor

### Description:

This class represents color as four floating point values: **r**, **g**, **b**, and an alpha channel **a**. All methods of this class are implemented by the system.

Also note the following typedef:

```
typedef AColor RGBA;
```

### Data Members:

public:

```
float r,g,b,a;
```

These values are in the range 0.0 to 1.0.

### Methods:

#### Prototype:

```
AColor()
```

#### Remarks:

Constructor. The resulting object should be initialized with one of the initialization methods.

#### Prototype:

```
AColor(float R, float G, float B, float A=1.0f)
```

#### Remarks:

Constructor. Initializes the AColor to the RGBA color values passed.

#### Prototype:

```
AColor(double R, double G, double B, double A=1.0)
```

#### Remarks:

Constructor. Initializes the AColor to the RGBA color values passed (cast to

float).

**Prototype:**

**AColor(int R, int G, int B, int A=0)**

**Remarks:**

Constructor. Initializes the AColor to the RGBA color values passed (cast to float).

**Prototype:**

**AColor(const AColor& c)**

**Remarks:**

Constructor. Initializes the AColor to the AColor passed.

**Prototype:**

**AColor(const Color& c, float alph=1.0f)**

**Remarks:**

Constructor. Initializes the AColor to the Color passed, optionally specifying an alpha value.

**Prototype:**

**AColor(DWORD rgb, float alph=1.0f);**

**Remarks:**

Constructor. Initializes the color to the Windows RGB value, optionally specifying an alpha value.

**Prototype:**

**AColor(float af[4])**

**Remarks:**

Constructor. Initializes the color to the value passed.

**Parameters:**

**float af[3]**

Specifies the color. r=af[0], g=af[1], b=af[2], a=af[3].

**Prototype:**

**AColor(const BMM\_Color\_24& c);**

**Remarks:**

This method is available in release 4.0 and later only.

Constructor. Initializes this AColor from the 24 bit color value passed.

**Parameters:**

**const BMM\_Color\_24& c**

The 24 bit color to initialize from.

**Prototype:**

**AColor(const BMM\_Color\_32& c);**

**Remarks:**

This method is available in release 4.0 and later only.

Constructor. Initializes this AColor from the 32 bit color value passed.

**Parameters:**

**const BMM\_Color\_32& c**

The 32 bit color to initialize from.

**Prototype:**

**AColor(const BMM\_Color\_48& c);**

**Remarks:**

This method is available in release 4.0 and later only.

Constructor. Initializes this AColor from the 48 bit color value passed.

**Parameters:**

**const BMM\_Color\_48& c**

The 48 bit color to initialize from.

**Prototype:**

**AColor(const BMM\_Color\_64& c);**

**Remarks:**

This method is available in release 4.0 and later only.

Constructor. Initializes this AColor from the 64 bit color value passed.

**Parameters:**

**const BMM\_Color\_64& c**

The 64 bit color to initialize from.

**Prototype:**

**AColor(const BMM\_Color\_fl& c);**

**Remarks:**

This method is available in release 4.0 and later only.

Constructor. Initializes this AColor from the floating point color passed.

**Parameters:**

**const BMM\_Color\_fl& c**

The floating point color to initialize from. No conversion or scaling is done.

**Prototype:**

**void Black()**

**Remarks:**

Sets this AColor to black.  $r = g = b = 0.0f$ ;  $a = 1.0f$

**Prototype:**

**void White()**

**Remarks:**

Sets the AColor to white.  $r = g = b = a = 1.0f$

**Prototype:**

**void ClampMin();**

**Remarks:**

Makes all the components of the AColor  $\geq 0.0$

**Prototype:**

**void ClampMax();**

**Remarks:**

Makes all the components of the AColor  $\leq 1.0$

**Prototype:**

**void ClampMinMax();**

**Remarks:**

Makes all the components of the AColor fall in the range 0.0 to 1.0.

**Prototype:**

**float& operator[](int i)  
const float& operator[](int i) const**

**Remarks:**

Access operators.

**Parameters:**

**int i**

The index of the component to return.

**Return Value:**

0=r, 1=g, 2=b, 3=a.

**Prototype:**

**operator float\*();**

**Remarks:**

Conversion function.

Returns a pointer to the AColor.

**Prototype:**

**operator DWORD()**

**Remarks:**

Convert the AColor to a Windows RGB color. See [COLORREF](#).

**Return Value:**

A Windows RGB color.

**Prototype:**

**operator Point3();**

**Remarks:**

Convert the AColor to a Point3.

**Return Value:**

A Point3. x=r, y=g, z=b.

**Prototype:**

**operator BMM\_Color\_24();**

**Remarks:**

This method is available in release 4.0 and later only.

Converts this AColor to the BMM\_Color\_24 format.

**Prototype:**

**operator BMM\_Color\_32();**

**Remarks:**

This method is available in release 4.0 and later only.

Converts this AColor to the BMM\_Color\_32 format.

**Prototype:**

**operator BMM\_Color\_48();**

**Remarks:**

This method is available in release 4.0 and later only.

Converts this AColor to the BMM\_Color\_48 format.

**Prototype:**

**operator BMM\_Color\_64();**

**Remarks:**

This method is available in release 4.0 and later only.

Converts this AColor to the BMM\_Color\_64 format.

**Prototype:**

**operator BMM\_Color\_fl();**

**Remarks:**

This method is available in release 4.0 and later only.  
Converts this AColor to the BMM\_Color\_fl format.

**Prototype:**

**AColor operator-() const**

**Remarks:**

Unary - operator.

**Return Value:**

The Color with the components negated, i.e.  
{ return(AColor(-r,-g,-b, -a)); }

**Prototype:**

**AColor operator+() const**

**Remarks:**

Unary + operator.

**Return Value:**

The AColor itself.

**Prototype:**

**inline AColor& operator-=(const AColor&);**

**Remarks:**

Subtracts an AColor from this AColor.

**Return Value:**

A Color that is the difference between two Colors.

**Prototype:**

**inline AColor& operator+=(const AColor&);**

**Remarks:**

Adds an AColor to this AColor.

**Return Value:**

An AColor that is the sum of two AColors.

**Prototype:**

**inline AColor& operator\*=(float);**

**Remarks:**

Multiplies the components of this AColor by a float.

**Return Value:**

An AColor multiplied by a float.

**Prototype:**

**inline AColor& operator/=(float);**

**Remarks:**

Divides the components of this AColor by a float.

**Return Value:**

An AColor divided by a float.

**Prototype:**

**inline AColor& operator\*=(const AColor&);**

**Remarks:**

Performs element-by-element multiplying between two AColors.

**Return Value:**

This AColor element-by-element multiplied by another AColor.

**Prototype:**

**int operator==(const AColor& p) const**

**Remarks:**

Test for equality between two AColors.

**Return Value:**

Nonzero if the AColors are equal; otherwise 0.

**Prototype:**

**int operator!=(const AColor& p) const**

**Remarks:**

Tests for inequality between two AColors.

**Return Value:**

Nonzero if the AColors are not equal; otherwise 0.

**Prototype:**

**inline AColor operator-(const AColor&) const;**

**Remarks:**

Subtracts an AColor from an AColor.

**Return Value:**

An AColor that is the difference between two AColors.

**Prototype:**

**inline AColor operator+(const AColor&) const;**

**Remarks:**

Adds an AColor to an AColor.

**Return Value:**

An AColor that is the difference between two AColors.

**Prototype:**

**inline AColor operator/(const AColor&) const;**

**Remarks:**

Divides an AColor by an AColor.

**Return Value:**

An AColor divided by an AColor. r/r, g/g, b/b, a/a.

**Prototype:**

**inline AColor operator\*(const AColor&) const;**

**Remarks:**

Multiplies an AColor by an AColor.

**Return Value:**

An AColor multiplied by an AColor. r\*r, g\*g, b\*b, a\*a.

**Prototype:**

**inline AColor operator^(const AColor&) const;**

**Remarks:**

Cross product of two AColors.

**Return Value:**

An AColor that is the cross product of two AColors.

**Prototype:**

**int MaxComponent(const Color&)**

**Remarks:**

Returns the index of the component with the maximum absolute value.

**Parameters:**

**const Color&**

The color to check.

**Return Value:**

The index of the component with the maximum absolute value. r=0, g=1, b=2, a=3.

**Prototype:**

**int MinComponent(const Color&)**

**Remarks:**

Returns the index of the component with the minimum absolute value.

**Parameters:**

**const Color&**

The color to check.

**Return Value:**

The index of the component with the minimum absolute value. r=0, g=1, b=2, a=3.

**Prototype:**

**inline AColor operator\*(float f, const AColor& a)**

**inline AColor operator\*(const AColor& a, float f)**

**Remarks:**

Multiplies each component of an AColor by a float.

**Return Value:**

An AColor with each component multiplied by a float.

**Prototype:**

**inline AColor CompOver(const AColor &fg, const AColor& bg)**

**Remarks:**

Composite **fg** over **bg**, assuming associated alpha, i.e. pre-multiplied alpha for both **fg** and **bg**

This is: **fg + (1.0f-fg.a)\*bg**

**Parameters:**

**const AColor &fg**

Specifies the foreground color to composite.

**const AColor& bg**

Specifies the background color to composite over.

**Return Value:**

The resulting AColor.

## Class StdCubic

See Also: [Class Texmap](#).

class StdCubic : public Texmap

### Description:

This class provides access to the parameters of the standard 3ds max Reflect/Refract texture. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

**virtual void SetSize(int n, TimeValue t)=0;**

#### Remarks:

Sets the map size parameter.

#### Parameters:

**int n**

The size in pixels.

**TimeValue t**

The time to set the value.

#### Prototype:

**virtual void SetDoNth(BOOL onoff)=0;**

#### Remarks:

Sets the 'Every Nth Frame' or 'First Frame Only' toggle.

#### Parameters:

**BOOL onoff**

TRUE for 'Every Nth Frame'; FALSE for 'First Frame Only'.

#### Prototype:

**virtual void SetNth(int n)=0;**

#### Remarks:

Sets the 'Nth Frame' parameter to the specified value.

#### Parameters:

**int n**

The Nth Frame setting.

**Prototype:**

**virtual void SetApplyBlur(BOOL onoff)=0;**

**Remarks:**

Sets or clears the 'Apply blur' checkbox.

**Parameters:**

**BOOL onoff**

TRUE for on; FALSE for off.

**Prototype:**

**virtual void SetBlur(float b, TimeValue t)=0;**

**Remarks:**

Sets the blur setting to the specified value at the specified time.

**Parameters:**

**float b**

The value to set.

**TimeValue t**

The time to set the value.

**Prototype:**

**virtual void SetBlurOffset(float b, TimeValue t)=0;**

**Remarks:**

Sets the blur offset setting to the specified value at the specified time.

**Parameters:**

**float b**

The value to set.

**TimeValue t**

The time to set the value.

**Prototype:**

**virtual void UseHighDynamicRange(BOOL onoff)=0;**

**Remarks:**

This method is available in release 4.0 and later only.

Sets if the reflect / refract texture uses high dynamic range bitmaps or not. See [Working With Bitmaps](#) for details on high dynamic range bitmaps.

**Parameters:**

**BOOL onoff**

Pass TRUE for on; FALSE for off.

**Prototype:**

**virtual int GetSize(TimeValue t)=0;**

**Remarks:**

Returns the size setting at the specified time.

**Parameters:**

**TimeValue t**

The time to retrieve the value.

**Prototype:**

**virtual BOOL GetDoNth()=0;**

**Remarks:**

Returns the state of the 'Every Nth Frame' or 'First Frame Only' toggle.

**Return Value:**

**BOOL onoff**

TRUE is 'Every Nth Frame'; FALSE is 'First Frame Only'.

**Prototype:**

**virtual int GetNth()=0;**

**Remarks:**

Returns the Nth Frame setting.

**Prototype:**

**virtual BOOL GetApplyBlur()=0;**

**Remarks:**

Returns the state of the 'Apply blur' checkbox.

**Return Value:**

TRUE is on; FALSE is off.

**Prototype:**

**virtual float GetBlur(TimeValue t)=0;**

**Remarks:**

Returns the blur setting at the specified time.

**Parameters:**

**TimeValue t**

The time to retrieve the value.

**Prototype:**

**virtual float GetBlurOffset(TimeValue t)=0;**

**Remarks:**

Returns the blur offset setting at the specified time.

**Parameters:**

**TimeValue t**

The time to retrieve the value.

## Class StdMirror

See Also: [Class Texmap](#).

```
class StdMirror : public Texmap
```

### Description:

This class provides access to the 3ds max Flat Mirror material. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

```
virtual void SetDoNth(BOOL onoff)=0;
```

#### Remarks:

This method determines if 'Every Nth Frame' or 'First Frame Only' is used.

#### Parameters:

**BOOL onoff**

TRUE for Every Nth Frame; FALSE for First Frame Only.

#### Prototype:

```
virtual void SetNth(int n)=0;
```

#### Remarks:

This methods controls the 'Nth Frame' value.

#### Parameters:

**int n**

The number of frames.

#### Prototype:

```
virtual void SetApplyBlur(BOOL onoff)=0;
```

#### Remarks:

This method controls the 'Apply Blur' check box setting.

#### Parameters:

**BOOL onoff**

TRUE to toggle on; FALSE to toggle off.

**Prototype:**

**virtual void SetBlur(float b, TimeValue t)=0;**

**Remarks:**

Sets the specified blur value at the specified time.

**Parameters:**

**float b**

The blur value to set in the range 0.0 to 100.0

**TimeValue t**

The time at which to set the blur value.

**Prototype:**

**virtual void UseHighDynamicRange(BOOL onoff)=0;**

**Remarks:**

This method is available in release 4.0 and later only.

Sets if the mirror texture uses high dynamic range bitmaps or not. See [Working With Bitmaps](#) for details on high dynamic range bitmaps.

**Parameters:**

**BOOL onoff**

Pass TRUE for on; FALSE for off.

**Prototype:**

**virtual BOOL GetDoNth()=0;**

**Remarks:**

Determines if 'Every Nth Frame' or 'First Frame Only' is used.

**Return Value:**

TRUE if Every Nth Frame is in use; FALSE if First Frame Only is in use.

**Prototype:**

**virtual int GetNth()=0;**

**Remarks:**

Returns the Nth Frame setting.

**Prototype:**

**virtual BOOL GetApplyBlur()=0;**

**Remarks:**

Returns TRUE if the Apply Blur check box is on; otherwise FALSE.

**Prototype:**

**virtual float GetBlur(TimeValue t)=0;**

**Remarks:**

Returns the blur setting at the specified time.

**Parameters:**

**TimeValue t**

The time to retrieve the blur setting.

## Structure BMM\_Color\_24

See Also: [Class Bitmap](#), [Class BitmapStorage](#), [Class BitmapManager](#).

```
typedef struct {  
    BYTE r,g,b;  
    24 bit color: 8 bits each for Red, Green, and Blue.  
} BMM_Color_24;
```

## Structure BMM\_Color\_32

See Also: [Class Bitmap](#), [Class BitmapStorage](#), [Class BitmapManager](#).

```
typedef struct {
```

```
    BYTE r,g,b,a;
```

```
    32 bit color: 8 bits each for Red, Green, Blue, and Alpha.
```

```
} BMM_Color_32;
```

## Structure BMM\_Color\_48

See Also: [Class Bitmap](#), [Class BitmapStorage](#), [Class BitmapManager](#).

```
typedef struct {
```

```
    WORD r,g,b;
```

```
    48 bit color: 16 bits each for Red, Green, and Blue.
```

```
} BMM_Color_48;
```

## Structure BMM\_Color\_64

See Also: [Class Bitmap](#), [Class BitmapStorage](#), [Class BitmapManager](#).

```
typedef struct {
```

```
    WORD r,g,b,a;
```

```
    64 bit color: 16 bits each for Red, Green, Blue, and Alpha.
```

```
} BMM_Color_64;
```

## Structure RealPixel

See Also: [Class Color](#).

```
struct RealPixel
```

### Description:

This structure describes color in terms of **r, g, b, e**.

This is taken from GraphicsGems II, "Real Pixels" by Greg Ward of Lawrence Berkeley Laboratory. What it means is this: "**e**" is the base 2 exponent of the maximum RGB component, and **r,g,b** are the mantissas of R,G,and B, relative to this exponent. It essentially compresses the essential data of a floating point color into 32 bits.

Quoting from Graphics Gems II:

"It appears that this format favors the largest primary value at the expense of accuracy in the other two primaries. This is true, but it also is true that the largest value dominates the displayed

pixel color so that the other primaries become less noticeable"

One GBuffer option is to write out the image in RealPixel format, storing NON CLAMPED colors. This could be used by a Video Post process to detect those areas of the image where the intensity goes beyond 1 and apply halo and flare effects much more realistically.

There are functions for converting between floating point and RealPixel format:

**RealPixel MakeRealPixel(float r, float g, float b);**

**ExpandRealPixel(RealPixel &rp, float& r, float &g, float& b);**

as well as methods in RealPixel and Color.

### Structure Data:

**unsigned char e;**

The base 2 exponent of the maximum RGB component.

**unsigned char r,g,b;**

The mantissas of R,G,and B, relative to this exponent.

### Operators:

### Prototype:

**operator Color();**

**Remarks:**

Converts the RealPixel format to the Color format.

## List of Copy Image Operations

### **COPY\_IMAGE\_CROP**

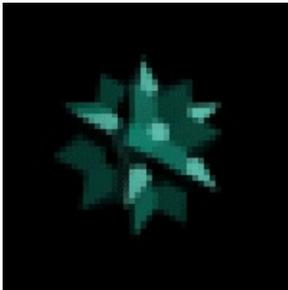

Copy image to current map size using cropping if necessary.

### **COPY\_IMAGE\_RESIZE\_LO\_QUALITY**

Resize the source image to the destination map size (draft quality).

This is a resize from 50x50 to 150x150 using

### **COPY\_IMAGE\_RESIZE\_LO\_QUALITY**

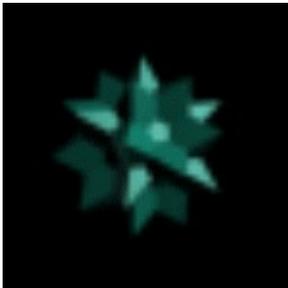

### **COPY\_IMAGE\_RESIZE\_HI\_QUALITY**

Resize source image to the destination map size (final quality).

This is a resize from 50x50 to 150x150 using

### **COPY\_IMAGE\_RESIZE\_HI\_QUALITY**

### **COPY\_IMAGE\_USE\_CUSTOM**

Resize based on the Image Input Options (BitmapInfo pointer).

## Pixel Storage Types

The following structures are defined for storing pixel data:

```
typedef struct {  
    BYTE r,g,b;  
} BMM_Color_24;
```

This is used for storing 24 bit color: 8 bits each for Red, Green, and Blue.

```
typedef struct {  
    BYTE r,g,b,a;  
} BMM_Color_32;
```

This is used for storing 32 bit color: 8 bits each for Red, Green, Blue, and Alpha.

```
typedef struct {  
    WORD r,g,b;  
} BMM_Color_48;
```

This is used for storing 48 bit color: 16 bits each for Red, Green, and Blue.

```
typedef struct {  
    WORD r,g,b,a;  
} BMM_Color_64;
```

This is used for storing 64 bit color: 16 bits each for Red, Green, Blue, and Alpha.

## Class PixelBuf

See Also: [Template Class PixelBufT](#).

class PixelBuf

### Description:

This class lets you set up a buffer for pixels that will automatically deallocate the buffer when it goes out of scope. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

**inline PixelBuf(int width)**

#### Remarks:

Constructor. This allocates the pixel buffer using the specified width.

#### Parameters:

**int width**

The number of pixels to allocate for the buffer.

#### Prototype:

**inline ~PixelBuf();**

#### Remarks:

Destructor. The pixel buffer is deallocated.

#### Prototype:

**inline BMM\_Color\_64 \*Ptr();**

#### Remarks:

Returns the address of the pixel buffer.

#### Prototype:

**int Fill(int start, int count, BMM\_Color\_64 color)**

#### Remarks:

Fills the specified portion of the pixel buffer with the specified color.

**Parameters:**

**int start**

The start location for the fill.

**int count**

The number of pixels to fill.

**T color**

The color to use as the fill.

**Return Value:**

Nonzero if filled; otherwise 0.

## Template Class PixelBufT

See Also: [Structure BMM\\_Color\\_24](#), [Structure BMM\\_Color\\_32](#), [Structure BMM\\_Color\\_48](#), [Structure BMM\\_Color\\_64](#).

```
template <Structure T> Structure PixelBufT
```

### Description:

These templated classes allow you to set up a buffer for pixels that will automatically deallocate the buffer when they goes out of scope. All methods of this class are implemented by the system.

Note the following typedefs set up for the standard pixel storage formats.

```
typedef PixelBufT<UBYTE> PixelBuf8;  
typedef PixelBufT<USHORT> PixelBuf16;  
typedef PixelBufT<BMM_Color_24> PixelBuf24;  
typedef PixelBufT<BMM_Color_32> PixelBuf32;  
typedef PixelBufT<BMM_Color_48> PixelBuf48;  
typedef PixelBufT<BMM_Color_64> PixelBuf64;
```

### Methods:

#### Prototype:

```
inline PixelBufT(int width);
```

#### Remarks:

Constructor. This allocates the pixel buffer using the specified width.

#### Parameters:

**int width**

The number of pixels to allocate for the buffer.

#### Prototype:

```
inline ~PixelBufT();
```

#### Remarks:

Destructor. The pixel buffer is deallocated.

#### Prototype:

**inline T\* Ptr();**

**Remarks:**

Returns the address of the pixel buffer.

**Prototype:**

**int Fill(int start, int count, T color)**

**Remarks:**

Fills the specified portion of the pixel buffer with the specified color.

**Parameters:**

**int start**

The start location for the fill.

**int count**

The number of pixels to fill.

**T color**

The color to use as the fill.

**Return Value:**

Nonzero if filled; otherwise 0.

**Operators:**

**Prototype:**

**inline T& operator[](int i);**

**Remarks:**

Array operator. This allows access to the pixel buffer using the [ ] operator.

**Parameters:**

**int i**

The index to access.

## List of Bitmap Filter Types

Specifies the type of filtering to perform. One of the following values:

### **BMM\_FILTER\_NONE**

Specifies no filtering should be performed.

### **BMM\_FILTER\_SUM**

Specifies summed area filtering.

### **BMM\_FILTER\_PYRAMID**

Specifies pyramidal filtering.

### **BMM\_FILTER\_DUMMY**

This is no longer used.

The Pyramidal and Summed Area options provide two methods of pixel averaging that antialias the bitmaps in mapped materials.

Both methods require approximately the same rendering time. Summed-area filtering generally yields superior results but requires much more memory.

Pyramidal filtering requires the program to allocate memory equal to approximately 133% of the size of the bitmap. By comparison, summed-area filtering requires the program to allocate approximately 400% of the size of the bitmap.

Use summed-area filtering only for smaller bitmaps, and avoid using any more such bitmaps in a scene than necessary.

Pyramidal filtering is quite adequate for most purposes. However, because it applies filtering as a function of distance, irregular antialiasing may occur on detailed texture maps that are applied to a plane receding into the distance.

The effect of pyramidal filtering on extreme perspectives such as this is even more noticeable in animations, where portions of the texture map appear to "swim."

## List of Video Color Check Utilities

These functions may be used to correct a pixel with RGB values that will give "unsafe" values of chrominance signal or composite signal amplitude when encoded into an NTSC or PAL color signal. This happens for certain high-intensity high-saturation colors that are rare in real scenes, but can easily be present in computer generated images.

### Prototype:

```
void BuildHotTable(int video_type = VID_NTSC);
```

### Remarks:

Implemented by the System.

A developer will never to need to call this method. It is maintained by MAX. The table that is stored depends only on the state of the NTSC/PAL switch and 3ds max updates it whenever this switch is changed, and on startup.

### Parameters:

```
int video_type = VID_NTSC
```

The type of color checking to perform. One of the following values:

```
VID_NTSC
```

```
VID_PAL
```

### Prototype:

```
int HotLimit(Color48 *thepix, int method = HOT_SCALE_LUM);
```

### Remarks:

Implemented by the System.

This method is called to perform the video color check for each pixel.

### Parameters:

```
Color48 *thepix
```

The pixel to check and correct if necessary.

```
int method = HOT_SCALE_LUM
```

One of the following values:

```
HOT_FLAG
```

Flag the pixel as black.

**HOT\_SCALE\_LUM**

Correct by scaling the luminance.

**HOT\_SCALE\_SAT**

Correct by scaling the saturation.

**Return Value:**

Nonzero if the color was corrected; otherwise if no problems then zero.

## Class SetXFormPacket

See Also: [Class Control](#), [Class Matrix3](#), [Class Quat](#), [Class AngAxis](#), [Class Point3](#).

class SetXFormPacket

### Description:

This class is used to allow a transform (**Matrix3**) controller to know that it is being specifically moved, rotated, or scaled.

When **SetValue()** is called on a controller, the **val** pointer is passed in for a certain data type. For a transform (**Matrix3**) controller **SetValue()** passes in a pointer to an instance of this. This provides higher level information to the transform controller than what is provided by passing a matrix. For example, if rotation is taking place, the **XFORM\_ROTATE** command would be used. In this way the PRS transform controller would not make position or scale keys since it knows only rotation is taking place. Typically one of the different constructors is used depending on the command needed. All methods of this class are implemented by the system.

### Data Members:

public:

#### **SetXFormCommand command;**

The command. The transform controller takes the **val** pointer and casts it to an instance of this class and looks at this data member to see which operation is being performed.

One of the following values:

#### **XFORM\_MOVE**

The move command. An incremental move is being applied to the matrix.

#### **XFORM\_ROTATE**

The rotate command. An incremental rotation is being applied to the matrix.

#### **XFORM\_SCALE**

The scale command. An incremental scaling is being applied to the matrix.

#### **XFORM\_SET**

To just set the matrix without telling the controller any other higher level information this command may be used. This just sets the value of the

matrix (it is not incremental). Any time a node modifies a **Matrix3** controller, it will set the method to get **CTRL\_RELATIVE**, and the packet command is set to **XFORM\_SET**.

**Matrix3 tmParent;**

The parent matrix.

**Matrix3 tmAxis;**

This usually represents the coordinate system one is moving, rotating, or scaling in. However, if the **command** is **XFORM\_SET**, then **tmAxis** is the actual matrix being set.

**Point3 p;**

If the **command** is **XFORM\_MOVE** or **XFORM\_SCALE**, then this contains the amount of the move or scale.

**Quat q;**

If the command is **XFORM\_ROTATE** then this contains the amount of the rotation.

**AngAxis aa;**

If the command is **XFORM\_ROTATE** this will also contain the amount of the rotation. This form can represent multiple revolutions however (as opposed to **Quat q**).

**BOOL localOrigin;**

Indicates the local axis is being used. If TRUE it is; otherwise it is not. If the rotation or scaling is occurring about the pivot point this is TRUE.

**Methods:**

**Prototype:**

```
SetXFormPacket(const Matrix3& mat,const Matrix3&
par=Matrix3(1))
```

**Remarks:**

Constructor. The **XFORM\_SET** command.

**Parameters:**

**const Matrix3& mat**

The **tmAxis** value.

**const Matrix3& par=Matrix3(1)**

The **tmParent** value.

**Prototype:**

**SetXFormPacket(Point3 pt, const Matrix3& par=Matrix3(1),  
const Matrix3& a=Matrix3(1))**

**Remarks:**

Constructor. The **XFORM\_MOVE** command.

**Parameters:**

**Point3 pt**

The **p** value.

**const Matrix3& par=Matrix3(1)**

The **tmParent** value.

**const Matrix3& a=Matrix3(1)**

The **tmAxis** value.

**Prototype:**

**SetXFormPacket(Quat qt, BOOL l, const Matrix3&  
par=Matrix3(1),  
const Matrix3& a=Matrix3(1))**

**Remarks:**

Constructor. The **XFORM\_ROTATE** command.

**Parameters:**

**Quat qt**

The **q** value.

**BOOL l**

The **localOrigin** value.

**const Matrix3& par=Matrix3(1)**

The **tmParent** value.

**const Matrix3& a=Matrix3(1)**

The **tmAxis** value.

**Prototype:**

**SetXFormPacket(AngAxis aA, BOOL l, const Matrix3&  
par=Matrix3(1),  
const Matrix3& a=Matrix3(1))**

**Remarks:**

Constructor. The **XFORM\_ROTATE** command.

**Parameters:**

**AngAxis aA**

The **aa** value.

**BOOL l**

The **localOrigin** value.

**const Matrix3& par=Matrix3(1)**

The **tmParent** value.

**const Matrix3& a=Matrix3(1)**

The **tmAxis** value.

**Prototype:**

**SetXFormPacket(Point3 pt, BOOL l, const Matrix3&  
par=Matrix3(1),  
const Matrix3& a=Matrix3(1))**

**Remarks:**

Constructor. The **XFORM\_SCALE** command.

**Parameters:**

**Point3 pt**

The **p** value.

**BOOL l**

The **localOrigin** value.

**const Matrix3& par=Matrix3(1)**

The **tmParent** value.

**const Matrix3& a=Matrix3(1)**

The **tmAxis** value.

**Prototype:**

**SetXFormPacket();**

**Remarks:**

Constructor. This constructor is provided in case you want to set the data members yourself.

## Class IKDeriv

See Also: [Class Control](#).

class IKDeriv

### Description:

This class provides method that a plug-in calls in its implementation of the Control method **CompDerivs()**. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

**virtual int NumEndEffectors()=0;**

#### Remarks:

This method returns the number of end effectors. There may be multiple end effectors if there is branching in the IK chain. For example if the plug-in is a controller controlling a torso there might be two end effectors - the two feet. The plug-ins implementation of **CompDerivs()** should loop through each end effector and call **DP()** and **DR()** for each end effector. Thus this method tells the plug-in how many times it needs to loop.

#### Return Value:

The number of end effectors

#### Prototype:

**virtual Point3 EndEffectorPos(int index)=0;**

#### Remarks:

If a plug-in needs to know the position of an end effector to calculate its derivative it may call this method to retrieve it. This method is used to return the position of the end effector whose index is passed.

#### Parameters:

**int index**

The index of the end effector whose position will be returned.

**Prototype:**

**virtual void DP(Point3 dp,int index)=0;**

**Remarks:**

The plug-in calls this method to specify the derivative of the position of the end effector with respect to the parameter whose index is passed.

**Parameters:****Point3 dp**

The derivative of the position of the end effector with respect to the parameter.

**int index**

The index of the end effector.

**Prototype:**

**virtual void DR(Point3 dr,int index)=0;**

**Remarks:**

Implemented by the Plug-In.

Allows the plug-in to specify the derivative of the orientation in terms of Euler angle of the end effector with respect to the parameter.

**Parameters:****Point3 dr**

The derivative of the orientation in terms of Euler angles of the end effector with respect to the parameter.

**int index**

The index of the end effector.

**Prototype:**

**virtual void NextDOF()=0;**

**Remarks:**

This method is called after a plug-in has called the above methods **DP()** and **DR()** for one of its parameters and it needs to call them again for the next parameter.

## Class IKEnumCallback

See Also: [Class Control](#).

class IKEnumCallback

### Description:

This class is for enumerating IK parameters. This callback is called once for each parameter a controller has. This callback is implemented by the system and passed into the method **EnumIKParams()** of the controller.

### Methods:

### Prototype:

```
virtual void proc(Control *c, int index)=0;
```

### Remarks:

Implemented by the System.

The plug-in calls this method once for each parameter (degree of freedom it has). It passes a pointer to itself and the index of the parameter.

### Parameters:

#### **Control \*c**

The controller itself is passed here.

#### **int index**

The index of the parameter. For example a position controller with three degrees of freedom (X, Y, Z) would call this method three times passing it and index of 0, then 1, then 2.

## Class JointParams

See Also: Class [AnimProperty](#), [Class Control](#), [Class InterpCtrlUI](#).

```
class JointParams : public AnimProperty
```

### Description:

This class handles the data storage and user interface for inverse kinematic joint parameters. The default 3ds max controllers use this data structure to store their IK information. Plug-in controllers don't have to unless they want to.

Note the following is a dialog proc for handling joint parameters that is exported for use by plug-ins.

```
BOOL CALLBACK JointParamDlgProc(HWND hWnd,UINT  
message,  
WPARAM wParam,LPARAM lParam);
```

### Data Members:

```
public:
```

```
float *min, *max;
```

Pointers to an array of floats corresponding to the number of degrees of freedom These are the From and To parameters.

```
float *damping;
```

Pointer to an array of floating point Damping parameters for each degree of freedom.

```
float scale;
```

This is a scale factor applied to the values in the spinner edit fields. This is to make them more sensible to the user. For example a percentage that is stored internally as 0.0 to 1.0 could be presented to the user as 0.0 to 100.0 by using a scale of 100.

```
DWORD flags;
```

One or more of the following values:

```
JNT_XACTIVE
```

```
JNT_YACTIVE
```

```
JNT_ZACTIVE
```

```
JNT_XLIMITED
```

```
JNT_YLIMITED
```

**JNT\_ZLIMITED**  
**JNT\_XEASE**  
**JNT\_YEASE**  
**JNT\_ZEASE**  
**JNT\_LIMITEXACT**  
**JNT\_ROLLOPEN**  
**JNT\_ROT**  
**JNT\_POS**

**int dofs;**

The number of degrees of freedom the plug-in has.

**Operators:**

**Prototype:**

**JointParams& operator=(JointParams& j);**

**Remarks:**

Assignment operator.

**Methods:**

**Prototype:**

**JointParams(DWORD type=JNT\_POS,int dofs=3,float s=1.0f);**

**Remarks:**

Constructor. The data members are initialized to the values passed.

**Prototype:**

**JointParams(const JointParams &j);**

**Remarks:**

Constructor. The data members are initialized to those of the JointParam passed.

**Prototype:**

**~JointParams();**

**Remarks:**

Destructor.

**Prototype:**

**DWORD ID();**

**Remarks:**

Implemented by the System.

Returns the ID of the AnimProperty - **PROPID\_JOINTPARAMS**

**Prototype:**

**BOOL IsDefault();**

**Remarks:**

Implemented by the System.

Returns TRUE if the current state of the parameters are the defaults.

**Prototype:**

**IOResult Save(ISave \*isave);**

**Remarks:**

Implemented by the System.

This method may be called to save the joint properties to the 3ds max file.

**Parameters:**

**ISave \*isave**

This pointer may be used to call methods to write data to disk. See [Class ISave](#).

**Return Value:**

One of the following values:

**IO\_OK** - The result was acceptable - no errors.

**IO\_ERROR** - This is returned if an error occurred.

**Prototype:**

**IOResult Load(ILoad \*iload);**

**Remarks:**

Implemented by the System.

This method is called to load the joint properties from the 3ds max file.

**Parameters:**

**ILoad \*iLoad**

This pointer may be used to call methods to load data from disk. See [Class ILoad](#).

**Return Value:**

One of the following values:

**IO\_OK** - The result was acceptable - no errors.

**IO\_ERROR** - This is returned if an error occurred.

**Prototype:**

**float ConstrainInc(int index,float v,float delta);**

**Remarks:**

Implemented by the System.

This method applies constraints to the given delta based on parameters and the current value v. It uses the current min/max limits to constrain the result:  $v+\text{delta}$  so that  $v+\text{delta} < \text{max}$  and  $v+\text{delta} > \text{min}$ . It returns a new delta such that the previous will both be TRUE. If ease is turned on, then the values will be slowed down as they approach the limits. It also applies the damping if turned on.

**Parameters:**

**int index**

This is the index of the parameter. For example on a position controller the index could be 0 (x), 1 (y), or 2 (z).

**float v**

The current value of the parameter.

**float delta**

The increment to apply.

**Return Value:**

A new delta value. Usually it will return **delta**, but if the value was constrained, then the value may be smaller or larger.

**Prototype:**

## **BOOL Active(int i);**

### **Remarks:**

Implemented by the System.

Returns TRUE if the specified joint is active; otherwise FALSE.

### **Parameters:**

**int i**

One of the following values:

**0** = X

**1** = Y

**2** = Z

### **Return Value:**

TRUE if the joint is active; otherwise FALSE.

### **Prototype:**

**BOOL Limited(int i)**

### **Remarks:**

Implemented by the System.

Returns TRUE if the joint is limited; otherwise FALSE.

### **Parameters:**

**int i**

One of the following values:

**0** = X

**1** = Y

**2** = Z

### **Return Value:**

TRUE if the joint is limited; otherwise FALSE.

### **Prototype:**

**BOOL Ease(int i)**

### **Remarks:**

Implemented by the System.

Returns TRUE if the joint has the Ease property set; otherwise FALSE.

**Parameters:**

**int i**

One of the following values:

**0** = X

**1** = Y

**2** = Z

**Return Value:**

TRUE if the joint has the Ease property set; otherwise FALSE.

**Prototype:**

**DWORD Type()**

**Remarks:**

Implemented by the System.

Returns the type of joint, sliding or rotation. This will either be **JNT\_POS** for sliding joints or **JNT\_ROT** for rotational joints.

**Prototype:**

**BOOL RollupOpen()**

**Remarks:**

Implemented by the System.

Returns TRUE if the rollup page is open; otherwise FALSE.

**Prototype:**

**void SetActive(int i,BOOL s)**

**Remarks:**

Implemented by the System.

Sets the specified joint to the specified active or inactive state.

**Parameters:**

**int i**

One of the following values:

**0** = X

**1** = Y

**2 = Z**

**BOOL s**

TRUE to set the joint active; otherwise FALSE.

**Prototype:**

**void SetLimited(int i,BOOL s)**

**Remarks:**

Implemented by the System.

Sets the specified joint to the specified limited or not limited state.

**Parameters:**

**int i**

One of the following values:

**0 = X**

**1 = Y**

**2 = Z**

**BOOL s**

TRUE to set the joint as limited; otherwise FALSE.

**Prototype:**

**void SetEase(int i,BOOL s)**

**Remarks:**

Implemented by the System.

Sets the specified joint to the specified eased or not eased state.

**Parameters:**

**int i**

One of the following values:

**0 = X**

**1 = Y**

**2 = Z**

**BOOL s**

TRUE to set the joint as eased; otherwise FALSE.

**Prototype:**

**void SetType(DWORD type)**

**Remarks:**

Implemented by the System.

Sets the type of joint.

**Parameters:**

**DWORD type**

Specifies the type of joint. One of the following values:

**JNT\_POS** - Sliding joint.

**JNT\_ROT** - Rotating joint.

**Prototype:**

**void SetRollOpen(BOOL open)**

**Remarks:**

Implemented by the System.

Set the rollup page as open or closed.

**Parameters:**

**BOOL open**

TRUE to open the page; FALSE to close it.

**Prototype:**

**virtual void SpinnerChange(InterpCtrlUI \*ui,WORD id,  
ISpinnerControl \*spin,BOOL interactive);**

**Remarks:**

Implemented by the Plug-In.

This is called when the user is interactively manipulating one of the spinner controls or enters a value into a spinner's edit field. This method has a default implementation.

**Parameters:**

**InterpCtrlUI \*ui**

This is simply a container class to hold some data while the controllers parameters are being edited.

**WORD id**

The spinner control id.

**ISpinnerControl \*spin**

A pointer to the spinner control.

**BOOL interactive**

TRUE if the user is doing an interactive adjustment; otherwise FALSE.

**These methods manage the joint parameters dialog.**

**Prototype:**

**void InitDialog(InterpCtrlUI \*ui);**

**Remarks:**

Implemented by the System.

This is used internally.

**Prototype:**

**void EndDialog(InterpCtrlUI \*ui,BOOL dontDel=FALSE);**

**Remarks:**

Implemented by the System.

This is used internally.

**Prototype:**

**void SpinnerDown(InterpCtrlUI \*ui,WORD id,ISpinnerControl \*spin);**

**Remarks:**

Implemented by the System.

This is used internally.

**Prototype:**

**void SpinnerUp(InterpCtrlUI \*ui,WORD id,ISpinnerControl \*spin,  
BOOL accept);**

**Remarks:**

Implemented by the System.

This is used internally.

**Prototype:**

**void Command(InterpCtrlUI \*ui,WORD notify, WORD id,**

**HWND hCtrl);**

**Remarks:**

Implemented by the System.

This is used internally.

**Prototype:**

**void EnableDisable(InterpCtrlUI \*ui);**

**Remarks:**

Implemented by the System.

This is used internally.

## Class EaseCurveList

See Also: [Class ReferenceTarget](#), [Class Control](#).

```
class EaseCurveList : public ReferenceTarget
```

### Description:

This class represents a list of ease curves.

The macro used to access this class is defined as follows:

```
#define GetEaseListInterface(anim) ((EaseCurveList*)anim->GetInterface(I_EASELIST))
```

This may be used to access the methods of this class as follows:

```
EaseCurveList *el = GetEaseListInterface(client);  
if (el) {  
    int num = el->NumEaseCurves();  
    // ...
```

All methods of this class are implemented by the system.

### Methods:

#### Prototype:

```
EaseCurveList();
```

#### Remarks:

Constructor.

#### Prototype:

```
~EaseCurveList();
```

#### Remarks:

Destructor. All the references are deleted from this class.

#### Prototype:

```
TimeValue ApplyEase(TimeValue t,Interval &valid);
```

#### Remarks:

Returns a **TimeValue** that reflects the **TimeValue** passed modified by each of the enabled ease curves in the list.

**Parameters:**

**TimeValue t**

The base time which is eased by the curves.

**Interval &valid**

The validity interval which is updated by each of the ease curves in the list.

**Prototype:**

**void AppendEaseCurve(Control \*cont);**

**Remarks:**

Adds the specified ease curve to the end of the ease curve list.

**Parameters:**

**Control \*cont**

Points to the ease curve to append.

**Prototype:**

**void DeleteEaseCurve(int i);**

**Remarks:**

Deletes the 'i-th' ease curve in the list.

**Parameters:**

**int i**

The index of the ease curve to delete.

**Prototype:**

**void DisableEaseCurve(int i);**

**Remarks:**

Disables the 'i-th' ease curve in the list.

**Parameters:**

**int i**

The index of the ease curve to disable.

**Prototype:**

**void EnableEaseCurve(int i);**

**Remarks:**

Enables the 'i-th' ease curve in the list.

**Parameters:**

**int i**

The index of the ease curve to enable.

**Prototype:**

**BOOL IsEaseEnabled(int i);**

**Remarks:**

Returns TRUE if the 'i-th' ease curve is enabled; otherwise FALSE.

**Parameters:**

**int i**

The index of the ease curve to check.

**Prototype:**

**int NumEaseCurves();**

**Remarks:**

Returns the number of ease curves in the list.

## Class MultCurveList

See Also: [Class ReferenceTarget](#), [Class Control](#).

```
class MultCurveList : public ReferenceTarget
```

### Description:

This class is a list of multiplier curves.

The macro used to access this class is defined as follows:

```
#define GetMultListInterface(anim) ((MultCurveList*)anim->GetInterface(I_MULTLIST))
```

This may be used to access the methods of this class as follows:

```
MultCurveList *ml = GetMultListInterface(client);  
if (ml) {  
    int num = ml->NumMultCurves();  
    // ...
```

All methods of this class are implemented by the system.

### Methods:

#### Prototype:

```
MultCurveList();
```

#### Remarks:

Constructor.

#### Prototype:

```
~MultCurveList();
```

#### Remarks:

Destructor. All references are removed from this class.

#### Prototype:

```
float GetMultVal(TimeValue t,Interval &valid);
```

#### Remarks:

This method starts with a value of **1.0f**, multiplies it by each enabled multiplier curve value in the list, and returns the resulting value.

**Parameters:**

**TimeValue t**

The time at which to get the multiplier values.

**Interval &valid**

The interval that is adjusted to reflect the validity of all the multiplier curve controllers validity.

**Prototype:**

**void AppendMultCurve(Control \*cont);**

**Remarks:**

Adds the specified multiplier curve to the end of the multiplier curve list.

**Parameters:**

**Control \*cont**

Points to the multiplier curve to append.

**Prototype:**

**void DeleteMultCurve(int i);**

**Remarks:**

Deletes the 'i-th' multiplier curve.

**Parameters:**

**int i**

The index of the multiplier curve to delete.

**Prototype:**

**void DisableMultCurve(int i);**

**Remarks:**

Disables the 'i-th' multiplier curve.

**Parameters:**

**int i**

The index of the multiplier curve to disable.

**Prototype:**

**void EnableMultCurve(int i);**

**Remarks:**

Enables the 'i-th' multiplier curve.

**Parameters:**

**int i**

The index of the multiplier curve to enable.

**Prototype:**

**BOOL IsMultEnabled(int i);**

**Remarks:**

Returns TRUE if the 'i-th' multiplier curve is enabled; otherwise FALSE.

**Parameters:**

**int i**

The index of the multiplier curve to check.

**Prototype:**

**int NumMultCurves();**

**Remarks:**

Returns the number of multiplier curves in the list.

# Class INoiseControl

See Also: [Class Control](#).

```
class INoiseControl : public StdControl
```

## Description:

This class is available in release 2.0 and later only.

This class provides access to noise controller's parameters. All noise controllers are derived from this class.

All methods of this class are implemented by the system.

## Methods:

### Prototype:

```
virtual void SetSeed(int seed)=0;
```

### Remarks:

Sets the seed value for the noise controller.

### Parameters:

**int seed**

The seed value, greater than or equal to zero.

### Prototype:

```
virtual int GetSeed()=0;
```

### Remarks:

Returns the seed value.

### Prototype:

```
virtual void SetFrequency(float f)=0;
```

### Remarks:

Sets the frequency parameter.

### Parameters:

**float f**

The value to set, greater than zero.

**Prototype:**

**virtual float GetFrequency()=0;**

**Remarks:**

Returns the frequency value.

**Prototype:**

**virtual void SetFractal(BOOL f)=0;**

**Remarks:**

Sets the fractal setting on or off.

**Parameters:**

**BOOL f**

TRUE for on; FALSE for off.

**Prototype:**

**virtual BOOL GetFractal()=0;**

**Remarks:**

Returns the state of the fractal setting. TRUE if on; FALSE if off.

**Prototype:**

**virtual void SetRoughness(float f)=0;**

**Remarks:**

Sets the roughness setting.

**Parameters:**

**float f**

The value to set, between 0.0 and 1.0.

**Prototype:**

**virtual float GetRoughness()=0;**

**Remarks:**

Returns the roughness setting.

**Prototype:**

**virtual void SetRampIn(TimeValue in)=0;**

**Remarks:**

Sets the ramp in setting.

**Parameters:**

**TimeValue in**

The value to set, greater than or equal to zero.

**Prototype:**

**virtual TimeValue GetRampIn()=0;**

**Remarks:**

Returns the ramp in setting.

**Prototype:**

**virtual void SetRampOut(TimeValue out)=0;**

**Remarks:**

Sets the ramp out setting.

**Parameters:**

**TimeValue out**

The value to set, greater than or equal to zero.

**Prototype:**

**virtual TimeValue GetRampOut()=0;**

**Remarks:**

Returns the ramp out setting.

**Prototype:**

**virtual void SetPositiveOnly(int which,BOOL onOff)=0;**

**Remarks:**

Sets the positive only setting (>0) for the specified axis to the specified value.

**Parameters:**

**int which**

Specifies the axis. One of the following values:

**0:** X, **1:** y, **2:** Z.

**BOOL onOff**

TRUE for on; FALSE for off.

**Prototype:**

```
virtual BOOL GetPositiveOnly(int which)=0;
```

**Remarks:**

Returns the positive only setting (>0) for the specified axis to the specified value.

**Parameters:****int which**

Specifies the axis. One of the following values:

**0:** X, **1:** y, **2:** Z.

**Prototype:**

```
virtual Control *GetStrengthController()=0;
```

**Remarks:**

Returns a pointer to the controller for the strength parameter.

**Prototype:**

```
virtual void SetStrengthController(Control *c)=0;
```

**Remarks:**

Sets the controller used for the strength parameter.

**Parameters:****Control \*c**

Points to the controller to set.

# Class ISurfPosition

See Also: [Class Control](#), [Class INode](#).

```
class ISurfPosition : public Control
```

## Description:

This class is available in release 2.0 and later only.

This class provides access to the surface position controller's parameters.

The following values may be used to access the surface controller's references.

**SURFCONT\_U\_REF**

**SURFCONT\_V\_REF**

**SURFCONT\_SURFOBJ\_REF**

All methods of this class are implemented by the system.

## Methods:

### Prototype:

```
virtual void SetSurface(INode *node)=0;
```

### Remarks:

Sets the node that this controller uses as the surface object.

### Parameters:

**INode \*node**

Points to the node to set.

### Prototype:

```
virtual int GetAlign()=0;
```

### Remarks:

Returns the alignment setting.

### Return Value:

One of the following values:

**0:** No Alignment.

**1:** Align to U.

**2:** Align to V.

**Prototype:**

**virtual void SetAlign(int a)=0;**

**Remarks:**

Sets the alignment setting.

**Parameters:**

**int a**

One of the following values:

**0:** No Alignment.

**1:** Align to U.

**2:** Align to V.

**Prototype:**

**virtual BOOL GetFlip()=0;**

**Remarks:**

Returns the flip setting. TRUE if on; FALSE if off.

**Prototype:**

**virtual void SetFlip(BOOL f)=0;**

**Remarks:**

Sets the flip setting.

**Parameters:**

**BOOL f**

TRUE for on; FALSE for off.

## Class ILinkCtrl

See Also: [Class Control](#).

class ILinkCtrl : public Control, public FPMixinInterface

### Description:

This class is available in release 2.0 and later only.

This class represents the interface to the Link Controller. You can obtain a pointer to the link controller interface using; **GetLinkConstInterface(cd)**.

This macro will return

**(LinkConstTransform\*)(CD)-**

**>GetFPInterface(LINK\_CONSTRAINT\_INTERFACE).**

Developers may use the following values to access the references of the Link controller.

**LINKCTRL\_CONTROL\_REF**

The TM controller

**LINKCTRL\_FIRSTPARENT\_REF**

The index of the first parent node.

**LINKCTRL\_PBLOCK\_REF**

The parameter block.

All methods of this class are Implemented by the System.

### Methods:

public:

### Prototype:

**virtual int GetNumTargets()=0;**

### Remarks:

This method is available in release 4.0 and later only.

This method returns the number of parents (links).

### Prototype:

**virtual TimeValue GetLinkTime(int i)=0;**

### Remarks:

Returns the start time associated with the 'i-th' link.

**Parameters:**

**int i**

Specifies which parent (link).

**Prototype:**

**virtual void SetLinkTime(int i, TimeValue t)=0;**

**Remarks:**

Sets the start time associated with the 'i-th' link. See **LinkTimeChanged()** below. Note: This method also sorts the indices according to increasing time values.

**Parameters:**

**int i**

Specifies which parent (link).

**TimeValue t**

The time to set.

**Prototype:**

**virtual void LinkTimeChanged()=0;**

**Remarks:**

This method should be called after changing link times. Note: This method also sorts the indices according to increasing time values.

**Prototype:**

**virtual void AddNewLink(INode \*node, TimeValue t)=0;**

**Remarks:**

Adds a new link at the specified time.

**Parameters:**

**INode \*node**

Points to the node of the link to add.

**TimeValue t**

The time to change to this link.

**Prototype:**

**virtual void DeleteTarget(int selection)=0;**

**Remarks:**

This method will delete the specified link.

**Parameters:**

**int selection**

Specifies which link to delete.

**Prototype:**

**virtual int GetFrameNumber(int targetNumber)=0;**

**Remarks:**

This method returns the start frame of the specified target.

**Parameters:**

**int targetNumber**

The target number for which to get the start frame.

**Prototype:**

**virtual BOOL SetFrameNumber(int targetNumber, int  
frameNumber)=0;**

**Remarks:**

This method is available in release 4.0 and later only.

This method allows you to set the start frame of the specified target.

**Parameters:**

**int targetNumber**

The target number for which to set the start frame.

**int frameNumber**

The time value.

**Return Value:**

TRUE if the start frame is set, otherwise FALSE.

**Prototype:**

**virtual BOOL SetTarget(INode \*target, int targetNumber)=0;**

**Remarks:**

This method is available in release 4.0 and later only.

Sets one of the link nodes that the link constraint controller targets, specified by **targetNumber**. If **targetNumber** is greater than the number of targets in the current list, it returns a FALSE. In this case use the function **AppendTarget**.

**Parameters:**

**INode \*target**

Points to the node to follow

**int targetNumber**

The node number in the link target list to be set.

**Return Value:**

TRUE if successful, otherwise FALSE.

**Prototype:**

**virtual BOOL AddTarget(INode \*target, int frameNo)=0;**

**Remarks:**

This method is available in release 4.0 and later only.

This method allows you to append a target.

**Parameters:**

**INode \*target**

The target node to append.

**int frameNo**

The frame time.

**Return Value:**

TRUE if the target was appended, otherwise FALSE.

**Prototype:**

**virtual INode\* GetNode(int targetNumber)=0;**

**Remarks:**

This method is available in release 4.0 and later only.

This method returns one of the link nodes that the link constraint controller targets, specified by **targetNumber**.

**Parameters:**

**int targetNumber**

The node number in the link target list to be obtained.

## Class ILookatControl

See Also: [Class Control](#).

```
class ILookatControl : public Control
```

### Description:

This class is available in release 2.0 and later only.

This class provides access to the LookAt Controller parameters.

Developers may use the following values to access the references of the Look At controller.

**LOOKAT\_TARGET\_REF**

**LOOKAT\_POS\_REF**

**LOOKAT\_ROLL\_REF**

**LOOKAT\_SCL\_REF**

All methods of this class are implemented by the system.

### Methods:

#### Prototype:

```
virtual void SetFlip(BOOL f)=0;
```

#### Remarks:

Sets the flip setting.

#### Parameters:

**BOOL f**

TRUE for on; FALSE for off.

#### Prototype:

```
virtual BOOL GetFlip()=0;
```

#### Remarks:

Returns the state of the flip setting. TRUE if on; FALSE if off.

#### Prototype:

```
virtual void SetAxis(int a)=0;
```

#### Remarks:

Sets the axis setting.

**Parameters:**

**int a**

One of the following values:

**0:** X axis.

**1:** Y axis.

**2:** Z axis.

**Prototype:**

**virtual int GetAxis()=0;**

**Remarks:**

Returns the axis setting.

**Return Value:**

One of the following values:

**0:** X axis.

**1:** Y axis.

**2:** Z axis.

## List of Additional Controller Related Functions

See Also: [Class Control](#), [Class StdControl](#).

### Description:

The following functions may be used to control the playing and suspension of animation, get and set the start and end animation times, and returns new instances of default controllers of various types.

### Functions:

The functions below allow a developer to control the state of the 'Animate' button in the user interface, and also set if animate mode is on or off. The pseudo code below demonstrate how these methods might be used. If you need to do something associated with a controller but did not want keys to be generated you could write:

```
SuspendAnimate();
```

```
AnimateOff();
```

```
// do some things...
```

```
ResumeAnimate();
```

This ensures that animate mode is unchanged after you're through. The animate button never changes appearance so the user doesn't have to be aware that anything is happening.

### Prototype:

```
int Animating();
```

### Remarks:

Determines if the animate button is on. Returns nonzero if on; zero if off.

### Prototype:

```
void AnimateOn();
```

### Remarks:

This method logically turns animating on but does not change the appearance of the button.

### Prototype:

**void AnimateOff();**

**Remarks:**

This method logically turns animating off but does not change the appearance of the button.

**Prototype:**

**void SuspendAnimate();**

**Remarks:**

Suspend the animation from running. This method uses a stack so if several calls are made to the **SuspendAnimate()**, they must all be resumed before animation will resume.

**Prototype:**

**void ResumeAnimate();**

**Remarks:**

Resume suspended animation. The method **SuspendAnimate()** uses a stack so if several calls are made to **SuspendAnimatie()**, they must all be resumed using this method before the animation will resume.

**Prototype:**

**TimeValue GetAnimStart();**

**Remarks:**

Retrieves the start time of the animation.

**Prototype:**

**TimeValue GetAnimEnd();**

**Remarks:**

Retrieves the end time of the animation.

**Prototype:**

**void SetAnimStart(TimeValue s);**

**Remarks:**

Sets the start time of the animation.

**Prototype:**

**void SetAnimEnd(TimeValue e);**

**Remarks:**

Sets the end time of the animation.

**Prototype:**

**Control \*NewDefaultFloatController();**

**Remarks:**

Returns an instance of the default float controller.

**Prototype:**

**Control \*NewDefaultPoint3Controller();**

**Remarks:**

Returns an instance of the default Point3 controller.

**Prototype:**

**Control \*NewDefaultMatrix3Controller();**

**Remarks:**

Returns an instance of the default Matrix3 controller.

**Prototype:**

**Control \*NewDefaultPositionController();**

**Remarks:**

Returns an instance of the default position controller.

**Prototype:**

**Control \*NewDefaultRotationController();**

**Remarks:**

Returns an instance of the default rotation controller.

**Prototype:**

**Control \*NewDefaultScaleController();**

**Remarks:**

Returns an instance of the default scale controller.

**Prototype:**

**Control \*NewDefaultColorController();**

**Remarks:**

Returns an instance of the default color controller.

**Prototype:**

**Control \*NewDefaultBoolController();**

**Remarks:**

Returns an instance of the default boolean controller.

**Prototype:**

**Control\* CreateInterpFloat();**

**Remarks:**

Creates and returns a pointer to a new Bezier float controller.

**Prototype:**

**Control\* CreateInterpPosition();**

**Remarks:**

Creates and returns a pointer to a new Bezier position controller.

**Prototype:**

**Control\* CreateInterpPoint3();**

**Remarks:**

Creates and returns a pointer to a new Bezier Color controller.

**Prototype:**

**Control\* CreateInterpRotation();**

**Remarks:**

Creates and returns a pointer to a new TCB Rotation controller.

**Prototype:**

**Control\* CreateInterpScale();**

**Remarks:**

Creates and returns a pointer to a new Bezier Scale controller.

**Prototype:**

**Control\* CreatePRSControl();**

**Remarks:**

Creates and returns a pointer to a new PRS transform controller.

**Prototype:**

**Control\* CreateLookatControl();**

**Remarks:**

Creates and returns a pointer to a new Look At transform controller.

**Prototype:**

**void SetDefaultController(SClass\_ID sid, ClassDesc \*desc);**

**Remarks:**

Sets the default controller of the specified type to the controller whose ClassDesc is passed.

**Parameters:**

**SClass\_ID sid**

The Super Class ID. See [List of Super Class IDs](#).

**ClassDesc \*desc**

Points to the Class Descriptor for the controller. See [Class ClassDesc](#).

**Prototype:**

**ClassDesc \*GetDefaultController(SClass\_ID sid);**

**Remarks:**

Returns a pointer to the Class Descriptor for the default controller of the specified type.

**Parameters:**

**SClass\_ID sid**

The Super Class ID. See [List of Super Class IDs](#).

**Prototype:**

**void SetDefaultColorController(ClassDesc \*desc);**

**Remarks:**

Sets the default Color controller.

**Parameters:**

**ClassDesc \*desc**

Points to the Class Descriptor for the controller. See [Class ClassDesc](#).

**Prototype:**

**void SetDefaultBoolController(ClassDesc \*desc);**

**Remarks:**

Sets the default Boolean controller.

**Parameters:**

**ClassDesc \*desc**

Points to the Class Descriptor for the controller. See [Class ClassDesc](#).

**Prototype:**

**void ApplyScaling(Matrix3 &m, const ScaleValue &v);**

**Remarks:**

This method may be used to apply a ScaleValue to the specified Matrix3. This is used in controller implementation of **GetValue()** when the **GetSetMethod** is **CTRL\_RELATIVE** and the controller is a scale controller.

**The global functions below provide access to the default tangent types for both the Bezier and TCB controllers.**

**Prototype:**

**void GetBezierDefaultTangentType(int &in, int &out);**

**Remarks:**

This function is available in release 2.0 and later only.

Retrieves the default tange types for the Bezier controller.

**Parameters:**

**int &in**

The in tangent value.

**int &out**

The out tangent value.

**Prototype:**

**void SetBezierDefaultTangentType(int in, int out);**

**Remarks:**

This function is available in release 2.0 and later only.

Sets the default tange types for the Bezier controller.

**Parameters:**

**int &in**

The in tangent value.

**int &out**

The out tangent value.

**Prototype:**

**void GetTCBDefaultParams(float &t, float &c, float &b, float &easeIn, float &easeOut);**

**Remarks:**

This function is available in release 2.0 and later only.

Retrieves the default tange types for the TCB controller.

**Parameters:**

**float &t**

The tension setting.

**float &c**

The continuity setting.

**float &b**

The bias setting.

**float &easeIn**

The ease in value.

**float &easeOut**

The ease out value.

**Prototype:**

```
void SetTCBDefaultParams(float t, float c, float b, float easeIn,  
float easeOut);
```

**Remarks:**

This function is available in release 2.0 and later only.

Sets the default tange types for the TCB controller.

**Parameters:****float t**

The tension setting.

**float c**

The continuity setting.

**float b**

The bias setting.

**float easeIn**

The ease in value.

**float easeOut**

The ease out value.

## Class DefaultLight

See Also: [Class Renderer](#), [Class Matrix3](#), [Structure LightState](#).

class DefaultLight

### Description:

This class describes a default light. An array of these default lights is passed into the method **Renderer::Open()**.

### Data Members:

public:f

#### **LightState ls;**

Describes the properties of the light.

#### **Matrix3 tm;**

This is the transformation of the light that controls its position in the scene.

Note: In 3ds max 3.0 the production renderer has been modified so that if a DefaultLight is passed into **Renderer::Open()** with a transformation matrix that is all zeros, the renderer will interpret this to mean that on each frame it should create a light located at the view point, pointing in the view direction. This allows the implementation of the new viewport 1-light option so that it tracks the camera during an animated camera move.

## Structure LightState

See Also: [Class GenLight](#), [Class LightObject](#), [Class Color](#), [Class Matrix3](#).

### Description:

This structure describes the properties of a light.

```
struct LightState {
```

```
    LightType type;
```

One of the following values:

(from **enum LightType { OMNI\_LGT, SPOT\_LGT, DIRECT\_LGT, AMBIENT\_LGT }**);

**OMNI\_LGT** - Omnidirectional

**SPOT\_LGT** - Spot (cone)

**DIRECT\_LGT** - Directional (parallel)

**AMBIENT\_LGT** - Global

```
    Matrix3 tm;
```

The transformation matrix of the light.

```
    Color color;
```

The color of the light (its intensity).

```
    float intens;
```

The multiplier applied to the **color**.

```
    float hotsize;
```

The hotspot size in degrees.

```
    float fallsize;
```

The hotspot falloff size in degrees.

```
    int useNearAtten;
```

This data member is available in release 2.0 and later only.

Nonzero if near attenuation is used; otherwise zero.

```
    float nearAttenStart;
```

This data member is available in release 2.0 and later only.

The near attenuation start value.

```
    float nearAttenEnd;
```

This data member is available in release 2.0 and later only.

The near attenuation end value.

**int useAtten;**

Nonzero if (far) attenuation is used; otherwise zero.

**float attenStart;**

The (far) start attenuation value.

**float attenEnd;**

The (far) end attenuation value.

**int shape;**

One of the following values:

**RECT\_LIGHT**

**CIRCLE\_LIGHT**

**float aspect;**

The aspect ratio of the light.

**BOOL overshoot;**

TRUE if the light supports overshoot; otherwise FALSE.

**BOOL shadow;**

TRUE if shadows are on; otherwise FALSE.

**BOOL on;**

TRUE if the light is on; otherwise FALSE.

**BOOL affectDiffuse;**

TRUE if affect diffuse is on; otherwise FALSE.

**BOOL affectSpecular;**

TRUE if affect specular is on; otherwise FALSE.

**};**

## Class LightDesc

See Also: [Class RenderData](#), [Class LightRayTraversal](#), [Class ObjLightDesc](#), [Class ShadeContext](#), [Class Color](#), [Class Point3](#).

```
class LightDesc : public RenderData
```

### Description:

This class has a method **Illuminate()** used to determine the color and direction of the light striking the point **sc.P()** and a method to get the position of the light. It also has two public data members that determine if the diffuse and specular colors of objects are affected.

### Data Members:

public:

#### **BOOL affectDiffuse;**

This data member is available in release 2.0 and later only.

If TRUE the light affects the diffuse color; otherwise it does not.

#### **BOOL affectSpecular;**

This data member is available in release 2.0 and later only.

If TRUE the light affects the specular color; otherwise it does not.

#### **BOOL ambientOnly;**

This data member is available in release 3.0 and later only.

If TRUE the light affects the ambient color only; otherwise it does not.

#### **DWORD extra;**

This data member is available in release 3.0 and later only.

This is not currently used and is available for use in the future.

### Methods:

### Prototype:

```
LightDesc();
```

### Remarks:

Constructor. The **affectDiffuse** and **affectSpecular** data members are set to TRUE.

### Prototype:

**virtual BOOL Illuminate(ShadeContext& sc, Point3& normal,  
Color& color, Point3 &dir, float &dot\_nl, float &diffuseCoef);**

**Remarks:**

Implemented by the Plug-In.

This method is called to determine the color and direction of illumination from the light that is hitting the point (**sc.P()**).

**Parameters:**

**ShadeContext& sc**

Describes the properties of the point to shade. The point itself is **sc.P()**.

**Point3& normal**

The normal to the surface in camera space.

**Color& color**

The color that is returned. This is the brightness of light striking the point (**sc.P()**)

**Point3 &dir**

The direction that the light is coming from.

**float &dot\_nl**

This provides a bit of optimization as most lights will have to calculate this quantity. This is the dot product between the light vector and the normal to the surface.

**float &diffuseCoef**

This parameter should be set by the Illuminate function. The default value is the same as dot\_nl. It will be used by shading functions instead of dot\_nl to compute the diffuse illumination of the surface. The built-in lights use the new "Contrast" parameter (which has a range of [0..100]) to compute the diffuseCoef from the dot\_nl by the Contrast function:

**// precomputed:**

**float a = contrast/200.0f + 0.5f; // so "a" varies from .5 to 1.0**

**kA = (2.0f-1.0f/a);**

**kB = 1.0f-kA;**

**// called by Illuminate() to compute diffuseCoef from dot\_nl.**

```
float ContrastFunc(float nl) {  
    // the "Bias" function described in Graphics Gems IV, pp. 401ff  
    return (contrast==0.0f)? nl : nl/(kA*nl+kB);  
}
```

**Return Value:**

Returns FALSE if the hitpoint is outside the effective range of the light or if the normal of the surface faces away from the light. This is a hint to the material that the light did not calculate its illumination because it is assumed it wasn't going to be used. If TRUE the point is being illuminated.

**Default Implementation:**

```
{ return 0;}
```

**Prototype:**

```
virtual Point3 LightPosition();
```

**Remarks:**

This method is available in release 2.0 and later only.  
Returns the position of the light.

**Default Implementation:**

```
{ return Point3(0,0,0); }
```

## Class LightRayTraversal

See Also: [Class ObjLightDesc](#).

```
class LightRayTraversal
```

### Description:

This is a callback class that can be given to a **ObjLightDesc** to have a ray traced through the light volume. A plug-in derives a class from this one and passes it as a callback in the **ObjLightDesc** method **TraverseVolume()**. This allows a developer to integrate the illumination of a segment due to a light. **t0** and **t1** define the segment in terms of the given ray.

This is what the 3ds max spotlights do: First they break the segment up into three main pieces. The first piece is from the camera to where the ray intersects the lights cone volume. The callback **Step()** is called once over this segment (**t0** and **t1** will have this first piece). The illumination is constant over this entire segment from **t0** to **t1**. It is a constant black since the light is not illuminating it at all.

The next segment is inside the cone. This segment will be broken up into small pieces. First as it's stepping along it will be between the falloff and the hotspot. The illumination over this segment goes from black to brighter and brighter as it moves towards to hotspot. Across the entire hotspot region the illumination may be constant. Then as it steps from the hotspot to the falloff the illumination will go back down to black.

Inside the hotspot region, if shadows are turned on, the light may be brighter or darker depending on if it's inside a shadow or on the edge of a shadow. The light handles all of this. It takes care of the shadows, attenuation, etc.

Now consider how the 3ds max atmospheric effects such as the volume lights use this information. For each light that they are bound to, they call the method **TraverseVolume()** on the light. The volume light atmospheric effect passes this callback to the **TraverseVolume()** method. The light then calls this **Step()** method of the callback for each partial segment of the ray. Given the illumination on the segment (**illum**) it computes the fog density over that piece. The density may be constant if noise is not turned on, or it may vary if noise is turned on. Using the fog density and the illumination it computes the light reflected off the atmosphere for the segment.

## Methods:

### Prototype:

**virtual BOOL Step(float t0, float t1, Color illum , float distAtten)=0;**

### Remarks:

Implemented by the Plug-In.

This method is called for every step defined by **t0** and **t1**. The illumination over this segment is passed in **illum**.

### Parameters:

#### **float t0**

The start of the segment. This is a distance along the ray. The ray is made up of a point **p** and a unit length direction vector **dir**. The point defined by **t0** is thus **ray.p+t0\*ray.dir**.

#### **float t1**

The end of the segment. This is a distance along the ray. The ray is made up of a point **p** and a unit length direction vector **dir**. The point defined by **t1** is thus **ray.p+t1\*ray.dir**.

#### **Color illum**

The light intensity over the entire segment. It can be assumed that the light intensity is constant for the segment.

#### **float distAtten**

This parameter is available in release 2.0 and later only.

This parameter may be used so that volume effects can use the distance attenuation value as an input variable to their effects. For instance, the volume light uses this to change the fog color based on the distance from the light.

### Return Value:

TRUE to continue; FALSE to halt the integration (stop the traversal).

## Class ParamDlg

See Also: [Class Mtl](#), [Class Texmap](#), [Working with Materials and Textures](#).

class ParamDlg : public InterfaceServer

### Description:

Every MtlBase sub-class defines a ParamDlg to manage its part of the material editor.

### Methods:

#### Prototype:

**virtual Class\_ID ClassID()=0;**

#### Remarks:

Implemented by the Plug-In.

Returns the unique Class\_ID of the plug-in this dialog manages. See [Class Class\\_ID](#).

#### Prototype:

**virtual void SetThing(ReferenceTarget \*m)=0;**

#### Remarks:

Implemented by the Plug-In.

This sets the current material or texture being edited to the material or texture passed.

#### Parameters:

**ReferenceTarget \*m**

The material or texture to set as current.

#### Prototype:

**virtual ReferenceTarget\* GetThing()=0;**

#### Remarks:

Implemented by the Plug-In.

This method returns the current material or texture being edited.

**Prototype:**

**virtual void SetTime(TimeValue t)=0;**

**Remarks:**

Implemented by the Plug-In.

This method is called when the current time has changed. This gives the developer an opportunity to update any user interface data that may need adjusting due to the change in time.

**Parameters:**

**TimeValue t**

The new current time.

**Prototype:**

**virtual void ReloadDialog()=0;**

**Remarks:**

Implemented by the Plug-In.

This method should stuff values into all the parameter dialog's controls, edit fields etc. In fact this method is now only called after doing a "Reset". It is also useful inside the material/map when a **NotifyRefChanged()** is processed it may need to be called.

**Prototype:**

**virtual void ActivateDlg(BOOL onOff)=0;**

**Remarks:**

Implemented by the Plug-In.

This method is called when the dialog box becomes active or inactive.

Currently this is used when working with color swatch custom controls. Color swatches need to know when the dialog box becomes active or inactive because they change their method of drawing themselves. When the dialog is active, color swatches are drawn in pure color (this requires a color register in the palette). When the dialog becomes inactive the color swatches are drawn using dithered painting. This is needed because there are only 8 available color registers.

A method of the color swatch control is called to indicate if it is in an active or

inactive dialog. See the sample code below. Also see [Class IColorSwatch](#).

**Parameters:**

**BOOL onOff**

TRUE if the dialog is active; otherwise FALSE.

**Sample Code:**

```
void NoiseDlg::ActivateDlg(BOOL onOff) {  
    for (int i=0; i<NCOLS; i++)  
        cs[i]->Activate(onOff);  
}
```

**Prototype:**

**virtual void DeleteThis()=0;**

**Remarks:**

Implemented by the Plug-In.

This method is called by the system to delete an instance of this class. A developer must use the same memory manager to delete the item as they did to allocate it (in **MtlBase::CreateParamDlg()**). For example if a developer used the **new** operator to allocate the memory, this method would be implemented as **{ delete this; }**

**Prototype:**

**virtual int FindSubTexFromHWND(HWND hwnd);**

**Remarks:**

This method is available in release 2.0 and later only.

This method needs to be implemented if the plug-in texmap is using a **TexDADMgr**. It should return the index of the sub-texmap corresponding to the window whose handle is passed. If the handle is not valid return -1.

**Parameters:**

**HWND hwnd**

The window handle to check.

**Default Implementation:**

```
{ return -1;}
```

**Sample Code:**

```
int CellTexParamDlg::FindSubTexFromHWND(HWND hw) {
    if (hw==GetDlgItem(pmap-
>GetHWnd(),IDC_CELLTEX_CELLCOLOR_MAP))
        return 0;
    if (hw==GetDlgItem(pmap-
>GetHWnd(),IDC_CELLTEX_DIVCOL1_MAP))
        return 1;
    if (hw==GetDlgItem(pmap-
>GetHWnd(),IDC_CELLTEX_DIVCOL2_MAP))
        return 2;
    return -1;
}
```

**Prototype:**

```
virtual int FindSubMtlFromHWND(HWND hwnd);
```

**Remarks:**

This method is available in release 2.0 and later only.

This method needs to be implemented if the plug-in material is using a **MtlDADMgr**. It should return the index of the sub-map corresponding to the window whose handle is passed. If the handle is not valid return -1.

**Parameters:**

**HWND hwnd**

The window handle to check.

**Default Implementation:**

```
{ return -1;}
```

## Class UVGen

See Also: [Class MtlBase](#), [Class ShadeContext](#), [Class MapSampler](#), [Class Point2](#), [Class Point3](#), [Class Matrix3](#).

```
class UVGen : public MtlBase
```

### Description:

Most texture maps that use UV coordinates will use an instance of this class. This class encapsulates much of the user interface functionality for setting mirroring, tiling and so on. These are the settings found in the 'Coordinate' and 'Noise' rollup pages. This class generates UV coordinates based on the results of a UV source provided by the plug-in and the user specified transformations. An instance of this class is referenced by all the 2D texture maps. All methods of this class are implemented by the system.

### Methods:

The following four methods are the only ones a plug-in needs to call typically:

### Prototype:

```
virtual AColor EvalUVMap(ShadeContext &sc, MapSampler*  
samp,  
  BOOL filter=TRUE)=0;
```

### Remarks:

This method is called to evaluate the color of the map based on the ShadeContext. It takes into account the users selections for mirroring, tiling, noise, etc. from the UVGen rollups.

### Parameters:

#### **ShadeContext &sc**

Describes the properties of the point to evaluate.

#### **MapSampler\* samp**

This is a callback used to sample the map. The plug-in creates an instance of this class, and implements its methods. A pointer to the instance is passed here. The methods of the class sample the texture for a single UV coordinate.

#### **BOOL filter=TRUE**

If TRUE the texture will be filtered.

### Return Value:

The result as an AColor.

**Prototype:**

```
virtual float EvalUVMapMono(ShadeContext &sc, MapSampler*  
somp,  
  BOOL filter=TRUE)=0;
```

**Remarks:**

This method is called to evaluate the value of the map based on the ShadeContext. It takes into account the users selections for mirroring, tiling, noise, etc. from the UVGen rollups.

**Parameters:**

**ShadeContext &sc**

Describes the properties of the point to evaluate.

**MapSampler\* somp**

This is a callback used to sample the map. The plug-in creates an instance of this class, and implements its methods. A pointer to the instance is passed here. The methods of the class sample the texture for a single UV coordinate.

**BOOL filter=TRUE**

If TRUE the texture will be filtered.

**Return Value:**

The result as a float.

The following two methods are called for bump mapping to retrieve a normal perturbation. The calling sequence for these methods is shown in the sample code below. This code takes the sum of the U derivative times the U bump vector, and the V derivative times the V bump vector. The result is the normal perturbation returned from **EvalNormalPerturb()**.

```
Point3 BMTex::EvalNormalPerturb(ShadeContext& sc) {  
  Point3 dPdu, dPdv;  
  if (thebm==NULL)  
    return Point3(0,0,0);  
  uvGen->GetBumpDP(sc,dPdu,dPdv); // get bump basis vectors  
  Point2 dM =(.01f)*uvGen-  
>EvalDeriv(sc,&mysomp,filterType!=FILTER_NADA);
```

```

return texout->Filter(dM.x*dPdu+dM.y*dPdv);
}

```

Note: In the following code you'll see the 'text book' Blinn's algorithm and the 'Lazy' approach that is actually used. During testing it was determined that these two methods are visually identical. The 'Lazy' algorithm avoids the cross products however.

```

Point3 Gradient::EvalNormalPerturb(ShadeContext& sc) {
    Point3 dPdu, dPdv;
    Point2 dM = uvGen->EvalDeriv(sc,&mysamp);
    uvGen->GetBumpDP(sc,dPdu,dPdv);
    #if 0
    // Blinn's algorithm
    Point3 N = sc.Normal();
    Point3 uVec = CrossProd(N,dPdv);
    Point3 vVec = CrossProd(N,dPdu);
    return dM.x*uVec-dM.y*vVec;
    #else
    // Lazy algorithm
    return texout->Filter(dM.x*dPdu+dM.y*dPdv);
    #endif
}

```

#### Prototype:

```

virtual void GetBumpDP(ShadeContext& sc, Point3& dPdu,
    Point3& dPdv)=0;

```

#### Remarks:

This method may be called to compute **dPdu** and **dPdv** bump basis vectors for bump mapping. These are two vector in 3D space that give you the U and V axis of the map space. This is like taking the map space into 3D space so you can determine where the U axis is and where the V axis is.

Note: In 3ds max 3.0 and later these vectors are always normalized. This change makes it so bump mapping is invariant when a Rescale World Units is performed.

See the Advanced Topics section on [Working with Materials and Textures](#) for

more information on bump mapping.

**Parameters:**

**ShadeContext& sc**

Describes the properties of the point to evaluate.

**Point3& dPdu, Point3& dPdv**

The bump basis vectors are returned here.

**Prototype:**

**virtual Point2 EvalDeriv(ShadeContext& sc, MapSampler\* samp, BOOL filter=TRUE)=0;**

**Remarks:**

This gets the amount that U and V are changing. It takes into account the users selections for mirroring, tiling, noise, etc. from the UVGen rollups.

**Parameters:**

**ShadeContext& sc**

Describes the properties of the point to evaluate.

**MapSampler\* samp**

This is a callback used to sample the map. The plug-in creates an instance of this class, and implements its methods. A pointer to the instance is passed here. The methods of the class sample the texture for a single UV coordinate.

**BOOL filter=TRUE**

If TRUE the texture will be filtered.

**Return Value:**

**df/du, df/dv** as a Point2.

**Prototype:**

**virtual void GetUV(ShadeContext& sc, Point2& UV, Point2& dUV)=0;**

**Remarks:**

This method is not normally called directly. It retrieves the UV coordinates (depending on if they are explicit, shrinked-wrapped environment, etc.) and transforms them using the offsets and noise parameters entered by the user. It does not do the mirroring or tiling. It then returns the texture coordinates and

derivatives for antialiasing.

**Parameters:**

**ShadeContext& sc**

Describes the properties of the point to evaluate.

**Point2& UV**

The UV texture coordinates for the point.

**Point2& dUV**

The derivatives of UV for the point to shade. This describes how big of a range in UV space the current pixel covers.

**Prototype:**

**virtual void GetUVTransform(Matrix3 &uvtrans)=0;**

**Remarks:**

This method is used internally to provide information to the interactive renderer.

**Prototype:**

**virtual int GetTextureTiling()=0;**

**Remarks:**

This method is used internally to provide information to the interactive renderer.

**Prototype:**

**virtual int GetUVWSource()=0;**

**Remarks:**

This method returns the source for the texture vertices.

**Return Value:**

One of the following values:

**UVWSRC\_EXPLICIT**

Use explicit mesh texture vertices from channel 1.

**UVWSRC\_EXPLICIT2**

Use explicit mesh texture vertices from channel 2.

## **UVWSRC\_OBJXYZ**

Generate planar UVW mapping coordinates from the object XYZ on-the-fly.

### **Prototype:**

```
virtual void SetUVWSource(int s)=0;
```

### **Remarks:**

This method sets the source for the texture vertices.

### **Parameters:**

**int s**

One of the following values:

#### **UVWSRC\_EXPLICIT**

Use explicit mesh texture vertices from one of the mapping channels (as established by **SetMapChannel()** below).

#### **UVWSRC\_EXPLICIT2**

Use explicit mesh texture vertices from the Vertex Color Channel.

#### **UVWSRC\_OBJXYZ**

Generate planar UVW mapping coordinates from the object XYZ on-the-fly.

#### **UVWSRC\_WORLDXYZ**

This parameter is available in release 3.0 and later only.

Generate planar uvw mapping from world xyz on-the-fly.

### **Prototype:**

```
virtual void SetMapChannel(int s);
```

### **Remarks:**

This method is available in release 3.0 and later only.

Sets the mapping channel used when **UVWSRC\_EXPLICIT** is in effect.

### **Parameters:**

**int s**

The mapping channel value to set.

### **Default Implementation:**

```
{}
```

**Prototype:**

**virtual int SymFlags()=0;**

**Remarks:**

This method is used internally.

**Prototype:**

**virtual void SetSymFlags(int f)=0;**

**Remarks:**

This method is available in release 2.0 and later only.

This method is used internally.

**Prototype:**

**virtual void SetClipFlag(BOOL b)=0;**

**Remarks:**

This method is available in release 2.0 and later only.

This method sets the clip flag. The clip flag controls whether the U,V values passed to **MapSampler** by **EvalUVMap()** and **EvalUVMapMono()** are clipped to the [0..1] interval or not. It defaults to ON (i.e., clipped).

If an object is covered by a texture, and that texture repeats (is tiled), this methods can be used to tell you which tile you're in. This allows one to do something depending on which tile it is. This is done, for example, in the Bitmap texture, when 'Jitter Placement' is on, so each tile can be moved about slightly. For an example of this see

**\MAXSDK\SAMPLES\MATERIALS\BMTEX.CPP**. If you need this information, you can just call **uvGen->SetClipFlag(FALSE)** (for instance in your **Update()** method) and then use **int(u)** and **int(v)** to get the this info. (You'd use **frac(u)** and **frac(v)** to get clipped versions of u,v. )

**Parameters:**

**BOOL b**

TRUE to clip; FALSE to not clip.

**Prototype:**

**virtual BOOL GetClipFlag()=0;**

**Remarks:**

This method is available in release 2.0 and later only.

This method returns the clip flag. The clip flag controls whether the U,V values passed to **MapSampler** by **EvalUVMMap()** and **EvalUVMMapMono()** are clipped to the [0..1] interval or not. It defaults to ON (i.e., clipped). See **SetClipFlag()** above.

**Return Value:**

TRUE for clipped; FALSE if not clipped.

**Prototype:**

```
virtual int GetAxis()=0;
```

**Remarks:**

This method is available in release 2.0 and later only.

Return the axis (mapping coordinate system) used.

**Return Value:**

One of the following values:

**AXIS\_UV**

**AXIS\_VW**

**AXIS\_WU**

**Prototype:**

```
virtual void SetAxis(int ax)=0;
```

**Remarks:**

This method is available in release 2.0 and later only.

Sets the axis (mapping coordinate system) used.

**Parameters:**

**int ax**

One of the following values:

**AXIS\_UV**

**AXIS\_VW**

**AXIS\_WU**

**Prototype:**

```
virtual void InitSlotType(int sType)=0;
```

**Remarks:**

Developers typically don't need to call this method. In the Coordinates rollup in the user interface for a texture map are two options. These options are Texture or Environment. The slot type is one of these two options. There are a variety of texture coordinate types. There are the type assigned to the object and the environment type (Spherical, Cylindrical, Shrink-wrap, Screen). This method is used initialize the radio button in the dialog based on the **sType** passed and update the drop down list.

**Parameters:**

**int sType**

One of the following values:

**MAPSLOT\_TEXTURE**

This is either texture coordinates.

**MAPSLOT\_ENVIRON**

Environment coordinates.

**Prototype:**

```
virtual void SetRollupOpen(BOOL open)=0;
```

**Remarks:**

This method is available in release 3.0 and later only.

Sets the UVGen rollup state to open or closed.

**Parameters:**

**BOOL open**

TRUE for open; FALSE for closed.

**Prototype:**

```
virtual BOOL GetRollupOpen()=0;
```

**Remarks:**

This method is available in release 3.0 and later only.

Returns the open or closed state of the UVGen rollup.

**Return Value:**

TRUE is open; FALSE is closed.

# Class MapSampler

See Also: [Class UVGen](#), [Class ShadeContext](#).

## Description:

A texture map implements this class and passes it into the **UVGen** methods **EvalUVMMap()**, **EvalUVMMapMono()**, and **EvalDeriv()** to evaluate itself with tiling & mirroring. Each of the methods of this class are used to sample the map at a single UV coordinate.

## Methods:

### Prototype:

```
virtual AColor Sample(ShadeContext& sc, float u, float v)=0;
```

### Remarks:

Implemented by the Plug-In.

This method is required. It is called to sample the map at a single UV coordinate. This method should not try to antialias the map, it should just return the value. Take for example a bitmap texture implementing this method. If the **u** values passed was 0.5 and the **v** value passed was 0.5, the plug-in would just return the pixel value at the center of the bitmap as an **AColor**.

### Parameters:

**ShadeContext& sc**

The ShadeContext.

**float u**

The U value in the range of 0.0 to 1.0

**float v**

The V value in the range of 0.0 to 1.0

### Return Value:

The sampled value as an **AColor**.

### Prototype:

```
virtual AColor SampleFilter(ShadeContext& sc, float u,  
float v, float du, float dv)=0;
```

**Remarks:**

Implemented by the Plug-In.

This method is required. It is called to return a value from the map that is the averaged value over the specified region of width **du** and height **dv**, centered at **u**, **v**. Certain map types may use the **du** and **dv** values directly to perform antialiasing of the map.

**Parameters:**

**ShadeContext& sc**

The ShadeContext.

**float u**

The U value in the range of 0.0 to 1.0

**float v**

The V value in the range of 0.0 to 1.0

**float du**

This parameter can be considered the width of a small rectangle center on u,v. The u and v value are guaranteed to be inside this rectangle.

**float dv**

This parameter can be considered the height of a small rectangle center on u,v. The u and v value are guaranteed to be inside this rectangle.

**Return Value:**

The sampled value as an **AColor**.

**Prototype:**

**virtual float SampleMono(ShadeContext& sc, float u, float v)**

**Remarks:**

Implemented by the Plug-In.

This method is optional as a default implementation is provided. It may be implemented however if a certain map type can be more efficient in evaluating a mono channel. For example a noise function that produces a single floating point value as a function of UV. This method is called to sample the map at a single UV coordinate. This method should not try to antialias the map, it should just return the value.

**Parameters:**

**ShadeContext& sc**

The ShadeContext.

**float u**

The U value in the range of 0.0 to 1.0

**float v**

The V value in the range of 0.0 to 1.0

**Return Value:**

The sampled value as an float.

**Default Implementation:**

```
{ return Intens(Sample(sc,u,v)); }
```

**Prototype:**

```
virtual float SampleMonoFilter(ShadeContext& sc, float u,  
float v, float du, float dv)
```

**Remarks:**

Implemented by the Plug-In.

This method is optional. It is called to return a value from the map that is the averaged value over the specified region of width **du** and height **dv**, centered at **u, v**. Certain map types may use the **du** and **dv** values directly to perform antialiasing of the map.

**Parameters:****ShadeContext& sc**

The ShadeContext.

**float u**

The U value in the range of 0.0 to 1.0

**float v**

The V value in the range of 0.0 to 1.0

**float du**

This parameter can be considered the width of a small rectangle center on **u,v**. The **u** and **v** value are guaranteed to be inside this rectangle.

**float dv**

This parameter can be considered the height of a small rectangle center on **u,v**. The **u** and **v** value are guaranteed to be inside this rectangle.

**Return Value:**

The sampled value as an float.

**Default Implementation:**

```
{ return Intens(SampleFilter(sc,u,v,du,dv)); }
```

## Class XYZGen

See Also: [Class MtlBase](#), [Class ShadeContext](#), [Class Point3](#).

```
class XYZGen : public MtlBase
```

### Description:

This class generates **Point3** coordinates based on the **ShadeContext**. A reference to one of these is referenced by all 3D texture maps. **XYZGen** does for 3D Texmaps what **UVGen** does for 2D Texmaps. It puts up the 3D "Coordinates" rollup, and supplies the 3D Texmap with transformed 3D coordinates. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

```
virtual void GetXYZ(ShadeContext& sc, Point3& p, Point3& dp)=0;
```

#### Remarks:

This method retrieves coordinates and derivatives for antialiasing. It returns the coordinates in the "Object Coordinate System", scaled and rotated by the parameters given in the Coordinates rollup. The default transformation is the identity transform, so you just get Object coordinates. For instance, if you have a sphere of radius 100, you will get coordinates ranging from -100 to +100.

A developer might wonder why 3ds max don't use some normalized coordinates space. This was considered, but it has some real problems. Say you make something by assembling several boxes, of varying sizes, and then apply a wood texture to the whole thing. You want the wood texture to be at the same scale for all the pieces, not smaller on the smaller pieces, and thus that doesn't work.

#### Parameters:

**ShadeContext& sc**

Describes the properties of the point to be shaded.

**Point3& p**

The 3D point is returned here.

**Point3& dp**

The derivative of the 3D point is returned here.

**Prototype:**

**virtual BOOL IsStdUVGen();**

**Remarks:**

This method is available in release 2.0 and later only.

This method asks the question 'Is this class an instance of **StdUVGen**?'. The derived class **StdUVGen** implements this to return TRUE. Others use the default implementation to return FALSE.

**Default Implementation:**

**{ return FALSE; }**

**Prototype:**

**virtual void SetRollupOpen(BOOL open)=0;**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the XYZGen rollup state to open or closed.

**Parameters:**

**BOOL open**

TRUE for open; FALSE for closed.

**Prototype:**

**virtual BOOL GetRollupOpen()=0;**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the open or closed state of the XYZGen rollup.

**Return Value:**

TRUE is open; FALSE is closed.

**Prototype:**

**virtual void GetBumpDP(ShadeContext& sc, Point3\* dP);**

**Remarks:**

This method is available in release 3.0 and later only.

This method returns the transformed bump unit vectors for 3D bump mapping. The 3D textures need to use these in computing the gradient.

**Parameters:**

**ShadeContext& sc**

Describes the properties of the point to be shaded.

**Point3\* dP**

The 3 unit vectors for computing differentials are returned here.

**Default Implementation:**

```
{
```

**Sample Code:**

Here is a typical use of XYZGen->GetBumpDP() to compute the bump mapping for a 3D texture:

```
Point3 Marble::EvalNormalPerturb(ShadeContext& sc) {
    float del,d;
    Point3 p,dp;
    if (!sc.doMaps) return Point3(0,0,0);
    if (gbufID) sc.SetGBufferID(gbufID);
    xyzGen->GetXYZ(sc,p,dp);
    if (size==0.0f) size=.0001f;
    p *= FACT/size;
    d = MarbleFunc(p);
    del = 20.0f;
    Point3 np;
    Point3 M[3];
    xyzGen->GetBumpDP(sc,M);
    np.x = (MarbleFunc(p+del*M[0]) - d)/del;
    np.y = (MarbleFunc(p+del*M[1]) - d)/del;
    np.z = (MarbleFunc(p+del*M[2]) - d)/del;
    np *= 100.0f;
    return sc.VectorFrom(np,REF_OBJECT);
}
```

## Class TextureOutput

See Also: [Class MtlBase](#), [Class AColor](#), [Class Point3](#).

```
class TextureOutput : public MtlBase
```

### Description:

This class is used by texture maps to put up the 'Output' rollup in the materials editor, and perform the output filtering. Currently this provides control over the Output Amount, RGB Level, and RGB Offset. In the future this may be enhanced to include other things that are often desirable on the output stage. These are things like tinting, color shifting, etc. All methods of this class are implemented by the system.

A plug-in will typically call these methods from the implementations of **EvalColor()**, **EvalMono()**, etc. This is just done as a final adjustment to scale or offset the value. The code below is from the Gradient texture map.

```
AColor Gradient::EvalColor(ShadeContext& sc) {  
    return texout->Filter(uvGen->EvalUVMMap(sc,&mysamp));  
}  
float Gradient::EvalMono(ShadeContext& sc) {  
    return texout->Filter(uvGen-  
>EvalUVMMapMono(sc,&mysamp));  
}
```

### Methods:

#### Prototype:

```
virtual AColor Filter(AColor c) = 0;
```

#### Remarks:

Filters the specified AColor and returns it.

#### Parameters:

**AColor c**

The color to filter.

#### Return Value:

The filtered color as an AColor.

**Prototype:**

**virtual float Filter(float f) = 0;**

**Remarks:**

Filters the specified float value and returns it.

**Parameters:**

**float f**

The value to filter.

**Return Value:**

The filtered value.

**Prototype:**

**virtual Point3 Filter(Point3 p) = 0;**

**Remarks:**

Filters the specified Point3 value and returns it.

**Parameters:**

**Point3 p**

The Point3 to filter.

**Return Value:**

The filtered Point3.

**Prototype:**

**virtual float GetOutputLevel(TimeValue t) = 0;**

**Remarks:**

Returns the output level (amount) at the specified time.

**Parameters:**

**TimeValue t**

The time at which to retrieve the output level.

**Prototype:**

**virtual void SetOutputLevel(TimeValue t, float v) = 0;**

**Remarks:**

Sets the output level at the specified time.

**Parameters:**

**TimeValue t**

The time to set the output level.

**float v**

The value of the output level.

**Prototype:**

**virtual void SetInvert(BOOL onoff)=0;**

**Remarks:**

Sets the state of the 'Invert' toggle in the Output rollup.

**Parameters:**

**BOOL onoff**

TRUE to turn on; FALSE to turn off.

**Prototype:**

**virtual BOOL GetInvert()=0;**

**Remarks:**

Returns the state of the 'Invert' toggle in the Output rollup.

**Return Value:**

TRUE is on; FALSE is off.

**Prototype:**

**virtual void SetRollupOpen(BOOL open)=0;**

**Remarks:**

This method is available in release 2.0 and later only.

Sets the 'Output' rollup page to open or closed.

**Parameters:**

**BOOL open**

TRUE to open the rollup; FALSE to close it.

**Prototype:**

**virtual BOOL GetRollupOpen()=0;**

**Remarks:**

This method is available in release 2.0 and later only.

Returns the open or closed state of the 'Output' rollup.

**Return Value:**

TRUE for open; FALSE for closed.

## Class MultiMtl

See Also: [Class Mtl](#).

```
class MultiMtl : public Mtl
```

### Description:

This class provides access to the developer alterable properties of the 3ds max Multi/Sub-Object material.

### Methods:

#### Prototype:

```
virtual void SetNumSubMtls(int n)=0;
```

#### Remarks:

Sets the number of sub-materials for the multi-material.

#### Parameters:

**int n**

The number of sub-materials.

#### Prototype:

```
virtual void GetSubMtlName(int mtlid, TSTR &s)=0;
```

#### Remarks:

This method is available in release 4.0 and later only.

Retrieves the name of the sub-material whose ID is passed.

#### Parameters:

**int mtlid**

The zero based index of the sub-material.

**TSTR &s**

The name is returned here.

#### Prototype:

```
virtual void SetSubMtlAndName(int mtlid, Mtl *m, TSTR  
&subMtlName)=0;
```

**Remarks:**

This method is available in release 4.0 and later only.

Retrieves the name and pointer to the material for the specified sub-material.

**Parameters:****int mtlid**

The zero based index of the sub-material.

**Mtl \*m**

Points to the sub-material.

**TSTR &subMtlName**

The name is returned here.

# Class StdUVGen

See Also: [Class UVGen](#).

```
class StdUVGen : public UVGen
```

## Description:

This class provides access to the parameters of the 3ds max UVGen class. These are the settings in the 'Coordinates' and 'Noise' rollups such as UV offsets, angle, blur, noise level, etc. All methods of this class are implemented by the system.

## Methods Groups:

The following hyperlinks take you to the beginning of groups of related method within the class.

[Setting properties](#)

[Retrieving properties](#)

## Methods:

### Setting properties

#### Prototype:

```
virtual void SetCoordMapping(int)=0;
```

#### Remarks:

This method is available in release 2.0 and later only.

Sets the mapping type to one of the specified values.

#### Parameters:

**int**

The mapping type. One of the following values:

**UVMAP\_EXPLICIT**

Explicit Texture mapping.

**UVMAP\_SPHERE\_ENV**

Spherical Environment mapping.

**UVMAP\_CYL\_ENV**

Cylindrical Environment mapping.

**UVMAP\_SHRINK\_ENV**

Shrink Wrap Environment mapping.

## **UVMAP\_SCREEN\_ENV**

Screen Environment mapping.

### **Prototype:**

**virtual void SetUOffs(float f, TimeValue t)=0;**

### **Remarks:**

Sets the U Offset setting to the specified value at the time passed.

### **Parameters:**

**float f**

The value to set.

**TimeValue t**

The time at which to set the value.

### **Prototype:**

**virtual void SetVOffs(float f, TimeValue t)=0;**

### **Remarks:**

Sets the V Offset setting to the specified value at the time passed.

### **Parameters:**

**float f**

The value to set.

**TimeValue t**

The time at which to set the value.

### **Prototype:**

**virtual void SetUScl(float f, TimeValue t)=0;**

### **Remarks:**

Sets the U tiling setting to the specified value at the time passed.

### **Parameters:**

**float f**

The value to set.

**TimeValue t**

The time at which to set the value.

**Prototype:**

**virtual void SetVScl(float f, TimeValue t)=0;**

**Remarks:**

Sets the V tiling setting to the specified value at the time passed.

**Parameters:**

**float f**

The value to set.

**TimeValue t**

The time at which to set the value.

**Prototype:**

**virtual void SetAng(float f, TimeValue t)=0;**

**Remarks:**

Sets the angle setting to the specified value at the time passed.

**Parameters:**

**float f**

The value to set in radians.

**TimeValue t**

The time at which to set the value.

**Prototype:**

**virtual void SetUAng(float f, TimeValue t)=0;**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the U Angle setting the specified value at the time passed.

**Parameters:**

**float f**

The angle to set in radians.

**TimeValue t**

The time at which to set the angle.

**Prototype:**

**virtual void SetVAng(float f, TimeValue t)=0;**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the V Angle setting the specified value at the time passed.

**Parameters:**

**float f**

The angle to set in radians.

**TimeValue t**

The time at which to set the angle.

**Prototype:**

**virtual void SetWAng(float f, TimeValue t)=0;**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the W Angle setting the specified value at the time passed.

**Parameters:**

**float f**

The angle to set in radians.

**TimeValue t**

The time at which to set the angle.

**Prototype:**

**virtual void SetBlur(float f, TimeValue t)=0;**

**Remarks:**

Sets the blur to the specified value at the time passed.

**Parameters:**

**float f**

The value to set.

**TimeValue t**

The time at which to set the value.

**Prototype:**

**virtual void SetBlurOffs(float f, TimeValue t)=0;**

**Remarks:**

Sets the blur offset to the specified value at the time passed.

**Parameters:**

**float f**

The value to set.

**TimeValue t**

The time at which to set the value.

**Prototype:**

**virtual void SetNoiseAmt(float f, TimeValue t)=0;**

**Remarks:**

Sets the noise amount to the specified value at the time passed.

**Parameters:**

**float f**

The value to set.

**TimeValue t**

The time at which to set the value.

**Prototype:**

**virtual void SetNoiseSize(float f, TimeValue t)=0;**

**Remarks:**

Sets the noise size to the specified value at the time passed.

**Parameters:**

**float f**

The value to set.

**TimeValue t**

The time at which to set the value.

**Prototype:**

**virtual void SetNoiseLev(int i, TimeValue t)=0;**

**Remarks:**

Sets the noise level to the specified value at the time passed.

**Parameters:****int i**

The value to set.

**TimeValue t**

The time at which to set the value.

**Prototype:****virtual void SetNoisePhs(float f, TimeValue t)=0;****Remarks:**

Sets the noise phase to the specified value at the time passed.

**Parameters:****float f**

The value to set.

**TimeValue t**

The time at which to set the value.

**Prototype:****virtual void SetTextureTiling(int tiling)=0;****Remarks:**

Sets the texture tiling setting.

**Parameters:****int tiling**

See [List of Texture Symmetry Flags](#).

**Prototype:****virtual void SetMapChannel(int i)=0;****Remarks:**

This method is available in release 3.0 and later only.

Sets the mapping channel to the specified value.

**Parameters:****int i**

The channel to set.

**Prototype:****virtual void SetFlag(ULONG f, ULONG val)=0;****Remarks:**

This method is available in release 4.0 and later only.

This method allows you to set the UVGen flags.

**Parameters:****ULONG f**See [List of Texture Symmetry Flags](#).**ULONG val**

The value to set.

**Prototype:****virtual void SetHideMapBackFlag(BOOL b)=0;****Remarks:**

This method is available in release 4.0 and later only.

This method allows you to set the hide map back flag.

**Parameters:****BOOL b**

TRUE to set the flag; FALSE to disable.

**Retrieving properties****Prototype:****virtual int GetCoordMapping(int)=0;****Remarks:**

Retrieves the coordinate mapping type.

**Parameters:****int**

This parameter is not used.

**Return Value:**

One of the following values:

**UVMAP\_EXPLICIT**  
**UVMAP\_SPHERE\_ENV**  
**UVMAP\_CYL\_ENV**  
**UVMAP\_SHRINK\_ENV**  
**UVMAP\_SCREEN\_ENV**

**Prototype:**

**virtual float GetUOffs(TimeValue t)=0;**

**Remarks:**

Retrieves the U Offset setting at the specified time.

**Parameters:**

**TimeValue t**

The time to retrieve the value.

**Prototype:**

**virtual float GetVOffs(TimeValue t)=0;**

**Remarks:**

Retrieves the V Offset setting at the specified time.

**Parameters:**

**TimeValue t**

The time to retrieve the value.

**Prototype:**

**virtual float GetUScl(TimeValue t)=0;**

**Remarks:**

Retrieves the U Tiling setting at the specified time.

**Parameters:**

**TimeValue t**

The time to retrieve the value.

**Prototype:**

**virtual float GetVScl(TimeValue t)=0;**

**Remarks:**

Retrieves the V Tiling setting at the specified time.

**Parameters:**

**TimeValue t**

The time to retrieve the value.

**Prototype:**

**virtual float GetAng(TimeValue t)=0;**

**Remarks:**

Retrieves the angle setting in radians.

**Parameters:**

**TimeValue t**

The time to retrieve the value.

**Prototype:**

**virtual float GetUAng(TimeValue t)=0;**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the U Angle setting (in radians) at the specified time.

**Parameters:**

**TimeValue t**

The time at which to return the angle.

**Prototype:**

**virtual float GetVAng(TimeValue t)=0;**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the V Angle setting (in radians) at the specified time.

**Parameters:**

**TimeValue t**

The time at which to return the angle.

**Prototype:**

**virtual float GetWAng(TimeValue t)=0;**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the W Angle setting (in radians) at the specified time.

**Parameters:****TimeValue t**

The time at which to return the angle.

**Prototype:**

**virtual float GetBlur(TimeValue t)=0;**

**Remarks:**

Retrieves the blur setting at the specified time.

**Parameters:****TimeValue t**

The time to retrieve the value.

**Prototype:**

**virtual float GetBlurOffs(TimeValue t)=0;**

**Remarks:**

Retrieves the blur offset setting at the specified time.

**Parameters:****TimeValue t**

The time to retrieve the value.

**Prototype:**

**virtual float GetNoiseAmt(TimeValue t)=0;**

**Remarks:**

Retrieves the noise amount setting at the specified time.

**Parameters:**

**TimeValue t**

The time to retrieve the value.

**Prototype:**

**virtual float GetNoiseSize(TimeValue t)=0;**

**Remarks:**

Retrieves the noise size setting at the specified time.

**Parameters:**

**TimeValue t**

The time to retrieve the value.

**Prototype:**

**virtual int GetNoiseLev(TimeValue t)=0;**

**Remarks:**

Retrieves the noise level setting at the specified time.

**Parameters:**

**TimeValue t**

The time to retrieve the value.

**Prototype:**

**virtual float GetNoisePhs(TimeValue t)=0;**

**Remarks:**

Retrieves the noise phase setting at the specified time.

**Parameters:**

**TimeValue t**

The time to retrieve the value.

**Prototype:**

**virtual int GetTextureTiling()=0;**

**Remarks:**

Returns the texture tiling flags.

**Return Value:**

See [List of Texture Symmetry Flags](#).

**Prototype:**

```
virtual int GetMapChannel()=0;
```

**Remarks:**

This method is available in release 3.0 and later only.

Returns the mapping channel.

**Prototype:**

```
virtual int GetFlag(ULONG f)=0;
```

**Remarks:**

This method is available in release 4.0 and later only.

This method returns the flag status of the UVGen.

**Parameters:**

**ULONG f**

See [List of Texture Symmetry Flags](#).

**Prototype:**

```
virtual BOOL GetHideMapBackFlag()=0;
```

**Remarks:**

This method is available in release 4.0 and later only.

This method returns the state of the hide map back flag.

## Class StdXYZGen

See Also: [Class XYZGen](#).

```
class StdXYZGen: public XYZGen
```

### Description:

This class is available in release 2.0 and later only.

This class provides access to the parameters of the 3ds max XYZGen class. The XYZGen class puts the 3D 'Coordinates' rollup.

### Methods:

#### Prototype:

```
BOOL IsStdXYZGen();
```

#### Remarks:

This is an implementation of a method of **XYZGen**. This returns TRUE to indicate this is a **StdXYZGen** instance.

#### Prototype:

```
virtual void SetCoordSystem(int s)=0;
```

#### Remarks:

Sets the coordinate system used.

#### Parameters:

**int s**

The coordinate system to set. One of the following values:

**XYZ\_COORDS** - Object XYZ

**UVW\_COORDS** - Explicit Map Channel

**UVW2\_COORDS** - Vertex Color Channel

**XYZ\_WORLD\_COORDS** - World XYZ. This option is available in release 3.0 and later only.

#### Prototype:

```
virtual void SetBlur(float f, TimeValue t)=0;
```

#### Remarks:

Sets the Blur setting to the specified value at the specified time.

**Parameters:**

**float f**

The value to set.

**TimeValue t**

The time at which to set the value.

**Prototype:**

**virtual void SetBlurOffs(float f, TimeValue t)=0;**

**Remarks:**

Sets the Blur Offset setting to the specified value at the specified time.

**Parameters:**

**float f**

The value to set.

**TimeValue t**

The time at which to set the value.

**Prototype:**

**virtual void SetOffs(int axis, float f, TimeValue t)=0;**

**Remarks:**

Sets the specified Offset setting to the specified value at the specified time.

**Parameters:**

**int axis**

The axis to set. **0** for X, **1** for Y, **2** for Z.

**float f**

The value to set.

**TimeValue t**

The time at which to set the value.

**Prototype:**

**virtual void SetScl(int axis, float f, TimeValue t)=0;**

**Remarks:**

Sets the specified Tiling (Scale) setting to the specified value at the specified time.

**Parameters:****int axis**

The axis to set. **0** for X, **1** for Y, **2** for Z.

**float f**

The value to set.

**TimeValue t**

The time at which to set the value.

**Prototype:****virtual void SetAng(int axis, float f, TimeValue t)=0;****Remarks:**

Sets the specified Angle setting to the specified value at the specified time.

**Parameters:****int axis**

The axis to set. **0** for X, **1** for Y, **2** for Z.

**float f**

The value to set.

**TimeValue t**

The time at which to set the value.

**Prototype:****virtual void SetMapChannel(int i)=0;****Remarks:**

This method is available in release 3.0 and later only.

Sets the mapping channel to the specified value.

**Parameters:****int i**

The mapping channel to set.

**Prototype:**

**virtual int GetCoordSystem()=0;**

**Remarks:**

Returns the coordinate system in use. One of the following values:

**XYZ\_COORDS** - Object XYZ

**UVW\_COORDS** - Explicit Map Channel

**UVW2\_COORDS** - Vertex Color Channel

**XYZ\_WORLD\_COORDS** - World XYZ. This option is available in release 3.0 and later only.

**Prototype:**

**virtual float GetBlur(TimeValue t)=0;**

**Remarks:**

Returns the Blur setting at the specified time.

**Parameters:**

**TimeValue t**

The time at which to retrieve the value.

**Prototype:**

**virtual float GetBlurOffs(TimeValue t)=0;**

**Remarks:**

Returns the Blur Offset setting at the specified time.

**Parameters:**

**TimeValue t**

The time at which to retrieve the value.

**Prototype:**

**virtual float GetScl(int axis, TimeValue t)=0;**

**Remarks:**

Returns the Tiling (Scale) setting for the specified axis at the specified time.

**Parameters:**

**int axis**

The axis to set. **0** for X, **1** for Y, **2** for Z.

**TimeValue t**

The time at which to retrieve the value.

**Prototype:**

**virtual float GetAng(int axis, TimeValue t)=0;**

**Remarks:**

Returns the Angle setting for the specified axis at the specified time.

**Parameters:**

**int axis**

The axis to set. **0** for X, **1** for Y, **2** for Z.

**TimeValue t**

The time at which to retrieve the value.

**Prototype:**

**virtual int GetMapChannel()=0;**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the mapping channel.

## Class MtlBaseLib

See Also: [Class ReferenceTarget](#), [Class MtlBaseList](#), [Class MtlBase](#), [Class Interface](#).

```
class MtlBaseLib : public ReferenceTarget, public MtlBaseList
```

### Description:

This class is a library of **MtlBase** entries. To get a list of the currently loaded materials use:

### **MtlBaseLib& Interface::GetMaterialLibrary()**.

When you load a material library, you can enumerate all the materials that it contains. **MtlBaseLib** is subclassed off of **MtlBaseList** which is a **Tab<MtlHandle>**, so for example, you can do the following to work with each material:

```
for (int i=0; i<mlib.Count(); i++) { DoSomething(mlib[i]); }
```

For additional information on this class see the Advanced Topics section in [Working with Materials and Textures](#). All methods of this class are implemented by the system.

### Methods:

#### Prototype:

```
virtual void Remove(MtlBase *m);
```

#### Remarks:

Removes the specified MtlBase from the library.

#### Parameters:

**MtlBase \*m**

The MtlBase to remove.

#### Prototype:

```
virtual void Add(MtlBase *m);
```

#### Remarks:

Adds the specified MtlBase to the library.

#### Parameters:

**MtlBase \*m**

The MtlBase to add.

**Prototype:**

**virtual void RemoveDuplicates();**

**Remarks:**

Removes all duplicate MtlBases from the library.

**Prototype:**

**void DeleteAll();**

**Remarks:**

Removes all MtlBases from the library and deletes all references.

**Prototype:**

**~MtlBaseLib();**

**Remarks:**

Destructor. All references are deleted.

## List of Texture Map Indices

See Also: [Class MtlBase](#), [Class Shader](#).

The Standard Material texture map index used by Blinn, Phong, Constant, Metal (defined in `\MAXSDK\INCLUDE\STDMAT.H`). One of the following values:

**ID\_AM** - Ambient (value 0)

**ID\_DI** - Diffuse (value 1)

**ID\_SP** - Specular (value 2)

**ID\_SH** - Shininess (value 3). In R3 and later this is called Glossiness.

**ID\_SS** - Shininess strength (value 4). In R3 and later this is called Specular Level.

**ID\_SI** - Self-illumination (value 5)

**ID\_OP** - Opacity (value 6)

**ID\_FI** - Filter color (value 7)

**ID\_BU** - Bump (value 8)

**ID\_RL** - Reflection (value 9)

**ID\_RR** - Refraction (value 10)

**ID\_DP** - Displacement (value 11)

## Class MultiTex

See Also: [Class Texmap](#), [Class Color](#), [Working with Materials and Textures](#).

```
class MultiTex : public Texmap
```

### Description:

This class provides access to the developer settable properties of the 3ds max multi-textures such as Composite, Tint and Mix. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

```
virtual void SetNumSubTexmaps(int n);
```

#### Remarks:

Sets the number of sub-textmaps for this texmap.

#### Parameters:

**int n**

The number of sub-textmaps.

#### Prototype:

```
virtual void SetColor(int i, Color c, TimeValue t=0);
```

#### Remarks:

Sets the color of the 'i-th' sub-textmap to the specified color at the time passed.

#### Parameters:

**int i**

The index of the sub-textmap to set.

**Color c**

The color to set.

**TimeValue t=0**

The time at which to set the color.

# Class GradTex

See Also: [Class MultiTex](#), [Class TextureOutput](#).

class GradTex: public MultiTex

## Description:

This class provides access to the 3ds max Gradient texture. All methods of this class are implemented by the system.

## Methods:

### Prototype:

**virtual StdUVGen\* GetUVGen()=0;**

### Remarks:

Retrieves a pointer to the **StdUVGen** interface for this texture. This allows access to the mapping parameters such as UV offsets, blur, angle, noise level, etc.

### Prototype:

**virtual TextureOutput\* GetTexout()=0;**

### Remarks:

Retrieves a pointer to the **TextureOutput** for this texture. This allows access to the RGB level and output and the output amount.

### Prototype:

**virtual void SetMidPoint(float m, TimeValue t=0);**

### Remarks:

Sets the 'Color 2 Position' setting at the time passed.

### Parameters:

**float m**

The value to set in the range of 0.0 to 1.0.

**TimeValue t=0**

The time to set the value.

## Class StdFog

See Also: [Class Atmospheric](#), [Class Texmap](#).

```
class StdFog : public Atmospheric
```

### Description:

This class provides access to the settings of the Standard Fog Atmospheric plugin of 3ds max. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

```
virtual void SetColor(Color c, TimeValue t)=0;
```

#### Remarks:

Sets the fog color.

#### Parameters:

**Color c**

The color to set.

**TimeValue t**

The time to set the color.

#### Prototype:

```
virtual void SetUseMap(BOOL onoff)=0;
```

#### Remarks:

Sets the state of the 'Use Map' toggle.

#### Parameters:

**BOOL onoff**

TRUE for on; FALSE for off.

#### Prototype:

```
virtual void SetUseOpac(BOOL onoff)=0;
```

#### Remarks:

Sets the state of the use opacity map toggle.

#### Parameters:

**BOOL onoff**

TRUE for on; FALSE for off.

**Prototype:**

```
virtual void SetColorMap(Texture *tex)=0;
```

**Remarks:**

Set the color map used.

**Parameters:**

**Texture \*tex**

The map to set.

**Prototype:**

```
virtual void SetOpacMap(Texture *tex)=0;
```

**Remarks:**

Set the opacity map used.

**Parameters:**

**Texture \*tex**

The map to set.

**Prototype:**

```
virtual void SetFogBackground(BOOL onoff)=0;
```

**Remarks:**

Sets the state of the fog background toggle.

**Parameters:**

**BOOL onoff**

TRUE for on; FALSE for off.

**Prototype:**

```
virtual void SetType(int type)=0;
```

**Remarks:**

Set the type of fog, layered or standard.

**Parameters:**

**int type**

The type of fog: 0 = Standard; 1 = Layered.

**Prototype:**

**virtual void SetNear(float v, TimeValue t)=0;**

**Remarks:**

Sets the standard fog near percentage.

**Parameters:**

**float v**

The value to set in the range 0 to 1.

**TimeValue t**

The time to set the value.

**Prototype:**

**virtual void SetFar(float v, TimeValue t)=0;**

**Remarks:**

Sets the standard fog far percentage.

**Parameters:**

**float v**

The value to set in the range 0 to 1.

**TimeValue t**

The time to set the value.

**Prototype:**

**virtual void SetTop(float v, TimeValue t)=0;**

**Remarks:**

Sets the layered fog top value.

**Parameters:**

**float v**

The value to set.

**TimeValue t**

The time to set the value.

**Prototype:**

**virtual void SetBottom(float v, TimeValue t)=0;**

**Remarks:**

Sets the layered fog bottom value.

**Parameters:**

**float v**

The value to set.

**TimeValue t**

The time to set the value.

**Prototype:**

**virtual void SetDensity(float v, TimeValue t)=0;**

**Remarks:**

Sets the layered fog density setting.

**Parameters:**

**float v**

The value to set (> 0).

**TimeValue t**

The time to set the value.

**Prototype:**

**virtual void SetFalloffType(int tv)=0;**

**Remarks:**

Sets the falloff type to top, bottom or none.

**Parameters:**

**int tv**

One of the following values:

**FALLOFF\_TOP**

**FALLOFF\_BOTTOM**

**FALLOFF\_NONE**

**Prototype:**

**virtual void SetUseNoise(BOOL onoff)=0;**

**Remarks:**

Sets the state of the 'Horizon Noise' toggle.

**Parameters:**

**BOOL onoff**

TRUE for on; FALSE for off.

**Prototype:**

**virtual void SetNoiseScale(float v, TimeValue t)=0;**

**Remarks:**

Set the 'Horizon Noise Size' setting.

**Parameters:**

**float v**

The value to set.

**TimeValue t**

The time to set the value.

**Prototype:**

**virtual void SetNoiseAngle(float v, TimeValue t)=0;**

**Remarks:**

Set the 'Horizon Noise Angle' setting.

**Parameters:**

**float v**

The value to set in radians.

**TimeValue t**

The time to set the value.

**Prototype:**

**virtual void SetNoisePhase(float v, TimeValue t)=0;**

**Remarks:**

Set the 'Horizon Noise Phase' setting.

**Parameters:**

**float v**

The value to set.

**TimeValue t**

The time to set the value.

**Prototype:**

**virtual Color GetColor(TimeValue t)=0;**

**Remarks:**

Returns the fog color at the time passed.

**Parameters:**

**TimeValue t**

The time to get the color.

**Prototype:**

**virtual BOOL GetUseMap()=0;**

**Remarks:**

Returns the state of the 'Use Map' toggle.

**Return Value:**

TRUE is on; FALSE is off.

**Prototype:**

**virtual BOOL GetUseOpac()=0;**

**Remarks:**

Returns the state of the use opacity map toggle.

**Return Value:**

TRUE is on; FALSE is off.

**Prototype:**

**virtual Texmap \*GetColorMap()=0;**

**Remarks:**

Returns the color map used.

**Prototype:**

**virtual Texmap \*GetOpacMap()=0;**

**Remarks:**

Returns the opacity map used.

**Prototype:**

**virtual BOOL GetFogBackground()=0;**

**Remarks:**

Returns the state of the fog background toggle.

**Return Value:**

TRUE is on; FALSE is off.

**Prototype:**

**virtual int GetType()=0;**

**Remarks:**

Returns the type of fog, layered or standard.

**Return Value:**

The type of fog: 0 = Standard; 1 = Layered.

**Prototype:**

**virtual float GetNear(TimeValue t)=0;**

**Remarks:**

Returns the standard fog near percentage.

**Parameters:**

**TimeValue t**

The time to get the value.

**Prototype:**

**virtual float GetFar(TimeValue t)=0;**

**Remarks:**

Returns the standard fog far percentage.

**Parameters:**

**TimeValue t**

The time to get the value.

**Prototype:**

**virtual float GetTop(TimeValue t)=0;**

**Remarks:**

Returns the layered fog top value.

**Parameters:**

**TimeValue t**

The time to get the value.

**Prototype:**

**virtual float GetBottom(TimeValue t)=0;**

**Remarks:**

Returns the layered fog bottom value.

**Parameters:**

**TimeValue t**

The time to get the value.

**Prototype:**

**virtual float GetDensity(TimeValue t)=0;**

**Remarks:**

Returns the layered fog density setting.

**Parameters:**

**TimeValue t**

The time to get the value.

**Prototype:**

**virtual int GetFalloffType()=0;**

**Remarks:**

Returns the falloff type to top, bottom or none.

**Return Value:**

One of the following values:

**FALLOFF\_TOP**

**FALLOFF\_BOTTOM**

**FALLOFF\_NONE**

**Prototype:**

**virtual BOOL GetUseNoise()=0;**

**Remarks:**

Returns the state of the 'Horizon Noise' toggle.

**Return Value:**

TRUE is on; FALSE is off.

**Prototype:**

**virtual float GetNoiseScale(TimeValue t)=0;**

**Remarks:**

Returns the 'Horizon Noise Size' setting.

**Parameters:**

**TimeValue t**

The time to get the value.

**Prototype:**

**virtual float GetNoiseAngle(TimeValue t)=0;**

**Remarks:**

Returns the 'Horizon Noise Angle' setting.

**Parameters:**

**TimeValue t**

The time to get the value.

**Prototype:**

**virtual float GetNoisePhase(TimeValue t)=0;**

**Remarks:**

Returns the 'Horizon Noise Phase' setting.

**Parameters:**

**TimeValue t**

The time to get the value.

## Class AdjEdgeList

See Also: [Class DWORDTab](#), [Template Class Tab](#), [Class MEdge](#), [Class Mesh](#).

class AdjEdgeList

### Description:

This class represents an edge adjacency list for meshes. For any given vertex in a mesh this class has a table of DWORDS. These DWORDS are indices into the edge table (**Tab<MEdge> edge**). The **edges** table stores the edges adjacent to the vertex. So, each vertex has a list of indices into the edge list that give it the list of edges adjacent to the vertex. All methods of the class are implemented by the system.

### Data Members:

public:

**DWORDTab \*list;**

This is an array of DWORDTabs, one per vertex. The Tab is a list of indices into the edge list, one for each edge adjacent to the vertex.

**Tab<MEdge> edges;**

The table of edges.

**int nverts;**

The size of **list**.

### Methods:

### Prototype:

**AdjEdgeList(Mesh& amesh);**

### Remarks:

Constructor. Builds an adjacency list from the specified mesh. This class require the mesh to be constructed so that each edge has exactly one or two faces.

### Parameters:

**Mesh& amesh**

The mesh to build the adjacency list from.

### Prototype:

**~AdjEdgeList();**

**Remarks:**

Destructor. Deletes the list.

**Prototype:**

**int FindEdge(DWORD v0, DWORD v1);**

**Remarks:**

Finds the edge in the edge table that has the two specified vertices.

**Parameters:**

**DWORD v0, DWORD v1**

The vertices.

**Return Value:**

The index into the edge table.

**Prototype:**

**int FindEdge(DWORDTab& vmap, DWORD v0, DWORD v1);**

**Remarks:**

This method is used internally as part of the Optimize modifier.

**Prototype:**

**void TransferEdges(DWORD from, DWORD to, DWORD  
except1,  
DWORD except2, DWORD del);**

**Remarks:**

This method is used internally as part of the Optimize modifier.

**Prototype:**

**void RemoveEdge(DWORD from, DWORD e);**

**Remarks:**

This method is used internally as part of the Optimize modifier.

**Prototype:**

**void OrderVertEdges(DWORD v, Face \*faces, Tab<DWORD> \*flist=NULL);**

**Remarks:**

This method is available in release 3.0 and later only.

Each vertex has a list of edges in the data member AdjEdgeList::list. This method reorders the elements of that list so that the edges are in order going around the vertex. The direction should be counterclockwise as seen from outside the mesh surface, though this necessarily breaks down with some rats' nest situations.

**Parameters:**

**DWORD v**

The vertex whose edges should be ordered.

**Face \*faces**

A pointer to the faces for this mesh.

**Tab<DWORD> \*flist=NULL**

If non-NULL, this points to an array where the faces using this vertex should be stored (in order).

**Prototype:**

**void OrderAllEdges(Face \*faces);**

**Remarks:**

This method is available in release 3.0 and later only.

This method simply calls **OrderVertEdges()** on all the vertices.

**Parameters:**

**Face \*faces**

A pointer to the faces for this mesh.

**Prototype:**

**void GetFaceList(DWORD v, Tab<DWORD> & flist);**

**Remarks:**

This method is available in release 3.0 and later only.

This places a list of all faces using this vertex in flist. The faces are in no

particular order.

**Parameters:**

**DWORD v**

The vertex to check.

**Tab<DWORD> & flist**

The table of faces.

**Prototype:**

**void AddEdgeToVertex(DWORD v,DWORD e);**

**Remarks:**

This method is available in release 3.0 and later only.

Appends the specified edge to the specified vertex.

**Parameters:**

**DWORD v**

The vertex the edge is added to.

**DWORD e**

The edge to add.

**Prototype:**

**void AddEdge(DWORD fi, DWORD v1, DWORD v2);**

**Remarks:**

This is used internally.

**Operators:**

**Prototype:**

**DWORDTab& operator[](int i);**

**Remarks:**

Array access operator. Returns the 'i-th' list element.

## Class AdjFaceList

See Also: [Class AdjFace](#), [Class AdjEdgeList](#).

class AdjFaceList

### Description:

This class represents a face adjacency list for meshes. This class require the mesh to be constructed so that each edge has exactly one or two faces. It will work with other meshes but may give misleading results (developers may wish to call **mesh.RemoveDegenerateFaces()** to attempt to correct the mesh to work with this class). All methods of this class are implemented by the system.

### Data Members:

public:

**Tab<AdjFace> list;**

The table of adjacent faces, one for each face.

### Methods:

#### Prototype:

**AdjFaceList(Mesh& mesh,AdjEdgeList& el);**

#### Remarks:

Constructor. The mesh and edge list passed define the mesh used to construct the face list.

### Operators:

#### Prototype:

**AdjFace& operator[](int i);**

#### Remarks:

Access operator. Returns the set of adjacent face for the i-th face.

# Class FaceElementList

See Also: [Class AdjEdgeList](#), [Class AdjFaceList](#).

class FaceElementList

## Description:

This class may be used to access the various elements that compose a mesh. Given a Mesh object **mesh**, the calls below allow a developer to access the element number for a particular face, and the total number of elements in the mesh.

**AdjEdgeList ae(mesh);**

**AdjFaceList af(mesh, ae);**

**FaceElementList elem(mesh, af);**

All methods of this class are implemented by the system.

## Data Members:

public:

**DWORDTab elem;**

This gives the element number for a particular face, i.e. **elem[i]** gives the element number for face **i**.

**DWORD count;**

The total number of elements.

## Methods:

### Prototype:

**FaceElementList(Mesh &mesh, AdjFaceList& af);**

### Remarks:

Constructor.

### Parameters:

**Mesh &mesh**

The mesh that the element list is being built for.

**AdjFaceList& af**

The face list for the mesh.

## Operators:

**Prototype:**

**DWORD operator[](int i);**

**Remarks:**

Accesses the i-th element of the table.

# Class FaceClusterList

See Also: [Class AdjFaceList](#), [Class BitArray](#).

class FaceClusterList

## Description:

This is a list of face "clusters" for a given mesh. A typical application would be in Edit(able) Mesh, where the user has selected two separate groups of faces on different parts of the mesh and wants to extrude them both, or rotate both around their local centers. Each "cluster" is a contiguous group of selected faces. Like AdjEdgeLists and AdjFaceLists, this class is only defined in relation to some mesh.

This class may be used to group faces together based on the angle between their normals or by their selection status.

All methods of this class are implemented by the system. Note that the functionality provided by this class is not available in the 1.0 release of the SDK. Later releases (1.1, 1.2, etc) do support it.

## Data Members:

public:

### **DWORDTab clust;**

The cluster number (id), one for each face. Non-selected faces have **UNDEFINED** for their id.

The cluster IDs of all the faces -- this table has size **mesh::numFaces**. **clust[i]** is **UNDEFINED** if face **i** is not in any cluster (ie is unselected).

### **DWORD count;**

The number of clusters.

## Methods:

### Prototype:

**FaceClusterList(Mesh \*mesh, AdjFaceList& adj, float angle, BOOL useSel);**

### Remarks:

Constructor. This version separates clusters using a minimum angle and optionally the selection set. A developer creates one of these cluster lists by

specifying the mesh, the face list and an angle. What is built is a cluster number for each face identifying what cluster it is in.

For example, if you create one of these for a sphere and set the angle threshold to 90 degrees, you would get back one cluster, and the cluster id for everything would be 0. If you ran it on a box, and you set the angle to < 90 degrees, you would get back 6 ids. Two faces in the box would have id 0, two would have id 1, etc.

**Parameters:**

**Mesh \*mesh**

The mesh to create the list for.

**AdjFaceList& adj**

The face list for this mesh.

**float angle**

The maximum angle (in radians) that can be used in joining adjacent faces into the same cluster.

**BOOL useSel**

If FALSE, selection is ignored and all faces are grouped into clusters by angle. If TRUE, only selected faces are grouped into clusters, but angle is still relevant. Non-selected faces will have **UNDEFINED** for their id.

**Prototype:**

**FaceClusterList(BitArray& fsel, AdjFaceList& adj);**

**Remarks:**

Constructor. This version separates clusters using the selection set. In this case a cluster is defined as a set of faces that are selected and are adjacent. For example you could have a sphere with some faces selected on one side, and another group of faces selected on the other side. Each group of adjacent and selected faces would comprise clusters within the mesh. This is used for example by the axis tripods in 3ds max where each selected group of faces gets their own coordinate system.

In this case the unselected faces will not be in any cluster. These store the value **UNDEFINED** for their id.

**Parameters:**

**BitArray& fsel**

This bit array defines the face selected state that the clusters will be grouped by. Each bit in the bit array corresponds to the parallel index in the mesh face table.

### **AdjFaceList& adj**

The face list for this mesh.

### **Prototype:**

```
void MakeVertCluster(Mesh &mesh, Tab<DWORD> &vclust);
```

### **Remarks:**

This method is available in release 3.0 and later only.

Creates a list of cluster IDs for vertices.

### **Parameters:**

#### **Mesh &mesh**

The mesh associated with this FaceClusterList.

#### **Tab<DWORD> &vclust**

This is where the output goes: vclust is set to size mesh.numVerts, and the value of each entry in this table tells which cluster the vertex has been assigned to, based on the faces it's on. If vertex "v" is not in any clusters (ie none of the faces that use it are in any clusters), vclust[v] is UNDEFINED.

In cases where a vertex is in two clusters, the larger face index is dominant. (In other words, if a vertex 6 is on faces 2 and 7, which are in two separate clusters, and face 9, which isn't in any cluster, it gets its cluster ID from face 7. This can happen if two selection regions touch at a vertex instead of along an edge.)

### **Prototype:**

```
void GetNormalsCenters(Mesh &mesh, Tab<Point3> &norm,  
Tab<Point3> &ctr);
```

### **Remarks:**

This method is available in release 3.0 and later only.

Computes average normals and centers for all face clusters. Within a cluster, normals are weighted by the area of the face -- a face twice as big contributes twice as much to the cluster normal. (Mathematically, we just total up the non-normalized cross-products of each face, which are equivalent to  $2 \cdot (\text{area}) \cdot (\text{face}$

normal). Then we normalize the cluster total.) Face centers are directly averaged, without weighting.

**Parameters:**

**Mesh &mesh**

The mesh associated with this FaceClusterList.

**Tab<Point3> &norm**

The average normal table to store the results in. This is set to size FaceClusterList::count, the number of clusters.

**Tab<Point3> &ctr**

The average center table to store the results in. This is set to size FaceClusterList::count, the number of clusters.

**Prototype:**

**void GetBorder(DWORD clustID, AdjFaceList &af,  
Tab<DWORD> &cbord);**

**Remarks:**

This method is available in release 3.0 and later only.

Each face cluster is a set of faces connected by shared edges. This method finds a cluster's boundary, which can be expressed as a sequence of edges on faces in the cluster (where the other side of each edge has no face or has a face not in this cluster). If there is more than one boundary, as for instance in the faces that make up the letter "o" in a ShapeMerge with Text, both boundaries are returned in no particular order.

**Parameters:**

**DWORD clustID**

The cluster to get the border of.

**AdjFaceList &af**

The adjacent face list associated with this FaceClusterList.

**Tab<DWORD> &cbord**

The table where the output goes. If there are no borders (as for instance in a sphere with all faces selected), it remains empty. Otherwise, this is filled with a series of edge indices, then an UNDEFINED to mark the end of each border. So for instance if this cluster represents the front face of a default box, cbord will contain 4 edge indices and an UNDEFINED. If the cluster represents all

the side faces of a cylinder, but not the top or bottom, there are two borders: on 24-sided cylinder, you'd get the 24 edge indices representing the bottom lip of the cylinder, then an UNDEFINED, then the 24 edge indices representing the top lip, followed by another UNDEFINED. (As elsewhere, edges are indexed by  $face*3+eid$ , where  $face$  is the face (in the cluster) the edge is on, and  $eid$  is the index of the edge on that face.)

**Prototype:**

```
void GetOutlineVectors(Mesh & m, AdjFaceList &af,  
Tab<Point3> &cnorms, Tab<Point3> &odir);
```

**Remarks:**

This method is available in release 3.0 and later only.

This creates "outline" directions for the vertices on the edge of the clusters. These are used in Edit(able) Mesh's new "Bevel" operation (when you Bevel by "Group"). These vectors, which are all perpendicular to the cluster normals, point in the direction and speed vertices must travel in order to move the edges out at a consistent rate without changing the shape of the outline of the cluster. To see how this works, create a Prism in 3ds max ("Extended Primitives") with dimensions like 20 x 40 x 40 x 40, and apply an Edit Mesh. Select all the faces on the top of the prism, and spin the Bevel spinner up and down. Notice that the vertex at the sharpest point moves faster than the other 2, but that the edges all remain parallel to their original positions. The essence of Outlining is that the edges move at a constant rate, and the vertices move faster or slower to make this happen. (This strategy is also used in the Bevel and Path Bevel modifiers.)

**Parameters:**

**Mesh & m**

The mesh associated with this FaceClusterList

**AdjFaceList &af**

The adjacent face list associated with this FaceClusterList

**Tab<Point3> &cnorms**

The cluster normals, as computed by GetNormalsCenters

**Tab<Point3> &odir**

A table to put the outline direction result in. This is set to size mesh.numVerts.

Entries for vertices that are not on a cluster border are all (0,0,0). Entries for cluster border vertices are scaled, such that if you move all vertices the specified amount, each cluster's border edges will move by one 3ds max unit.

**Operators:**

**Prototype:**

**DWORD operator[](int i)**

**Remarks:**

Access operator. Returns the cluster ID for face **i**.

## Class NURBSObject

See Also: [Class NURBSSurface](#), [Class NURBSControlVertex](#), [Class NURBSPoint](#), [Class NURBSCurve](#), [Class NURBSSet](#), [List of NURBSObjects Types](#).

class NURBSObject

### Description:

This class is available in release 2.0 and later only.

This is the base class for many of the other classes in the NURBS API. It provides a common set of methods that each of them use. It has methods to get and set the name of the item, and methods to deal with error processing. To determine the type of object the derived class is use the method **GetType()**.

All methods of this class are implemented by the system.

### Data Members:

protected:

**TCHAR mName[NURBS\_NAME\_SIZE];**

The name of the NURBS object. The maximum length of this name including the terminating NULL is specified using the following #define: **#define NURBS\_NAME\_SIZE 80**

**NURBSType mType;**

The type of NURBS object this is. See [List of NURBSObjects Types](#).

**NURBSKind mKind;**

The kind of NURBS object this is. See [List of NURBSObject Kinds](#).

**NURBSId mId;**

This is the ID of the NURBS object used to specify the parent object in many of the dependent point, curves and surface classes. This ID is not persistent across sessions and should not be saved to a file. A NURBSId is defined as follows: **typedef unsigned long NURBSId;**

**Object \*mpObject;**

When an object is instantiated in the 3ds max scene this pointer is filled in. For example, if you use the function **CreateNURBSObject()** and pass a **NURBSSet**, this data member is filled in to point to the actual editable NURBS object in 3ds max that this **NURBSObject** is a part of.

**NURBSSet\* mpNSet;**

When an object is instantiated in the 3ds max scene this pointer is filled in. This points to the **NURBSSet** this object is contained within.

**BOOL mSelected;**

TRUE if the object is selected; otherwise FALSE.

**Methods:**

protected:

**Prototype:**

**void Clean(NURBSIdTab ids);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the **mId** to 0 and **mpObject** pointer to NULL. This effectively breaks the relation between this **NURBSObject** and a **NURBSSet**.

**Parameters:**

**NURBSIdTab ids**

This parameter is not used.

public:

**Prototype:**

**NURBSObject();**

**Remarks:**

Constructor. The data members are initialized as follows:

**mName[0] = '\0';**

**mId = 0;**

**mpObject = NULL;**

**mpNSet = NULL;**

**mSelected = FALSE;**

**Prototype:**

**~NURBSObject();**

**Remarks:**

Destructor.

**Prototype:**

**void SetName(TCHAR \*name);**

**Remarks:**

Sets the name of the item to the specified string.

**Parameters:**

**TCHAR \*name**

The name to set.

**Prototype:**

**TCHAR \*GetName();**

**Remarks:**

Returns a pointer to the name of the item.

**Prototype:**

**NURBStype GetType();**

**Remarks:**

Returns the specific type of object this is. See [List of NURBSObjects Types](#).

**Prototype:**

**NURBStype GetKind();**

**Remarks:**

Returns the specific kind of object this is. See [List of NURBSObjects Kinds](#).

**Prototype:**

**NURBSId GetId();**

**Remarks:**

Returns the **NURBSId** of this **NURBSObject**. This ID is not persistent across sessions and should not be saved to a file.

**Prototype:**

**void SetId(NURBSId id);**

**Remarks:**

Sets the **NURBSId** of this **NURBSObject**.

**Parameters:**

**NURBSId id**

The ID to set.

**Prototype:**

**int GetIndex();**

**Remarks:**

Returns the index in the **NURBSSet** of this object or -1 if there isn't an associated **NURBSSet**.

**Prototype:**

**void SetNSet(NURBSSet \*nset);**

**Remarks:**

Sets the pointer to the **NURBSSet** maintained by the object.

**Parameters:**

**NURBSSet \*nset**

The pointer to set.

**Prototype:**

**NURBSSet\* GetNSet();**

**Remarks:**

Returns a pointer to the **NURBSSet** maintained by this class.

**Prototype:**

**void SetObject(Object \*object);**

**Remarks:**

Sets the pointer to the 3ds max editable NURBS object maintained by this object.

**Parameters:**

## **Object \*object**

The pointer to set.

### **Prototype:**

**Object\* GetMAXObject();**

### **Remarks:**

Returns a pointer to the **Object** maintained by this class.

### **Prototype:**

**BOOL IsSelected();**

### **Remarks:**

Returns TRUE if the object is selected; otherwise FALSE.

### **Prototype:**

**void SetSelected(BOOL set);**

### **Remarks:**

Sets the object to selected or not.

### **Parameters:**

**BOOL set**

TRUE to select the object; FALSE to de-select it.

### **Operators:**

#### **Prototype:**

**NURBSObject & operator=(const NURBSObject& pt);**

#### **Remarks:**

Assignment operator.

#### **Parameters:**

**const NURBSObject& pt**

The NURBSObject to assign.

## Class NURBSSurface

See Also: [Class NURBSObject](#), [NURBSTextureSurface](#), [Template Class Tab](#), [Class NURBSTextureChannelSet](#).

```
class NURBSSurface : public NURBSObject
```

### Description:

This class is available in release 2.0 and later only.

This class describes the properties of a NURBS surface. This includes its material ID, texture/tiling options, renderable state, open/closed state, and normal inverted state. The **Evaluate()** method is used to compute points and tangents on the surface.

All methods of this class are implemented by the system.

### Friend Classes:

```
friend class NURBSCVSurface;  
friend class NURBSPointSurface;  
friend class NURBSBlendSurface;  
friend class NURBSNBlendSurface;  
friend class NURBSOffsetSurface;  
friend class NURBSXFormSurface;  
friend class NURBSMirrorSurface;  
friend class NURBSCapSurface;  
friend class NURBSIsoCurve;  
friend class NURBSProjectVectorCurve;  
friend class NURBSProjectNormalCurve;  
friend class NURBSSurfSurfIntersectionCurve;  
friend class NURBSCurveOnSurface;  
friend class NURBSPointCurveOnSurface;  
friend class NURBSMultiCurveTrimSurface;  
friend class NURBSTextureChannel;  
friend class NURBSTextureChannelSet;
```

## Data Members:

protected:

### **BOOL mGenUVs;**

TRUE if the 'Generate Mapping Coordinates' checkbox is on; otherwise FALSE.

### **BOOL mFlipNormals;**

TRUE if the surface normals are inverted; otherwise FALSE.

### **BOOL mRenderable;**

TRUE if the surface may be rendered; otherwise FALSE.

### **int mMatID;**

The material ID for the surface.

### **BOOL mClosedInU, mClosedInV;**

The surface closed flags.

### **NURBSTextureChannelSet mTextureChannelSet;**

This data member is available in release 3.0 and later only.

This is the set of texture mapping channels used by this surface.

### **BOOL mFlipNormals;**

TRUE if normals are flipped for the surface; otherwise FALSE.

### **BOOL mRenderable;**

TRUE if the surface is renderable; otherwise FALSE.

### **int mMatID;**

The zero based material ID for the surface.

### **BOOL mClosedInU**

TRUE if the surface is closed in U; otherwise FALSE.

### **BOOL mClosedInV;**

TRUE if the surface is closed in V; otherwise FALSE.

### **TessApprox \*mpVTess;**

This data member is available in release 3.0 and later only.

Points to the TessApprox object for the viewport (optional).

### **TessApprox \*mpRTess;**

This data member is available in release 3.0 and later only.

Points to the TessApprox object for the production renderer (optional).

### **TessApprox \*mpRTessDisp;**

This data member is available in release 3.0 and later only.  
Points to the TessApprox object for displacement mapping (optional).

**TessApprox \*mpVTessCurve;**

This data member is available in release 3.0 and later only.  
Points to the TessApprox object for tesselating curves in the viewports(optional).

**TessApprox \*mpRTessCurve;**

This data member is available in release 3.0 and later only.  
Points to the TessApprox object for tesselating curves in the production renderer (optional).

**Methods:**

**Prototype:**

**NURBSSurface();**

**Remarks:**

Constructor. The surface is initialized as follows:

**mKind = kNURBSSurface;**

**mFlipNormals = FALSE;**

**mRenderable = TRUE;**

**mMatID = 1;**

**mpVTess = NULL;**

**mpRTess = NULL;**

**mpRTessDisp = NULL;**

**mpVTessCurve = NULL;**

**mpRTessCurve = NULL;**

**Prototype:**

**~NURBSSurface();**

**Remarks:**

Destructor. Any **TessApprox** objects are freed.

**Prototype:**

**BOOL Renderable();**

**Remarks:**

Returns TRUE if the surface is renderable; otherwise FALSE.

**Prototype:**

**void Renderable(BOOL state);**

**Remarks:**

Sets the renderable flag to the specified state.

**Parameters:**

**BOOL state**

TRUE for renderable; FALSE for non-renderable.

**Prototype:**

**BOOL FlipNormals();**

**Remarks:**

Returns the state of the flip normals flag.

**Prototype:**

**void FlipNormals(BOOL state);**

**Remarks:**

Set the state of the flip normals flag.

**Parameters:**

**BOOL state**

TRUE if the normals should be flipped; FALSE for not flipped.

**Prototype:**

**BOOL GenerateUVs(int channel = 0);**

**Remarks:**

Returns TRUE if the generate UV mapping coordinates flag is set for the specified channel; otherwise FALSE.

**Parameters:**

**int channel = 0**

The channel. This is a number in the range 0 and 98 which correspond to 1 to 99 in the user interface.

**Prototype:**

**void SetGenerateUVs(BOOL state, int channel = 0);**

**Remarks:**

Sets the state of the generate UV mapping coordinates flag.

**Parameters:**

**BOOL state**

TRUE for on; FALSE for off.

**int channel = 0**

The channel. This is a number in the range 0 and 98 which correspond to 1 to 99 in the user interface.

**Prototype:**

**int MatID();**

**Remarks:**

Returns the material ID.

**Prototype:**

**void MatID(int id);**

**Remarks:**

Sets the materials ID to the specified value.

**Parameters:**

**int id**

Specifies the material ID to set.

**Prototype:**

**Point2 GetTextureUVs(TimeValue t, int i, int channel = 0);**

**Remarks:**

Returns the specified texture coordinate.

**Parameters:**

**TimeValue t**

The time to get the texture UVs.

**int i**

The zero based index of the coordinate to return. This value must be  $\geq 0$  and  $< 4$ .

**int channel = 0**

The channel. This is a number in the range 0 and 98 which correspond to 1 to 99 in the user interface.

**Prototype:**

**void SetTextureUVs(TimeValue t, int i, Point2 pt, int channel = 0);**

**Remarks:**

Set the specified texture coordinate to the specified value.

**Parameters:**

**TimeValue t**

The time to set the texture UVs.

**int i**

The zero based index of the texture coordinate to set. This value must be  $\geq 0$  and  $< 4$ .

**Point2 pt**

The texture coordinate value to set.

**int channel = 0**

The channel. This is a number in the range 0 and 98 which correspond to 1 to 99 in the user interface.

**Prototype:**

**void GetTileOffset(TimeValue t, float &ut, float &vt, float &uo, float &vo, int channel = 0);**

**Remarks:**

Retrieves the texture tiling and offset values for the surface.

**Parameters:**

**TimeValue t**

The time to get the tile offset.

**float &ut**

The tiling value in the U direction.

**float &vt**

The tiling value in the V direction.

**float &uo**

The offset value in the U direction.

**float &vo**

The offset value in the V direction.

**int channel = 0**

The channel. This is a number in the range 0 and 98 which correspond to 1 to 99 in the user interface.

**Prototype:**

```
void SetTileOffset(TimeValue t, float ut, float vt, float uo, float vo,  
int channel = 0);
```

**Remarks:**

Sets the texture tiling and offset values for the surface.

**Parameters:****TimeValue t**

The time to set the tile offset.

**float ut**

The tiling value in the U direction.

**float vt**

The tiling value in the V direction.

**float uo**

The offset value in the U direction.

**float vo**

The offset value in the V direction.

**int channel = 0**

The channel. This is a number in the range 0 and 98 which correspond to 1 to 99 in the user interface.

**Prototype:**

**NURBSTextureSurface& GetTextureSurface(int channel);**

**Remarks:**

This method is available in release 3.0 and later only.

Returns a reference to the texture surface used by this surface for the specified channel.

**Parameters:**

**int channel**

The channel. This is a number in the range 0 and 98 which correspond to 1 to 99 in the user interface.

**Prototype:**

**void SetTextureSurface(int channel, NURBSTextureSurface& texSurf);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the texture surface used by this surface for the specified channel.

**Parameters:**

**int channel**

The channel. This is a number in the range 0 and 98 which correspond to 1 to 99 in the user interface.

**NURBSTextureSurface& texSurf**

The texture surface to set.

**Prototype:**

**int NumChannels();**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the number of channels used by the surface.

**Prototype:**

**int GetChannelFromIndex(int index);**

**Remarks:**

This method is available in release 3.0 and later only.

Returns a channel number corresponding to the specified index into the **NURBSTextureChannelSet**.

**Parameters:**

**int index**

The zero based index into the **NURBSTextureChannelSet**.

**Prototype:**

**BOOL IsClosedInU();**

**Remarks:**

Returns TRUE if the surface is closed in the U direction; otherwise FALSE.

**Prototype:**

**BOOL IsClosedInV();**

**Remarks:**

Returns TRUE if the surface is closed in the V direction; otherwise FALSE.

**Prototype:**

**BOOL Evaluate(TimeValue t, double u, double v, Point3& pt, Point3& dPdU, Point3& dPdV);**

**Remarks:**

Retrieves the point on the surface, and the u and v derivatives based on the parameters u and v.

**Parameters:**

**TimeValue t**

The time at which to evaluate the surface.

**double u**

The value at which to evaluate the surface in u. This value must be between the **uMin** and **uMax** as returned from **GetParameterRange()**.

**double v**

The value at which to evaluate the surface in v. This value must be between the **vMin** and **vMax** as returned from **GetParameterRange()**.

**Point3& pt**

The point on the surface.

**Point3& dPdU**

The derivative along u.

**Point3& dPdV**

The derivative along v.

**Return Value:**

TRUE if the method was able to evaluate the surface; otherwise FALSE.

**Prototype:**

**BOOL Evaluate(TimeValue t, double u, double v, Point3& pt, Point3& dPdU, Point3& dPdV, Point3& d2PdU2, Point3& d2PdV2, Point3& d2PdUdV);**

**Remarks:**

Retrieves the point on the surface, and the u and v derivatives and second derivatives based on the parameters u and v.

**Parameters:****TimeValue t**

The time at which to evaluate the surface.

**double u**

The value at which to evaluate the surface in u. This value must be between the **uMin** and **uMax** as returned from **GetParameterRange()**.

**double v**

The value at which to evaluate the surface in v. This value must be between the **vMin** and **vMax** as returned from **GetParameterRange()**.

**Point3& pt**

The point on the surface.

**Point3& dPdU**

The derivative along u.

### **Point3& dPdV**

The derivative along v.

### **Point3& d2PdU2**

The second derivative along u.

### **Point3& d2PdV2**

The second derivative along v.

### **Point3& d2PdUdV**

#### **Return Value:**

TRUE if the method was able to evaluate the surface; otherwise FALSE.

#### **Prototype:**

```
void GetParameterRange(TimeValue t, double& uMin, double& uMax, double& vMin, double& vMax);
```

#### **Remarks:**

Retrieves the minimum and maximum valid values for **u** and **v** as passed to **Evaluate()**.

#### **Parameters:**

##### **TimeValue t**

The time at which to get the parameter range.

##### **double& uMin**

The minimum value in u is returned here.

##### **double& uMax**

The maximum value in v is returned here.

##### **double& vMin**

The minimum value in u is returned here.

##### **double& vMax**

The maximum value in v is returned here.

#### **Prototype:**

```
BOOL GetNURBSData(TimeValue t, int& degreeInU, int& degreeInV, int& numInU, int& numInV, NURBSCVTab& cvs, int& numKnotsInU, int& numKnotsInV, NURBSKnotTab uKnots,
```

**NURBSKnotTab vKnots);**

**Remarks:**

This method is available in release 2.5 and later only.

Retrieves data about the NURBSSurface at the specified time.

**Parameters:**

**TimeValue t**

The time at which to get the NURBS information.

**int& degreeInU**

The degree of the surface in U.

**int& degreeInV**

The degree of the surface in V.

**int& numInU**

The number of CVs in U.

**int& numInV**

The number of CVs in V.

**NURBSCVTab& cvs**

The table of CVs. Note: **typedef Tab<NURBSControlVertex>**

**NURBSCVTab;**

**int& numKnotsInU**

The number of knots in U.

**int& numKnotsInV**

The number of knots in V.

**NURBSKnotTab uKnots**

A table of knots in U. Note: **typedef Tab<double> NURBSKnotTab;**

**NURBSKnotTab vKnots**

A table of knots in V.

**Return Value:**

TRUE if the data was retrieved; otherwise FALSE.

**Prototype:**

**BOOL GetCLPTextureSurfaceData(TimeValue t, int channel, int& degreeInU, int& degreeInV, int& numInU, int& numInV,**

**NURBSCVTab& cvs, int& numKnotsInU, int& numKnotsInV,  
NURBSKnotTab uKnots, NURBSKnotTab vKnots);**

**Remarks:**

This method is available in release 2.5 and later only.

This method retrieves the Chord Length Parameterization Texture Surface data.

**Parameters:**

**TimeValue t**

The time at which to retrieve the data.

**int channel**

The texture channel. This is a number in the range 0 and 98 which correspond to 1 to 99 in the user interface.

**int& degreeInU**

The degree of the surface in U.

**int& degreeInV**

The degree in V.

**int& numInU**

The number of CVs in U.

**int& numInV**

The number of CVs in V.

**NURBSCVTab& cvs**

The table of CVs. Note: **typedef Tab<NURBSControlVertex>**

**NURBSCVTab;**

**int& numKnotsInU**

The number of knots in U.

**int& numKnotsInV**

The number of knots in V.

**NURBSKnotTab uKnots**

A table of knots in U. Note: **typedef Tab<double> NURBSKnotTab;**

**NURBSKnotTab vKnots**

A table of knots in V.

**Return Value:**

TRUE if the data was retrieved; otherwise FALSE.

**Prototype:**

```
int NumTrimLoops(TimeValue t);
```

**Remarks:**

This method is available in release 2.5 and later only.

Returns the number of trim loops at the specified time. Each loop may be made up of several curves.

**Parameters:**

**TimeValue t**

The time at which to return the number.

**Prototype:**

```
int NumCurvesInLoop(TimeValue t, int loop);
```

**Remarks:**

This method is available in release 2.5 and later only.

Returns the number of curves in the specified trim loop.

**Parameters:**

**TimeValue t**

The time at which to return the number.

**int loop**

The zero based index of the trim loop.

**Prototype:**

```
BOOL Get2dTrimCurveData(TimeValue t, int loop, int curve, int&  
degree, int& numCVs, NURBSCVTab& cvs, int& numKnots,  
NURBSKnotTab knots);
```

**Remarks:**

This method is available in release 2.5 and later only.

Retrieves data about the specified 2D trim curve in use by the surface.

**Parameters:**

**TimeValue t**

The time at which to retrieve the data.

**int loop**

The zero based index of the trim loop.

**int curve**

The zero based index of the trim curve within the loop.

**int& degree**

The degree of the curve is returned here.

**int& numCVs**

The number of CVs.

**NURBSCVTab& cvs**

The table of CVs. Note: **typedef Tab<NURBSControlVertex>**

**NURBSCVTab;****int& numKnots**

The number of knots.

**NURBSKnotTab knots**

A table of knots. Note: **typedef Tab<double> NURBSKnotTab;**

**Return Value:**

TRUE if the data was retrieved; otherwise FALSE.

**Prototype:**

**BOOL Get3dTrimCurveData(TimeValue t, int loop, int curve, int& degree, int& numCVs, NURBSCVTab& cvs, int& numKnots, NURBSKnotTab knots);**

**Remarks:**

This method is available in release 2.5 and later only.

Retrieves data about the specified 2D trim curve in use by the surface.

**Parameters:****TimeValue t**

The time at which to retrieve the data.

**int loop**

The zero based index of the trim loop.

**int curve**

The zero based index of the trim curve within the loop.

**int& degree**

The degree of the curve is returned here.

**int& numCVs**

The number of CVs.

**NURBSCVTab& cvs**

The table of CVs. Note: **typedef Tab<NURBSControlVertex>**

**NURBSCVTab;****int& numKnots**

The number of knots.

**NURBSKnotTab knots**

A table of knots. Note: **typedef Tab<double> NURBSKnotTab;**

**Return Value:**

TRUE if the data was retrieved; otherwise FALSE.

**Prototype:**

**TessApprox\* GetProdTess(NURBSTessType  
type=kNTessSurface);**

**Remarks:**

This method is available in release 3.0 and later only.

Returns a pointer to the TessApprox object used for production rendering of the specified type.

**Parameters:**

**NURBSTessType type=kNTessSurface**

The tessellation type. See [List of NURBSTessTypes](#).

**Prototype:**

**TessApprox\* GetViewTess(NURBSTessType  
type=kNTessSurface);**

**Remarks:**

This method is available in release 3.0 and later only.

Returns a pointer to the TessApprox object used for viewport rendering of the specified type.

**Parameters:**

**NURBSTessType type=kNTessSurface**

The tessellation type. See [List of NURBSTessTypes](#).

**Prototype:**

**void SetProdTess(TessApprox& tess, NURBSTessType type=kNTessSurface);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the TessApprox object used for production rendering of the specified type.

**Parameters:**

**TessApprox& tess**

The object to set.

**NURBSTessType type=kNTessSurface**

The tessellation type. See [List of NURBSTessTypes](#).

**Prototype:**

**void SetViewTess(TessApprox& tess, NURBSTessType type=kNTessSurface);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the TessApprox object used for viewport rendering of the specified type.

**Parameters:**

**TessApprox& tess**

The object to set.

**NURBSTessType type=kNTessSurface**

The tessellation type. See [List of NURBSTessTypes](#).

**Prototype:**

**void ClearViewTess(NURBSTessType type=kNTessSurface);**

**Remarks:**

This method is available in release 3.0 and later only.

Clears (deletes) the TessApprox object used for viewport rendering of the specified type.

**Parameters:**

**NURBSTessType type=kNTessSurface**

The tessellation type. See [List of NURBSTessTypes](#).

**Prototype:**

**void ClearProdTess(NURBSTessType type=kNTessSurface);**

**Remarks:**

This method is available in release 3.0 and later only.

Clears (deletes) the TessApprox object used for production rendering of the specified type.

**Parameters:**

**NURBSTessType type=kNTessSurface**

The tessellation type. See [List of NURBSTessTypes](#).

**Operators:**

**Prototype:**

**NURBSSurface & operator=(const NURBSSurface& curve);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSSurface& curve**

The surface to assign.

## Class NURBSControlVertex

See Also: [Class NURBSObject](#), [Class NURBSSurface](#), [Class NURBSSet](#), [Class NURBSPoint](#), [Class NURBSCurve](#), [Class NURBSFuseSurfaceCV](#), [Class NURBSFuseCurveCV](#).

```
class NURBSControlVertex : public NURBSObject
```

### Description:

This class is available in release 2.0 and later only.

This class represents a control vertex in a NURBS curve. Methods are available to get and set the point position, and get/set the weight.

All methods of this class are implemented by the system.

### Methods:

#### Prototype:

```
NURBSControlVertex();
```

#### Remarks:

Constructor. The name is set to NULL, the points are set to 0.0f and the weight is set to 1.0.

#### Prototype:

```
~NURBSControlVertex();
```

#### Remarks:

Destructor.

#### Prototype:

```
void SetPosition(TimeValue t, Point3 pt);
```

#### Remarks:

Sets the position of the control vertex.

#### Parameters:

**TimeValue t**

The time to set the position.

**Point3 pt**

Specifies the position to set.

**Prototype:**

**void SetPosition(TimeValue t, float x, float y, float z);**

**Remarks:**

Sets the position of the control vertex.

**Parameters:**

**TimeValue t**

The time to set the position.

**float x, float y, float z**

Specifies the position to set.

**Prototype:**

**void SetPosition(TimeValue t, double x, double y, double z);**

**Remarks:**

Sets the position of the control vertex.

**Parameters:**

**TimeValue t**

The time to set the position.

**double x, double y, double z**

Specifies the position to set.

**Prototype:**

**Point3 GetPosition(TimeValue t);**

**Remarks:**

Returns the position of the control vertex.

**Parameters:**

**TimeValue t**

The time to get the position.

**Prototype:**

**void GetPosition(TimeValue t, float& x, float& y, float& z);**

**Remarks:**

Retrieves the position of the control vertex.

**Parameters:**

**TimeValue t**

The time to get the position.

**float& x**

The X coordinates is returned here.

**float& y**

The Y coordinates is returned here.

**float& z**

The Z coordinates is returned here.

**Prototype:**

**void GetPosition(TimeValue t, double& x, double& y, double& z);**

**Remarks:**

Retrieves the position of the control vertex.

**Parameters:**

**TimeValue t**

The time to get the position.

**double& x**

The X coordinates is returned here.

**double& y**

The Y coordinates is returned here.

**double& z**

The Z coordinates is returned here.

**Prototype:**

**void SetWeight(TimeValue t, float wt);**

**Remarks:**

Sets the weight of the control vertex.

**Parameters:**

**TimeValue t**

The time to set the weight.

**float wt**

Specifies the weight to set. This is a value greater than zero. Larger values cause the CV to have a greater effect, thus the curve or surface will try to pass closer to the CV.

**Prototype:**

**void SetWeight(TimeValue t, double wt);**

**Remarks:**

Sets the weight of the control vertex.

**Parameters:**

**TimeValue t**

The time to set the weight.

**double wt**

Specifies the weight to set. . This is a value greater than zero. Larger values cause the CV to have a greater effect, thus the curve or surface will try to pass closer to the CV.

**Prototype:**

**void GetWeight(TimeValue t, float& wt);**

**Remarks:**

Retrieves the weight of the control vertex.

**Parameters:**

**TimeValue t**

The time to get the weight.

**float& wt**

The weight is returned here.

**Prototype:**

**double GetWeight(TimeValue t);**

**Remarks:**

Returns the weight of the control vertex.

**Parameters:**

**TimeValue t**

The time to get the weight.

**Prototype:**

**void GetWeight(TimeValue t, double& wt);**

**Remarks:**

Retrieves the weight of the control vertex.

**Parameters:**

**TimeValue t**

The time to get the weight.

**double& wt**

The weight is returned here.

**Operators:****Prototype:**

**NURBSControlVertex & operator=(const NURBSControlVertex& cv);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSControlVertex& cv**

The control vertex to assign.

**Prototype:**

**BOOL operator==(const NURBSControlVertex& cv);**

**Remarks:**

Equality operator. Compares if the coordinates and weight are the same.

**Parameters:**

**const NURBSControlVertex& cv**

The control vertex to compare.

**Return Value:**

TRUE if the CVs are equal; otherwise FALSE.

**Prototype:**

**BOOL operator!=(const NURBSControlVertex& cv);**

**Remarks:**

Inequality operator. Compares if the coordinates or weight are **not** the same.

**Parameters:**

**const NURBSControlVertex& cv**

The control vertex to compare.

**Return Value:**

TRUE if the CVs are not equal; otherwise FALSE.

## Class NURBSPoint

See Also: [Class NURBSObject](#), [Class NURBSSurface](#), [Class NURBSSet](#), [Class NURBSControlVertex](#), [Class NURBSCurve](#), [Class NURBSFuseSurfaceCV](#), [Class NURBSFuseCurveCV](#).

```
class NURBSPoint : public NURBSObject
```

### Description:

This class is available in release 2.0 and later only.

This class describes a point in 3 space using double precision X, Y and Z coordinates. Methods are available for getting the point coordinates a floats, doubles or a **Point3**.

All methods of this class are implemented by the system.

### Data Members:

protected:

```
double mX, mY, mZ;
```

The X, Y and Z coordinates for the point.

### Methods:

#### Prototype:

```
Point3 GetPosition();
```

#### Remarks:

Returns the point position as a **Point3**.

#### Prototype:

```
void GetPosition(float& x, float& y, float& z);
```

#### Remarks:

Retrieves the point position using single precision.

#### Parameters:

```
float& x
```

The X coordinate is returned here.

```
float& y
```

The Ycoordinate is returned here.

**float& z**

The Z coordinate is returned here.

**Prototype:**

**void GetPosition(double& x, double& y, double& z);**

**Remarks:**

Retrieves the point position using double precision.

**Parameters:**

**double& x**

The X coordinate is returned here.

**double& y**

The Y coordinate is returned here.

**double& z**

The Z coordinate is returned here.

## Class NURBSFuseSurfaceCV

See Also: [Class NURBSSurface](#), [Class NURBSSet](#), [Class NURBSControlVertex](#), [Class NURBSPoint](#), [Class NURBSCurve](#), [Class NURBSFuseCurveCV](#).

class NURBSFuseSurfaceCV

### Description:

This class is available in release 2.0 and later only.

This class may be used with a NURBSSet to fuse two CVs in a surface. This causes the CVs to reference one another so if you move one the other moves with it.

All methods of this class are implemented by the system.

### Data Members:

public:

**int mSurf1, mSurf2;**

The zero based indices of the surfaces to fuse. These may be the same value. Note that this is **not** the index in the **NURBSSet** of these items. Rather it is the index of CV surface in list of CV surfaces in the NURBSSet. For instance, if there were first two CV curves and then two CV surfaces in the **NURBSSet**, **mSurf1** would be 0 and **mSurf2** would be 1 since the CV curves don't count.

**int mRow1, mCol1, mRow2, mCol2;**

The indices of the row and column CVs of surface 1 and surface 2 to fuse.

### Methods:

#### Prototype:

**NURBSFuseSurfaceCV();**

#### Remarks:

Constructor. The data members are initialized as follows:

**mSurf1 = mSurf2 = 0;**

**mRow1 = mCol1 = mRow2 = mCol2 = 0;**

## Class NURBSFuseCurveCV

See Also: [Class NURBSSurface](#), [Class NURBSSet](#), [Class NURBSControlVertex](#), [Class NURBSPoint](#), [Class NURBSCurve](#), [Class NURBSFuseSurfaceCV](#).

```
class NURBSFuseCurveCV
```

### Description:

This class is available in release 2.0 and later only.

This class may be used with a **NURBSSet** to fuse two CVs in a curve. This causes the CVs to reference one another so if you move one the other moves with it.

All methods of this class are implemented by the system.

### Data Members:

public:

**int mCurve1, mCurve2;**

The zero based indices of the curves to fuse. These may be the same value. Note that this is **not** the index in the **NURBSSet** of these items. Rather it is the index of CV curve in list of CV curves in the **NURBSSet**. For instance, if there were first two CV surfaces and then two CV curves in the **NURBSSet**, **mCurve1** would be 0 and **mCurve2** would be 1 since the CV surfaces don't count.

**int mCV1, mCV2;**

The indices of the CVs of curve1 and curve2 to fuse.

### Methods:

#### Prototype:

**NURBSFuseCurveCV();**

#### Remarks:

Constructor. The data members are initialized as follows:

**mCurve1 = mCurve2 = 0;**

**mCV1 = mCV2 = 0;**

## Class NURBSIndependentPoint

See Also: [Class NURBSPoint](#).

```
class NURBSIndependentPoint : public NURBSPoint
```

### Description:

This class is available in release 2.0 and later only.

This class is used to create an independent, free-standing point. There are methods to set the position of the point in various floating point formats and operators to compare points.

All methods of this class are implemented by the system.

### Methods:

#### Prototype:

```
NURBSIndependentPoint();
```

#### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNPoint;
```

```
mX = mY = mZ = 0.0;
```

#### Prototype:

```
virtual ~NURBSIndependentPoint();
```

#### Remarks:

Destructor.

#### Prototype:

```
void SetPosition(TimeValue t, Point3 pt);
```

#### Remarks:

Sets the position of the point at the specified time (as a Point3).

#### Parameters:

```
TimeValue t
```

Specifies the time to set the position.

```
Point3 pt
```

The position to set.

**Prototype:**

**void SetPosition(TimeValue t, float x, float y, float z);**

**Remarks:**

Sets the position of the point at the specified time (as floats).

**Parameters:**

**TimeValue t**

Specifies the time to set the position.

**float x**

The X position to set.

**float y**

The Y position to set.

**float z**

The Z position to set.

**Prototype:**

**void SetPosition(TimeValue t, double x, double y, double z);**

**Remarks:**

Sets the position of the point at the specified time (as doubles).

**Parameters:**

**TimeValue t**

Specifies the time to set the position.

**double x**

The X position to set.

**double y**

The Y position to set.

**double z**

The Z position to set.

**Operators:**

**Prototype:**

**BOOL operator==(const NURBSIndependentPoint& pt);**

**Remarks:**

Equality operator. Compares if the X, Y and Z coordinates are equal.

**Parameters:**

**const NURBSIndependentPoint& pt**

The point to compare.

**Return Value:**

TRUE if equal; otherwise FALSE.

**Prototype:**

**BOOL operator!=(const NURBSIndependentPoint& pt);**

**Remarks:**

Inequality operator. Compares if the X, Y and Z coordinates are **not** equal.

**Parameters:**

**const NURBSIndependentPoint& pt**

The point to compare.

**Return Value:**

TRUE if any of the coordinates are **not** equal; otherwise FALSE.

**Prototype:**

**NURBSIndependentPoint & operator=(const  
NURBSIndependentPoint& pt);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSIndependentPoint& pt**

The point to assign.

## Class NURBTrimPoint

See Also: [List of NURBS Trim Directions](#).

### Description:

This class is available in release 2.0 and later only.

This class defines a point on a curve used to trim a portion of the curve from the point towards one of the ends of the curve. The trim point is defined by a parameter and a direction. For instance, consider a CV curve that exists in the parameter space from 0.0 to 1.0. If there is a trim point in the middle of the curve the parameter for the point would be 0.5. If the portion that was being trimmed off was from 0.5 to 1.0 then the trim direction would be positive.

All methods of this class are implemented by the system.

### Friend Classes:

friend class NURBSSet;

### Methods:

#### Prototype:

```
NURBTrimPoint(double parameter, NURBTrimDirection direction) : mParameter(parameter), mDirection(direction);
```

### Remarks:

Constructor.

### Parameters:

**double parameter**

This is point in parameter space at which the trim point exists.

**NURBTrimDirection direction**

The positive or negative direction in parameter space of the portion that is being trimmed off. The direction can also be set to 'none' so no trimming is done.

### Prototype:

```
double GetParameter();
```

### Remarks:

Returns the point in parameter space at which the trim point exists.

**Prototype:**

**NURBTrimDirection GetDirection();**

**Remarks:**

Returns the trim direction (positive, negative, or none) describing which portion of the curve is trimmed off.

## Class NURBSPointConstPoint

See Also: [Class NURBSObject](#), [List of NURBSConst Types](#), [Class Point3](#).

```
class NURBSPointConstPoint : public NURBSObject
```

### Description:

This class is available in release 2.0 and later only.

This class is used to create a dependent point that lies at a point or relative to it.

All methods of this class are implemented by the system.

### Data Members:

protected:

**NURBSId mParentId;**

The id of the parent object.

**int mParentIndex;**

The index in the NURBSSet of the parent object.

**NURBSConstType mCType;**

The type of constraint in use.

**Point3 mOffset;**

The offset from the object that the point is.

### Friend Classes:

```
friend class NURBSSet;
```

### Methods:

protected:

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

**Prototype:**

**NURBSPointConstPoint();**

**Remarks:**

Constructor. The data members are initialized as follows:

**mType = kNPointCPoint;**

**mpObject = NULL;**

**mpNSet = NULL;**

**mParentId = 0;**

**mParentIndex = -1;**

**mCType = kNConstOnObject;**

**mOffset = Point3(0,0,0);**

**Prototype:**

**~NURBSPointConstPoint();**

**Remarks:**

Destructor.

**Prototype:**

**void SetParent(int index);**

**Remarks:**

Sets the parent index to the specified value.

**Parameters:**

**int index**

The parent index to set.

**Prototype:**

**void SetParentId(NURBSId id);**

**Remarks:**

Sets the parent ID to the specified value.

**Parameters:**

**NURBSId id**

The parent ID to set.

**Prototype:****int GetParent();****Remarks:**

Returnst the parent index.

**Prototype:****NURBSId GetParentId();****Remarks:**

Returns the **NURBSId** of the parent. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene.

**Prototype:****void SetPointType(NURBSConstType type);****Remarks:**

Sets the type of point.

**Parameters:****NURBSConstType type**

Specifies the type of point to set. See [List of NURBSConst Types](#).

**Prototype:****NURBSConstType GetPointType();****Remarks:**

Returns the type of construction point this is. See [List of NURBSConst Types](#).

**Prototype:****void SetOffset(TimeValue t, Point3 pt);****Remarks:**

Sets the offset value at the specified time.

**Parameters:**

**TimeValue t**

Specifies the time at which the offset is set.

**Point3 pt**

The offset value to set. This value is specified in object coordinates.

**Prototype:**

**Point3 GetOffset(TimeValue t);**

**Remarks:**

Returns the offset value at the specified time in object coordinates.

**Parameters:**

**TimeValue t**

The time to retrieve the offset.

**Operators:**

**Prototype:**

**NURBSPointConstPoint & operator=(const  
NURBSPointConstPoint& pt);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSPointConstPoint& pt**

The construction point to assign.

## Class NURBSCurveConstPoint

See Also: [Class NURBSObject](#), [List of NURBSConst Types](#), [Class Point3](#).

```
class NURBSCurveConstPoint : public NURBSObject
```

### Description:

This class is available in release 2.0 and later only.

This class is used to create a dependent point that lies on a curve or relative to it.

The point can either be on the curve or off the curve. If it is on the curve, the **U Position** is the only control of its location. The **U Position** specifies a location along the curve (based on the curve's local U axis). There are three ways to displace the point's location relative to the U position:

**Offset** moves the point according to a relative (object space) X,Y,Z location.

**Normal** moves the point along the direction of the curve's normal. (Negative values move it opposite to the normal.)

U Position

**Tangent** moves the point along the tangent of the **U Position**.

All methods of this class are implemented by the system.

### Data Members:

protected:

**NURBSId mParentId;**

The NURBSId of the parent curve.

**int mParentIndex;**

The index in the **NURBSSet** of the parent curve.

**NURBSConstType mCType;**

The type of constraint in use.

**Point3 mOffset;**

The offset amount.

**float mNormal;**

The distance along the normal.

**float mUTangent;**

The distance along the tangent.

**double mUParam;**

Specifies the point along the parent curve.

**BOOL mTrimCurve;**

The point that is constrained to the curve may be used to trim the curve.

**BOOL mFlipTrim;**

If TRUE the curve is trimmed from the point towards low parameter space. If FALSE the curve is trimmed from the point towards high parameter space.

**Friend Classes:**

friend class NURBSSet;

**Methods:**

protected:

**Prototype:**

**void Clean(NURBSIdTab ids);**

**Remarks:**

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

**Parameters:**

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

**Prototype:**

**NURBSCurveConstPoint();**

**Remarks:**

Constructor. The data members are initialized as follows:

**mType = kNCurveCPoint;**

**mpObject = NULL;**

**mpNSet = NULL;**

**mParentId = 0;**

**mParentIndex = -1;**

**mCType = kNConstOnObject;**

```
mOffset = Point3(0,0,0);  
mNormal = 0.0f;  
mUTangent = 0.0f;  
mUParam = 0.0;  
mTrimCurve = FALSE;  
mFlipTrim = FALSE;
```

**Prototype:**

```
virtual ~NURBSCurveConstPoint();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int index);
```

**Remarks:**

Sets the parent index to the specified value.

**Parameters:**

**int index**

The parent index to set.

**Prototype:**

```
void SetParentId(NURBSId id);
```

**Remarks:**

Sets the parent ID to the specified value.

**Parameters:**

**NURBSId id**

The parent ID to set.

**Prototype:**

```
int GetParent();
```

**Remarks:**

Returns the parent index.

**Prototype:**

**NURBSId GetParentId();**

**Remarks:**

Returns the **NURBSId** of the parent. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene.

**Prototype:**

**void SetPointType(NURBSConstType type);**

**Remarks:**

Sets the point type.

**Parameters:**

**NURBSConstType type**

Specifies the construction point type. See [List of NURBSConst Types](#).

**Prototype:**

**NURBSConstType GetPointType();**

**Remarks:**

Returns the point type. See [List of NURBSConst Types](#).

**Prototype:**

**void SetOffset(TimeValue t, Point3 pt);**

**Remarks:**

Sets the offset value at the specified time.

**Parameters:**

**TimeValue t**

Specifies the time at which the offset value is set.

**Point3 pt**

The offset to set in object space.

**Prototype:**

### **Point3 GetOffset(TimeValue t);**

#### **Remarks:**

Returns the offset value in object space at the specified time.

#### **Parameters:**

##### **TimeValue t**

Specifies the time at which the offset value is returned.

#### **Prototype:**

**void SetUParam(TimeValue t, double param);**

#### **Remarks:**

Sets the U Parameter for the point.

#### **Parameters:**

##### **TimeValue t**

Specifies the time at which the value is set.

##### **double param**

The U parameter to set.

#### **Prototype:**

**double GetUParam(TimeValue t);**

#### **Remarks:**

Returns the U parameter at the specified time.

#### **Parameters:**

##### **TimeValue t**

Specifies the time at which the value is returned.

#### **Prototype:**

**void SetNormal(TimeValue t, float dist);**

#### **Remarks:**

Sets the normal distance at the specified time.

#### **Parameters:**

##### **TimeValue t**

Specifies the time at which the value is set.

**float dist**

The distance to set.

**Prototype:**

**float GetNormal(TimeValue t);**

**Remarks:**

Returns the distance along the normal at the specified time.

**Parameters:**

**TimeValue t**

Specifies the time at which the value is returned.

**Prototype:**

**void SetUTangent(TimeValue t, float dist);**

**Remarks:**

Set the U tangent value at the specified time.

**Parameters:**

**TimeValue t**

Specifies the time at which the value is set.

**float dist**

The distance to set.

**Prototype:**

**float GetUTangent(TimeValue t);**

**Remarks:**

Returns the U tangent value at the specified time.

**Parameters:**

**TimeValue t**

Specifies the time at which the value is returned.

**Prototype:**

**BOOL GetTrimCurve();**

**Remarks:**

Returns TRUE if this point is used to trim the curve and FALSE if it is not.

**Prototype:**

**void SetTrimCurve(BOOL trim);**

**Remarks:**

Sets the trim curve boolean.

**Parameters:**

**BOOL trim**

TRUE to indicate this point is used to trim the curve; FALSE to indicate the curve is not trimmed beyond the point.

**Prototype:**

**BOOL GetFlipTrim();**

**Remarks:**

Returns the state of the flip trim boolean.

**Prototype:**

**void SetFlipTrim(BOOL flip);**

**Remarks:**

Sets the state of the flip trim boolean.

**Parameters:**

**BOOL flip**

TRUE to indicate the curve is trimmed from the point towards low parameter space. Use FALSE to indicate the curve is trimmed from the point towards high parameter space.

**Operators:**

**Prototype:**

**NURBSCurveConstPoint & operator=(const  
NURBSCurveConstPoint& pt);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSCurveConstPoint& pt**

The point to assign.

## Class NURBSCurveCurveIntersectionPoint

See Also: [Class NURBSPoint](#).

```
class NURBSCurveCurveIntersectionPoint : public NURBSPoint
```

### Description:

This class is available in release 2.0 and later only.

This class is used to create a dependent point at the intersection of two curves.

All methods of this class are implemented by the system.

### Data Members:

protected:

**NURBSId mParentId[2];**

The ids of the two parent curves.

**int mParentIndex[2];**

The indices of the two parent curves in the **NURBSSet**.

**BOOL mTrimCurve[2];**

Indicates the point that is constrained to the curve may be used to trim the curve.

**BOOL mFlipTrim[2];**

If TRUE the curve is trimmed from the point towards low parameter space. If FALSE the curve is trimmed from the point towards high parameter space.

### Friend Classes:

```
friend class NURBSSet;
```

### Methods:

protected:

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

## **NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

### **Prototype:**

**NURBSCurveCurveIntersectionPoint();**

### **Remarks:**

Constructor. The data members are initialized by value:

**mType = kNCurveCurveIntersectionPoint;**

**mpObject = NULL;**

**mpNSet = NULL;**

**mParentId[0] = mParentId[1] = 0;**

**mParentIndex[0] = mParentIndex[1] = -1;**

**mCurveParam[0] = mCurveParam[1] = 0.0;**

**mTrimCurve[0] = mTrimCurve[1] = FALSE;**

**mFlipTrim[0] = mFlipTrim[1] = FALSE;**

### **Prototype:**

**virtual ~NURBSCurveCurveIntersectionPoint();**

### **Remarks:**

Destructor.

### **Prototype:**

**double GetCurveParam(int curveNum);**

### **Remarks:**

Returns the point in parameter space of the specified curve of the point of intersection.

### **Parameters:**

**int curveNum**

The parent curve number: 0 or 1.

### **Prototype:**

**void SetParent(int pnum, int index);**

**Remarks:**

Sets the index in the **NURBSSet** of the specified parent object.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**int index**

The index into the **NURBSSet** of the parent surface.

**Prototype:**

**void SetParentId(int pnum, NURBSId id);**

**Remarks:**

Sets the **NURBSId** of the specified parent.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**NURBSId id**

The id to set.

**Prototype:**

**int GetParent(int pnum);**

**Remarks:**

Returns the index in the **NURBSSet** of the specified parent object.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**Prototype:**

**NURBSId GetParentId(int pnum);**

**Remarks:**

Returns the **NURBSId** of the specified parent. Note that a **NURBSId** won't

be valid until the object has been instantiated in the scene

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**Prototype:**

**BOOL GetTrimCurve(int pnum);**

**Remarks:**

Returns TRUE if this point is used to trim the specified curve and FALSE if it is not.

**Parameters:**

**int pnum**

The parent curve number: 0 or 1.

**Prototype:**

**void SetTrimCurve(int pnum, BOOL trim);**

**Remarks:**

Sets the trim curve boolean for the specified curve.

**Parameters:**

**int pnum**

The parent curve number: 0 or 1.

**BOOL trim**

TRUE to indicate this point is used to trim the curve; FALSE to indicate the curve is not trimmed beyond the point.

**Prototype:**

**BOOL GetFlipTrim(int pnum);**

**Remarks:**

Returns the state of the flip trim boolean.

**Parameters:**

**int pnum**

The parent curve number: 0 or 1.

**Return Value:**

TRUE indicates the specified curve is trimmed from the point towards low parameter space. FALSE indicates the curve is trimmed from the point towards high parameter space.

**Prototype:**

```
void SetFlipTrim(int pnum, BOOL flip);
```

**Remarks:**

Sets the state of the flip trim boolean for the specified parent curve.

**Parameters:**

**int pnum**

The parent curve number: 0 or 1.

**BOOL flip**

TRUE to indicate the curve is trimmed from the point towards low parameter space. Use FALSE to indicate the curve is trimmed from the point towards high parameter space.

**Operators:****Prototype:**

```
NURBSCurveCurveIntersectionPoint & operator=(const  
NURBSCurveCurveIntersectionPoint &pt);
```

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSCurveCurveIntersectionPoint &pt**

The intersection point to assign.

## Class NURBSSurfConstPoint

See Also: [Class NURBSObject](#), [List of NURBSConst Types](#).

```
class NURBSSurfConstPoint : public NURBSObject
```

### Description:

This class is available in release 2.0 and later only.

This class is used to create a dependent point on a surface or related to it.

All methods of this class are implemented by the system.

### Data Members:

protected:

**NURBSId mParentId;**

The **NURBSId** of the parent surface.

**int mParentIndex;**

The index in the **NURBSSet** of the parent surface.

**NURBSConstType mCType;**

The type of constraint used by the point.

**Point3 mOffset;**

The offset amount.

**float mNormal;**

The distance along the normal.

**float mUTangent;**

The positive tangent offset in U. At the location in parameter space of the constrained point is a tangent to the surface. This is the distance along the positive U tangent in parameter space.

**double mUParam;**

The point is constrained to exist on the parent surface. The surface itself is defined over a parameter range. The point is defined at a point in the parent surface parameter space. This is the location of the point in the parent surface parameter space in U.

**float mVTangent;**

This is the distance along the positive V tangent in parameter space.

**double mVParam;**

This is the location of the point in the parent surface parameter space in V.

**Friend Classes:**

friend class NURBSSet;

**Methods:**

protected:

**Prototype:**

**void Clean(NURBSIdTab ids);**

**Remarks:**

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

**Parameters:**

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

**Prototype:**

**NURBSSurfConstPoint();**

**Remarks:**

Constructor. The data members are initialized as follows:

**mType = kNSurfaceCPoint;**

**mpObject = NULL;**

**mpNSet = NULL;**

**mParentId = 0;**

**mParentIndex = -1;**

**mCType = kNConstOnObject;**

**mOffset = Point3(0,0,0);**

**mNormal = 0.0f;**

**mUTangent = 0.0f;**

**mUParam = 0.0;**

**mVTangent = 0.0f;**

**mVParam = 0.0;**

**Prototype:**

**virtual ~NURBSSurfConstPoint();**

**Remarks:**

Destructor.

**Prototype:**

**void SetParent(int index);**

**Remarks:**

Sets the index in the **NURBSSet** of the parent object.

**Parameters:**

**int index**

The index into the **NURBSSet** of the parent surface.

**Prototype:**

**void SetParentId(NURBSId id);**

**Remarks:**

Sets the **NURBSId** of the specified parent.

**Parameters:**

**NURBSId id**

The id to set.

**Prototype:**

**int GetParent();**

**Remarks:**

Returns the index in the **NURBSSet** of the parent object.

**Prototype:**

**NURBSId GetParentId();**

**Remarks:**

Returns the **NURBSId** of the parent. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene

**Prototype:**

**void SetPointType(NURBSConstType type);**

**Remarks:**

Sets the type of constrained point this is. See [List of NURBSConst Types](#).

**Parameters:**

**NURBSConstType type**

The type of the constrained point.

**Prototype:**

**NURBSConstType GetPointType();**

**Remarks:**

Returns the type of constrained point this is. See [List of NURBSConst Types](#).

**Prototype:**

**void SetUParam();**

**Remarks:**

Sets the position of the point in the parent U parameter space.

**Parameters:**

**TimeValue t**

The time to set the U parameter.

**double param**

The value to set.

**Prototype:**

**double GetUParam(TimeValue t);**

**Remarks:**

Returns the position of the point in the parent U parameter space.

**Parameters:**

**TimeValue t**

The time to get the U parameter.

**Prototype:**

**void SetVParam(TimeValue t, double param);**

**Remarks:**

Sets the position of the point in the parent V parameter space.

**Parameters:**

**TimeValue t**

The time to set the U parameter.

**double param**

The value to set.

**Prototype:**

**double GetVParam(TimeValue t);**

**Remarks:**

Returns the position of the point in the parent V parameter space.

**Parameters:**

**TimeValue t**

The time to get the Vparameter.

**Prototype:**

**void SetOffset(TimeValue t, Point3 pt);**

**Remarks:**

Sets the offset of the point from the parent surface.

**Parameters:**

**TimeValue t**

The time at which to set the offset.

**Point3 pt**

The offset to set.

**Prototype:**

**Point3 GetOffset(TimeValue t);**

**Remarks:**

Returns the offset of the point from the parent surface at the specified time.

**Parameters:**

**TimeValue t**

The time at which to get the offset.

**Prototype:**

**void SetNormal(TimeValue t, float dist);**

**Remarks:**

Sets the distance along the normal to the surface of the point at the specified time.

**Parameters:**

**TimeValue t**

The time at which to set the distance.

**float dist**

The distance to set.

**Prototype:**

**float GetNormal(TimeValue t);**

**Remarks:**

Returns the distance along the normal to the surface of the point at the specified time.

**Parameters:**

**TimeValue t**

The time at which to get the distance.

**Prototype:**

**void SetUTangent(TimeValue t, float dist);**

**Remarks:**

Sets the distance along the U tangent of the point.

**Parameters:**

**TimeValue t**

The time at which to set the distance.

**float dist**

The distance to set.

**Prototype:**

**float GetUTangent(TimeValue t);**

**Remarks:**

Returns the distance along the U tangent of the point.

**Parameters:**

**TimeValue t**

The time at which to get the distance.

**Prototype:**

**void SetVTangent(TimeValue t, float dist);**

**Remarks:**

Sets the distance along the V tangent of the point.

**Parameters:**

**TimeValue t**

The time at which to set the distance.

**float dist**

The distance to set.

**Prototype:**

**float GetVTangent(TimeValue t);**

**Remarks:**

Returns the distance along the V tangent of the point.

**Parameters:**

**TimeValue t**

The time at which to get the distance.

**Operators:**

**Prototype:**

**NURBSSurfConstPoint & operator=(const**

**NURBSSurfConstPoint& pt);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSSurfConstPoint& pt**

The point to assign.

## Class NURBSPointCurve

See Also: [Class NURBSCurve](#), [Class NURBSIndependentPoint](#).

```
class NURBSPointCurve : public NURBSCurve
```

### Description:

This class is available in release 2.0 and later only.

This class defines a curve that uses points to describe its shape. All the points lie on the curve itself. There are methods to get/set the number of points in the curve, get/set the points themselves, refine the curve (add points without changing its shape), and to get/set the transformation matrix used by the curve. This matrix is used to set the position of the curve in the **NURBSSet**.

All methods of this class are implemented by the system.

### Friend Classes:

```
friend class NURBSSet
```

### Data Members:

protected:

```
NURBSIndependentPoint *mpPts;
```

Array of independent points.

```
BOOL mClosed;
```

TRUE if the curve is closed; otherwise FALSE.

```
int mNumPts;
```

The number of independent points.

### Methods:

#### Prototype:

```
NURBSPointCurve();
```

#### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNPointCurve;
```

```
mClosed = FALSE;
```

```
mpPts = NULL;
```

**Prototype:**

**virtual ~NURBSPointCurve();**

**Remarks:**

Destructor. If any points were allocated they are freed and the cache is cleared.

**Prototype:**

**void Close();**

**Remarks:**

Closes the point curve.

**Prototype:**

**BOOL IsClosed();**

**Remarks:**

This method is available in release 3.0 and later only.

Returns TRUE if the curve is closed; otherwise FALSE.

**Prototype:**

**void SetNumPts(int num);**

**Remarks:**

Sets the number of points in the point curve. Note that any previous point data is not maintained when the new number is set.

**Parameters:**

**int num**

The number of points in the curve.

**Prototype:**

**int GetNumPts();**

**Remarks:**

Returns the number of points in the curve.

**Prototype:**

**void GetNumPts(int &num);**

**Remarks:**

Retrieves the number of points in the curve.

**Parameters:**

**int &num**

The result is stored here.

**Prototype:**

**NURBSIndependentPoint\* GetPoint(int index);**

**Remarks:**

Returns a pointer to the specified point.

**Parameters:**

**int index**

The zero based index of the point to get.

**Prototype:**

**void SetPoint(int index, NURBSIndependentPoint &pt);**

**Remarks:**

Sets the specified point in the curve.

**Parameters:**

**int index**

The zero based index of the point to set.

**NURBSIndependentPoint &pt**

The point to set.

**Prototype:**

**void SetTransformMatrix(TimeValue t, SetXFormPacket& xPack);**

**Remarks:**

Sets the transformation matrix for the **NURBSPointCurve**. This controls the relative position of the item within a **NURBSSet**.

**Parameters:****TimeValue t**

The time at which to set the matrix.

**SetXFormPacket& xPack**

An instance of the **XFormPacket** class that describes the properties of the transformation. See [Class SetXFormPacket](#).

**Prototype:**

**Matrix3 GetTransformMatrix(TimeValue t);**

**Remarks:**

Returns the transformation matrix that controls the relative position of the point curve in the **NURBSSet**.

**Parameters:****TimeValue t**

The time at which to return the matrix.

**Prototype:**

**void Refine(TimeValue t, double u);**

**Remarks:**

This method adds a new point at the specified location on the curve without changing its shape. The point is specified as a distance in U parameter space. Note that calling this method causes all animation of the curve to be removed.

**Parameters:****TimeValue t**

The time at which to refine the curve. The curve may be animated, and thus the underlying parameter space may be changing. So when the **u** value is specified it must relate to the curve at a specific time.

**double u**

The point at which to refine the curve. Developers should use the method **NURBSCurve::GetParameterRange()** to get the valid range of values that may be passed here.

**Operators:**

**Prototype:**

**NURBSPointCurve & operator=(const NURBSPointCurve& curve);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSPointCurve& curve**

The curve to assign.

## Class NURBSCVCurve

See Also: [Class NURBSCurve](#), [Class NURBSControlVertex](#).

```
class NURBSCVCurve : public NURBSCurve
```

### Description:

This class is available in release 2.0 and later only.

This class defines a NURBS CV Curve. CV Curves have control vertices. The position of the control vertices (CVs) controls the shape of the curve. Unlike spline vertices, CVs don't necessarily lie on the curve they define. The CVs define a control lattice which surrounds the NURBS curve.

All methods of this class are implemented by the system.

### Data Members:

protected:

```
NURBSControlVertex *mpCVs;
```

Array of control vertices.

```
double *mpKnots;
```

Array of knots.

```
BOOL mClosed;
```

TRUE if the curve is closed; otherwise FALSE.

```
int mOrder;
```

The order of the curve.

```
int mNumKnots;
```

The number of knots.

```
int mNumCVs;
```

The number of control vertices.

```
NURBSAutoParam mAutoParam;
```

This data member is available in release 3.0 and later only.

Controls automatic reparameterization. See [List of NURBSAutoParam Types](#).

### Friend Classes:

```
friend class NURBSSet;
```

### Methods:

public:

**Prototype:**

```
NURBSCVCurve();
```

**Remarks:**

Constructor. The data members are initialized as follows:

```
mType = kNCVCurve;
```

```
mClosed = FALSE;
```

```
mpCVs = NULL;
```

```
mpKnots = NULL;
```

**Prototype:**

```
virtual ~NURBSCVCurve();
```

**Remarks:**

Destructor. If the knots and CV arrays are allocated they are freed and any caches are cleared.

**Prototype:**

```
void Close();
```

**Remarks:**

Closes the curve.

**Prototype:**

```
void SetOrder(int order);
```

**Remarks:**

Sets the order of the curve. This is one more than the degree of polynomial of any segment of the curve. All curves have a degree. The degree of a curve is the highest exponent in the equation used to represent it. A linear equation is degree 1, a quadratic equation degree 2. NURBS curves typically are represented by cubic equations and have a degree of 3.

**Parameters:**

```
int order
```

Specifies the order of the curve.

**Prototype:**

**int GetOrder();**

**Remarks:**

Returns the order of the curve.

**Prototype:**

**void SetNumKnots(int num);**

**Remarks:**

Sets the number of knots in the curve. Note that the previous knot data is NOT maintained

Because they are generated mathematically, NURBS curves have a parameter space in addition to the 3D geometric space in which they are displayed.

Specifically, an array of values called knots specifies the extent of influence of each control vertex (CV) on the curve or surface.

**Parameters:**

**int num**

Specifies the number of knots for the curve.

**Prototype:**

**int GetNumKnots();**

**Remarks:**

Returns the number of knots in the curve.

**Prototype:**

**void SetNumCVs(int num);**

**Remarks:**

Set the number of control vertices in the curve. Note that the previous control vertex data is NOT maintained.

**Parameters:**

**int num**

Specifies the number of control vertices.

**Prototype:**

**void GetNumCVs(int& num);**

**Remarks:**

Retrieves the number of control vertices.

**Parameters:**

**int& num**

The number is stored here.

**Prototype:**

**int GetNumCVs();**

**Remarks:**

Returns the number of control vertices.

**Prototype:**

**double GetKnot(int index);**

**Remarks:**

Returns the knot value whose index is passed.

**Parameters:**

**int index**

Specifies which knot value to return.

**Prototype:**

**void SetKnot(int index, double value);**

**Remarks:**

Sets the specified knot to the specified value.

**Parameters:**

**int index**

The 0 based index of the knot to set.

**double value**

Specifies the value to set.

**Prototype:**

**NURBSControlVertex \*GetCV(int index);**

**Remarks:**

Returns a pointer to the specified control vertex of the curve.

**Parameters:**

**int index**

The 0 based index of the control vertex to return.

**Prototype:**

**void SetCV(int index, NURBSControlVertex &cv);**

**Remarks:**

Sets the specified control vertex to the CV passed.

**Parameters:**

**int index**

The 0 based index of the control vertex to set.

**NURBSControlVertex &cv**

The CV to set.

**Prototype:**

**void SetTransformMatrix(TimeValue t, SetXFormPacket& xPack);**

**Remarks:**

Sets the transformation matrix for the **NURBSCVCurve**. This controls the relative position of the item within a **NURBSSet**.

**Parameters:**

**TimeValue t**

The time at which to set the matrix.

**SetXFormPacket& xPack**

An instance of the **XFormPacket** class that describes the properties of the transformation. See [Class SetXFormPacket](#).

**Prototype:**

**Matrix3 GetTransformMatrix(TimeValue t);**

**Remarks:**

Returns the transformation matrix of the **NURBSCVCurve** at the specified time.

**Parameters:**

**TimeValue t**

The time at which to retrieve the matrix.

**Prototype:**

**NURBSAutoParam AutoParam();**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the current settings for automatic reparameterization. See [List of NURBSAutoParam Types](#).

**Prototype:**

**void AutoParam(TimeValue t, NURBSAutoParam param);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the automatic reparameterization settings at the specified time.

**Parameters:**

**TimeValue t**

The time to set them.

**NURBSAutoParam param**

The settings to establish. See [List of NURBSAutoParam Types](#).

**Prototype:**

**void Reparameterize(TimeValue t, NURBSParamaterization param);**

**Remarks:**

This method is available in release 3.0 and later only.

This method reparameterizes this CV sub-object. This can be used to provide a better relation between control point locations and the shape of the sub-object.

**Parameters:**

**TimeValue t**

The time to reparameterize.

**NURBSParamaterization param**

The type of reparameterizing to perform. See [List of NURBSParamaterization Types](#).

**Prototype:**

**void EndsOverlap(BOOL& overlap);**

**Remarks:**

This method determines if the ends of the curve overlap even though the curve may not be closed (that is, the tangents match at the ends).

**Parameters:**

**BOOL& overlap**

The result is returned here: TRUE if the ends overlap; otherwise FALSE.

**Prototype:**

**void Refine(TimeValue t, double u);**

**Remarks:**

By specifying a parameter point on the curve, this method adds a new control vertex to the curve. It moves all the other CVs but maintains the shape of the curve. Note that this causes the loss of any animation on the curve.

**Parameters:**

**TimeValue t**

The time at which to refine the curve. If the curve is animated the **u** parameter below is time dependent.

**double u**

Specifies the distance along the curve to add the CV. See the base class method **GetParameterRange()** for the valid range of values for this parameter.

**Prototype:**

**void Insert(TimeValue t, double u);**

**Remarks:**

This method is available in release 2.5 and later only.

This method places a new CV along the current CV hull at the specified parameter point. This method leaves all the other CVs in place and changes the shape of the curve. This method preserves animation.

**Parameters:****TimeValue t**

The time at which to refine the curve. If the curve is animated the **u** parameter below is time dependent.

**double u**

Specifies the distance along the curve to add the CV. See the base class method **GetParameterRange()** for the valid range of values for this parameter.

**Operators:****Prototype:**

**NURBSCVCurve & operator=(const NURBSCVCurve& curve);**

**Remarks:**

Assignment operator.

**Parameters:****const NURBSCVCurve& curve**

The NURBSCVCurve to assign.

## Class NURBSBlendCurve

See Also: [Class NURBSCurve](#).

```
class NURBSBlendCurve : public NURBSCurve
```

### Description:

This class is available in release 2.0 and later only.

This class defines a dependent blend curve. A blend curve connects the specified end of one curve to the specified end of another, blending the curvature of the parents to create a smooth curve between them. Methods are available to get/set the parent indices and ids, to get/set the ends of the curves used for the blend, and to get/set the tension values used.

All methods of this class are implemented by the system.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

protected:

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

### Prototype:

```
NURBSBlendCurve();
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNBlendCurve;
```

```
mpObject = NULL;
mpNSet = NULL;
for (int i = 0; i < 2; i++) {
    mParentId[i] = 0;
    mParentIndex[i] = -1;
    mParentEnd[i] = TRUE;
    mTension[i] = 1.0;
}
```

**Prototype:**

```
~NURBSBlendCurve();
```

**Remarks:**

Destructor. The cache is cleared.

**Prototype:**

```
void SetParent(int pnum, int index);
```

**Remarks:**

Sets the index in the **NURBSSet** of the specified parent object.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**int index**

The index into the **NURBSSet** of the parent object.

**Prototype:**

```
void SetParentId(int pnum, NURBSId id);
```

**Remarks:**

Sets the **NURBSId** of the specified parent.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**NURBSId id**

The id to set.

**Prototype:****int GetParent(int pnum);****Remarks:**

Returns the index in the **NURBSSet** of the specified parent object.

**Parameters:****int pnum**

The parent number: 0 or 1.

**Prototype:****NURBSId GetParentId(int pnum);****Remarks:**

Returns the **NURBSId** of the parent. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene

**Parameters:****int pnum**

The parent number: 0 or 1.

**Prototype:****void SetEnd(int pnum, BOOL end);****Remarks:**

Sets if the beginning or end of the specified curve is used for the blend.

**Parameters:****int pnum**

The parent number: 0 or 1.

**BOOL end**

TRUE to use the end of the curve; FALSE to use the beginning. The beginning of the curve has lesser parameter values than the end.

**Prototype:**

**BOOL GetEnd(int pnum);**

**Remarks:**

Indicates if the beginning or end of the specified curve is used for the blend.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**Return Value:**

TRUE if the end of the curve is used; FALSE if the beginning is used.

**Prototype:**

**void SetTension(TimeValue t, int pnum, double ten);**

**Remarks:**

Sets the tension value for the specified parent curve.

**Parameters:**

**TimeValue t**

The time at which to set the tension

**int pnum**

The parent number: 0 or 1.

**double ten**

The tension value to set.

**Prototype:**

**double GetTension(TimeValue t, int pnum);**

**Remarks:**

Returns the tension value for the specified parent curve.

**Parameters:**

**TimeValue t**

The time at which to get the tension

**int pnum**

The parent number: 0 or 1.

**Operators:**

**Prototype:**

**NURBSBlendCurve & operator=(const NURBSBlendCurve& curve);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSBlendCurve& curve**

The curve to assign.

## Class NURBSOffsetCurve

See Also: [Class NURBSCurve](#).

```
class NURBSOffsetCurve : public NURBSCurve
```

### Description:

This class is available in release 2.0 and later only.

This class defines a dependent offset curve. An offset curve is offset from the original, parent curve. It lies in the same plane as its parent, and is normal to the original. Methods are available to get/set the parent index and id and to get/set the distance from the parent curve.

All methods of this class are implemented by the system.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

protected:

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

### Prototype:

```
NURBSOffsetCurve();
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNOffsetCurve;
```

```
mpObject = NULL;  
mpNSet = NULL;  
mParentId = 0;  
mParentIndex = -1;  
mDistance = 0.0;
```

**Prototype:**

```
~NURBSOffsetCurve();
```

**Remarks:**

Destructor. The cache is cleared.

**Prototype:**

```
void SetParent(int index);
```

**Remarks:**

Sets the index in the **NURBSSet** of the parent object.

**Parameters:**

**int index**

The index into the **NURBSSet** of the parent curve.

**Prototype:**

```
void SetParentId(NURBSId id);
```

**Remarks:**

Sets the **NURBSId** of the parent.

**Parameters:**

**NURBSId id**

The id to set.

**Prototype:**

```
int GetParent();
```

**Remarks:**

Returns the index in the **NURBSSet** of the specified parent object.

**Prototype:**

**NURBSId GetParentId();**

**Remarks:**

Returns the **NURBSId** of the parent. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene

**Prototype:**

**void SetDistance(TimeValue t, double d);**

**Remarks:**

Sets the distance of the offset curve from the original in 3ds max units at the specified time.

**Parameters:**

**TimeValue t**

The time to set the offset distance.

**double d**

The distance to set.

**Prototype:**

**double GetDistance(TimeValue t);**

**Remarks:**

Returns the distance of the offset curve from the parent at the specified time.

**Parameters:**

**TimeValue t**

The time to get the offset distance.

**Operators:**

**Prototype:**

**NURBSOffsetCurve & operator=(const NURBSOffsetCurve& curve);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSOffsetCurve& curve**

The curve to assign.

## Class NURBSXFormCurve

See Also: [Class NURBSCurve](#).

```
class NURBSXFormCurve : public NURBSCurve
```

### Description:

This class is available in release 2.0 and later only.

This class defines a dependent transform (xform) curve. A transform curve is a copy of the original curve with a different position, rotation, or scale.

All methods of this class are implemented by the system.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

```
protected:
```

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

```
NURBSIdTab ids
```

A table with the IDs of each object in the **NURBSSet**.

```
public:
```

### Prototype:

```
NURBSXFormCurve();
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNXFormCurve;
```

```
mpObject = NULL;
```

```
mpNSet = NULL;
```

```
mParentId = 0;  
mParentIndex = -1;  
mXForm.IdentityMatrix();
```

**Prototype:**

```
~NURBSXFormCurve();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int index);
```

**Remarks:**

Sets the index in the **NURBSSet** of the specified parent object.

**Parameters:**

**int index**

The index into the **NURBSSet** of the parent curve.

**Prototype:**

```
void SetParentId(NURBSId id);
```

**Remarks:**

Sets the **NURBSId** of the parent.

**Parameters:**

**NURBSId id**

The id to set.

**Prototype:**

```
int GetParent();
```

**Remarks:**

Returns the index in the **NURBSSet** of the parent object.

**Prototype:**

**NURBSId GetParentId();**

**Remarks:**

Returns the **NURBSId** of the parent. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene

**Prototype:**

**void SetXForm(TimeValue t, Matrix3& mat);**

**Remarks:**

Sets the transformation used to move/rotate/scale the curve from the original.

**Parameters:**

**TimeValue t**

The time to set the transformation.

**Matrix3& mat**

The transformation matrix to set.

**Prototype:**

**Matrix3& GetXForm(TimeValue t);**

**Remarks:**

Returns the transformation used to move/rotate/scale the curve from the original.

**Parameters:**

**TimeValue t**

The time to get the transformation.

**Operators:**

**Prototype:**

**NURBSXFormCurve & operator=(const NURBSXFormCurve& curve);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSXFormCurve& curve**

The curve to assign.

## Class NURBSMirrorCurve

See Also: [Class NURBSCurve](#), [List of NURBSMirrorAxis Types](#).

```
class NURBSMirrorCurve : public NURBSCurve
```

### Description:

This class is available in release 2.0 and later only.

This class defines a dependent mirror curve. A mirror curve is similar to a mirror object that you create using the Mirror tool (on the 3ds max toolbar) or the Mirror modifier. It is the original curve reflected about one or two axes. Methods are available to get/set the parent index and id, to get/set the reflection axis, and to get/set the offset distance.

All methods of this class are implemented by the system.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

protected:

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

```
NURBSIdTab ids
```

A table with the IDs of each object in the **NURBSSet**.

public:

### Prototype:

```
NURBSMirrorCurve();
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNMirrorCurve;
```

```
mpObject = NULL;  
mpNSet = NULL;  
mParentId = 0;  
mParentIndex = -1;  
mXForm.IdentityMatrix();  
mAxis = kMirrorX;  
mDistance = 0.0;
```

**Prototype:**

```
~NURBSMirrorCurve();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int index);
```

**Remarks:**

Sets the index in the **NURBSSet** of the parent object.

**Parameters:**

**int index**

The index into the **NURBSSet** of the parent curve.

**Prototype:**

```
void SetParentId(NURBSId id);
```

**Remarks:**

Sets the **NURBSId** of the specified parent.

**Parameters:**

**NURBSId id**

The id to set.

**Prototype:**

```
int GetParent();
```

**Remarks:**

Returns the index in the **NURBSSet** of the parent object.

**Prototype:**

**NURBSId GetParentId();**

**Remarks:**

Returns the **NURBSId** of the parent. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene

**Prototype:**

**void SetAxis(NURBSMirrorAxis axis);**

**Remarks:**

Sets the axis or axes of reflection for the curve.

**Parameters:**

**NURBSMirrorAxis axis**

Specifies the axis or axes of reflection.

**Prototype:**

**NURBSMirrorAxis GetAxis();**

**Remarks:**

Returns the axis or axes of reflection for the curve.

**Prototype:**

**void SetXForm(TimeValue t, Matrix3& mat);**

**Remarks:**

This is an additional transformation applied to the axis specification. This corresponds to the gizmo they user may use interactively to alter the location of the mirror axis. This is exactly equivalent to setting the transform on the gizmo of a mirror modifier.

**Parameters:**

**TimeValue t**

The time at which to set the transformation.

## **Matrix3& mat**

The transformation to set.

### **Prototype:**

**Matrix3& GetXForm(TimeValue t);**

### **Remarks:**

Returns the additional transformation applied to the mirror axis at the specified time.

### **Parameters:**

**TimeValue t**

The time at which to get the transformation matrix.

### **Prototype:**

**void SetDistance(TimeValue t, double d);**

### **Remarks:**

Sets the offset distance of the curve.

### **Parameters:**

**TimeValue t**

The time at which to set the distance.

**double d**

The distance to set.

### **Prototype:**

**double GetDistance(TimeValue t);**

### **Remarks:**

Returns the offset distance of the curve.

### **Parameters:**

**TimeValue t**

The time at which to get the distance.

### **Operators:**

### **Prototype:**

**NURBSMirrorCurve & operator=(const NURBSMirrorCurve& curve);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSMirrorCurve& curve**

The curve to assign.

## Class NURBSFilletCurve

See Also: [Class NURBSCurve](#).

```
class NURBSFilletCurve : public NURBSCurve
```

### Description:

This class is available in release 2.0 and later only.

This class defines a dependent fillet curve. A fillet is a curve that creates a circular arc corner between two parent curves. Methods are available to get/set the parent indices and ids, get/set the trim state of the curves, get/set which ends of the curves are used, and get/set the radius of the fillet.

All methods of this class are implemented by the system.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

protected:

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

### Prototype:

```
NURBSFilletCurve();
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNFilletCurve;
```

```
mpObject = NULL;
mpNSet = NULL;
mRadius = 10.0;
for (int i = 0; i < 2; i++) {
    mParentId[i] = 0;
    mParentIndex[i] = -1;
    mParentEnd[i] = TRUE;
    mTrimCurve[i] = TRUE;
    mFlipTrim[i] = FALSE;
}
```

**Prototype:**

```
~NURBSFilletCurve();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int pnum, int index);
```

**Remarks:**

Sets the index in the **NURBSSet** of the specified parent object.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**int index**

The index into the **NURBSSet** of the parent curve.

**Prototype:**

```
void SetParentId(int pnum, NURBSId id);
```

**Remarks:**

Sets the **NURBSId** of the specified parent.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**NURBSId id**

The id to set.

**Prototype:**

**int GetParent(int pnum);**

**Remarks:**

Returns the index in the NURBSSet of the specified parent object.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**Prototype:**

**NURBSId GetParentId(int pnum);**

**Remarks:**

Returns the **NURBSId** of the specified parent. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**Prototype:**

**void SetEnd(int pnum, BOOL end);**

**Remarks:**

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**BOOL end**

TRUE to use the end of the curve; FALSE to use the beginning.

**Prototype:**

**BOOL GetEnd(int pnum);**

**Remarks:**

Returns which end of the specified curve is used for the fillet. TRUE if the end of the curve is used; FALSE if the beginning is used.

**Parameters:**

**int pnum**

The parent curve number: 0 or 1.

**Prototype:**

**void SetRadius(TimeValue t, double radius);**

**Remarks:**

Sets the radius for the fillet at the specified time.

**Parameters:**

**TimeValue t**

The time at which to set the radius value.

**double radius**

The radius to set.

**Prototype:**

**double GetRadius(TimeValue t);**

**Remarks:**

Returns the radius of the fillet at the specified time.

**Parameters:**

**TimeValue t**

The time to return the fillet value.

**Prototype:**

**void SetTrimCurve(int pnum, BOOL trim);**

**Remarks:**

Sets if the specified curve is trimmed beyond the fillet.

**Parameters:**

**int pnum**

The parent curve number: 0 or 1.

**BOOL trim**

TRUE to trim the curve beyond the fillet; otherwise FALSE.

**Prototype:**

**BOOL GetTrimCurve(int pnum);**

**Remarks:**

Determines if the specified curve is trimmed beyond the fillet. TRUE if the curve is trimmed; otherwise FALSE.

**Parameters:**

**int pnum**

The parent curve number: 0 or 1.

**Prototype:**

**BOOL GetFlipTrim(int pnum);**

**Remarks:**

Returns the flip state for the specified curve.

**Parameters:**

**int pnum**

The parent curve number: 0 or 1.

**Return Value:**

TRUE if flip is set; FALSE if not.

**Prototype:**

**void SetFlipTrim(int pnum, BOOL flip);**

**Remarks:**

Sets the flip state for the specified curve.

**Parameters:**

**int pnum**

The parent curve number: 0 or 1.

## **BOOL flip**

TRUE to flip; FALSE to not flip.

### **Operators:**

### **Prototype:**

```
NURBSFilletCurve & operator=(const NURBSFilletCurve&  
curve);
```

### **Remarks:**

Assignment operator.

### **Parameters:**

```
const NURBSFilletCurve& curve
```

The curve to assign.

## Class NURBSChamferCurve

See Also: [Class NURBSCurve](#).

```
class NURBSChamferCurve : public NURBSCurve
```

### Description:

This class is available in release 2.0 and later only.

This class defines a dependent chamfer curve. A chamfer is a curve that creates a straight line corner between two parent curves. Methods are available to get/set the parent indices and ids, to get/set which ends of the curves are used for the chamfer, get/set the trim settings for each curve, and to get/set the length of the curve back from the selected end that represents the start of the chamfer.

All methods of this class are implemented by the system.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

protected:

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

### Prototype:

```
NURBSChamferCurve();
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNChamferCurve;
```

```
mpObject = NULL;
mpNSet = NULL;
for (int i = 0; i < 2; i++) {
    mParentId[i] = 0;
    mParentIndex[i] = -1;
    mParentEnd[i] = TRUE;
    mTrimCurve[i] = TRUE;
    mFlipTrim[i] = FALSE;
    mLength[i] = 0.0;
}
```

**Prototype:**

```
~NURBSChamferCurve();
```

**Remarks:**

Destructor. The cache is cleared.

**Prototype:**

```
void SetParent(int pnum, int index);
```

**Remarks:**

Sets the index in the **NURBSSet** of the specified parent object.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**int index**

The index into the **NURBSSet** of the parent object.

**Prototype:**

```
void SetParentId(int pnum, NURBSId id);
```

**Remarks:**

Sets the **NURBSId** of the specified parent.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**NURBSId id**

The id to set.

**Prototype:**

**int GetParent(int pnum);**

**Remarks:**

Returns the index in the **NURBSSet** of the specified parent object.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**Prototype:**

**NURBSId GetParentId(int pnum);**

**Remarks:**

Returns the **NURBSId** of the specified parent. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**Prototype:**

**void SetEnd(int pnum, BOOL end);**

**Remarks:**

Sets which end of the specified curve is used for the chamfer.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**BOOL end**

TRUE to use the end of the curve; FALSE to use the beginning.

**Prototype:**

**BOOL GetEnd(int pnum);**

**Remarks:**

Returns which end of the specified curve is used for the chamfer. TRUE if the end of the curve is used; FALSE if the beginning is used.

**Parameters:**

**int pnum**

The parent curve number: 0 or 1.

**Prototype:**

**void SetLength(TimeValue t, int pnum, double length);**

**Remarks:**

Sets the length for the specified parent curve back from the end that defines the beginning of the chamfer, at the specified time.

**Parameters:**

**TimeValue t**

The time at which to set the chamfer length.

**int pnum**

The parent curve number: 0 or 1.

**double length**

The chamfer length to set.

**Prototype:**

**double GetLength(TimeValue t, int pnum);**

**Remarks:**

Returns the length of the chamfer at the specified time.

**Parameters:**

**TimeValue t**

The time at which to return the chamfer length.

**int pnum**

The parent curve number: 0 or 1.

**Prototype:**

**void SetTrimCurve(int pnum, BOOL trim);**

**Remarks:**

Sets if the specified curve is trimmed beyond the chamfer.

**Parameters:**

**int pnum**

The parent curve number: 0 or 1.

**BOOL trim**

TRUE to trim the curve beyond the chamfer; otherwise FALSE.

**Prototype:**

**BOOL GetTrimCurve(int pnum);**

**Remarks:**

Determines if the specified curve is trimmed beyond the fillet. TRUE if the curve is trimmed; otherwise FALSE.

**Parameters:**

**int pnum**

The parent curve number: 0 or 1.

**Prototype:**

**BOOL GetFlipTrim(int pnum);**

**Remarks:**

Returns the flip state for the specified curve.

**Parameters:**

**int pnum**

The parent curve number: 0 or 1.

**Return Value:**

TRUE if flip is set; FALSE it not.

**Prototype:**

**void SetFlipTrim(int pnum, BOOL flip);**

**Remarks:**

Sets the flip state for the specified curve.

**Parameters:**

**int pnum**

The parent curve number: 0 or 1.

**BOOL flip**

TRUE to flip; FALSE to not flip.

**Operators:**

**Prototype:**

**NURBSChamferCurve & operator=(const  
NURBSChamferCurve& curve);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSChamferCurve& curve**

The curve to assign.

## Class NURBSIsoCurve

See Also: [Class NURBSCurve](#).

```
class NURBSIsoCurve : public NURBSCurve
```

### Description:

This class is available in release 2.0 and later only.

This class defines a dependent iso curve. U and V iso curves are dependent curves created along lines of constant parameter value of a NURBS surface. Note the difference between "Iso Lines", which are a display artifact, and "Iso Curves" which are the dependent objects. There are methods available to get/set the parent surface index and id, get/set the direction of the iso curve, and get/set the parameter which determines the location on the surface the curve matches.

All methods of this class are implemented by the system.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

protected:

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

### Prototype:

```
NURBSIsoCurve();
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNIsoCurve;  
mpObject = NULL;  
mpNSet = NULL;  
mParentId = 0;  
mParentIndex = -1;  
mIsU = TRUE;  
mParam = 0.0;  
mTrim = FALSE;  
mFlipTrim = FALSE;  
mSeed = Point2(0.0, 0.0);
```

**Prototype:**

```
~NURBSIsoCurve();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int index);
```

**Remarks:**

Sets the index in the **NURBSSet** of the specified parent object.

**Parameters:**

**int index**

The index into the **NURBSSet** of the parent surface.

**Prototype:**

```
void SetParentId(NURBSId id);
```

**Remarks:**

Sets the **NURBSId** of the specified parent.

**Parameters:**

**NURBSId id**

The id to set.

**Prototype:**

**int GetParent();**

**Remarks:**

Returns the index in the **NURBSSet** of the parent object.

**Prototype:**

**NURBSId GetParentId();**

**Remarks:**

Returns the **NURBSId** of the parent. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene.

**Prototype:**

**void SetDirection(BOOL isU);**

**Remarks:**

Sets the direction of the iso curve, either U or V.

**Parameters:**

**BOOL isU**

TRUE for U; FALSE for V.

**Prototype:**

**BOOL GetDirection();**

**Remarks:**

Returns TRUE if the iso curve is in the U direction; FALSE for the V direction.

**Prototype:**

**void SetParam(TimeValue t, double p);**

**Remarks:**

Sets the parameter which determines where on the surface the iso curve is defined.

**Parameters:**

**TimeValue t**

The time at which to evaluate the surface.

**double p**

The parameter defining the location on the surface.

**Prototype:**

**double GetParam(TimeValue t);**

**Remarks:**

Returns the parameter which determines where on the surface the iso curve is defined.

**Parameters:**

**TimeValue t**

The time at which to evaluate the surface.

**Prototype:**

**BOOL GetTrim();**

**Remarks:**

Returns the state of the trim flag. When set the surface is trimmed against the curve. When not set, the surface isn't trimmed

**Prototype:**

**void SetTrim(BOOL trim);**

**Remarks:**

Sets the state of the trim flag. When set the surface is trimmed against the curve. When not set, the surface isn't trimmed

**Parameters:**

**BOOL trim**

TRUE to trim; FALSE to not trim.

**Prototype:**

**BOOL GetFlipTrim();**

**Remarks:**

Returns the state of the trim flip flag. When set this trims the surface in the

opposite direction

**Prototype:**

**void SetFlipTrim(BOOL flip);**

**Remarks:**

Sets the state of the trim flip flag. When set this trims the surface in the opposite direction

**Parameters:**

**BOOL flip**

TRUE to flip; FALSE to not flip.

**Prototype:**

**Point2 GetSeed();**

**Remarks:**

Returns the UV location of the seed value on the curve.

**Prototype:**

**void SetSeed(Point2& seed);**

**Remarks:**

Sets the UV location of the seed value on the curve.

**Parameters:**

**Point2& seed**

The seed value to set.

**Operators:**

**Prototype:**

**NURBSIsoCurve & operator=(const NURBSIsoCurve& curve);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSIsoCurve& curve**

The curve to assign.

## Class NURBSPointSurface

See Also: [Class NURBSSurface](#), [Class NURBSIndependentPoint](#).

```
class NURBSPointSurface : public NURBSSurface
```

### Description:

This class is available in release 2.0 and later only.

This class defines a surface that uses points to describe its shape. This class has methods to close the surface in U and V, set the number of points in U and V, and get/set the points in U and V. There is also a method to add additional points to the surface. The point surface has a transformation matrix used to set the relative position of the surface in a **NURBSSet**.

All methods of this class are implemented by the system.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

#### Prototype:

```
NURBSPointSurface();
```

#### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNPointSurface;
```

```
mClosedInU = FALSE;
```

```
mClosedInV = FALSE;
```

```
mpPts = NULL;
```

#### Prototype:

```
virtual ~NURBSPointSurface();
```

#### Remarks:

Destructor. Any allocated points are deleted.

#### Prototype:

```
void CloseInU();
```

**Remarks:**

This method closes the surface in the U direction.

**Prototype:**

```
void CloseInV();
```

**Remarks:**

This method closes the surface in the V direction.

**Prototype:**

```
void SetNumPts(int u, int v);
```

**Remarks:**

Sets the number of points in the surface in the U and V directions. Any previously allocated points are not maintained when the new number is set.

**Parameters:**

**int u**

The number of points in U.

**int v**

The number of points in V.

**Prototype:**

```
int GetNumUPts();
```

**Remarks:**

Returns the number of points in the U direction.

**Prototype:**

```
int GetNumVPts();
```

**Remarks:**

Returns the number of points in the V direction.

**Prototype:**

```
void GetNumPts(int &u, int &v);
```

**Remarks:**

Retrieves the number of points in both the U and V directions.

**Parameters:**

**int &u**

The number in U is stored here.

**int &v**

The number in V is stored here.

**Prototype:**

**NURBSIndependentPoint\* GetPoint(int u, int v);**

**Remarks:**

Returns a pointer to the specified point in the surface.

**Parameters:**

**int u**

The zero based index of the point in the U direction.

**int v**

The zero based index of the point in the V direction.

**Prototype:**

**void SetPoint(int u, int v, NURBSIndependentPoint& pt);**

**Remarks:**

Sets the specified point in the surface to the point passed.

**Parameters:**

**int u**

The zero based index of the point in the U direction.

**int v**

The zero based index of the point in the V direction.

**NURBSIndependentPoint& pt**

The point to set.

**Prototype:**

**void SetTransformMatrix(TimeValue t, SetXFormPacket& mat);**

**Remarks:**

Sets the transformation matrix for the **NURBSPointSurface**. This controls the relative position of the surface within a **NURBSSet**.

**Parameters:**

**TimeValue t**

The time at which to set the matrix.

**SetXFormPacket& xPack**

An instance of the **XFormPacket** class that describes the properties of the transformation. See [Class SetXFormPacket](#).

**Prototype:**

**Matrix3 GetTransformMatrix(TimeValue t);**

**Remarks:**

Returns the transformation matrix of the **NURBSPointSurface** at the specified time.

**Parameters:**

**TimeValue t**

The time at which to retrieve the matrix.

**Prototype:**

**void Refine(TimeValue t, double u, double v, int U\_V\_Both);**

**Remarks:**

This method adds a new point at the specified location on the surface without changing the shape of the surface. The location may be specified as a U value or a V value, or both.

If you refine in U (U\_V\_Both = 0) you must specify v

If you refine in V (U\_V\_Both = 1) you must specify u

If you refine in U and V (U\_V\_Both = -1) you must specify u and v

**Parameters:**

**TimeValue t**

The time at which to refine the surface.

**double u**

The location for the point in U space (range 0.0 to 1.0).

**double v**

The location for the point in V space (range 0.0 to 1.0).

**int U\_V\_Both**

This value must be **0**, **1** or **-1**.

If 0 the refinement is done in u (and v is specified).

If 1 the refinement is done in v (and u is specified).

If -1 the refinement is done in both u and v (and both u and v must be specified).

**Operators:****Prototype:**

```
NURBSPointSurface & operator=(const NURBSPointSurface&  
surf);
```

**Remarks:**

Assignment operator.

**Parameters:**

```
const NURBSPointSurface& surf
```

The surface to assign.

## Class NURBSCVSurface

See Also: [Class NURBSSurface](#).

```
class NURBSCVSurface : public NURBSSurface
```

### Description:

This class is available in release 2.0 and later only.

This class defines a surface that uses control vertices (CVs) to describe its shape. The CVs define a control lattice which surrounds the surface. This class has methods to close the surface in U and V, set its order in U and V, set the number of knots and CVs in U and V, and get/set the knots and CVs in U and V. There is also a method to add additional CVs to the surface. The CV surface has a transformation matrix used to position the surface within a NURBSSet.

All methods of this class are implemented by the system.

### Methods:

#### Prototype:

```
NURBSCVSurface();
```

#### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNCVSurface;
```

```
mRigid = FALSE;
```

```
mClosedInU = FALSE;
```

```
mClosedInV = FALSE;
```

```
mpCVs = NULL;
```

```
mpUKnots = NULL;
```

```
mpVKnots = NULL;
```

```
mNumUCVs = 0;
```

```
mNumVCVs = 0;
```

```
mNumUKnots = 0;
```

```
mNumVKnots = 0;
```

```
mUOrder = 0;
```

```
mVOrder = 0;
```

**mAutoParam = kNotAutomatic;**

**Prototype:**

**virtual ~NURBSCVSurface();**

**Remarks:**

Destructor.

**Prototype:**

**BOOL IsRigid();**

**Remarks:**

This method is available in release 3.0 and later only.  
Returns TRUE if the surface is 'rigid'; otherwise FALSE.

**Prototype:**

**void SetRigid(BOOL isRigid);**

**Remarks:**

This method is available in release 3.0 and later only.  
Sets the 'rigid' state of the surface.

**Parameters:**

**BOOL isRigid**

TRUE for on; FALSE for off.

**Prototype:**

**NURBSAutoParam AutoParam();**

**Remarks:**

This method is available in release 3.0 and later only.  
Returns the automatic parameterization setting. See [List of NURBSAutoParam Types](#).

**Prototype:**

**void AutoParam(TimeValue t, NURBSAutoParam param);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the automatic parameterization setting at the specified time.

**Parameters:****TimeValue t**

The time at which to set the parameterization.

**NURBSAutoParam param**

See [List of NURBSAutoParam Types](#).

**Prototype:**

```
void Reparameterize(TimeValue t, NURBSParamaterization  
param);
```

**Remarks:**

This method is available in release 3.0 and later only.

Sets the reparameterization type at the specified time.

**Parameters:****TimeValue t**

The time at which to sets the reparameterization type.

**NURBSParamaterization param**

See [List of NURBSParamaterization Types](#).

**Prototype:**

```
void CloseInU();
```

**Remarks:**

This method closes the surface in the U direction. The aligns the surface edge to edge in U and sets the tangents to match.

**Prototype:**

```
void CloseInV();
```

**Remarks:**

This method closes the surface in the V direction. The aligns the surface edge to edge in V and sets the tangents to match.

**Prototype:**

**void SetUOrder(int order);**

**Remarks:**

Sets the order of the surface in the U direction.

**Parameters:**

**int order**

Specifies the order of the surface in the U direction.

**Prototype:**

**int GetUOrder();**

**Remarks:**

Returns the order of the surface in the U direction.

**Prototype:**

**int GetVOrder();**

**Remarks:**

Returns the order of the surface in the V direction.

**Prototype:**

**void SetVOrder(int order);**

**Remarks:**

Sets the order of the surface in the V direction.

**Parameters:**

**int order**

Specifies the order of the surface in the V direction.

**Prototype:**

**void SetNumUKnots(int num);**

**Remarks:**

Sets the number of knots in the U direction. Note that the knot data is not maintained.

**Parameters:**

**int num**

Specifies the number of knots in the U direction.

**Prototype:**

**void SetNumVKnots(int num);**

**Remarks:**

Sets the number of knots in the V direction. Note that the knot data is not maintained.

**Parameters:**

**int num**

Specifies the number of knots in the V direction.

**Prototype:**

**int GetNumUKnots();**

**Remarks:**

Returns the number of knots in the U direction.

**Prototype:**

**int GetNumVKnots();**

**Remarks:**

Returns the number of knots in the V direction.

**Prototype:**

**void SetNumCVs(int u, int v);**

**Remarks:**

Sets the number of control vertices in both the U and V directions. Note that the CV data is not maintained.

**Parameters:**

**int u**

Specifies the number of control vertices in the U direction.

**int v**

Specifies the number of control vertices in the V direction.

**Prototype:**

**int GetNumUCVs();**

**Remarks:**

Returns the number of control vertices in the U direction.

**Prototype:**

**int GetNumVCVs();**

**Remarks:**

Returns the number of control vertices in the V direction.

**Prototype:**

**void GetNumCVs(int &u, int &v);**

**Remarks:**

Returns the number of control vertices in both the U and V directions.

**Parameters:**

**int &u**

The number of CVs in the U direction is returned here.

**int &v**

The number of CVs in the V direction is returned here.

**Prototype:**

**double GetUKnot(int index);**

**Remarks:**

Returns the specified knot value in the U direction.

**Parameters:**

**int index**

The 0 based index of the knot value to return.

**Prototype:**

**double GetVKnot(int index);**

**Remarks:**

Returns the specified knot value in the V direction.

**Parameters:**

**int index**

The 0 based index of the knot value to return.

**Prototype:**

**void SetUKnot(int index, double value);**

**Remarks:**

Sets the specified knot in the U direction to the specified value.

**Parameters:**

**int index**

The 0 based index of the knot value to set.

**double value**

The value to set.

**Prototype:**

**void SetVKnot(int index, double value);**

**Remarks:**

Sets the specified knot in the U direction to the specified value.

**Parameters:**

**int index**

The 0 based index of the knot value to set.

**double value**

The value to set.

**Prototype:**

**NURBSControlVertex &GetCV(int u, int v);**

**Remarks:**

Returns the specified control vertex of this surface.

**Parameters:**

**int u**

The 0 based index in the U direction.

**int v**

The 0 based index in the V direction.

**Prototype:**

**void SetCV(int u, int v, NURBSControlVertex &cv);**

**Remarks:**

Sets the specified control vertex.

**Parameters:**

**int u**

The 0 based index in the U direction.

**int v**

The 0 based index in the V direction.

**NURBSControlVertex &cv**

The control vertex to set.

**Prototype:**

**void SetTransformMatrix(TimeValue t, SetXFormPacket& mat);**

**Remarks:**

Sets the transformation matrix for the **NURBSCVSurface**. This matrix controls the relative position of the surface within a **NURBSSet**.

**Parameters:**

**TimeValue t**

The time at which to set the matrix.

**SetXFormPacket& xPack**

An instance of the **XFormPacket** class that describes the properties of the transformation (specifically if it's being moved, rotated, or scaled). See [Class SetXFormPacket](#).

**Prototype:**

## **Matrix3 GetTransformMatrix(TimeValue t);**

### **Remarks:**

Returns the transformation matrix of the **NURBSCVSurface** at the specified time.

### **Parameters:**

#### **TimeValue t**

The time at which to retrieve the matrix.

### **Prototype:**

**void EdgesOverlap(BOOL& uOverlap, BOOL& vOverlap);**

### **Remarks:**

This method determines if the edges of the surface overlap in U and/or V even though the surface may not be closed (that is, the tangents match at the edges).

### **Parameters:**

#### **BOOL& uOverlap**

The U result is returned here: TRUE if the edges overlap in U; otherwise FALSE.

#### **BOOL& vOverlap**

The V result is returned here: TRUE if the edges overlap in V; otherwise FALSE.

### **Prototype:**

**void Refine(TimeValue t, double u, double v, int U\_V\_Both);**

### **Remarks:**

This method adds a control vertex at the specified point on the surface without changing the shape of the surface. The other CV points will move to maintain the current shape. The point may be specified as a U value or a V value, or both.

If you refine in U (U\_V\_Both = 0) you must specify v

If you refine in V (U\_V\_Both = 1) you must specify u

If you refine in U and V (U\_V\_Both = -1) you must specify u and v

### **Parameters:**

**TimeValue t**

The time at which to refine the surface.

**double u**

The position for the point in U space.

**double v**

The position for the point in V space.

**int U\_V\_Both**

This value must be **0**, **1** or **-1**.

If 0 the refinement is done in u (and v is specified).

If 1 the refinement is done in v (and u is specified).

If -1 the refinement is done in both u and v (and both u and v must be specified).

**Prototype:**

```
void Insert(TimeValue t, double u, double v, int U_V_Both);
```

**Remarks:**

This method is available in release 2.5 and later only.

This method adds a new CV to the surface and changes its shape. The other CVs will not move as they do in **Refine()**. This method preserves any existing animation of the surface.

**Parameters:****TimeValue t**

The time at which to refine the surface.

**double u**

The position for the point in U space.

**double v**

The position for the point in V space.

**int U\_V\_Both**

This value must be **0**, **1** or **-1**.

If 0 the refinement is done in u (and v is specified).

If 1 the refinement is done in v (and u is specified).

If -1 the refinement is done in both u and v (and both u and v must be specified).

**Operators:**

**Prototype:**

**NURBSCVSurface & operator=(const NURBSCVSurface& surf);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSCVSurface& surf**

The CV surface to assign.

# Class NURBSBlendSurface

See Also: [Class NURBSSurface](#).

```
class NURBSBlendSurface : public NURBSSurface
```

## Description:

This class is available in release 2.0 and later only.

This class defines a dependent blend surface. A blend surface connects the edge of one surface to the edge of another, blending the curvature of the parents to create a smooth surface between them. Methods are available to get/set the parents, parent Ids, tension parameters and surface normal matching state. All methods of this class are implemented by the system.

## Friend Classes:

```
friend class NURBSSet
```

## Methods:

```
protected:
```

## Prototype:

```
void Clean(NURBSIdTab ids);
```

## Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

## Parameters:

```
NURBSIdTab ids
```

A table with the IDs of each object in the **NURBSSet**.

```
public:
```

## Prototype:

```
NURBSBlendSurface();
```

## Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNBlendSurface;
```

```
mpObject = NULL;
mpNSet = NULL;
for (int i = 0; i < 2; i++) {
    mParentId[i] = 0;
    mParentIndex[i] = -1;
    mParentEdge[i] = 0;
    mFlip[i] = FALSE;
    mTension[i] = 1.0;
    mCurveStartParam[i] = 0.0;
}
```

**Prototype:**

```
virtual ~NURBSBlendSurface();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int pnum, int index);
```

**Remarks:**

Sets the index in the **NURBSSet** of the specified parent object.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**int index**

The index into the **NURBSSet** of the parent surface.

**Prototype:**

```
void SetParentId(int pnum, NURBSId id);
```

**Remarks:**

Sets the **NURBSId** of the specified parent.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**NURBSId id**

The id to set.

**Prototype:**

**int GetParent(int pnum);**

**Remarks:**

Returns the index in the **NURBSSet** of the specified parent object.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**Prototype:**

**NURBSId GetParentId(int pnum);**

**Remarks:**

Returns the **NURBSId** of the specified parent. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**Prototype:**

**void SetEdge(int pnum, int edge);**

**Remarks:**

Sets which edge of the specified surface is used for the blend.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**int edge**

One of the following values:

**0:** The low U edge.

**1:** The high U edge.

**2:** The low V edge.

**3:** The high V edge.

**Prototype:**

**int GetEdge(int pnum);**

**Remarks:**

Returns an integer that determines which edge of the specified surface is used for the blend.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**Return Value:**

One of the following values:

**0:** The low U edge.

**1:** The high U edge.

**2:** The low V edge.

**3:** The high V edge.

**Prototype:**

**void SetTension(TimeValue t, int pnum, double ten);**

**Remarks:**

Sets the tension value for the specified parent surface.

**Parameters:**

**TimeValue t**

The time at which to set the tension value.

**int pnum**

The parent number: 0 or 1.

**double ten**

The tension value to set.

**Prototype:**

**double GetTension(TimeValue t, int pnum);**

**Remarks:**

Returns the tension value for the specified parent surface.

**Parameters:**

**TimeValue t**

The time at which to return the tension value.

**int pnum**

The parent number: 0 or 1.

**Prototype:**

**void SetFlip(int pnum, BOOL flip);**

**Remarks:**

This allows one to control the matching of parent surface normals when creating the blend surface. For example, normally when you create a blend surface between two parent surfaces you don't want a 'bow tie' surface (one with the ends rotated 180 degrees so it crosses on itself in the middle). If you simply match the parent normals you'll occasionally get a 'bow tie' surface. To prevent this you use this method to set a state indicating that one or the other should be flipped before it's used. In this way, when the blend is created, a 'bow tie' won't occur.

**Parameters:**

**int pnum**

The number of the parent surface: 0 or 1.

**BOOL flip**

TRUE to match the parent surface normal; FALSE to not match it.

**Prototype:**

**BOOL GetFlip(int pnum);**

**Remarks:**

Returns the flip state of the specified parent surface.

**Parameters:**

**int pnum**

The number of the parent surface: 0 or 1.

**Prototype:**

**void SetCurveStartPoint(TimeValue t, int pnum, double startpoint);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the start point for the specified parent curve. Note: This is only applicable if the parent is a closed curve.

**Parameters:**

**TimeValue t**

The time at which to set the start point.

**int pnum**

The number of the parent surface: 0 or 1.

**double startpoint**

The start point in the range 0.0 to 1.0.

**Prototype:**

**double GetCurveStartPoint(TimeValue t, int pnum);**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the start point of the specified parent curve.

Note: This is only applicable if the parent is a closed curve.

**Parameters:**

**TimeValue t**

The time at which to get the start point.

**int pnum**

The number of the parent surface: 0 or 1.

**Operators:**

**Prototype:**

**NURBSBlendSurface & operator=(const NURBSBlendSurface& surf);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSBlendSurface& surf**

The surface to assign.

# Class NURBSOffsetSurface

See Also: [Class NURBSSurface](#).

```
class NURBSOffsetSurface : public NURBSSurface
```

## Description:

This class is available in release 2.0 and later only.

This class defines a dependent offset surface. An Offset surface is offset a specified distance from the original along the parent surface's normals. Methods are available to get/set the parent index and parent Ids, and to get/set the offset distance of the surface.

All methods of this class are implemented by the system.

## Friend Classes:

```
friend class NURBSSet
```

## Methods:

protected:

## Prototype:

```
void Clean(NURBSIdTab ids);
```

## Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

## Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

## Prototype:

```
NURBSOffsetSurface();
```

## Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNOffsetSurface;
```

```
mpObject = NULL;  
mpNSet = NULL;  
mParentId = 0;  
mParentIndex = -1;  
mDistance = 0.0;
```

**Prototype:**

```
virtual ~NURBSOffsetSurface();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int index);
```

**Remarks:**

Sets the index in the **NURBSSet** of the specified parent object.

**Parameters:**

**int index**

The index into the **NURBSSet** of the parent surface.

**Prototype:**

```
void SetParentId(NURBSId id);
```

**Remarks:**

Sets the Id of the parent surface.

**Parameters:**

**NURBSId id**

The Id to set.

**Prototype:**

```
int GetParent();
```

**Remarks:**

Returns the index in the **NURBSSet** of the parent surface.

**Prototype:**

**NURBSId GetParentId();**

**Remarks:**

Returns the **NURBSId** of the parent surface. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene.

**Prototype:**

**void SetDistance(TimeValue t, double d);**

**Remarks:**

Sets the offset distance of the surface at the specified time.

**Parameters:**

**TimeValue t**

The time at which to set the offset a value.

**double d**

A distance of the offset in 3ds max units.

**Prototype:**

**double GetDistance(TimeValue t);**

**Remarks:**

Returns the distance of the offset at the specified time.

**Parameters:**

**TimeValue t**

The time at which to return the offset a value.

**Operators:**

**Prototype:**

**NURBSOffsetSurface & operator=(const NURBSOffsetSurface& surf);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSOffsetSurface& surf**

The surface to assign.

# Class NURBSXFormSurface

See Also: [Class NURBSSurface](#).

```
class NURBSXFormSurface : public NURBSSurface
```

## Description:

This class is available in release 2.0 and later only.

This class defines a dependent transform (xform) surface. A transform surface is a copy of the original surface with a different position, rotation, or scale.

Methods are available to get/set the indices of the parent surface in the **NURBSSet** and the parent Ids and to specify/retrieve the transformation used on the surface.

All methods of this class are implemented by the system.

## Friend Classes:

```
friend class NURBSSet
```

## Methods:

protected:

## Prototype:

void Clean(NURBSIdTab ids);
```

## Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

## Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

## Prototype:

```
NURBSXFormSurface();
```

## Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNXFormSurface;
```

```
mpObject = NULL;  
mpNSet = NULL;  
mParentId = 0;  
mParentIndex = -1;  
mXForm.IdentityMatrix();
```

**Prototype:**

```
virtual ~NURBSXFormSurface();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int index);
```

**Remarks:**

Sets the index in the NURBSSet of the parent object.

**Parameters:**

**int index**

The index in the NURBSSet of the parent object.

**Prototype:**

```
void SetParentId(NURBSId id);
```

**Remarks:**

Set the NURBSId of the parent object.

**Parameters:**

**NURBSId id**

The Id to set.

**Prototype:**

```
int GetParent();
```

**Remarks:**

Returns the index in the NURBSSet of the parent object.

**Prototype:**

**NURBSId GetParentId();**

**Remarks:**

Returns the NURBSId of the parent object.

**Prototype:**

**void SetXForm(TimeValue t, Matrix3& mat);**

**Remarks:**

Sets the transformation from the parent surface.

**Parameters:**

**TimeValue t**

The time at which to set the transformation.

**Matrix3& mat**

The transformation to set.

**Prototype:**

**Matrix3& GetXForm(TimeValue t);**

**Remarks:**

Returns the transformation from the parent surface.

**Parameters:**

**TimeValue t**

The time at which the transformation is returned.

**Operators:**

**Prototype:**

**NURBSXFormSurface & operator=(const  
NURBSXFormSurface& surf);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSXFormSurface& surf**

The surface to assign.

# Class NURBSMirrorSurface

See Also: [Class NURBSSurface](#), [List of NURBSMirrorAxis Types](#).

```
class NURBSMirrorSurface : public NURBSSurface
```

## Description:

This class is available in release 2.0 and later only.

This class defines a dependent mirror surface. A mirror surface is similar to a mirror object that you create using the Mirror tool (on the 3ds max toolbar) or the Mirror modifier. It is the original surface reflected about one or two axes. Methods are available to get/set the indices of the parent surface in the **NURBSSet** and the parent Ids, to get/set the mirror axes, to get/set the mirror distance, and to set the transformation used to position the surface in the **NURBSSet**.

All methods of this class are implemented by the system.

## Friend Classes:

```
friend class NURBSSet
```

## Methods:

protected:

## Prototype:

```
void Clean(NURBSIdTab ids);
```

## Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

## Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

## Prototype:

```
NURBSMirrorSurface();
```

## Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNMirrorSurface;  
mpObject = NULL;  
mpNSet = NULL;  
mParentId = 0;  
mParentIndex = -1;  
mXForm.IdentityMatrix();  
mAxis = kMirrorX;  
mDistance = 0.0;
```

**Prototype:**

```
virtual ~NURBSMirrorSurface();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int index);
```

**Remarks:**

Sets the index in the **NURBSSet** of the parent object.

**Parameters:**

**int index**

The index in the **NURBSSet** of the parent object

**Prototype:**

```
void SetParentId(NURBSId id);
```

**Remarks:**

Sets the **NURBSId** of the parent object.

**Parameters:**

**NURBSId id**

The **NURBSId** of the parent object.

**Prototype:**

**int GetParent();**

**Remarks:**

Returns the index in the **NURBSSet** of the parent object.

**Prototype:**

**NURBSId GetParentId();**

**Remarks:**

Returns the **NURBSId** of the parent. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene.

**Prototype:**

**void SetAxis(NURBSMirrorAxis axis);**

**Remarks:**

Sets the mirror axis to the specified constant.

**Parameters:**

**NURBSMirrorAxis axis**

The mirror axis to set.

**Prototype:**

**NURBSMirrorAxis GetAxis();**

**Remarks:**

Returns the axis or axes of reflection for the surface.

**Prototype:**

**void SetXForm(TimeValue t, Matrix3& mat);**

**Remarks:**

This is an additional transformation applied to the axis specification. This corresponds to the gizmo the user may use interactively to alter the location of the mirror axis. This is exactly equivalent to setting the transform on the gizmo of a mirror modifier.

**Parameters:**

**TimeValue t**

The time at which to set the transformation.

**Matrix3& mat**

The transformation to set.

**Prototype:**

**Matrix3& GetXForm(TimeValue t);**

**Remarks:**

Returns the additional transformation applied to the mirror axis at the specified time.

**Parameters:****TimeValue t**

The time at which to get the transformation matrix.

**Prototype:**

**void SetDistance(TimeValue t, double d);**

**Remarks:**

This is just like the offset parameter in the mirror modifier. It is an offset from the center of the local coordinate system for the mirror object that moves the mirror, in the direction specified by the mirror axis.

**Parameters:****TimeValue t**

The time at which to set the offset.

**double d**

The offset distance.

**Prototype:**

**double GetDistance(TimeValue t);**

**Remarks:**

Returns the offset distance of the mirror at the specified time.

**Parameters:****TimeValue t**

The time at which to return the offset.

**Operators:**

**Prototype:**

**NURBSMirrorSurface & operator=(const  
NURBSMirrorSurface& surf);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSMirrorSurface& surf**  
The surface to assign.

## Class NURBSRuledSurface

See Also: [Class NURBSSurface](#).

```
class NURBSRuledSurface : public NURBSSurface
```

### Description:

This class is available in release 2.0 and later only.

This class defines a dependent ruled surface. A ruled surface is generated from two curve sub-objects. It lets you use curves to design the two opposite borders of a surface. Methods are available to get/set the indices of the parent surface in the **NURBSSet** and the parent Ids and to set the surface normal matching state of the surfaces.

All methods of this class are implemented by the system.

### Friend Classes:

```
protected:
```

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

```
NURBSIdTab ids
```

A table with the IDs of each object in the **NURBSSet**.

```
public:
```

### Prototype:

```
NURBSRuledSurface();
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNRuledSurface;
```

```
mpObject = NULL;  
mpNSet = NULL;  
for (int i = 0; i < 2; i++) {  
  mParentId[i] = 0;  
  mParentIndex[i] = -1;  
  mFlip[i] = FALSE;  
  mCurveStartParam[i] = 0.0;  
}
```

**Prototype:**

```
virtual ~NURBSRuledSurface();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int pnum, int index);
```

**Remarks:**

Sets the index in the **NURBSSet** of the specified parent object.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

**int index**

The index in the **NURBSSet** of the specified parent object.

**Prototype:**

```
void SetParentId(int pnum, NURBSId id);
```

**Remarks:**

Sets the **NURBSId** of the specified parent.

**Parameters:**

**int pnum**

The parent number: 0 or 1.

## **NURBSId id**

The id to set.

### **Prototype:**

**int GetParent(int pnum);**

### **Remarks:**

Returns the index in the **NURBSSet** of the specified parent object.

### **Parameters:**

**int pnum**

The parent number: 0 or 1.

### **Prototype:**

**NURBSId GetParentId(int pnum);**

### **Remarks:**

Returns the **NURBSId** of the specified parent. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene

### **Parameters:**

**int pnum**

The parent number: 0 or 1.

### **Prototype:**

**void SetFlip(int pnum, BOOL flip);**

### **Remarks:**

This allows one to control the matching of parent surface normals when creating the ruled surface. For example, normally when you create a ruled surface between two parent curves you don't want a 'bow tie' surface (one with the ends rotated 180 degrees so it crosses on itself in the middle). If you simply match the parent normals you'll get a 'bow tie' surface. To prevent this you use this method to set a state indicating that one or the other should be flipped before it's used. In this way, when the ruled surface is created, a 'bow tie' won't occur.

### **Parameters:**

**int pnum**

The number of the parent curve: 0 or 1.

**BOOL flip**

TRUE to match the parent surface normal; FALSE to not match it.

**Prototype:**

**BOOL GetFlip(int pnum);**

**Remarks:**

Returns the flip state of the specified parent curve.

**Parameters:**

**int pnum**

The number of the parent curve: 0 or 1.

**Prototype:**

**void SetCurveStartPoint(TimeValue t, int pnum, double startpoint);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the start point for the specified parent curve. Note: This is only applicable if the parent is a closed curve.

**Parameters:**

**TimeValue t**

The time at which to set the start point.

**int pnum**

The number of the parent curve: 0 or 1.

**double startpoint**

The start point in the range 0.0 to 1.0.

**Prototype:**

**double GetCurveStartPoint(TimeValue t, int pnum);**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the start point for the specified parent curve. Note: This is only applicable if the parent is a closed curve.

**Parameters:**

**TimeValue t**

The time at which to get the start point.

**int pnum**

The number of the parent curve: 0 or 1.

**Operators:**

**Prototype:**

**NURBSRuledSurface & operator=(const NURBSRuledSurface& surf);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSRuledSurface& surf**

The surface to assign.

## Class NURBSULoftSurface

See Also: [Class NURBSSurface](#).

```
class NURBSULoftSurface : public NURBSSurface
```

### Description:

This class is available in release 2.0 and later only.

This class defines a dependent U Loft surface. A U Loft surface interpolates a surface across multiple curve sub-objects. The curves become U-axis contours of the surface. Methods are available to get/set the number of curves used to make the loft, append curves to the list, get/set the parent ids, and get/set the flipped state for each of the curves.

All methods of this class are implemented by the system.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

protected:

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

### Prototype:

```
NURBSULoftSurface();
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNULOftSurface;
```

```
mpObject = NULL;  
mpNSet = NULL;  
mParentId.SetCount(0);  
mParentIndex.SetCount(0);  
mFlip.SetCount(0);  
mCurveStartParam.SetCount(0);  
mTension.SetCount(0);  
mUseTangents.SetCount(0);  
mFlipTangents.SetCount(0);  
mAutoAlign = FALSE;  
mCloseLoft = FALSE;
```

**Prototype:**

```
virtual ~NURBSULoftSurface();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetNumCurves(int num);
```

**Remarks:**

Sets the number of curves used by the U loft.

**Parameters:**

**int num**

The number of curves to set.

**Prototype:**

```
int GetNumCurves();
```

**Remarks:**

Returns the number of curves used by the surface.

**Prototype:**

**int AppendCurve(int index, BOOL flip);**

**Remarks:**

Adds a curve to the end of the list of curves used to make the U loft surface.

**Parameters:**

**int index**

The index of the curve to add in the **NURBSSet**.

**BOOL flip**

TRUE to flip the orientation of this curve's normal used to build the loft; otherwise FALSE.

**Return Value:**

The number of curves in the list prior to this one being added.

**Prototype:**

**int AppendCurve(NURBSId id, BOOL flip);**

**Remarks:**

Adds a curve to the end of the list of curves used to make the U loft surface.

**Parameters:**

**NURBSId id**

The NURBS id of the curve to add.

**BOOL flip**

TRUE to flip the orientation of this curve's normal used to build the loft; otherwise FALSE.

**Prototype:**

**void SetParent(int pnum, int index);**

**Remarks:**

Sets the index in the **NURBSSet** of the specified parent object.

**Parameters:**

**int pnum**

The parent number, 0, 1, 2, etc.

**int index**

The index into the **NURBSSet** of the parent surface.

**Prototype:**

**void SetParentId(int pnum, NURBSId id);**

**Remarks:**

Sets the **NURBSId** of the specified parent.

**Parameters:**

**int pnum**

The parent number, 0, 1, 2, etc.

**NURBSId id**

The id to set.

**Prototype:**

**int GetParent(int pnum);**

**Remarks:**

Returns the index in the **NURBSSet** of the specified parent object.

**Parameters:**

**int pnum**

The parent number, 0, 1, 2, etc.

**Prototype:**

**NURBSId GetParentId(int pnum);**

**Remarks:**

Returns the **NURBSId** of the specified parent. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene

**Parameters:**

**int pnum**

The parent number, 0, 1, 2, etc.

**Prototype:**

**void SetFlip(int pnum, BOOL flip);**

**Remarks:**

This method allows one to control the matching of parent normals when

creating the U loft surface.

**Parameters:**

**int pnum**

The parent number, 0, 1, 2, etc.

**BOOL flip**

TRUE to flip the orientation of the normal when building the surface at this curve; otherwise FALSE.

**Prototype:**

**BOOL GetFlip(int pnum);**

**Remarks:**

Returns the flip state of the specified parent normal.

**Parameters:**

**int pnum**

The parent number, 0, 1, 2, etc.

**Prototype:**

**void SetCurveStartPoint(TimeValue t, int pnum, double startpoint);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the start point for the specified parent curve. Note: This is only applicable if the parent is a closed curve.

**Parameters:**

**TimeValue t**

The time at which to set the start point.

**int pnum**

The parent number, 0, 1, 2, etc.

**double startpoint**

The start point in the range 0.0 to 1.0.

**Prototype:**

**double GetCurveStartPoint(TimeValue t, int pnum);**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the start point for the specified parent curve. Note: This is only applicable if the parent is a closed curve.

**Parameters:**

**TimeValue t**

The time at which to get the start point.

**int pnum**

The parent number, 0, 1, 2, etc.

**Prototype:**

**void SetCurveTension(TimeValue t, int pnum, double tension);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the curve tension for the specified parent curve.

**Parameters:**

**TimeValue t**

The time at which to set the tension.

**int pnum**

The parent number, 0, 1, 2, etc.

**double tension**

The tension value to set.

**Prototype:**

**double GetCurveTension(TimeValue t, int pnum);**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the tension setting of the specified parent curve at the specified time.

**Parameters:**

**TimeValue t**

The time at which to get the tension.

**int pnum**

The parent number, 0, 1, 2, etc.

**Prototype:**

**void SetCurveUseSurfaceTangent(int pnum, BOOL useTangent);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the curve use surface tangent setting. If the curve is a curve on surface, turning this on causes the U loft to use the tangency of the surface. This can help blend a loft smoothly onto a surface.

**Parameters:**

**int pnum**

The parent number, 0, 1, 2, etc.

**BOOL useTangent**

TRUE to use the tangent; otherwise FALSE.

**Prototype:**

**BOOL GetCurveUseSurfaceTangent(int pnum);**

**Remarks:**

This method is available in release 3.0 and later only.

Returns TRUE if the curve use surface tangent setting is on; FALSE if off.

**Parameters:**

**int pnum**

The parent number, 0, 1, 2, etc.

**Prototype:**

**void SetFlipTangent(int pnum, BOOL flipTangent);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the flip tangent setting for the specified parent curve.

**Parameters:**

**int pnum**

The parent number, 0, 1, 2, etc.

**BOOL flipTangent**

TRUE to flip the tangent; otherwise FALSE.

**Prototype:**

**BOOL GetFlipTangent(int pnum);**

**Remarks:**

This method is available in release 3.0 and later only.

Returns TRUE if the tangent is flipped for the specified parent curve; otherwise FALSE.

**Parameters:**

**int pnum**

The parent number, 0, 1, 2, etc.

**Prototype:**

**void SetAutoAlign(BOOL autoalign);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets if auto align is on or off.

**Parameters:**

**BOOL autoalign**

TRUE for on; FALSE for off.

**Prototype:**

**BOOL GetAutoAlign();**

**Remarks:**

This method is available in release 3.0 and later only.

Returns TRUE if auto align is on; otherwise FALSE.

**Prototype:**

**void SetCloseLoft(BOOL closeLoft);**

**Remarks:**

This method is available in release 3.0 and later only.  
Sets if the loft is closed or not.

**Parameters:****BOOL closeLoft**

TRUE for closed; FALSE for open.

**Prototype:**

**BOOL GetCloseLoft();**

**Remarks:**

This method is available in release 3.0 and later only.  
Returns TRUE if loft is closed; otherwise FALSE.

**Operators:****Prototype:**

**NURBSULoftSurface & operator=(const NURBSULoftSurface&  
surf);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSULoftSurface& surf**

The surface to assign.

# Class NURBSLatheSurface

See Also: [Class NURBSSurface](#).

```
class NURBSLatheSurface : public NURBSSurface
```

## Description:

This class is available in release 2.0 and later only.

This class defines a dependent lathe surface. A lathe surface is generated from a curve sub-object. It is similar to a surface created with the Lathe modifier. The advantage is that a lathe sub-object is part of the NURBS model, so you can use it to construct other curve and surface sub-objects. Methods are available to get/set the parent index and id, get/set the axis and amount rotation of the lathe. All methods of this class are implemented by the system.

## Friend Classes:

```
friend class NURBSSet
```

## Methods:

protected:

## Prototype:

```
void Clean(NURBSIdTab ids);
```

## Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

## Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

## Prototype:

```
NURBSLatheSurface();
```

## Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNLatheSurface;
```

```
mpObject = NULL;  
mpNSet = NULL;  
mParentId = 0;  
mParentIndex = -1;  
mXForm.IdentityMatrix();  
mRotation = 360.0;  
mCurveStartParam = 360.0;
```

**Prototype:**

```
virtual ~NURBSLatheSurface();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int index);
```

**Remarks:**

Sets the index in the **NURBSSet** of the parent object.

**Parameters:**

**int index**

The index into the **NURBSSet** of the parent surface.

**Prototype:**

```
void SetParentId(NURBSId id);
```

**Remarks:**

Sets the **NURBSId** of the specified parent.

**Parameters:**

**NURBSId id**

The id to set.

**Prototype:**

```
int GetParent();
```

**Remarks:**

Returns the index in the **NURBSSet** of the specified parent object.

**Prototype:**

**NURBSId GetParentId();**

**Remarks:**

Returns the **NURBSId** of the parent. Note that a **NURBSId** won't be valid until the object has been instantiated in the scene

**Prototype:**

**void SetAxis(TimeValue t, Matrix3& ray);**

**Remarks:**

Sets the axis to use for the surface of revolution by specifying a time and a axis system.

**Parameters:**

**TimeValue t**

The time at which the axis is set.

**Matrix3& ray**

Specifies the axis for revolution. See [Class Matrix3](#).

**Prototype:**

**Matrix3& GetAxis(TimeValue t);**

**Remarks:**

Returns the axis system for the surface of revolution.

**Parameters:**

**TimeValue t**

The time at which to return the axis.

**Prototype:**

**void SetRotation(TimeValue t, double degrees);**

**Remarks:**

Sets the amount of rotation for the surface.

**Parameters:**

**TimeValue t**

The time at which to set the amount.

**double degrees**

The angle of the revolution in degrees.

**Prototype:**

**double GetRotation(TimeValue t);**

**Remarks:**

Returns the angle of the revolution in degrees.

**Parameters:**

**TimeValue t**

The time at which to return the angle.

**Prototype:**

**void SetCurveStartPoint(TimeValue t, double startpoint);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the start point at the specified time.

**Parameters:**

**TimeValue t**

The time at which to set the start point.

**double startpoint**

The start point to set in the range 0.0 to 1.0.

**Prototype:**

**double GetCurveStartPoint(TimeValue t);**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the start point at the specified time.

**Parameters:**

**TimeValue t**

The time at which to get the start point.

**Operators:****Prototype:**

```
NURBSLatheSurface & operator=(const NURBSLatheSurface&  
surf);
```

**Remarks:**

Assignment operator.

**Parameters:**

```
const NURBSLatheSurface& surf
```

The surface to assign.

## Class NURBSCurveSurfaceIntersectionPoint

See Also: [Class NURBSPoint](#).

```
class NURBSCurveSurfaceIntersectionPoint : public NURBSPoint
```

### Description:

This class is available in release 2.5 and later only.

This class is used to create a dependent point at the intersection of a curve and a surface.

### Data Members:

protected:

**NURBSId mParentId[2];**

The NURBSIds of the parent surface and curve. Parent 0 should be the surface parent 1 should be the curve.

**int mParentIndex[2];**

The NURBSSet indexes of the parent surface and curve. Parent 0 should be the surface parent 1 should be the curve.

**double mSeed;**

The seed location is a U position along the length of the parent curve.

**BOOL mTrimCurve;**

The trim curve flag.

**BOOL mFlipTrim;**

The trim flip flag.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

protected:

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a

## **NURBSSet.**

### **Parameters:**

#### **NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

### **Prototype:**

**NURBSCurveSurfaceIntersectionPoint(void);**

### **Remarks:**

Constructor. The data members are initialized as follows:

**mType = kNCurveSurfaceIntersectionPoint;**

**mpObject = NULL;**

**mpNSet = NULL;**

**mParentId[0] = mParentId[1] = 0;**

**mParentIndex[0] = mParentIndex[1] = -1;**

**mSeed = 0.5;**

**mTrimCurve = FALSE;**

**mFlipTrim = FALSE;**

### **Prototype:**

**virtual ~NURBSCurveSurfaceIntersectionPoint(void);**

### **Remarks:**

Destructor.

### **Prototype:**

**void SetSeed(double seed);**

### **Remarks:**

Sets the seed value.

### **Parameters:**

#### **double seed**

The U position along the length of the parent curve.

### **Prototype:**

**double GetSeed();**

**Remarks:**

Returns the seed value.

**Prototype:**

**void SetParent(int pnum, int index);**

**Remarks:**

Establishes the curve or surface used by specifying its index in the **NURBSSet**.

**Parameters:**

**int pnum**

Pass 0 for the surface; 1 for the curve.

**int index**

The index in the **NURBSSet** of the curve or surface.

**Prototype:**

**void SetParentId(int pnum, NURBSId id);**

**Remarks:**

Establishes the curve or surface used by specifying its **NURBSId**.

**Parameters:**

**int pnum**

Pass 0 for the surface; 1 for the curve.

**NURBSId id**

The id to set.

**Prototype:**

**int GetParent(int pnum);**

**Remarks:**

Returns the index in the **NURBSSet** of the parent curve or surface.

**Parameters:**

**int pnum**

Pass 0 for the surface; 1 for the curve.

**Prototype:**

**NURBSId GetParentId(int pnum);**

**Remarks:**

Returns the **NURBSId** of the parent curve or surface.

**Parameters:**

**int pnum**

Pass 0 for the surface; 1 for the curve.

**Prototype:**

**BOOL GetTrimCurve();**

**Remarks:**

Returns the state of the trim curve flag. TRUE causes trimming; FALSE does not.

**Prototype:**

**void SetTrimCurve(BOOL trim);**

**Remarks:**

Sets the state of the trim curve flag.

**Parameters:**

**BOOL trim**

TRUE to trim; FALSE to not trim.

**Prototype:**

**BOOL GetFlipTrim();**

**Remarks:**

Returns the state of the trim flip flag. TRUE for flipped; FALSE for not flipped.

**Prototype:**

**void SetFlipTrim(BOOL flip);**

**Remarks:**

Sets the state of the trim flip flag.

**Parameters:**

**BOOL flip**

TRUE to flip; FALSE to not flip.

**Prototype:**

```
NURBSCurveSurfaceIntersectionPoint & operator=(const  
NURBSCurveSurfaceIntersectionPoint &pt);
```

**Remarks:**

Assignment operator.

**Parameters:**

```
const NURBSCurveSurfaceIntersectionPoint &pt
```

The point to assign.

## Class NURBSProjectNormalCurve

See Also: [Class NURBSCurve](#), [Class Point2](#).

```
class NURBSProjectNormalCurve : public NURBSCurve
```

### Description:

This class is available in release 2.5 and later only.

This class provides access to the Normal Projected Curve. A Normal Projected curve lies on a surface. It is based on an existing curve, which is projected onto the surface in the direction of the surface's normals.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

```
protected:
```

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

```
public:
```

### Prototype:

```
NURBSProjectNormalCurve(void);
```

### Remarks:

Constructor.

### Prototype:

```
virtual ~NURBSProjectNormalCurve(void);
```

### Remarks:

Destructor.

**Prototype:**

**void SetParent(int pnum, int index);**

**Remarks:**

Sets the surface or curve used by specifying its index into the NURBSSet.

**Parameters:**

**int pnum**

Pass 0 for the surface and 1 for the curve.

**int index**

The index in the NURBSSet of the surface or curve.

**Prototype:**

**void SetParentId(int pnum, NURBSId id);**

**Remarks:**

Sets the surface or curve used by specifying its NURBSId.

**Parameters:**

**int pnum**

Pass 0 for the surface and 1 for the curve.

**NURBSId id**

The id of the surface or curve.

**Prototype:**

**int GetParent(int pnum);**

**Remarks:**

Returns the index in the NURBSSet of the surface or curve in use.

**Parameters:**

**int pnum**

Pass 0 for the surface and 1 for the curve.

**Prototype:**

**NURBSId GetParentId(int pnum);**

**Remarks:**

Returns the NURBSId of the surface or curve in use.

**Parameters:**

**int pnum**

Pass 0 for the surface and 1 for the curve.

**Prototype:**

**BOOL GetTrim();**

**Remarks:**

Returns the state of the trim flag. When set the surface is trimmed against the curve. When not set, the surface isn't trimmed

**Prototype:**

**void SetTrim(BOOL trim);**

**Remarks:**

Sets the state of the trim flag. When set the surface is trimmed against the curve. When not set, the surface isn't trimmed

**Parameters:**

**BOOL trim**

TRUE to trim; FALSE to not trim.

**Prototype:**

**BOOL GetFlipTrim();**

**Remarks:**

Returns the state of the trim flip flag. When set this trims the surface in the opposite direction

**Prototype:**

**void SetFlipTrim(BOOL flip);**

**Remarks:**

Sets the state of the trim flip flag. When set this trims the surface in the opposite direction

**Parameters:**

**BOOL flip**

TRUE to flip; FALSE to not flip.

**Prototype:**

**void SetSeed(Point2& seed);**

**Remarks:**

Sets the UV location of the seed value on the surface. If there is a choice of projections, the projection closest to the seed point is the one used to create the curve.

**Parameters:**

**Point2& seed**

The seed value to set.

**Prototype:**

**Point2 GetSeed();**

**Remarks:**

Returns the UV location of the seed value on the surface.

**Prototype:**

**NURBSProjectNormalCurve & operator=(const  
NURBSProjectNormalCurve& curve);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSProjectNormalCurve& curve**

The curve to assign.

## Class NURBSProjectVectorCurve

See Also: [Class NURBSCurve](#), [Class Point2](#), [Class Point3](#).

```
class NURBSProjectVectorCurve : public NURBSCurve
```

### Description:

This class is available in release 2.5 and later only.

This class provides access to the Vector Projected Curve. A Vector Projected curve lies on a surface. This is almost the same as a Normal Projected curve, except that the projection from the existing curve to the surface is in the direction of a vector that you can control. Vector projected curves may be used for trimming.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

protected:

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

### Prototype:

```
NURBSProjectVectorCurve(void);
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNProjectVectorCurve;
```

```
mpObject = NULL;  
mpNSet = NULL;  
mParentId[0] = mParentId[1] = 0;  
mParentIndex[0] = mParentIndex[1] = -1;  
mTrim = FALSE;  
mFlipTrim = FALSE;  
mSeed = Point2(0.0, 0.0);  
mPVec = Point3(0.0, 0.0, 1.0);
```

**Prototype:**

```
virtual ~NURBSProjectVectorCurve(void);
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int pnum, int index);
```

**Remarks:**

**Parameters:**

**int pnum**

Pass 0 for the surface and 1 for the curve.

**int index**

The index in the **NURBSSet** of the surface or curve.

**Prototype:**

```
void SetParentId(int pnum, NURBSId id);
```

**Remarks:**

Sets the surface or curve used by specifying its **NURBSId**.

**Parameters:**

**int pnum**

Pass 0 for the surface and 1 for the curve.

**NURBSId id**

The id of the surface or curve.

**Prototype:**

**int GetParent(int pnum);**

**Remarks:**

Returns the index into the **NURBSSet** of surface or curve used.

**Parameters:**

**int pnum**

Pass 0 for the surface and 1 for the curve.

**Prototype:**

**NURBSId GetParentId(int pnum);**

**Remarks:**

Returns the **NURBSId** of surface or curve used.

**Parameters:**

**int pnum**

Pass 0 for the surface and 1 for the curve.

**Prototype:**

**BOOL GetTrim();**

**Remarks:**

Returns the state of the trim flag. When set the surface is trimmed against the curve. When not set, the surface isn't trimmed

**Prototype:**

**void SetTrim(BOOL trim);**

**Remarks:**

Sets the state of the trim flag. When set the surface is trimmed against the curve. When not set, the surface isn't trimmed

**Parameters:**

**BOOL trim**

TRUE to trim; FALSE to not trim.

**Prototype:**

**BOOL GetFlipTrim();**

**Remarks:**

Returns the state of the trim flip flag. When set this trims the surface in the opposite direction.

**Prototype:**

**void SetFlipTrim(BOOL flip);**

**Remarks:**

Sets the state of the trim flip flag. When set this trims the surface in the opposite direction

**Parameters:**

**BOOL flip**

TRUE to flip; FALSE to not flip.

**Prototype:**

**Point2 GetSeed();**

**Remarks:**

Returns the UV location of the seed value on the surface.

**Prototype:**

**void SetSeed(Point2& seed);**

**Remarks:**

Sets the UV location of the seed value on the surface. If there is a choice of projections, the projection closest to the seed point is the one used to create the curve.

**Parameters:**

**Point2& seed**

The seed value to set.

**Prototype:**

**void SetPVec(TimeValue t, Point3& pvec);**

**Remarks:**

Sets the projection vector used at the time passed.

**Parameters:**

**TimeValue t**

The time at which to set the projection vector.

### **Point3& pvec**

The vector to set.

#### **Prototype:**

**Point3& GetPVec(TimeValue t);**

#### **Remarks:**

Returns the projection vector used at the time passed.

#### **Parameters:**

**TimeValue t**

The time at which to get the projection vector.

#### **Prototype:**

**NURBSProjectVectorCurve & operator=(const  
NURBSProjectVectorCurve& curve);**

#### **Remarks:**

Assignment operator.

#### **Parameters:**

**const NURBSProjectVectorCurve& curve**

The curve to assign.

## Class NURBSSurfaceNormalCurve

See Also: [Class NURBSCurve](#).

```
class NURBSSurfaceNormalCurve : public NURBSCurve
```

### Description:

This class is available in release 2.5 and later only.

This provides access to the Surface Normal Curve. This is a curve created at a specified distance from a surface and normal to it.

Note: The parent curve specified below must have one of the following types: surface-surface intersection, U Iso, V Iso, normal projected, vector projected, CV curve on surface, or point curve on surface.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

protected:

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

### Prototype:

```
NURBSSurfaceNormalCurve(void);
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNSurfaceNormalCurve;
```

```
mpObject = NULL;  
mpNSet = NULL;  
mParentId = 0;  
mParentIndex = -1;
```

**Prototype:**

```
virtual ~NURBSSurfaceNormalCurve(void);
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int index);
```

**Remarks:**

Establishes the parent curve to use by passing its index in the **NURBSSet**.

**Parameters:**

**int index**

The index in the **NURBSSet** of the parent curve to use.

**Prototype:**

```
void SetParentId(NURBSId id);
```

**Remarks:**

Establishes the parent curve to use by passing its **NURBSId**.

**Parameters:**

**NURBSId id**

The id of the parent curve to use.

**Prototype:**

```
int GetParent();
```

**Remarks:**

Returns the index in the **NURBSSet** of the parent curve.

**Prototype:**

```
NURBSId GetParentId();
```

**Remarks:**

Returns the **NURBSId** of the parent curve.

**Prototype:**

**void SetDistance(TimeValue t, double dist);**

**Remarks:**

Set the distance along the normal of the curve from the surface at the specified time.

**Parameters:**

**TimeValue t**

The time at which to set the distance.

**double dist**

The distance along the normal from the surface to the curve.

**Prototype:**

**double GetDistance(TimeValue t);**

**Remarks:**

Returns the distance along the normal from the surface to the curve.

**Parameters:**

**TimeValue t**

The time at which to get the distance.

**Prototype:**

**NURBSSurfaceNormalCurve & operator=(const  
NURBSSurfaceNormalCurve& curve);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSSurfaceNormalCurve& curve**

The curve to assign.

## Class NURBSSurfSurfIntersectionCurve

See Also: [Class NURBSCurve](#), [Class Point2](#).

```
class NURBSSurfSurfIntersectionCurve : public NURBSCurve
```

### Description:

This class is available in release 2.5 and later only.

This class provides access to the Surface-Surface Intersection Curve. This is a curve that is defined by the intersection of two surfaces. You can use surface-surface intersection curves for trimming.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

```
protected:
```

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

```
public:
```

### Prototype:

```
NURBSSurfSurfIntersectionCurve(void);
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNSurfSurfIntersectionCurve;
```

```
mpObject = NULL;
```

```
mpNSet = NULL;
```

```
mParentId[0] = mParentId[1] = 0;  
mParentIndex[0] = mParentIndex[1] = -1;  
mTrim[0] = mTrim[1] = FALSE;  
mFlipTrim[0] = mFlipTrim[1] = FALSE;  
mSeed = Point2(0.0, 0.0);
```

**Prototype:**

```
virtual ~NURBSSurfSurfIntersectionCurve(void);
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int pnum, int index);
```

**Remarks:**

Sets the surface or curve by specifying its index into the NURBSSet.

**Parameters:**

**int pnum**

Pass 0 for the surface and 1 for the curve.

**int index**

The index into the NURBSSet of the object to set.

**Prototype:**

```
void SetParentId(int pnum, NURBSId id);
```

**Remarks:**

Sets the surface or curve by specifying its index into the NURBSSet.

**Parameters:**

**int pnum**

Pass 0 for the surface and 1 for the curve.

**NURBSId id**

The id of the object to set.

**Prototype:**

```
int GetParent(int pnum);
```

**Remarks:**

Returns the index into the NURBSSet of the curve or surface.

**Parameters:**

**int pnum**

Pass 0 for the surface and 1 for the curve.

**Prototype:**

**NURBSId GetParentId(int pnum);**

**Remarks:**

Returns the NURBSId of the curve or surface.

**Parameters:**

**int pnum**

Pass 0 for the surface and 1 for the curve.

**Prototype:**

**BOOL GetTrim(int tnum);**

**Remarks:**

Returns the state of the specified trim flag. When on, the surface is trimmed against the intersection curve. When off, the surface isn't trimmed.

**Parameters:**

**int tnum**

Passing 0 trims the first parent surface, and passing 1 trims the second parent surface

**Prototype:**

**void SetTrim(int tnum, BOOL trim);**

**Remarks:**

Sets the state of the specified trim flag. When on, the surface is trimmed against the intersection curve. When off, the surface isn't trimmed.

**Parameters:**

**int tnum**

Passing 0 trims the first parent surface, and passing 1 trims the second parent surface

**BOOL trim**

TRUE to trim; FALSE to not trim.

**Prototype:**

**BOOL GetFlipTrim(int tnum);**

**Remarks:**

Returns the state of the trim flip flag. When on, the specified surface is trimmed in the opposite direction.

**Parameters:**

**int tnum**

0 for the first surface; 1 for the second surface.

**Prototype:**

**void SetFlipTrim(int tnum, BOOL flip);**

**Remarks:**

Sets the state of the trim flip flag. When on, the specified surface is trimmed in the opposite direction.

**Parameters:**

**int tnum**

0 for the first surface; 1 for the second surface.

**BOOL flip**

TRUE to flip; FALSE not to flip.

**Prototype:**

**void SetSeed(Point2& seed);**

**Remarks:**

Change the UV location of the seed value on the first surface. If there is a choice of intersections, the intersection closest to the seed point is the one used to create the curve.

**Parameters:**

**Point2& seed**

The UV location.

**Prototype:**

**Point2 GetSeed();**

**Remarks:**

Returns the UV location of the seed value on the first surface. If there is a choice of intersections, the intersection closest to the seed point is the one used to create the curve.

**Prototype:**

```
NURBSSurfSurfIntersectionCurve & operator=(const  
NURBSSurfSurfIntersectionCurve& curve);
```

**Remarks:**

Assignment operator.

**Parameters:**

```
const NURBSSurfSurfIntersectionCurve& curve  
The curve to assign.
```

## Class NURBSCurveOnSurface

See Also: [Class NURBSCVCurve](#).

```
class NURBSCurveOnSurface : public NURBSCVCurve
```

### Description:

This class is available in release 2.5 and later only.

This class provides access to the CV curve on surface parameters. These curves can be used for trimming the surface they lie on.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

#### Prototype:

```
NURBSCurveOnSurface(void);
```

#### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNCurveOnSurface;
```

```
mpObject = NULL;
```

```
mpNSet = NULL;
```

```
mParentId = 0;
```

```
mParentIndex = -1;
```

```
mTrim = FALSE;
```

```
mFlipTrim = FALSE;
```

#### Prototype:

```
virtual ~NURBSCurveOnSurface(void);
```

#### Remarks:

Destructor.

#### Prototype:

```
void SetParent(int index);
```

#### Remarks:

Sets the index in the **NURBS**Set of the parent surface.

**Parameters:**

**int index**

The index into the **NURBS**Set of the parent surface.

**Prototype:**

**void SetParentId(NURBSId id);**

**Remarks:**

Sets the **NURBS**Id of the parent.

**Parameters:**

**NURBSId id**

The id to set.

**Prototype:**

**int GetParent();**

**Remarks:**

Returns the index in the **NURBS**Set of the specified parent object.

**Prototype:**

**NURBSId GetParentId();**

**Remarks:**

Returns the **NURBS**Id of the parent. Note that a **NURBS**Id won't be valid until the object has been instantiated in the scene.

**Prototype:**

**BOOL GetTrim();**

**Remarks:**

Returns the state of the trim surface toggle.

**Prototype:**

**void SetTrim(BOOL trim);**

**Remarks:**

Sets the state of the trim surface toggle.

**Parameters:**

## **BOOL trim**

TRUE to trim the surface at the curve; FALSE to not trim.

### **Prototype:**

**BOOL GetFlipTrim();**

### **Remarks:**

Returns the state of the trim flip toggle.

### **Prototype:**

**void SetFlipTrim(BOOL flip);**

### **Remarks:**

Sets the state of the trim flip toggle. This controls which portion of the surface is trimmed.

### **Parameters:**

**BOOL flip**

TRUE for on; FALSE for off.

### **Prototype:**

**NURBSCurveOnSurface & operator=(const  
NURBSCurveOnSurface& curve);**

### **Remarks:**

Assignment operator.

### **Parameters:**

**const NURBSCurveOnSurface& curve**

The curve to assign.

## Class NURBSPointCurveOnSurface

See Also: [Class NURBSPointCurve](#).

```
class NURBSPointCurveOnSurface : public NURBSPointCurve
```

### Description:

This class is available in release 2.5 and later only.

This class provides access to the point curve on surface parameters. These curves can be used for trimming the surface they lie on.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

```
protected:
```

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

```
public:
```

### Prototype:

```
NURBSPointCurveOnSurface(void);
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNPointCurveOnSurface;
```

```
mpObject = NULL;
```

```
mpNSet = NULL;
```

```
mParentId = 0;
```

```
mParentIndex = -1;  
mTrim = FALSE;  
mFlipTrim = FALSE;
```

**Prototype:**

```
virtual ~NURBSPointCurveOnSurface(void);
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int index);
```

**Remarks:**

Sets the index in the **NURBSSet** of the parent surface.

**Parameters:**

**int index**

The index in the **NURBSSet** of the parent surface.

**Prototype:**

```
void SetParentId(NURBSId id);
```

**Remarks:**

Sets the **NURBSId** of the parent.

**Parameters:**

**NURBSId id**

The id to set.

**Prototype:**

```
int GetParent();
```

**Remarks:**

Returns the index in the **NURBSSet** of the parent surface.

**Prototype:**

```
NURBSId GetParentId();
```

**Remarks:**

Returns the **NURBSId** of the parent surface. Note that a **NURBSId** won't be

valid until the object has been instantiated in the scene.

**Prototype:**

**BOOL GetTrim();**

**Remarks:**

Returns the state of the trim toggle.

**Prototype:**

**BOOL GetFlipTrim();**

**Remarks:**

Returns the state of the trim flip toggle.

**Prototype:**

**void SetFlipTrim(BOOL flip);**

**Remarks:**

Sets the state of the trim flip toggle. This controls which portion of the parent surface is trimmed.

**Parameters:**

**BOOL flip**

TRUE for flipped; FALSE for not.

**Prototype:**

**NURBSPointCurveOnSurface & operator=(const  
NURBSPointCurveOnSurface& curve);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSPointCurveOnSurface& curve**

The curve to assign.

## Class NURBSUVLoftSurface

See Also: [Class NURBSSurface](#).

```
class NURBSUVLoftSurface : public NURBSSurface
```

### Description:

This class is available in release 2.5 and later only.

This class provides access to the UV Loft Surface. This surface is similar to the U Loft surface, but has a set of curves in the V dimension as well as the U dimension.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

```
protected:
```

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

```
public:
```

### Prototype:

```
NURBSUVLoftSurface(void);
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNUVLoftSurface;
```

```
mpObject = NULL;
```

```
mpNSet = NULL;
```

```
mUParentId.SetCount(0);  
mUParentIndex.SetCount(0);  
mVParentId.SetCount(0);  
mVParentIndex.SetCount(0);
```

**Prototype:**

```
virtual ~NURBSUVLoftSurface(void);
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetNumUCurves(int num);
```

**Remarks:**

Sets the number of curves in the U dimension.

**Parameters:**

**int num**

The number of curves to use in the U dimension.

**Prototype:**

```
int GetNumUCurves(void);
```

**Remarks:**

Returns the number of curves in the U dimension.

**Prototype:**

```
int AppendUCurve(int index);
```

**Remarks:**

Appends the specified curve (by NURBSSet index) to the list of U curves.

**Parameters:**

**int index**

The index in the **NURBSSet** of the curve to use.

**Prototype:**

```
int AppendUCurve(NURBSId id);
```

**Remarks:**

Appends the specified curve (by NURBSId) to the list of U curves.

**Parameters:**

**NURBSId id**

The **NURBSId** of the curve to use.

**Return Value:**

Returns the number of curves in the set prior to appending.

**Prototype:**

**void SetUParent(int pnum, int index);**

**Remarks:**

Sets the specified parent curve (by NURBSSet index) as the specified curve in the surface.

**Parameters:**

**int pnum**

The index into the list of U curves of the parent curve to set.

**int index**

The index into the **NURBSSet** of the parent curve to set.

**Prototype:**

**void SetUParentId(int pnum, NURBSId id);**

**Remarks:**

Sets the specified parent curve (by NURBSId) as the specified curve in the surface.

**Parameters:**

**int pnum**

The index into the list of U curves of the parent curve to set.

**NURBSId id**

The **NURBSId** of the parent curve to set.

**Prototype:**

**int GetUParent(int pnum);**

**Remarks:**

Returns the index into the **NURBSSet** of the specified parent curve.

**Parameters:**

**int pnum**

The zero based index of the parent curve.

**Prototype:**

**NURBSId GetUParentId(int pnum);**

**Remarks:**

Returns the **NURBSId** of the specified parent curve. Note that a **NURBSId** won't be valid until the surface has been instantiated in the scene.

**Parameters:**

**int pnum**

The zero based index of the parent curve.

**Prototype:**

**void SetNumVCurves(int num);**

**Remarks:**

Sets the number of curves in the V dimension.

**Parameters:**

**int num**

The number of curves to use in the V dimension.

**Prototype:**

**int GetNumVCurves(void);**

**Remarks:**

Returns the number of curves in the V dimension.

**Prototype:**

**int AppendVCurve(int index);**

**Remarks:**

Appends the specified curve (by NURBSSet index) to the list of V curves.

**Parameters:**

**int index**

The index in the **NURBSSet** of the curve to use.

**Return Value:**

Returns the number of curves in the set prior to appending.

**Prototype:**

**int AppendVCurve(NURBSId id);**

**Remarks:**

Appends the specified curve (by NURBSId) to the list of U curves.

**Parameters:**

**NURBSId id**

The **NURBSId** of the curve to use.

**Return Value:**

Returns the number of curves in the set prior to appending.

**Prototype:**

**void SetVParent(int pnum, int index);**

**Remarks:**

Sets the specified parent curve (by **NURBSSet** index) as the specified curve in the surface.

**Parameters:**

**int pnum**

The index into the list of V curves of the parent curve to set.

**int index**

The index into the **NURBSSet** of the parent curve to set.

**Prototype:**

**void SetVParentId(int pnum, NURBSId id);**

**Remarks:**

Sets the specified parent curve (by NURBSId) as the specified curve in the surface.

**Parameters:**

**int pnum**

The index into the list of V curves of the parent curve to set.

**NURBSId id**

The **NURBSId** of the parent curve to set.

**Prototype:**

**int GetVParent(int pnum);**

**Remarks:**

Returns the index into the **NURBSSet** of the specified parent curve.

**Parameters:**

**int pnum**

The zero based index of the parent curve.

**Prototype:**

**NURBSId GetVParentId(int pnum);**

**Remarks:**

Returns the **NURBSId** of the specified parent curve. Note that a **NURBSId** won't be valid until the surface has been instantiated in the scene.

**Parameters:**

**int pnum**

The zero based index of the parent curve.

**Prototype:**

**NURBSUVLoftSurface & operator=(const  
NURBSUVLoftSurface& surf);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSUVLoftSurface& surf**

The surface to assign.

## Class NURBSNBlendSurface

See Also: [Class NURBSSurface](#).

```
class NURBSNBlendSurface : public NURBSSurface
```

### Description:

This class is available in release 2.5 and later only.

This class provides access to the Multisided Blend surface. A Multisided Blend surface is a surface that "fills in" the edges defined by three or four other curve or surfaces. Unlike a regular, two-sided Blend surface, the curves or surfaces edges must form a closed loop<sup>3/4</sup>that is, they must completely surround the opening the Multisided Blend will cover.

Note: For the blend to work, the curves that define the blend must form a loop (that is, sequence head to tail, and the ends must match).

### Methods:

protected:

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

```
NURBSIdTab ids
```

A table with the IDs of each object in the **NURBSSet**.

public:

### Prototype:

```
NURBSNBlendSurface(void);
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNNBlendSurface;
```

```
mpObject = NULL;
```

```
mpNSet = NULL;
for (int i = 0; i < 4; i++) {
    mParentId[i] = 0;
    mParentIndex[i] = -1;
    mParentEdge[i] = 0;
}
```

**Prototype:**

```
virtual ~NURBSNBlendSurface(void);
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParent(int pnum, int index);
```

**Remarks:**

Sets the specified parent curve or surface (by NURBSSet index) as the specified edge for the surface.

**Parameters:**

**int pnum**

The index of the parent curve or surface to set.

**int index**

The index in the **NURBSSet** of the curve or surface.

**Prototype:**

```
void SetParentId(int pnum, NURBSId id);
```

**Remarks:**

Sets the specified parent curve or surface (by NURBSId) as the specified edge for the surface.

**Parameters:**

**int pnum**

The index of the parent curve or surface to set.

**NURBSId id**

The id of the curve or surface to set.

**Prototype:**

**int GetParent(int pnum);**

**Remarks:**

Returns the index in the **NURBSSet** of the specified curve or surface.

**Parameters:**

**int pnum**

The index of the parent curve or surface to get.

**Prototype:**

**NURBSId GetParentId(int pnum);**

**Remarks:**

Returns the **NURBSId** of the specified curve or surface.

**Parameters:**

**int pnum**

The index of the parent curve or surface to get.

**Prototype:**

**void SetEdge(int pnum, int edge);**

**Remarks:**

If using a surface for the blend surface edge, this method indicates which edge on the surface to use.

**Parameters:**

**int pnum**

The index of the parent surface.

**int edge**

The edge to use for the blend. One of the following values:

**0:** The low U edge.

**1:** The high U edge.

**2:** The low V edge.

**3:** The high V edge.

**Prototype:**

**int GetEdge(int pnum);**

**Remarks:**

Returns the edge used by the specified surface to create the blend.

**Parameters:**

**int pnum**

The index of the parent surface.

**Return Value:**

The edge used for the blend. One of the following values:

**0:** The low U edge.

**1:** The high U edge.

**2:** The low V edge.

**3:** The high V edge.

**Prototype:**

**NURBSNBlendSurface & operator=(const  
NURBSNBlendSurface& surf);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSNBlendSurface& surf**

The surface to assign.

## Class NURBS1RailSweepSurface

See Also: [Class NURBSSurface](#).

```
class NURBS1RailSweepSurface : public NURBSSurface
```

### Description:

This class is available in release 2.5 and later only.

This class provides access to the 1-Rail Sweep Surface. A 1-Rail Sweep Surface uses at least two curves. One curve, the "rail," defines one edge of the surface. The other curves define the surface's cross sections. The cross-section curves should intersect the rail curve. If the cross sections don't intersect the rail, the resulting surface is unpredictable.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

```
protected:
```

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

```
public:
```

### Prototype:

```
NURBS1RailSweepSurface();
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kN1RailSweepSurface;
```

```
mpObject = NULL;
```

```
mpNSet = NULL;  
mRailId = NULL;  
mRailIndex = -1;  
mParentId.SetCount(0);  
mParentIndex.SetCount(0);  
mFlip.SetCount(0);  
mCurveStartParam.SetCount(0);  
mSnapCrossSections = FALSE;  
mRoadlike = FALSE;  
mXForm.IdentityMatrix();
```

**Prototype:**

```
virtual ~NURBS1RailSweepSurface();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetParentRail(int index);
```

**Remarks:**

Establishes the curve to use as the rail by specifying its index in the **NURBSSet**.

**Parameters:**

**int index**

The index in the **NURBSSet**.

**Prototype:**

```
void SetParentRailId(NURBSId id);
```

**Remarks:**

Establishes the curve to use as the rail by specifying its **NURBSId**.

**Parameters:**

**NURBSId id**

The id of the rail curve to use.

**Prototype:**

**int GetParentRail();**

**Remarks:**

Returns the index in the **NURBSSet** of the rail curve.

**Prototype:**

**NURBSId GetParentRailId();**

**Remarks:**

Returns the **NURBSId** of the rail curve.

**Prototype:**

**void SetNumCurves(int num);**

**Remarks:**

Sets the number of cross-section curves.

**Parameters:**

**int num**

The number of cross-section curves to use.

**Prototype:**

**int GetNumCurves(void);**

**Remarks:**

Returns the number of cross-section curves used.

**Prototype:**

**int AppendCurve(int index, BOOL flip);**

**Remarks:**

Adds a curve to the end of the list of cross-section curves by specifying the index in the **NURBSSet**.

**Parameters:**

**int index**

The index in the **NURBSSet** of the cross-section curve to append.

**BOOL flip**

TRUE to reverse (or flip) the direction of the curve; FALSE to use the non-reversed orientation.

**Return Value:**

The number of cross-section curves prior to appending.

**Prototype:**

**int AppendCurve(NURBSId id, BOOL flip);**

**Remarks:**

Adds a curve to the end of the list of cross-section curves by specifying a **NURBSId**.

**Parameters:**

**NURBSId id**

Specifies the cross-section curve to append.

**BOOL flip**

TRUE to reverse (or flip) the direction of the curve; FALSE to use the non-reversed orientation.

**Return Value:**

The number of cross-section curves prior to appending.

**Prototype:**

**void SetParent(int pnum, int index);**

**Remarks:**

Specifies the curve to use as a cross-section via its index in the **NURBSSet**.

**Parameters:**

**int pnum**

The zero based index of the curve to set.

**int index**

The index in the **NURBSSet** of the curve.

**Prototype:**

**void SetParentId(int pnum, NURBSId id);**

**Remarks:**

Specifies the curve to use as a cross-section via its **NURBSId**.

**Parameters:**

**int pnum**

The zero based index of the curve to set.

**NURBSId id**

The id of the curve.

**Prototype:**

**int GetParent(int pnum);**

**Remarks:**

Returns the index in the **NURBSSet** of the specified cross-section curve.

**Parameters:**

**int pnum**

The zero based index of the curve to get.

**Prototype:**

**NURBSId GetParentId(int pnum);**

**Remarks:**

Returns the **NURBSId** of the specified cross-section curve.

**Parameters:**

**int pnum**

The zero based index of the curve to get.

**Prototype:**

**void SetFlip(int pnum, BOOL flip);**

**Remarks:**

Sets the reversed (or flipped) state of the specified cross-section curve.

**Parameters:**

**int pnum**

The zero based index of the curve.

**BOOL flip**

TRUE to reverse the direction; FALSE for the normal direction.

**Prototype:**

**BOOL GetFlip(int pnum);**

**Remarks:**

Returns the reversed (or flipped) state of the specified cross-section curve. TRUE is reversed; FALSE is not.

**Parameters:**

**int pnum**

The zero based index of the curve.

**Prototype:**

**void SetParallel(BOOL para);**

**Remarks:**

Sets the state of the parallel flag. When on, it ensures that the sweep surface's normal is parallel to the rail.

**Parameters:**

**BOOL para**

TRUE for on; FALSE for off.

**Prototype:**

**BOOL GetParallel();**

**Remarks:**

Returns the state of the parallel flag. When TRUE, 3ds max ensures that the sweep surface's normal is parallel to the rail.

**Prototype:**

**void SetCurveStartPoint(TimeValue t, int pnum, double startpoint);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the start point for the specified parent curve. Note: This is only applicable if the parent is a closed curve.

**Parameters:**

**TimeValue t**

The time at which to set the start point.

**int pnum**

The zero based index of the curve in the set of cross sections.

**double startpoint**

The start point in the range 0.0 to 1.0.

**Prototype:****double GetCurveStartPoint(TimeValue t, int pnum);****Remarks:**

This method is available in release 3.0 and later only.

Returns the start point of the specified parent curve.

**Parameters:****TimeValue t**

The time at which to get the start point.

**int pnum**

The zero based index of the curve in the set of cross sections.

**Prototype:****void SetSnapCS(BOOL snapCS);****Remarks:**

This method is available in release 3.0 and later only.

Sets the snap cross sections setting. When on, cross-section curves are translated so they intersect the rail.

**Parameters:****BOOL snapCS**

TRUE for on; FALSE for off.

**Prototype:****BOOL GetSnapCS();****Remarks:**

This method is available in release 3.0 and later only.

Returns TRUE if snap to Cross Section is on; otherwise FALSE.

**Prototype:**

**void SetRoadlike(BOOL roadlike);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the roadlike setting to on or off. When on, the sweep uses a constant up-vector so the cross sections twist uniformly as they travel along the rail. In other words, the cross sections bank like a car following a road, or a camera following a path controller in 3ds max.

**Parameters:**

**BOOL roadlike**

TRUE for on; FALSE for off.

**Prototype:**

**BOOL GetRoadlike();**

**Remarks:**

This method is available in release 3.0 and later only.

Returns TRUE if the roadlike setting is on; otherwise FALSE.

**Prototype:**

**void SetAxis(TimeValue t, Matrix3& ray);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the axis of the sweep.

**Parameters:**

**TimeValue t**

The time at which to set the axis.

**Matrix3& ray**

The axis system to set.

**Prototype:**

**Matrix3& GetAxis(TimeValue t);**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the axis of the sweep.

**Parameters:**

**TimeValue t**

The time at which to get the axis.

**Operators:**

**Prototype:**

**NURBS1RailSweepSurface & operator=(const  
NURBS1RailSweepSurface& surf);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBS1RailSweepSurface& surf**

The surface to assign.

## Class NURBS2RailSweepSurface

See Also: [Class NURBSSurface](#).

```
class NURBS2RailSweepSurface : public NURBSSurface
```

### Description:

This class is available in release 2.5 and later only.

This class provides access to the 2-Rail Sweep Surface. A 2-Rail Sweep surface uses at least three curves. Two curves, the "rails," define the two edges of the surface. The other curves define the surface's cross sections. A 2-Rail Sweep surface is similar to a 1-Rail sweep. The additional rail gives you more control over the shape of the surface.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

```
protected:
```

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

```
NURBSIdTab ids
```

A table with the IDs of each object in the **NURBSSet**.

```
public:
```

### Prototype:

```
NURBS2RailSweepSurface();
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kN2RailSweepSurface;
```

```
mpObject = NULL;
```

```
mpNSet = NULL;  
mParentId.SetCount(0);  
mParentIndex.SetCount(0);  
mRailParentId[0] = mRailParentId[1] = NULL;  
mRailParentIndex[0] = mRailParentIndex[1] = -1;  
mCurveStartParam.SetCount(0);  
mSnapCrossSections = FALSE;
```

**Prototype:**

```
virtual ~NURBS2RailSweepSurface();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetNumCurves(int num);
```

**Remarks:**

Sets the number of cross-section curves.

**Parameters:**

**int num**

The number of cross-section curves to use.

**Prototype:**

```
int GetNumCurves(void);
```

**Remarks:**

Returns the number of cross-section curves used.

**Prototype:**

```
int AppendCurve(int index, BOOL flip);
```

**Remarks:**

Adds a curve to the end of the list of cross-section curves by specifying the index in the **NURBSSet**.

**Parameters:**

**int index**

The index in the **NURBSSet** of the cross-section curve to append.

**BOOL flip**

TRUE to reverse (or flip) the direction of the curve; FALSE to use the non-reversed orientation.

**Return Value:**

The number of cross-section curves prior to appending.

**Prototype:**

**int AppendCurve(NURBSId id, BOOL flip);**

**Remarks:**

Adds a curve to the end of the list of cross-section curves by specifying a **NURBSId**.

**Parameters:**

**NURBSId id**

Specifies the cross-section curve to append.

**BOOL flip**

TRUE to reverse (or flip) the direction of the curve; FALSE to use the non-reversed orientation.

**Return Value:**

The number of cross-section curves prior to appending.

**Prototype:**

**void SetParent(int pnum, int index);**

**Remarks:**

Specifies the curve to use as a cross-section via its index in the **NURBSSet**.

**Parameters:**

**int pnum**

The zero based index of the curve to set.

**int index**

The index in the **NURBSSet** of the curve.

**Prototype:**

**void SetParentId(int pnum, NURBSId id);**

**Remarks:**

Specifies the curve to use as a cross-section via its **NURBSId**.

**Parameters:**

**int pnum**

The zero based index of the curve to set.

**NURBSId id**

The id of the curve.

**Prototype:**

**int GetParent(int pnum);**

**Remarks:**

Returns the index in the **NURBSSet** of the specified cross-section curve.

**Parameters:**

**int pnum**

The zero based index of the curve to get.

**Prototype:**

**NURBSId GetParentId(int pnum);**

**Remarks:**

Returns the **NURBSId** of the specified cross-section curve.

**Parameters:**

**int pnum**

The zero based index of the curve to get.

**Prototype:**

**void SetFlip(int pnum, BOOL flip);**

**Remarks:**

Sets the reversed (or flipped) state of the specified cross-section curve.

**Parameters:**

**int pnum**

The zero based index of the curve.

**BOOL flip**

TRUE to reverse the direction; FALSE for the normal direction.

**Prototype:**

**BOOL GetFlip(int pnum);**

**Remarks:**

Returns the reversed (or flipped) state of the specified cross-section curve. TRUE is reversed; FALSE is not.

**Parameters:**

**int pnum**

The zero based index of the curve.

**Prototype:**

**void SetParallel(BOOL para);**

**Remarks:**

Sets the state of the parallel flag. When off, it allows the cross section curve to bank to follow the rails. If on, it maintains the initial orientation of the cross section during the course of the sweep

**Parameters:**

**BOOL para**

TRUE for on; FALSE for off.

**Prototype:**

**BOOL GetParallel();**

**Remarks:**

Returns the state of the parallel flag.

**Prototype:**

**void SetScale(BOOL scale);**

**Remarks:**

To allow the cross sections to run along the rails, the cross section curves may need to be scaled. This method controls if the scaling is done uniformly or non-uniformly.

**Parameters:**

**BOOL scale**

TRUE to scale uniformly; FALSE to scale non-uniformly.

**Prototype:**

**BOOL GetScale();**

**Remarks:**

Returns TRUE if the cross section curves are scaled uniformly; FALSE for non-uniformly.

**Prototype:**

**void SetRailParent(int pnum, int index);**

**Remarks:**

Specifies the index in the **NURBSSet** of the first or second rail curve to use.

**Parameters:**

**int pnum**

Pass 0 for the first rail curve; 1 for the second rail curve.

**int index**

The index in the **NURBSSet** of the curve to use as a rail.

**Prototype:**

**void SetRailParentId(int pnum, NURBSId id);**

**Remarks:**

Specifies the **NURBSId** of the first or second rail curve to use.

**Parameters:**

**int pnum**

Pass 0 for the first rail curve; 1 for the second rail curve.

**NURBSId id**

The id of the curve to use as a rail.

**Prototype:**

**int GetRailParent(int pnum);**

**Remarks:**

Returns the index in the **NURBSSet** of the specified parent rail curve.

**Parameters:**

**int pnum**

Pass 0 for the first rail curve; 1 for the second rail curve.

**Prototype:**

**NURBSId GetRailParentId(int pnum);**

**Remarks:**

Returns the **NURBSId** of the specified parent rail curve.

**Parameters:**

**int pnum**

Pass 0 for the first rail curve; 1 for the second rail curve.

**Prototype:**

**void SetSnapCS(BOOL snapCS);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the snap cross sections setting. When on, cross-section curves are translated so they intersect the rail.

**Parameters:**

**BOOL snapCS**

TRUE for on; FALSE for off.

**Prototype:**

**BOOL GetSnapCS();**

**Remarks:**

This method is available in release 3.0 and later only.

Returns TRUE if snap cross sections is on; otherwise FALSE.

**Prototype:**

**void SetCurveStartPoint(TimeValue t, int pnum, double startpoint);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the start point for the specified parent curve at the time passed.

**Parameters:**

**TimeValue t**

The time at which to set the start point.

**int pnum**

Pass 0 for the first rail curve; 1 for the second rail curve.

**double startpoint**

The start point in the range of 0.0 to 1.0.

**Prototype:**

**double GetCurveStartPoint(TimeValue t, int pnum);**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the start point for the specified parent curve at the time passed.

**Parameters:****TimeValue t**

The time at which to get the start point.

**int pnum**

Pass 0 for the first rail curve; 1 for the second rail curve.

**Operators:****Prototype:**

**NURBS2RailSweepSurface & operator=(const  
NURBS2RailSweepSurface& surf);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBS2RailSweepSurface& surf**

The surface to assign.

## Class NURBSCapSurface

See Also: [Class NURBSSurface](#).

```
class NURBSCapSurface : public NURBSSurface
```

### Description:

This class is available in release 2.5 and later only.

This class provides access to the Cap Surface. A Cap Surface is a surface that caps a closed curve or the edge of a closed surface. Caps are especially useful with extruded surfaces.

### Methods:

protected:

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

### Prototype:

```
NURBSCapSurface(void);
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNCapSurface;
```

```
mpObject = NULL;
```

```
mpNSet = NULL;
```

```
mParentId = 0;
```

```
mParentIndex = -1;
```

**mParentEdge = -1;**  
**mCurveStartParam = 0.0;**

**Prototype:**

**virtual ~NURBSCapSurface(void);**

**Remarks:**

Destructor.

**Prototype:**

**void SetParent(int index);**

**Remarks:**

Establishes the curve or surface that's capped by specifying its index in the **NURBSSet**.

**Parameters:**

**int index**

The index in the **NURBSSet** of the curve or surface to cap.

**Prototype:**

**void SetParentId(NURBSId id);**

**Remarks:**

Establishes the curve or surface that's capped by specifying its **NURBSId**.

**Parameters:**

**NURBSId id**

The id of the curve or surface to cap.

**Prototype:**

**int GetParent(void);**

**Remarks:**

Returns the index in the **NURBSSet** of the curve or surface that's capped.

**Prototype:**

**NURBSId GetParentId(void);**

**Remarks:**

Returns the **NURBSId** of the curve or surface that's capped.

**Prototype:****void SetEdge(int edge);****Remarks:**

Establishes which edge of the closed parent surface is capped.

**Parameters:****int edge**

The edge to cap. One of the following values:

**0:** The low U edge.

**1:** The high U edge.

**2:** The low V edge.

**3:** The high V edge.

**Prototype:****int GetEdge();****Remarks:**

Returns the edge of the closed parent surface is capped.

**Return Value:**

One of the following values:

**0:** The low U edge.

**1:** The high U edge.

**2:** The low V edge.

**3:** The high V edge.

**Prototype:****void SetCurveStartPoint(TimeValue t, double startpoint);****Remarks:**

This method is available in release 3.0 and later only.

Sets the start point for the curve. Note: This is only applicable if the parent is a closed curve.

**Parameters:****TimeValue t**

The time to set the start point.

## **double startpoint**

The start point to set.

### **Prototype:**

**double GetCurveStartPoint(TimeValue t);**

### **Remarks:**

This method is available in release 3.0 and later only.

Returns the start point for the curve. Note: This is only applicable if the parent is a closed curve.

### **Parameters:**

#### **TimeValue t**

The time to get the start point.

### **Prototype:**

**NURBSCapSurface & operator=(const NURBSCapSurface& surf);**

### **Remarks:**

Assignment operator.

### **Parameters:**

**const NURBSCapSurface& surf**

The surface to assign.

## Class NURBSMultiCurveTrimSurface

See Also: [Class NURBSSurface](#).

```
class NURBSMultiCurveTrimSurface : public NURBSSurface
```

### Description:

This class is available in release 2.5 and later only.

This class provides access to the Multicurve Trim Surface which is a surface that is trimmed by multiple curves forming a loop.

### Friend Classes:

```
friend class NURBSSet
```

### Methods:

protected:

### Prototype:

```
void Clean(NURBSIdTab ids);
```

### Remarks:

This method is available in release 3.0 and later only.

This methods breaks the relation between this **NURBSObject** and a **NURBSSet**.

### Parameters:

**NURBSIdTab ids**

A table with the IDs of each object in the **NURBSSet**.

public:

### Prototype:

```
NURBSMultiCurveTrimSurface();
```

### Remarks:

Constructor. The data members are initialized as follows:

```
mType = kNMultiCurveTrimSurface;
```

```
mpObject = NULL;
```

```
mpNSet = NULL;
```

```
mParentId.SetCount(0);
```

```
mParentIndex.SetCount(0);  
mSurfaceId = NULL;  
mSurfaceIndex = -1;  
mFlipTrim = FALSE;
```

**Prototype:**

```
virtual ~NURBSMultiCurveTrimSurface();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetNumCurves(int num);
```

**Remarks:**

Sets the number of curves used for the trim loop.

**Parameters:**

**int num**

The number of curves to use.

**Prototype:**

```
int GetNumCurves(void);
```

**Remarks:**

Returns the number of curves used for the trim loop.

**Prototype:**

```
int AppendCurve(int index);
```

**Remarks:**

Adds the specified curve (using a **NURBSSet** index) to the end of the list of curves comprising the trim loop.

**Parameters:**

**int index**

The index into the **NURBSSet** of the curve to add.

**Return Value:**

The number of curves in the loop prior to appending.

**Prototype:**

```
int AppendCurve(NURBSId id);
```

**Remarks:**

Adds the specified curve (using a **NURBSSet** index) to the end of the list of curves comprising the trim loop.

**Parameters:**

**NURBSId id**

The id to use.

**Return Value:**

The number of curves in the loop prior to appending.

**Prototype:**

```
void SetParent(int pnum, int index);
```

**Remarks:**

Sets the specified curve in the trim loop to the curve specified by an index into the **NURBSSet**.

**Parameters:**

**int pnum**

Zero based index of which curve to set.

**int index**

The index into the **NURBSSet** of the curve to use.

**Prototype:**

```
void SetParentId(int pnum, NURBSId id);
```

**Remarks:**

Sets the specified curve in the trim loop to the curve specified by a **NURBSId**.

**Parameters:**

**int pnum**

Zero based index of which curve to set.

**NURBSId id**

The id of the curve to use.

**Prototype:****int GetParent(int pnum);****Remarks:**

Returns the index in the **NURBSSet** of the specified parent object.

**Parameters:****int pnum**

Zero based index of which curve to get.

**Prototype:****NURBSId GetParentId(int pnum);****Remarks:**

Returns the **NURBSId** of the specified curve in the trim loop.

**Parameters:****int pnum**

Zero based index of which curve to get.

**Prototype:****void SetSurfaceParent(int index);****Remarks:**

Sets the surface that's trimmed by specifying it's index into the **NURBSSet**.

**Parameters:****int index**

The index in the **NURBSSet** of the surface.

**Prototype:****void SetSurfaceParentId(NURBSId id);****Remarks:**

Sets the surface that's trimmed by specifying it's **NURBSId**.

**Parameters:****NURBSId id**

The id of the surface.

**Prototype:**

**int GetSurfaceParent();**

**Remarks:**

Returns the index in the **NURBSSet** of the surface that is trimmed.

**Prototype:**

**NURBSId GetSurfaceParentId();**

**Remarks:**

Returns the **NURBSId** of the surface that's trimmed.

**Prototype:**

**BOOL GetFlipTrim();**

**Remarks:**

Returns the state of the flip trim flag. This controls which side of the curve is trimmed from the surface.

**Prototype:**

**void SetFlipTrim(BOOL flip);**

**Remarks:**

Sets the state of the flip trim flag.

**Parameters:**

**BOOL flip**

TRUE to flip; FALSE to not flip.

**Operators:**

**Prototype:**

**NURBSMultiCurveTrimSurface & operator=(const  
NURBSMultiCurveTrimSurface& surf);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSMultiCurveTrimSurface& surf**

The surface to assign.

## Class NURBSTextureSurface

See Also: [Class NURBSControlVertex](#), [Class NURBSSurface](#), [Class NURBSTexturePoint](#).

class NURBSTextureSurface

### Description:

This class is available in release 2.5 and later only.

A NURBS texture surface is a surface associated with the surface sub-object. 3ds max uses the texture surface to control how materials are mapped. In effect, changing the texture surface stretches or otherwise changes the UV coordinates for the surface, altering the mapping.

This class provides access to the NURBS Texture Surface. This is a 2D (not 3D) surface that lives in the parameter space of the corresponding **NURBSSurface** which controls the texture mapping used by the **NURBSSurface**.

### Methods:

#### Prototype:

**NURBSTextureSurface();**

#### Remarks:

Constructor. The data members are initialized as follows:

**mMapperType = kNMapDefault;**

**mpPoints = NULL;**

#### Prototype:

**~NURBSTextureSurface();**

#### Remarks:

Destructor. Any **mpPoints** are deleted.

#### Prototype:

**NURBSTexSurfType MapperType();**

#### Remarks:

This method is available in release 3.0 and later only.

Returns the NURBS Texture Surface Type. See [List of NURBS Texture](#)

## [Surface Types.](#)

### **Prototype:**

**void SetMapperType(NURBSTexSurfType type);**

### **Remarks:**

This method is available in release 3.0 and later only.

Sets the NURBS Texture Surface Type.

### **Parameters:**

**NURBSTexSurfType type**

The type to set. See [List of NURBS Texture Surface Types](#).

### **Prototype:**

**void SetParent(int index);**

### **Remarks:**

This method is available in release 3.0 and later only.

This sets the Id of the "source" surface for a **kNMapSurfaceMapper** texture surface, it should be NULL in other cases. This is only used if the **NURBSTexSurfType** is set the **kNMapSurfaceMapper**. In that case the texture surface is generated by projecting the texture of another NURBS surface sub-object in the NURBS model. The projection travels along the direction of the normals of the source surface. Projected texture surfaces are relational. This method set the parent surface which is projected.

### **Parameters:**

**int index**

The index in the **NURBSSet** of the source surface.

### **Prototype:**

**void SetParentId(NURBSId id);**

### **Remarks:**

This method is available in release 3.0 and later only.

This sets the index in the NURBSSet of the "source" surface for a **kNMapSurfaceMapper** texture surface. This is only used if the

**NURBSTexSurfType** is set the **kNMapSurfaceMapper**. In that case the texture surface is generated by projecting the texture of another NURBS surface sub-object in the NURBS model. The projection travels along the direction of the normals of the source surface. Projected texture surfaces are relational. This method set the parent surface which is projected.

**Parameters:**

**NURBSId id**

The ID of the source surface.

**Prototype:**

**int GetParent();**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the index in the NURBSSet of the surface that's mapped.

**Prototype:**

**NURBSId GetParentId();**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the ID of the surface that's mapped.

**Prototype:**

**void SetNumPoints(int u, int v);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the number of points in U and V for the texture surface.

**Parameters:**

**int u**

The number of points in U.

**int v**

The number of points in V.

**Prototype:**

**int GetNumUPoints();**

**Remarks:**

This method is available in release 3.0 and later only.  
Returns the number of points in U.

**Prototype:**

**int GetNumVPoints();**

**Remarks:**

This method is available in release 3.0 and later only.  
Returns the number of points in V.

**Prototype:**

**void GetNumPoints(int &u, int &v);**

**Remarks:**

This method is available in release 3.0 and later only.  
Retrieves the number of points in U and V.

**Parameters:**

**int &u**

The number of points in U is returned here.

**int &v**

The number of points in V is returned here.

**Prototype:**

**NURBSTexturePoint\* GetPoint(int u, int v);**

**Remarks:**

This method is available in release 3.0 and later only.  
Returns a pointer to the specified NURBS Texture Point.

**Parameters:**

**int u**

Specifies the U point.

**int v**

Specifies the V point.

**Prototype:**

**void SetPoint(int u, int v, NURBSTexturePoint& pnt);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the specified NURBS Texture Point.

**Parameters:**

**int u**

Specifies the U point.

**int v**

Specifies the V point.

**NURBSTexturePoint& pnt**

The point to set.

**Prototype:**

**NURBSTextureSurface & operator=(const  
NURBSTextureSurface& surf);**

**Remarks:**

Assignment operator.

**Parameters:**

**const NURBSTextureSurface& surf**

The surface to assign.

## List of NURBS Results

See Also: [Working With NURBS](#).

These results show up when one is modifying existing objects. This enum has the following choices:

### **kNOk**

The function succeeded.

### **kNInvalidObject**

The specified object was invalid. For example, if you use the **SetSurfaceApprox()** function and specify a non-NURBS object as input you'll get this error.

### **kNInvalidId**

The specified ID was invalid. For example, if you use the **Transform()** function and pass an invalid **NURBSId** you'll get this error.

### **kNInvalidParameter**

A specified parameter was invalid. For example if you tried to create a cone using **GenNURBSConeSurface()** with a radius  $\leq 0$  you'd get this error.

### **kNBad**

The function failed. This is a catch-all for any kind of unwanted result not covered above.

## Class NURBSDisplay

See Also: [Class NURBSSet](#).

class NURBSDisplay

### Description:

This class is available in release 2.5 or later.

This class provides information about the display of the **NURBSSet** in the 3D viewports. An instance of this class is maintained by each **NURBSSet**.

### Data Members:

#### **BOOL mDisplayCurves;**

TRUE if curves are displayed; otherwise FALSE.

#### **BOOL mDisplaySurfaces;**

TRUE if surfaces are displayed; otherwise FALSE.

#### **BOOL mDisplayLattices;**

TRUE if lattices are displayed; otherwise FALSE.

#### **BOOL mDisplaySurfCVLattices;**

TRUE if surface CV lattices are displayed; otherwise FALSE.

#### **BOOL mDisplayCurveCVLattices;**

TRUE if curve CV lattices are displayed; otherwise FALSE.

#### **BOOL mDisplayDependents;**

TRUE if dependent sub-objects are displayed; otherwise FALSE.

#### **BOOL mDisplayTrimming;**

TRUE if surface trimming is displayed; otherwise FALSE.

#### **BOOL mDegradeOnMove;**

TRUE if the surface may degrade while transforming it; otherwise FALSE.

### Methods:

### Prototype:

**NURBSDisplay();**

### Remarks:

Constructor. The data members are initialized as follows:

**mDisplayCurves = TRUE;**

```
mDisplaySurfaces = TRUE;  
mDisplayLattices = FALSE;  
mDisplaySurfCVLattices = TRUE;  
mDisplayCurveCVLattices = TRUE;  
mDisplayDependents = TRUE;  
mDisplayTrimming = TRUE;  
mDegradeOnMove = TRUE;
```

**Prototype:**

```
NURBSDisplay & operator=(const NURBSDisplay& disp);
```

**Remarks:**

Assignment operator.

**Parameters:**

```
const NURBSDisplay& disp
```

The object to assign.

## List of NURBSSubObjectLevel Options

See Also: [Class NURBSSurface](#), [Class NURBSSet](#).

One of the following enum values describes the sub-object level of the object.

### **kNTopLevel**

The object level.

### **kNSurfaceCVLevel**

The surface CV sub-object level.

### **kNSurfaceLevel**

The surface level.

### **kNCurveCVLevel**

The curve CV sub-object level.

### **kNPointLevel**

The point sub-object level.

### **kNCurveLevel**

The curve sub-object level.

### **kNImportsLevel**

The imports level.

## Class BezierShape

See Also: [Class ShapeObject](#), [Class Spline3D](#), [Class PatchCapInfo](#), [Class ShapeVSEL](#), [Class ShapeSSEL](#), [Class ShapePSEL](#), [Class Material](#), [Working with Shapes and Splines](#).

```
class BezierShape : public BaseInterfaceServer
```

### Description:

Defines a basic bezier shape object. The **BezierShape** is effectively a collection of Bezier Splines. For example the 3ds max Donut object has two splines in a hierarchy to make a shape. The **BezierShape** contains these splines.

### Method Groups:

The following hyperlinks jump to the start of groups of related methods within the class:

### Data Members:

public:

```
    PatchCapInfo patchCap;
```

Patch capping cache (mesh capping and hierarchy caches stored in PolyShape cache)

**BOOL patchCapCacheValid;**

Indicates if the patch cap is valid or not.

**Spline3D \*\*splines;**

A pointer to the list of splines.

**int splineCount;**

The number of splines in this shape.

**int steps;**

Number of steps (a value of -1 will use adaptive).

**BOOL optimize;**

Setting this to TRUE optimizes linear segments

**ShapeVsel vertSel;**

The selected vertices.

**ShapeSsel segSel;**

The selected segments.

**ShapePsel polySel;**

The selected polygons.

**int bezVecPoly;**

This is used internally in hit testing.

**int bezVecVert;**

This is used internally in hit testing.

**DWORD selLevel;**

Selection level.

**SHAPE\_OBJECT** - Object level selection.

**SHAPE\_SPLINE** - Spline level selection (a single polygon within the shape).

**SHAPE\_SEGMENT** - Segment level selection.

**SHAPE\_VERTEX** - Vertex level selection.

**DWORD dispFlags;**

Display attribute flags. See [List of BezierShape Display Flags](#).

**Tab<bindShape> bindList;**

The table of bind points. See [Template Class Tab](#).

**Methods:**

## **Constructors / Destructor / Init()**

**Prototype:**

**BezierShape();**

**Remarks:**

The data members are initialized as follows:

```
splines = NULL;  
splineCount = 0;  
dispFlags = 0;  
selLevel = SHAPE_OBJECT;  
bdgBox.Init();  
bezVecPoly = -1;  
bezVecVert = -1;  
vertSel.Empty();  
segSel.Empty();  
polySel.Empty();  
optimize = FALSE;  
steps = 5;
```

**Prototype:**

**BezierShape(BezierShape& fromShape);**

**Remarks:**

Constructor. The shape is initialized based on the **fromShape**.

**Prototype:**

**void Init();**

**Remarks:**

Initializes the **BezierShape**. The data members are initialized as follows:

```
splines = NULL;
```

```
splineCount = 0;  
dispFlags = 0;  
selLevel = SHAPE_OBJECT;  
bdgBox.Init();  
bezVecPoly = -1;  
bezVecVert = -1;  
vertSel.Empty();  
segSel.Empty();  
polySel.Empty();  
optimize = FALSE;  
steps = 5;
```

**Prototype:**

```
~BezierShape();
```

**Remarks:**

Destructor. All the splines in this shape are cleared.

**Get/SetVert()**

**Prototype:**

```
Point3& GetVert(int poly, int i);
```

**Remarks:**

Returns the 'i-th' vertex of the specified spline.

**Parameters:**

**int poly**

The index into the splines list where **poly**  $\geq$  **0** and **poly**  $<$  **splineCount**.

**int i**

The index of the control point in the spline.

**Prototype:**

```
void SetVert(int poly, int i, const Point3 &xyz);
```

**Remarks:**

Sets the 'i-th' vertex of the specified spline.

**Parameters:**

**int poly**

The index into the splines list where **poly**  $\geq 0$  and **poly**  $<$  **splineCount**.

**int i**

The index of the vertex in the spline.

**const Point3 &xyz**

The point to set.

**Render / Select / Snap / HitTest**

**Prototype:**

```
void Render(GraphicsWindow *gw, Material *ma, RECT *rp, int  
compFlags, int numMat);
```

**Remarks:**

This is used internally to render the shape.

**Prototype:**

```
BOOL Select(GraphicsWindow *gw, Material *ma, HitRegion *hr,  
int abortOnHit = FALSE);
```

**Remarks:**

This is used internally to hit test the shape.

**Prototype:**

```
void Snap(GraphicsWindow *gw, SnapInfo *snap, IPoint2 *p,  
Matrix3 &tm);
```

**Remarks:**

This is used internally to snap to the shape.

**Prototype:**

```
void Snap(GraphicsWindow *gw, SnapInfo *snap, IPoint2 *p,  
Matrix3 &tm, DWORD flags);
```

**Remarks:**

This is used internally to snap to the shape.

**Prototype:**

```
BOOL SubObjectHitTest(GraphicsWindow *gw, Material *ma,  
HitRegion *hr,  
DWORD flags, SubShapeHitList& hitList );
```

**Remarks:**

This method is used internally to perform sub-object hit testing of the shape.

**Prototype:**

```
float FindSegmentPoint(int poly, int segment, GraphicsWindow  
*gw,  
Material *ma, HitRegion *hr, int ptype = PARAM_SIMPLE);
```

**Remarks:**

This is used for hit testing. This method returns a value from 0.0 to 1.0 that tells you where a hit was found on a particular segment. Sample code that uses this is the edit spline modifier in `\MAXSDK\SAMPLES\MODIFIERS\EDITSPL.H`. This allows a refinement of the hit testing.

**Parameters:**

**int poly**

The index of the spline.

**int segment**

The index of the segment.

**GraphicsWindow \*gw**

The graphics window where the hit test was done.

**Material \*ma**

The list of materials.

**HitRegion \*hr**

The hit region. See [Class HitRegion](#).

**int ptype = PARAM\_SIMPLE**

This parameter is available in release 4.0 and later only.

This allows the caller to get the location on the segment in either parameter

space or normalized distance space. Both return values of 0-1. For proper backward compatibility, the default parameter type is **PARAM\_SIMPLE**. The other option is **PARAM\_NORMALIZED**.

## **Bounding Box / Transform() / InvalidateGeomCache() / InvalidateCapCache() / FreeAll()**

### **Prototype:**

```
void BuildBoundingBox(void);
```

### **Remarks:**

Computes the bounding box of the splines making up this bezier shape object. The result is stored in the **bdgBox** data member.

### **Prototype:**

```
Box3 GetBoundingBox(Matrix3 *tm=NULL);
```

### **Remarks:**

Returns the bounding box of the splines making up this bezier shape object. The optional TM allows the box to be calculated in any space.

### **Parameters:**

**Matrix3 \*tm=NULL**

The matrix to transform the points before computing the bounding box.

### **Prototype:**

```
void GetDeformBBox(TimeValue t, Box3& box, Matrix3 *tm, BOOL useSel );
```

### **Remarks:**

Computes the bounding box of this shape.

### **Parameters:**

**TimeValue t**

This parameter is not used.

**Box3& box**

The result is stored here.

**Matrix3 \*tm**

The points of each spline in this shape are deformed using this matrix.

**BOOL useSel**

If TRUE the box is computed about the selected vertices only; otherwise all points.

**Prototype:**

```
void Transform(Matrix3 &tm);
```

**Remarks:**

Transforms the points of each poly in the shape by the matrix passed.

**Parameters:****Matrix3 &tm**

The transformation matrix.

**Prototype:**

```
void InvalidateGeomCache();
```

**Remarks:**

This method should be called when a shape changes. It invalidates the caches of the shape. This resets the bounding box, and removes the hierarchy, cap and shape caches.

**Prototype:**

```
void InvalidateCapCache();
```

**Remarks:**

This method is used internally.

**Prototype:**

```
void FreeAll();
```

**Remarks:**

Frees everything from the shape.

**Data Flow Evaluation**

**Prototype:**

**void ShallowCopy(BezierShape \*ashape, ULONG\_PTR channels);**

**Remarks:**

This method is used internally in data flow evaluation

**Prototype:**

**void DeepCopy(BezierShape \*ashape, ULONG\_PTR channels);**

**Remarks:**

This method is used internally in data flow evaluation

**Prototype:**

**void NewAndCopyChannels(ULONG\_PTR channels);**

**Remarks:**

This method is used internally in data flow evaluation

**Prototype:**

**void FreeChannels(ULONG\_PTR channels, int zeroOthers=1);**

**Remarks:**

This method is used internally in data flow evaluation

## **Display Flag Access**

**Prototype:**

**void SetDispFlag(DWORD f);**

**Remarks:**

Sets the state of the specified display flags.

**Parameters:**

**DWORD f**

The flags to set. See [List of BezierShape Display Flags](#).

**Prototype:**

**DWORD GetDispFlag(DWORD f);**

**Remarks:**

Returns the state of the specified display flags.

**Parameters:****DWORD f**

The flags to get. See [List of BezierShape Display Flags](#).

**Prototype:****void ClearDispFlag(DWORD f);****Remarks:**

Clears the specified display flags.

**Parameters:****DWORD f**

The flags to clear. See [List of BezierShape Display Flags](#).

**Selection / UpdateSels()****Prototype:****BitArray VertexTempSel(int poly, int level = -1);****Remarks:**

Constructs a vertex selection list based on the current selection level for the specified spline. For example if the selection level is at object level all the bits are set. If the selection level is at vertex level only the selected vertex bits are set. See [Class BitArray](#).

**Parameters:****int poly**

The index into the **splines** data member.

**int level = -1**

This allows a selection level to be optionally specified. For example if the selection level is at object level all the bits are set. If the selection level is at vertex level only the selected vertex bits are set. One of the following values:

**SHAPE\_OBJECT****SHAPE\_SPLINE****SHAPE\_SEGMENT**

## SHAPE\_VERTEX

### Prototype:

**BitArray VertexTempSelAll(int poly = -1, BOOL includeVecs = FALSE, int level = 0, BOOL forceSel = FALSE);**

### Remarks:

This method looks at the selection state for the selection level and sets the appropriate bits based on the selection set **unless forceSel** is TRUE. If **forceSel** is TRUE, it acts as if every item in the selection set for the specified spline was set. It's an easy way to select entire splines.

See [Class BitArray](#).

### Parameters:

**int poly = -1**

The index into the **splines** data member (-1 means use all).

**BOOL includeVecs = FALSE**

If set, this method will set the bits for vectors associated with selected knots.

**int level = 0**

This allows a selection level to be optionally specified. For example if the selection level is at object level all the bits are set. If the selection level is at vertex level only the selected vertex bits are set. One of the following values:

**SHAPE\_OBJECT**

**SHAPE\_SPLINE**

**SHAPE\_SEGMENT**

**SHAPE\_VERTEX**

**BOOL forceSel = FALSE**

If TRUE, it acts as if every item in the selection set for the specified spline was set. It's an easy way to select entire splines. For example, selecting spline 2 regardless of the spline-level selection state:

**VertexTempSelAll(2, FALSE, SHAPE\_SPLINE, TRUE);**

This just builds the selection set as if spline 2 was completely selected.

Otherwise, the spline bits would have only been selected if `BezierShape::polySel.sel[2]` was set.

Incidentally, the following calls will do exactly the same thing:

**VertexTempSelAll(2, FALSE, SHAPE\_VERTEX, TRUE);**  
**VertexTempSelAll(2, FALSE, SHAPE\_SEGMENT, TRUE);**

For what it's worth, the SHAPE\_SPLINE version is the most efficient.

**Prototype:**

**void UpdateSels(BOOL save = FALSE);**

**Remarks:**

This is a very important call to make. When you are done adding polygons to the shape you should call this method. This method updates a set of embedded selection set data within the shape. This selection set data tells what polygons are selected, what segments are selected, and what control points are selected. This resets the sizes of the selection bit arrays for this shape.

**Parameters:**

**BOOL save = FALSE**

This parameter is available in release 4.0 and later only.

This optional parameter preserves the selection set information when set to TRUE, and erases it when set to FALSE. The default, FALSE, is present for backward compatibility, where there was no argument.

**Load() / Save()**

**Prototype:**

**IOResult Save(ISave\* isave);**

**Remarks:**

Saves the shape data to the .MAX file.

**Prototype:**

**IOResult Load(ILoad\* iload);**

**Remarks:**

Loads the shape data from the .MAX file.

**SplineCount() / GetSpline() / NewSpline() / AddSpline() /  
DeleteSpline() / InsertSpline() / NewShape()**

**Prototype:**

**inline int SplineCount();**

**Remarks:**

Returns the number of splines in this shape.

**Prototype:**

**Spline3D\* GetSpline(int index);**

**Remarks:**

Returns a pointer to the spline specified by the index passed.

**Parameters:**

**int index**

Specifies which spline to return. This is an index into the **splines** data member.

**Prototype:**

**Spline3D\* NewSpline(int itype = KTYPE\_CORNER,int dtype = KTYPE\_BEZIER,  
int ptype = PARM\_UNIFORM);**

**Remarks:**

Creates and adds an empty spline to the shape.

**Parameters:**

**int itype = KTYPE\_CORNER**

The initial knot type you get when you click and release the mouse during spline creation. See [List of Knot Types](#).

**int dtype = KTYPE\_BEZIER**

The drag knot type used when you click and drag to create a vertex during spline creation. See [List of Knot Types](#).

**int ptype = PARM\_UNIFORM**

This parameter is not used. Let it default to **PARM\_UNIFORM**.

**Return Value:**

A pointer to the newly created spline.

**Prototype:**

**Spline3D\* AddSpline(Spline3D\* spline);**

**Remarks:**

Add an existing spline to this shape as the last one in the list. Note that this copies only the pointer, it **does not** copy the entire spline, so **do not** delete the spline anywhere else. This will do it when it's done with it.

**Parameters:**

**Spline3D\* spline**

The spline to add.

**Return Value:**

A pointer to the spline passed or NULL if the call failed.

**Prototype:**

**int DeleteSpline(int index);**

**Remarks:**

Deletes the specified spline.

**Parameters:**

**int index**

The index into the splines data member.

**Return Value:**

Nonzero on success; otherwise zero.

**Prototype:**

**int InsertSpline(Spline3D\* spline, int index);**

**Remarks:**

Inserts the specified spline into the spline list at the location passed.

**Parameters:**

**Spline3D\* spline**

The spline to add.

**int index**

The index in to the splines data member indicating where to insert the spline.

**Return Value:**

Nonzero on success; otherwise zero.

**Prototype:**

**void NewShape();**

**Remarks:**

This method deletes every spline in the shape.

**Prototype:**

**void AddAndWeld(BezierShape &from, float weldThreshold);**

**Remarks:**

This method is available in release 3.0 and later only.

This method is used for adding the splines from one BezierShape to another, with a weld threshold that will weld endpoints of the new splines onto endpoints of existing splines. Calling this method will cause the splines of the "from" shape to be added to those of the shape. If any endpoints in the "from" shape are within the specified weld threshold, they will be automatically welded.

**Parameters:**

**BezierShape &from**

The shape whose splines are added.

**float weldThreshold**

The endpoint weld threshold.

## **GetNumVerts() / GetNumSegs()**

**Prototype:**

**int GetNumVerts();**

**Remarks:**

Returns the total number of vertices in the entire shape.

**Prototype:**

**int GetNumSegs();**

**Remarks:**

Returns the total number of segments in the entire shape.

## **Get/SetClosures()**

### **Prototype:**

**void GetClosures(BitArray& array);**

### **Remarks:**

For each spline in this shape, this method sets the corresponding bit if the shape is closed and clears the bit if the shape is open.

### **Parameters:**

**BitArray& array**

The BitArray to update.

### **Prototype:**

**void SetClosures(BitArray& array);**

### **Remarks:**

Sets the closed state of each spline in this shape based on the BitArray passed.

### **Parameters:**

**BitArray& array**

Indicates which shapes should be closed: 1 = closed; 0 = open.

## **Shape Hierarchy / Reverse() / MakeFirst()**

### **Prototype:**

**ShapeHierarchy &OrganizeCurves(TimeValue t, ShapeHierarchy \*hier = NULL);**

### **Remarks:**

This method looks at the shape organization, and puts together a shape hierarchy. This provides information on how the shapes are nested. For example on a donut object with two circles, this method determines which circle is inside the other one.

### **Parameters:**

**TimeValue t**

This parameter is not used.

**ShapeHierarchy \*hier = NULL**

If non-NULL the result is store here (in addition to being returned). See [Class ShapeHierarchy](#).

**Return Value:**

The result is returned here.

**Prototype:**

**void Reverse(int poly, BOOL keepZero = FALSE);**

**Remarks:**

Reverses the spline whose index is passed.

**Parameters:**

**int poly**

The spline to reverse.

**BOOL keepZero = FALSE**

This optional parameter is available in release 2.0 and later only.

This parameter defaults to FALSE in order to retain backwards compatibility. Setting it to TRUE insures that a closed spline will have the same vertex as its first point when it is reversed. The parameter is ignored on open splines.

**Prototype:**

**void Reverse(BitArray &reverse, BOOL keepZero = FALSE);**

**Remarks:**

Reverses the splines of this shape if the corresponding bit in **reverse** is set.

**Parameters:**

**BitArray &reverse**

If the bit is set the spline is reversed; otherwise it is left alone.

**BOOL keepZero = FALSE**

This optional parameter is available in release 2.0 and later only.

This parameter defaults to FALSE in order to retain backwards compatibility. Setting it to TRUE insures that a closed spline will have the same vertex as its first point when it is reversed. The parameter is ignored on open splines.

**Prototype:**

```
void MakeFirst(int poly, int vertex);
```

**Remarks:**

Sets the specified vertex of the specified poly as the first vertex. On an open polygon this has to be one of the end control points. On a closed shape it doesn't matter.

**Parameters:**

**int poly**

The poly to update.

**int vertex**

The vertex to make first.

**MakePolyShape() / ReadyCachedPolyShape()****Prototype:**

```
void MakePolyShape(PolyShape &pshp, int steps = -1, BOOL  
optimize = FALSE);
```

**Remarks:**

Makes a **PolyShape** from this shape.

**Parameters:**

**PolyShape &pshp**

The results are stored here.

**int steps = -1**

The number of steps between knots in the spline.

**BOOL optimize = FALSE**

If TRUE, linear segments between control points in the spline will not generate steps in between. It will just be one line segment.

**Prototype:**

```
void ReadyCachedPolyShape();
```

**Remarks:**

This method is used internally.

## Capping Methods

### Prototype:

**int MakeCap(TimeValue t, MeshCapInfo &capInfo, int capType);**

### Remarks:

This method is passed a capping information structure and it will compute the information it needs to make a mesh cap for this shape.

### Parameters:

#### **TimeValue t**

This parameter is not used.

#### **MeshCapInfo &capInfo**

The capping information. See [Class MeshCapInfo](#).

#### **int capType**

See [List of Shape Capping Types](#).

### Return Value:

Nonzero if the method succeeded; otherwise zero.

### Prototype:

**int MakeCap(TimeValue t, PatchCapInfo &capInfo);**

### Remarks:

This method is passed a capping information structure and it will compute the information it needs to make a patch cap for this shape.

### Parameters:

#### **TimeValue t**

This parameter is not used.

#### **PatchCapInfo &capInfo**

The capping information. See [Class PatchCapInfo](#).

### Return Value:

Nonzero if the method succeeded; otherwise zero.

### Prototype:

**int ReadyPatchCap();**

**Remarks:**

This method is used internally by the BezierShape code. When you call **BezierShape::MakeCap(TimeValue t, PatchCapInfo &capInfo)**, if the patch cap data isn't cached, this method is called to build it. Calling it is not normally necessary, or a good idea -- it builds the PatchCapInfo data structure regardless of whether it's cached or not. Just call the **MakeCap()** method to get the cap information and the caching is done automatically.

**Prototype:**

**void CopyShapeDataFrom(BezierShape &fromShape);**

**Remarks:**

This method copies the shapes, selection sets and any caches from the source object. It does **not** copy selection level, or display information.

**Parameters:**

**BezierShape &fromShape**

The shape to copy from.

**Prototype:**

**void PrepVertBaseIndex();**

**Remarks:**

This method is used internally.

**Prototype:**

**int GetVertIndex(int poly, int vert);**

**Remarks:**

This method provides an easy way to derive a simple index for any vertex in any spline in the shape.

**Parameters:**

**int poly**

The zero based index of the spline.

**int vert**

The zero based index of the vertex.

**Return Value:**

A zero based index for vertex.

**Prototype:**

```
void GetPolyAndVert(int index, int &polyOut, int &vertOut);
```

**Remarks:**

This method takes a vertex index and turns it back into a poly / vertex pair (see **GetVertIndex()** above).

**Parameters:**

**int index**

The input index.

**int &polyOut**

The output poly.

**int &vertOut**

The output vertex.

**Prototype:**

```
int GetTotalVerts();
```

**Remarks:**

Returns the total number of vertices in the shape.

**Prototype:**

```
void PrepKnotBaseIndex();
```

**Remarks:**

This method is used internally, automatically.

**Prototype:**

```
int GetKnotIndex(int poly, int knot);
```

**Remarks:**

This method returns an index for any knot in any spline in the shape.

**Parameters:**

**int poly**

The input poly number.

**int knot**

The input knot number.

**Return Value:**

The zero based index of the knot.

**Prototype:**

**void GetPolyAndKnot(int index, int &polyOut, int &knotOut);**

**Remarks:**

This method computes a poly / knot pair from an index (see **GetKnotIndex()** above).

**Parameters:**

**int index**

The input knot index.

**int &polyOut**

The output index of the poly it is a part of.

**int &knotOut**

The output knot number.

**Prototype:**

**int GetTotalKnots();**

**Remarks:**

Returns the total number of knots in the shape.

**Prototype:**

**BOOL DeleteSelVerts(int poly);**

**Remarks:**

Deletes the selected vertices for the specified poly in the shape.

**Parameters:**

**int poly**

The zero based index of the polygon.

**Return Value:**

TRUE if any were deleted; FALSE if none were deleted.

**Prototype:**

**BOOL DeleteSelSegs(int poly);**

**Remarks:**

Deletes the selected polygons for the specified poly in the shape.

**Parameters:**

**int poly**

The zero based index of the polygon.

**Return Value:**

TRUE if any were deleted; FALSE if none were deleted.

**Prototype:**

**BOOL DeleteSelectedVerts();**

**Remarks:**

Deletes the selected vertices for all polys in the shape.

**Return Value:**

TRUE if any were deleted; FALSE if none were deleted.

**Prototype:**

**BOOL DeleteSelectedSegs();**

**Remarks:**

Deletes the selected segments for all polys in the shape.

**Return Value:**

TRUE if any were deleted; FALSE if none were deleted.

**Prototype:**

**BOOL DeleteSelectedPolys();**

**Remarks:**

Deletes the selected polygons for all polys in the shape.

**Return Value:**

TRUE if any were deleted; FALSE if none were deleted.

**Prototype:**

**BOOL CloneSelectedParts(BOOL reverse=FALSE);**

**Remarks:**

Copies the selected geometry (segments or polys), reversing if needed.

**Parameters:**

**BOOL reverse=FALSE**

TRUE to reverse; FALSE to leave alone.

**Return Value:**

Returns TRUE if anything was copied.

**Prototype:**

**BOOL RecordTopologyTags(int channel=0);**

**Remarks:**

Tags the points in the spline components to record the topology of the shape. (This stores identifying values in the Spline3D's Knot::aux fields for each control point). This info can be used after topology-changing operations to remap information tied to control points.

**Parameters:**

**int channel=0**

This parameter is available in release 3.0 and later only.

Specifies which auxiliary channel. One of the following values:

**0**=aux2

**1**=aux3

**Return Value:**

Returns FALSE if > 32767 knots or polys (it can't record that many).

**Prototype:**

**Point3 InterpCurve3D(int poly, float param, int ptype=PARAM\_SIMPLE);**

**Remarks:**

This method returns a point interpolated on the specified spline on the entire curve. This method returns the point but you don't know which segment the point falls on. See method **InterpPiece3D()**.

**Parameters:**

**int poly**

The zero based index of the spline.

**float param**

The position along the curve to return where 0 is the start and 1 is the end.

**int ptype=PARAM\_SIMPLE**

The parameter type for spline interpolation. See [List of Parameter Types for Shape Interpolation](#).

**Return Value:**

The interpolated point on the curve.

**Prototype:**

**Point3 TangentCurve3D(int poly, float param, int ptype=PARAM\_SIMPLE);**

**Remarks:**

This method returns a tangent vector interpolated on the entire curve of the specified spline. Also see method **TangentPiece3D()**.

**Parameters:**

**int poly**

The zero based index of the spline.

**float param**

The position along the curve to return where 0 is the start and 1 is the end.

**int ptype=PARAM\_SIMPLE**

The parameter type for spline interpolation. See [List of Parameter Types for Shape Interpolation](#).

**Return Value:**

The tangent vector

**Prototype:**

**Point3 InterpPiece3D(int poly, int piece, float param, int ptype=PARAM\_SIMPLE);**

**Remarks:**

This method returns the interpolated point along the specified sub-curve (segment) for the specified spline. For example consider a shape that is a single circle with four knots. If you called this method with curve=0 and piece=0 and param=0.0 you'd get back the point at knot 0. If you passed the same parameters except param=1.0 you'd get back the point at knot 1.

**Parameters:**

**int poly**

The zero based index of the spline.

**int piece**

The sub-curve (segment) to evaluate.

**float param**

The position along the curve to return where 0 is the start and 1 is the end.

**int ptype=PARAM\_SIMPLE**

The parameter type for spline interpolation. See [List of Parameter Types for Shape Interpolation](#).

**Return Value:**

The point in world space.

**Prototype:**

**Point3 TangentPiece3D(int poly, int piece, float param, int ptype=PARAM\_SIMPLE);**

**Remarks:**

Returns the tangent vector of the specified spline on a sub-curve at the specified 'distance' along the curve.

**Parameters:**

**int poly**

The zero based index of the spline.

**int piece**

The sub-curve (segment) to evaluate.

**float param**

The position along the curve to return where 0 is the start and 1 is the end.

**int ptype=PARAM\_SIMPLE**

The parameter type for spline interpolation. See [List of Parameter Types for Shape Interpolation](#).

**Prototype:**

**float LengthOfCurve(int poly);**

**Remarks:**

Returns the length of the specified spline.

**Parameters:**

**int poly**

The index of the spline to check.

**Prototype:**

**MtlID GetMatID(int poly, int piece);**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the material ID for the specified spline and segment of this shape.

**Parameters:**

**int poly**

The zero based index of the spline.

**int piece**

The zero based index of the segment of the spline.

**Prototype:**

**void GetTopology(BezierShapeTopology &topo);**

**Remarks:**

This method is available in release 3.0 and later only.

Retrieves information on the shape topology.

**Parameters:**

**BezierShapeTopology &topo**

The object which is updated with the shape data. See [Class](#)

[BezierShapeTopology](#).

**Prototype:**

**BOOL PerformTrimOrExtend(IObjParam \*ip, ViewExp \*vpt, ShapeHitData \*hit, IPoint2 &m, ShapeContextCallback &cb, int trimType, int trimInfinite);**

**Remarks:**

This method is available in release 3.0 and later only.

This method provides a way for a BezierShape to trim and extend splines.

This method is meant to perform as part of a mouse-centered operation -- Click on the part of the spline and pass the hitrecord, viewport and mouse point to the trim function.

**Parameters:**

**IObjParam \*ip**

The interface pointer. See [Class Interface](#).

**ViewExp \*vpt**

The viewport the user clicked in. See [Class ViewExp](#).

**ShapeHitData \*hit**

The hit record for the selection. See [Class ShapeHitData](#).

**IPoint2 &m**

The point the user clicked on in the viewport. See [Class IPoint2](#).

**ShapeContextCallback &cb**

The callback object. See [Class ShapeContextCallback](#).

**int trimType**

Specifies if the operation is a Trim or an Extend. One of the following values:

**SHAPE\_TRIM**

**SHAPE\_EXTEND**

**int trimInfinite**

This is set to TRUE for infinite projections.

**Return Value:**

This returns TRUE if the trim or extend was performed.

**Prototype:**

**void BindKnot(BOOL isEnd, int segIndex, int splineSegID, int splinePointID);**

**Remarks:**

This method is available in release 3.0 and later only.

This method binds a knot to a segment. A bind acts as a constraint, it constrains the first point or the end point of a spline to the mid point of a segment.

**Parameters:**

**BOOL isEnd**

Specifies whether the first or last point is bound. TRUE for the end; FALSE for the start.

**int segIndex**

The index of the segment to be bound to.

**int splineSegID**

The index of the spline that contains the segment.

**int splinePointID**

The index of spline that is being bound.

**Prototype:**

**void UnbindKnot(int splineID, BOOL isEnd);**

**Remarks:**

This method is available in release 3.0 and later only.

This method unbinds the specified spline.

**Parameters:**

**int splineID**

The index of spline that is being bound.

**BOOL isEnd**

Specifies whether the first or last point is unbound. TRUE for the end; FALSE for the start.

**Prototype:**

**void UpdateBindList(BOOL useGeomTracking=FALSE);**

**Remarks:**

This method is available in release 3.0 and later only.

This method needs to be called when the topology changes to update the bind list.

**Parameters:****BOOL useGeomTracking=FALSE**

This parameter is available in release 4.0 and later only.

This allows the update to be dependant on previous recorded topology or geometry. If this flag is set to TRUE it uses the old method of using the geometry to rebuild the binds, else it uses the new method which uses the aux flags of the splines which store the old topology indices. Normally this will be FALSE since most of the times the topology tracking is more accurate, it should be set to TRUE when there is no initial topology to work from for instance when attaching or detaching geometry.

**Prototype:****BOOL HideSelectedSegs();****Remarks:**

This method is available in release 3.0 and later only.

Hides the selected segments.

**Return Value:**

TRUE if any were hidden. FALSE if none were hidden.

**Prototype:****BOOL HideSelectedVerts();****Remarks:**

This method is available in release 3.0 and later only.

Hides the segments attached to the selected vertices.

**Return Value:**

TRUE if any were hidden. FALSE if none were hidden.

**Prototype:****BOOL HideSelectedSplines();**

**Remarks:**

This method is available in release 3.0 and later only.

Hides the segments attached to the selected splines.

**Return Value:**

TRUE if any were hidden. FALSE if none were hidden.

**Prototype:**

**BOOL UnhideSegs();**

**Remarks:**

This method is available in release 3.0 and later only.

Unhides all the segments in the shape.

**Return Value:**

TRUE if any were unhidden. FALSE if none were unhidden.

**Operators:****Prototype:**

**BezierShape& operator+=(BezierShape& from);**

**Remarks:**

This lets you add another shape to this one.

**Prototype:**

**BezierShape& operator=(BezierShape& fromShape);**

**Remarks:**

Assignment operator.

**Prototype:**

**BezierShape& operator=(PolyShape& fromShape);**

**Remarks:**

Assignment operator.

## Class PolyShape

See Also: [Class ShapeObject](#), [Class PolyLine](#), [Class ShapeVSel](#), [Class ShapeSSel](#), [Class ShapePSel](#), [Class ShapeHierarchy](#).

class PolyShape

### Description:

A multi-polygon shape class. This class is used in the caching of bezier shapes. This is used for doing a one time interpolation of a bezier shape into a form that is the same shape but doesn't require any further interpolation. In this way the system can do the complex calculations once, store the shape into this **PolyShape** representation, and not have to go through the cubic spline calculations to figure out where the points are in the future. This class maintains an array of **PolyLines**.

This is used for example in the Extrude modifier. The first thing it does is generate a **PolyShape** from the bezier shape it is extruding. This **PolyShape** is then used to generate the mesh.

### Method Groups:

The following hyperlinks take you to the start of groups of related methods within the class:

[Constructors / Destructor / Init\(\) / GetMatID\(\)](#)

[SetNumLines\(\) / NewShape\(\) / NewLine\(\)](#)

[Append / Insert / Delete / Reverse\(\)](#)

[Bounding Box / InvalidateGeomCache\(\) / InvalidateCapCache\(\)](#)

[Render / Select / Snap / Transform](#)

[Capping Methods](#)

[Selection / UpdateSels\(\)](#)

[Shape Hierarchy](#)

[Data Flow Evaluation](#)

[Dump\(\) / Load\(\) / Save\(\)](#)

[Operators](#)

### Data Members:

public:

**int numLines;**

The number of lines in the polyshape.

**PolyLine \*lines;**

The array of lines.

**DWORD flags;**

These are not currently used.

**Box3 bdgBox;**

Stores the bounding box surrounding each **PolyLine** in the shape.

**ShapeVSel vertSel;**

The selected vertices.

**ShapeSSel segSel;**

The selected segments.

**ShapePSel polySel;**

The selected polygons.

**DWORD selLevel;**

The selection level. One of the following values:

**SHAPE\_OBJECT** - Object level selection.

**SHAPE\_SPLINE** - Spline level selection.

**SHAPE\_SEGMENT** - Segment level selection.

**SHAPE\_VERTEX** - Vertex level selection.

**DWORD dispFlags;**

Display attribute flags.

**DISP\_VERTTICKS** - Display vertices as ticks.

**DISP\_SELVERTS** - Display selected vertices.

**DISP\_SELSEGMENTS** - Display selected segments.

**DISP\_SELPOLYS** - Display selected polygons.

The following capping and cache information is used internally:

**MeshCapInfo morphCap;**

The morph cap information.

**BOOL morphCapCacheValid;**

Determines if the morph cap is valid.

**MeshCapInfo gridCap;**

The grid cap information.

**BOOL gridCapCacheValid;**

Determines if the grid cap is valid.

**PatchCapInfo patchCap;**

The patch cap information.

**BOOL patchCapCacheValid;**

Determines if the patch cap is valid.

**ShapeHierarchy cachedHier;**

Hierarchy cache.

**BOOL hierCacheValid;**

Determines if the hierarchy cache is valid.

**Methods:**

**Constructors / Destructor / Init() / GetMatID**

**Prototype:**

**PolyShape();**

**Remarks:**

Constructor. The number of lines is set to 0, the lines array is set to NULL, the flags and display flags are set to 0, the selection level is set to SHAPE\_OBJECT, the geometry cache is invalidated, and the masterObject is set to NULL.

**Prototype:**

**PolyShape(PolyShape& from);**

**Remarks:**

Constructor. The **PolyShape** is initialized from the specified **PolyShape**.

**Prototype:**

**~PolyShape();**

**Remarks:**

Destructor.

**Prototype:**

**void Init();**

**Remarks:**

**PolyShape::Init()** is a special version used by the constructors and should not be called by plug-in developers. If you need to clear out a **PolyShape** use **NewShape()** described below.

**Prototype:**

**MtlID GetMatID(int poly, int piece);**

**Remarks:**

This method is available in release 3.0 and later only.

Returns the material ID for the specified segment of the specified poly.

**Parameters:**

**int poly**

The zero based index of the poly.

**int piece**

The zero based index of the segment.

**SetNumLines() / NewShape() / NewLine()****Prototype:**

**BOOL SetNumLines(int count, BOOL keep = TRUE);**

**Remarks:**

Sets the number of polygons used by the poly shape.

**Parameters:**

**int count**

The number of lines.

**BOOL keep = TRUE**

If TRUE any old lines are copied to the new storage; otherwise they are freed.

**Return Value:**

TRUE if the number of lines were set; otherwise FALSE.

**Prototype:**

**void NewShape();**

**Remarks:**

This deletes all the lines from the **PolyShape** and clears the shape out. Use this method instead of **Init()** above.

**Prototype:**

**PolyLine\* NewLine();**

**Remarks:**

Creates a new **PolyLine** and appends it to the end of the list of lines maintained by this **PolyShape**.

**Return Value:**

The address of the newly added line.

**Append / Insert / Delete / Reverse()****Prototype:**

**void Append(PolyLine &l);**

**Remarks:**

Appends the specified **PolyLine** to the end of the lines list.

**Parameters:**

**PolyLine &l**

The **PolyLine** to append.

**Prototype:**

**void Insert(int where, PolyLine& l);**

**Remarks:**

Inserts the specified **PolyLine** at the location passed.

**Parameters:**

**int where**

The index into the lines list specifying where to insert the **PolyLine**.

**PolyLine& l**

The **PolyLine** to insert.

**Prototype:**

**void Delete(int where);**

**Remarks:**

Deletes the specified **PolyLine** from the lines list.

**Parameters:**

**int where**

The index into the lines list specifying which line to delete.

**Prototype:**

**void Reverse(int poly, BOOL keepZero=FALSE);**

**Remarks:**

Reverses the **PolyLine** whose index is passed.

**Parameters:**

**int poly**

The spline to reverse.

**BOOL keepZero=FALSE**

This should normally be passed as TRUE. If TRUE, and the polyline is closed, this method will make sure that vertex zero is the same on the reversed version as on the non-reversed version. Otherwise if passed as FALSE the last vertex becomes the first vertex, and the first vertex becomes the last. This is an important distinction for the loftter because it always wants vertex zero to be in the same place.

**Prototype:**

**void Reverse(BitArray &reverse, BOOL keepZero=FALSE);**

**Remarks:**

Reverses the splines of this shape if the corresponding bit in **reverse** is set. The BitArray has one bit for each polyline.

**Parameters:**

**BitArray &reverse**

If the bit is set the spline is reversed; otherwise it is left alone.

**BOOL keepZero=FALSE**

This should normally be passed as TRUE. If TRUE, and the polyline is closed, this method will make sure that vertex zero is the same on the reversed version as on the non-reversed version. Otherwise if passed as FALSE the last vertex becomes the first vertex, and the first vertex becomes the last. This is an important distinction for the lofter because it always wants vertex zero to be in the same place.

## **Bounding Box / InvalidateGeomCache() / InvalidateCapCache()**

### **Prototype:**

```
void BuildBoundingBox();
```

### **Remarks:**

Builds a bounding box surrounding every line in the lines list. The bounding box is returned through the **bdgBox** data member.

### **Prototype:**

```
Box3 GetBoundingBox(Matrix3 *tm=NULL);
```

### **Remarks:**

Returns the bounding box of the **PolyLines** in this **PolyShape**. The optional TM allows the box to be calculated in any space.

### **Parameters:**

**Matrix3 \*tm=NULL**

The points of the **PolyLines** in this **PolyShape** are transformed by this matrix prior to the bounding box computations.

### **Prototype:**

```
void GetDeformBBox(TimeValue t, Box3& box, Matrix3 *tm,  
BOOL useSel);
```

### **Remarks:**

Computes the bounding box of this **PolyShape**.

### **Parameters:**

**TimeValue t**

The time at which to evaluate the bounding box.

**Box3& box**

The result is stored here.

**Matrix3 \*tm**

The points of each **PolyLine** in this **PolyShape** are deformed using this matrix.

**BOOL useSel**

If TRUE the box is computed about the selected vertices only; otherwise all points.

**Prototype:**

```
void InvalidateGeomCache(BOOL unused);
```

**Remarks:**

Invalidates the cache of each line in the **PolyShape**. The bounding box is set to empty. This method also invalidates the capping caches.

**Parameters:****BOOL unused**

This parameter is not used.

**Prototype:**

```
void InvalidateCapCache();
```

**Remarks:**

Invalidates the morph, and grid cap caches.

**Render / Select / Snap / Transform****Prototype:**

```
void Render(GraphicsWindow *gw, Material *ma, RECT *rp, int compFlags);
```

**Remarks:**

This method is used internally.

**Prototype:**

**BOOL Select(GraphicsWindow \*gw, Material \*ma, HitRegion \*hr,  
int abortOnHit = FALSE);**

**Remarks:**

This method is used internally.

**Prototype:**

**void Snap(GraphicsWindow \*gw, SnapInfo \*snap, IPoint2 \*p,  
Matrix3 &tm);**

**Remarks:**

This method is used internally.

**Prototype:**

**void Snap(GraphicsWindow \*gw, SnapInfo \*snap, IPoint2 \*p,  
Matrix3 &tm, DWORD flags);**

**Remarks:**

This method is used internally.

**Prototype:**

**void Transform(Matrix3 &tm);**

**Remarks:**

Transforms the vertices of each PolyLine in this PolyShape by the specified matrix.

**Parameters:**

**Matrix3 &tm**

The transformation matrix.

## **Capping Methods**

**Prototype:**

**int MakeCap(TimeValue t, MeshCapInfo &capInfo, int capType);**

**Remarks:**

This method may be called to fill in the MeshCapInfo passed with the

appropriate capping information. See [Working with Patches](#) for more details on capping. This method is used for meshes. The method below is used for patches.

**Parameters:**

**TimeValue t**

This should be passed as the current time. You may retrieve this using **Interface::GetTime()**. See [Class Interface](#).

**MeshCapInfo &capInfo**

This information is filled in by this method. See [Class MeshCapInfo](#).

**int capType**

The cap type. See [List of Shape Capping Types](#).

**Return Value:**

Nonzero if the cap info was set up successfully; otherwise zero.

**Prototype:**

**int MakeCap(TimeValue t, PatchCapInfo &capInfo);**

**Remarks:**

This method may be called to fill in the **PatchCapInfo** passed with the appropriate capping information. This method is used for patches. Note that it is generally not recommended to try to create patch caps from **PolyShapes**.

The patch cap uses bezier information, so it is much better to use a **BezierShape** to make a patch cap. It is very inefficient to do this with a **PolyShape**.

**Parameters:**

**TimeValue t**

This should be passed as the current time. You may retrieve this using **Interface::GetTime()**. See [Class Interface](#).

**PatchCapInfo &capInfo**

This information is filled in by this method. See [Class PatchCapInfo](#).

**Return Value:**

Nonzero if the cap info was set up successfully; otherwise zero.

**Prototype:**

**int Make3DSCap(MeshCapInfo &capInfo, DWORD options = 0);**

**Remarks:**

This method is used internally.

**Prototype:**

**int MakeGridCap(MeshCapInfo &capInfo);**

**Remarks:**

This method is used internally.

**Dump() / Load() / Save()**

**Prototype:**

**void Dump(TCHAR \*title = NULL);**

**Remarks:**

This may be called to display information about the PolyShape to the debug window via **DebugPrint()**. See [Debugging](#).

**Parameters:**

**TCHAR \*title = NULL**

A string to be display before the **PolyShape** data is displayed.

**Prototype:**

**IOResult Save(ISave \*isave);**

**Remarks:**

This method is used internally in saving to the MAX file.

**Prototype:**

**IOResult Load(ILoad \*iload);**

**Remarks:**

This method is used internally in loading from the MAX file.

## **Shape Hierarchy**

**Prototype:**

```
void UpdateCachedHierarchy();
```

**Remarks:**

This method is used internally.

**Prototype:**

```
ShapeHierarchy &OrganizeCurves(TimeValue t, ShapeHierarchy  
*hier = NULL);
```

**Remarks:**

This methods looks at the shape organization, and puts together a shape hierarchy. This provides information on how the shapes are nested. For example on a donut object with two circles, this method determines which circle is inside the other one.

**Parameters:**

**TimeValue t**

This parameter is not used.

**ShapeHierarchy \*hier = NULL**

If non-NULL the result is store here (in addition to being returned). See [Class ShapeHierarchy](#).

**Return Value:**

The result is store here.

**Selection / UpdateSels()****Prototype:**

```
BitArray VertexTempSel(int poly);
```

**Remarks:**

Constructs a vertex selection list based on the current selection level of the specified poly. For example if the selection level is at object level all the bits are set. If the selection level is at vertex level only the selected vertex bits are set. See [Class BitArray](#).

**Parameters:**

**int poly**

The poly whose selection level is constructed.

**Prototype:**

**void UpdateSels();**

**Remarks:**

This is a very important call to make. Whenever you have changed the **PolyShape**, for example after you are done adding polygons to the shape or have changed the number of points in a shape, you should call this method. This method updates a set of embedded selection set data within the shape. This selection set data tells what polygons are selected, what segments are selected, and what control points are selected. This resets the sizes of the selection bit arrays for this shape.

## **Data Flow Evaluation**

**Prototype:**

**void ShallowCopy(PolyShape \*ashape, ULONG\_PTR channels);**

**Remarks:**

This method is used internally in data flow evaluation in the pipeline.

**Prototype:**

**void DeepCopy(PolyShape \*ashape, ULONG\_PTR channels);**

**Remarks:**

This method is used internally in data flow evaluation in the pipeline.

**Prototype:**

**void NewAndCopyChannels(ULONG\_PTR channels);**

**Remarks:**

This method is used internally in data flow evaluation in the pipeline.

**Prototype:**

**void FreeChannels(ULONG\_PTR channels, int zeroOthers=1);**

**Remarks:**

This method is used internally in data flow evaluation in the pipeline.

## **Operators:**

### **Prototype:**

**PolyShape& operator=(PolyShape& from);**

### **Remarks:**

Assignment operator.

### **Prototype:**

**PolyShape& operator=(BezierShape& from);**

### **Remarks:**

Assignment operator. Note that this operator does not offer as much control as calling the method on the **BezierShape** itself named **MakePolyShape()**. That version allows you to specify the number of steps and an optimize parameter. These options are not available on this simple assignment operator.

# Class PolyLine

See Also: [Class PolyPt](#), [Class PolyShape](#).

class PolyLine

## Description:

This class describes a single polygon in a **PolyShape** using linear segments. All methods of this class are implemented by the system.

## Method Groups:

The following hyperlinks take you to the start of groups of related methods within the class:

[Constructors / Destructor / Init\(\) / GetMatID\(\)](#)  
[Opened/Closed/Self Intersects/Clockwise/Surrounds](#)  
[Point/SetNumPts\(\)/CurveLength\(\)](#)  
[SpliceLine\(\) / HitsSegment\(\) / HitsPolyLine\(\)](#)  
[Vertex / Segment counts](#)  
[Append / Insert / Delete / Reverse\(\)](#)  
[Bounding Box / InvalidateGeomCache\(\)](#)  
[Render / Select / Snap / Transform](#)  
[Interpolated Points / Tangent Vectors](#)  
[Capping Methods](#)  
[Dump\(\)](#)  
[Operators](#)

## Data Members:

public:

**int numPts;**

The number of points in the polyline.

**PolyPt \*pts;**

The points themselves.

**DWORD flags;**

PolyLine flags. One or more of the following values:

**POLYLINE\_CLOSED**

Indicates the polyline is closed.

**POLYLINE\_NO\_SELF\_INT**

Ignore self-intersections. This is used internally in the patch capping to indicate that this line always returns FALSE from the self intersects test. Normally this should not be set.

**Box3 bdgBox;**

The bounding box of the polyline.

**float cachedLength;**

The length of the polyline.

**float \*lengths;**

Cached lengths for each point

**float \*percents;**

Cached percentages for each point

**BOOL cacheValid;**

Indicates if the cache is valid.

**Methods:**

**Constructors / Destructor / Init / GetMatID()**

**Prototype:**

**PolyLine();**

**Remarks:**

Constructor. The number of points is set to zero, the points array is set to NULL, the flags are set to 0, the cache validity is set to FALSE and the bounding box is set to empty.

**Prototype:**

**PolyLine(PolyLine& from);**

**Remarks:**

Constructor. The **PolyLine** is initialized using **from**.

**Prototype:**

**~PolyLine();**

**Remarks:**

Destructor. The array of points is freed.

**Prototype:**

**void Init();**

**Remarks:**

Initializes the PolyLine. The **pts** array is freed, the number of points is set to 0, and the cache validity is set to FALSE.

**Prototype:**

**MtlID GetMatID(int segment);**

**Remarks:**

This method is available in release 3.0 and later only.  
Returns the material ID for the specified segment.

**Parameters:**

**int segment**

The zero based index of the segment.

**Opened / Closed / Self Intersects / Clockwise / Surrounds Point / SetNumPts()**

**Prototype:**

**void Close();**

**Remarks:**

Call this method to indicate the polyline is closed.

**Prototype:**

**BOOL IsClosed();**

**Remarks:**

Returns TRUE if the polyline is closed; otherwise FALSE.

**Prototype:**

**void Open();**

**Remarks:**

Call this method to indicate the polyline is open.

**Prototype:**

**BOOL IsOpen();**

**Remarks:**

Returns TRUE if the polyline is open; otherwise FALSE.

**Prototype:**

**void SetNoSelfInt();**

**Remarks:**

Call this method to set the self intersects flag. This is used in the patch capping to indicate that this line always returns FALSE from the self intersects test. Normally this should not be set.

**Prototype:**

**BOOL IsNoSelfInt()**

**Remarks:**

Returns TRUE if the no self intersect flag is set; otherwise FALSE.

**Prototype:**

**BOOL IsClockWise();**

**Remarks:**

Returns TRUE if the polyline is clockwise in the XY plane (it ignores Z); otherwise FALSE. If the **PolyLine** self intersects, the results from this method are meaningless.

**Prototype:**

**BOOL SelfIntersects(BOOL findAll = FALSE,  
IntersectionCallback3D \*cb = NULL);**

**Remarks:**

Returns TRUE if the polyline intersects itself in the XY plane (it ignores Z);

otherwise FALSE.

**Parameters:**

**BOOL findAll = FALSE**

TRUE to find all self intersections. FALSE to find only the first self intersection.

**IntersectionCallback3D \*cb = NULL**

A pointer to an IntersectionCallback3D class.

**Prototype:**

**float CurveLength();**

**Remarks:**

Returns the length of the **PolyLine**.

**Prototype:**

**BOOL SurroundsPoint(Point2 &point);**

**Remarks:**

Returns TRUE if the specified point is surrounded (contained within) this spline. This method should only be called on closed **PolyLines**.

**Parameters:**

**Point2 &point**

The point to check.

## **Vertex / Segment counts**

**Prototype:**

**int Verts()**

**Remarks:**

Returns the number of vertices (points) in the polyline.

**Prototype:**

**int Segments();**

**Remarks:**

Returns the number of segments (edges between vertices) of the polyline.

**Prototype:**

**BOOL SetNumPts(int count, BOOL keep = TRUE);**

**Remarks:**

Sets the number of points in the polyline.

**Parameters:**

**int count**

The number to set.

**BOOL keep = TRUE**

If TRUE any existing points are copied to the new array; otherwise they are freed.

**Return Value:**

TRUE if the number of points was set; otherwise FALSE.

**Append() / Insert() / Delete() / Reverse()**

**Prototype:**

**void Append(PolyPt& p);**

**Remarks:**

Appends the specified point to the polyline. This adds the point to the end of the points list.

**Parameters:**

**PolyPt& p**

The point to append.

**Prototype:**

**void Insert(int where, PolyPt& p);**

**Remarks:**

Inserts the specified point at the location passed.

**Parameters:**

**int where**

The **pts** array index indicating where to insert the point.

**PolyPt& p**

The point to insert.

**Prototype:**

**void Delete(int where);**

**Remarks:**

Deletes the specified point.

**Parameters:**

**int where**

The **pts** array index indicating which point to delete.

**Prototype:**

**void Reverse(BOOL keepZero=FALSE);**

**Remarks:**

Reverses the order of the points in the polyline.

**Parameters:**

**BOOL keepZero=FALSE**

This should normally be passed as TRUE. If TRUE, and the polyline is closed, this method will make sure that vertex zero is the same on the reversed version as on the non-reversed version. Otherwise if passed as FALSE the last vertex becomes the first vertex, and the first vertex becomes the last. This is an important distinction for the lofter because it always wants vertex zero to be in the same place.

## **Bounding Box / InvalidateGeomCache()**

**Prototype:**

**void BuildBoundingBox();**

**Remarks:**

Computes the bounding box of the polyline. The result is stored in the **bdgBox** data member.

**Prototype:**

**Box3 GetBoundingBox(Matrix3 \*tm=NULL);**

**Remarks:**

Returns the bound box of the polyline. The optional TM allows the box to be calculated in any space.

**Parameters:**

**Matrix3 \*tm=NULL**

The points of the polyline are multiplied by this matrix before the box computation.

**Prototype:**

**void InvalidateGeomCache();**

**Remarks:**

This method makes sure the **PolyLine** has flushed out any cached data it may have had. This resets the bounding box size and sets the cache validity to FALSE. This should be called when any points have been changed in the polyline.

## **Render / Select / Snap / Transform**

**Prototype:**

**void Render(GraphicsWindow \*gw, Material \*ma, RECT \*rp, int compFlags, int numMat);**

**Remarks:**

This method is used internally.

**Prototype:**

**void Render(GraphicsWindow \*gw, Material \*ma, in numMat, BOOL colorSegs, BitArray &segSel);**

**Remarks:**

This method is used internally.

**Prototype:**

**BOOL Select(GraphicsWindow \*gw, Material \*ma, HitRegion \*hr,  
int abortOnHit = FALSE);**

**Remarks:**

This method is used internally.

**Prototype:**

**void Snap(GraphicsWindow \*gw, SnapInfo \*snap, IPoint2 \*p,  
Matrix3 &tm, DWORD flags);**

**Remarks:**

This method is used internally.

**Prototype:**

**void Transform(Matrix3 &tm);**

**Remarks:**

Transforms the points of the polyline by the specified matrix.

**Parameters:**

**Matrix3 &tm**

The matrix to transform the points.

## **Dump()**

**Prototype:**

**void Dump(TCHAR \*title = NULL);**

**Remarks:**

You may call this method to dump the polyline structure via **DebugPrint()**.

See [Debugging](#).

**Parameters:**

**TCHAR \*title = NULL**

This title string is displayed using a **DebugPrint()** before the rest of the data.

## **Splice() / HitsSegment() / HitsPolyLine()**

**Prototype:**

**void SpliceLine(int where, PolyLine &source, int splicePoint);**

**Remarks:**

This method is used internally as part of the capping mechanism and should not be used.

**Prototype:**

**BOOL HitsSegment(Point2 p1, Point2 p2, BOOL findAll=FALSE, IntersectionCallback3D \*cb = NULL);**

**Remarks:**

Returns TRUE if the line segment defined between points **p1** and **p2** intersects this **PolyLine**; otherwise FALSE.

**Parameters:**

**Point2 p1, Point2 p2**

The endpoints of the line to check.

**BOOL findAll=FALSE**

TRUE to find all intersections. FALSE to find only the first intersection.

**IntersectionCallback3D \*cb = NULL**

A pointer to an IntersectionCallback3D class.

**Prototype:**

**BOOL HitsPolyLine(PolyLine &line, BOOL findAll=FALSE, IntersectionCallback3D \*cb = NULL);**

**Remarks:**

Returns TRUE if the specified **PolyLine** intersects this PolyLine; otherwise FALSE.

**Parameters:**

**PolyLine &line**

The PolyLine to check

**BOOL findAll=FALSE**

TRUE to find all intersections. FALSE to find only the first intersection.

**IntersectionCallback3D \*cb = NULL**

A pointer to an IntersectionCallback3D class.

## Capping Methods

### Prototype:

```
int Cap3DS(CapVert *capverts, MeshCapInfo &capInfo, DWORD options = 0);
```

### Remarks:

This method is used internally.

## Interpolated Points / Tangent Vectors

### Prototype:

```
Point3 InterpPiece3D(int segment, float t);
```

### Remarks:

This method returns a point interpolated on a segment between two points.

### Parameters:

**int segment**

The index of the segment to interpolate.

**float t**

A value in the range of 0.0 to 1.0. 0 is the first point and 1 is the second point.

### Return Value:

The interpolated point.

### Prototype:

```
Point3 InterpCurve3D(float u, int ptype=POLYSHP_INTERP_SIMPLE);
```

### Remarks:

This method returns a point interpolated on the entire curve. This method returns a point but you don't know which segment the point falls on.

### Parameters:

**float u**

A value in the range of 0.0 to 1.0 for the entire curve.

**int ptype=POLYSHP\_INTERP\_SIMPLE**

This parameter is available in release 2.0 and later only.

The parameter type for interpolation. The default value is based on segments (rather than the entire curve). See [List of Parameter Types for PolyLine Interpolation](#).

**Return Value:**

The interpolated point.

**Prototype:**

**Point3 TangentPiece3D(int segment, float t);**

**Remarks:**

This method returns a tangent vector interpolated on a segment between two points.

**Parameters:**

**int segment**

The index of the segment.

**float t**

A value in the range of 0.0 to 1.0. 0 is the first point and 1 is the second point.

**Return Value:**

The tangent vector.

**Prototype:**

**Point3 TangentCurve3D(float u, int ptype=POLYSHP\_INTERP\_SIMPLE);**

**Remarks:**

This method returns a tangent vector interpolated on the entire curve.

**Parameters:**

**float u**

A value in the range of 0.0 to 1.0 for the entire curve.

**int ptype=POLYSHP\_INTERP\_SIMPLE**

This parameter is available in release 2.0 and later only.

The parameter type for interpolation. The default value is based on segments

(rather than the entire curve). See [List of Parameter Types for PolyLine Interpolation](#).

**Return Value:**

The tangent vector.

**Operators:**

**Prototype:**

**PolyLine& operator=(PolyLine& from);**

**Remarks:**

Assignment operator.

**Prototype:**

**PolyLine& operator=(Spline3D& from);**

**Remarks:**

Assignment operator. This generates a polyline from the spline.

**Prototype:**

**PolyPt& operator[](int index);**

**Remarks:**

Array access operator. Returns the specified point in the **pts** array.

## Class INodeTab

See Also: [Class Interface](#), [Template Class Tab](#), [Class INode](#).

```
class INodeTab : public Tab<INode*>;
```

### **Description:**

This class is used to hold a list of **INode** pointers. Methods of the template class **Tab** are used to manipulate the table.

## Class NameEnumCallback

See Also: [Class Animatable](#), [Class NameTab](#).

class NameEnumCallback

### Description:

This class is the callback object passed to **Interface::EnumAuxFiles()** and to **Animatable::EnumAuxFiles()**. A developer derives a class from this class and implements the **RecordName()** method to store each name as it's passed to it. At the end of the **EnumAuxFiles()** processing, the table of names may be used. See [Class NameTab](#) for help storing the names.

### Methods:

### Prototype:

```
virtual void RecordName(TCHAR *name)=0;
```

### Remarks:

Implemented by the Plug-In.

This method is used to record the name passed.

### Parameters:

**TCHAR \*name**

The name to store.

## List of EnumAuxFiles Flags

See Also: [Class Interface](#), [Class Animatable](#).

One or more of the following values:

### **FILE\_ENUM\_INACTIVE**

Enumerate inactive files. Inactive files are those that aren't being used currently. For instance, a texture map file that is present, but not activated in the materials editor user interface, is considered inactive.

### **FILE\_ENUM\_VP**

Enumerate video post files.

### **FILE\_ENUM\_RENDER**

Enumerate render files.

### **FILE\_ENUM\_ALL**

Enumerate ALL files (this is the same as:

**FILE\_ENUM\_INACTIVE|FILE\_ENUM\_VP|FILE\_ENUM\_RENDER|FILE\_ENUM\_MISSING\_ONLY**

Enumerate missing files only.

### **FILE\_ENUM\_1STSUB\_MISSING**

Just enumerate the first file named by an IFL (Image File List) if missing.

### **FILE\_ENUM\_DONT\_RECURSE**

Don't enumerate references.

### **FILE\_ENUM\_CHECK\_AWORK1**

Don't enumerate things with flag **A\_WORK1** set.

## Class TimeChangeCallback

See Also: [Class Interface](#).

class TimeChangeCallback

### Description:

A callback object passed to **Interface::RegisterTimeChangeCallback()**. The method **TimeChange()** is called every time the user changes the frame slider allowing the plug-in to respond.

### Methods:

### Prototype:

**virtual void TimeChanged(TimeValue t)=0;**

### Remarks:

Implemented by the Plug-In.

This method is called every time the user changes the frame slider.

### Parameters:

#### **TimeValue t**

The time the user has moved the frame slider to.

See Also: Methods **RegisterTimeChangeCallback()** and **UnRegisterTimeChangeCallback()** in [Class Interface](#).

# Class ViewportDisplayCallback

See Also: [Class Interface](#), [Class ViewExp](#), [Data Types](#).

```
class ViewportDisplayCallback
```

## Description:

This class is available in release 2.0 and later only.

This class is a callback object that enables plug-ins that aren't actually objects (such as utility plug-ins) to draw in the 3ds max viewports. See the methods in class **Interface** that register and unregister this callback object:

**Interface::RegisterViewportDisplayCallback()**, and  
**Interface::UnRegisterViewportDisplayCallback()**

Also see the method

**Interface::NotifyViewportDisplayCallbackChanged()**.

## Methods:

### Prototype:

```
virtual void Display(TimeValue t, ViewExp *vpt, int flags)=0;
```

### Remarks:

This method is called to allow the plug-in to draw in the viewports.

### Parameters:

**TimeValue t**

The current time when this method is called.

**ViewExp \*vpt**

An interface into the viewport.

**int flags**

These flags are used internally.

### Prototype:

```
virtual void GetViewportRect(TimeValue t, ViewExp *vpt, Rect *rect)=0;
```

### Remarks:

Retrieves the dimensions of the specified viewport given an **ViewExp**

interface to it.

**Parameters:**

**TimeValue t**

The time to get the viewport rectangle.

**ViewExp \*vpt**

Specifies which viewport

**Rect \*rect**

The rectangle is returned here.

**Prototype:**

**virtual BOOL Foreground()=0;**

**Remarks:**

This method should return TRUE if the object changes a lot or FALSE if it doesn't change very much. This method relates to the foreground/background display system used by 3ds max. Basically, items that change a lot are placed in the foreground buffer. Items that don't change much are placed in the background buffer and simply biltted to the dispaly. See the Advanced Topics section on [Foreground / Background Planes](#) for more details. Most plug-ins can simply return TRUE because they are not likely to be very heavyweight objects (they are usually just a gizmo or apparatus image) and can simply go into the foreground. On the other hande, some items, for instance the 3ds max home grid, don't change and can always go into the background. The home grid only changes when the view direction is changed in which case everything is redrawn.

# Class ExitMAXCallback

See Also: [Class Interface](#), [Structure NotifyInfo](#).

class ExitMAXCallback

## Description:

This class is available in release 2.0 and later only.

This class is a callback object that will get called before the program exits. All methods of this class are implemented by the plug-in.

## Methods:

### Prototype:

**virtual BOOL Exit(HWND hWnd)=0;**

### Remarks:

This method is called when 3ds max is about to exit.

### Parameters:

**HWND hWnd**

The main 3ds max window handle.

### Return Value:

TRUE to exit; FALSE to abort the exit and remain in 3ds max.

## Class AxisChangeCallback

See Also: [Class Interface](#).

class AxisChangeCallback

### Description:

This is the callback used with **Interface::RegisterAxisChangeCallback()**.

### Methods:

### Prototype:

```
virtual void proc(Interface *ip)=0;
```

### Remarks:

This callback object will be notified any time the user changes the reference coordinate system by:

- Changing the transform coordinate system drop-down menu.
- Changing the state of the transform center fly-off.
- Changing X, Y, Z, XY, YZ, ZX constraint buttons/fly-off.
- Using an accelerator or anything else that changes the above.

### Parameters:

**Interface \*ip**

A pointer available for calling methods provided by 3ds max.

# Class RedrawViewsCallback

See Also: [Class Interface](#).

class RedrawViewsCallback

## Description:

This is the callback used with

**Interface::RegisterRedrawViewsCallback()**.

## Methods:

## Prototype:

```
virtual void proc(Interface *ip)=0;
```

## Remarks:

Implemented by the Plug-In.

This method will be called after all the viewports have completed drawing.

## Parameters:

**Interface \*ip**

A pointer for calling functions available in 3ds max.

## Class SelectFilterCallback

See Also: [Class InterfaceServer](#), [Class Interface](#).

```
class SelectFilterCallback : public InterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

This is a call-back class for the selection filter drop down in the tab panel. This allows plug-ins to add additional filters to this list.

### Methods:

public:

### Prototype:

```
virtual TCHAR* GetName()=0;
```

### Remarks:

Returns the name of the filter that will appear in the drop down list in the tab panel.

### Prototype:

```
virtual BOOL IsFiltered(SClass_ID sid, Class_ID cid, INode  
*node) = 0;
```

### Remarks:

This is the method that does the filtering of the node. It returns TRUE if the node may be selected; FALSE if it is not selectable.

### Parameters:

**SClass\_ID sid**

The Super Class ID of the node.

**Class\_ID cid**

The Class ID of the node.

**INode \*node**

Points to the node to check.

# Class DisplayFilterCallback

See Also: [Class Interface](#).

```
class DisplayFilterCallback : public InterfaceServer
```

## Description:

This class is available in release 4.0 and later only.

This is a call-back class for the display filter list in the Hide by Category rollup of the Display command panel. This allows plug-ins to add additional filters to this list.

## Data Members:

public:

### **BOOL on;**

Determines if the callback is on or off. If a callback is selected in the list in the Display Panel list it is on; else it's off.

## Methods:

public:

## Prototype:

```
virtual TCHAR* GetName()=0;
```

## Remarks:

Returns the name that will appear in the drop down list in the display panel when the callback is registered.

## Prototype:

```
virtual BOOL IsVisible(SClass_ID sid, Class_ID cid, INode  
*node)=0;
```

## Remarks:

This is the method that does the filtering of the node. It returns TRUE if the node is visible; FALSE if it is not visible.

## Parameters:

**SClass\_ID sid**

The Super Class ID of the node.

**Class\_ID cid**

The Class ID of the node.

**Inode \*node**

Points to the node to check.

## List of Standard Command Modes

See Also: [Class Interface](#), [Command Modes and Mouse Procs](#), [Class Command Mode](#).

One of the following values:

## **XForm Command Modes**

**CID\_OBJMOVE**

**CID\_OBJROTATE**

**CID\_OBJSCALE**

**CID\_OBJUSCALE**

**CID\_OBJSQUASH**

**CID\_OBJSELECT**

## **Hierarchy / Space warp Command Modes**

**CID\_LINK**

**CID\_BINDWSM**

## **Viewport Command Modes**

**CID\_ZOOMVIEW**

**CID\_ZOOMREGION**

**CID\_PANVIEW**

**CID\_ROTATEVIEW**

**CID\_ZOOMALL**

**CID\_RNDREGION**

## **Camera Command Modes**

**CID\_CAMFOV**

**CID\_CAMDOLLY**

**CID\_CAMPERSP**

**CID\_CAMTRUCK**

**CID\_CAMROTATE**

**CID\_CAMROLL**

# Class EventUser

See Also: [Class EventRouter](#), [Class Interface](#).

class EventUser

## Description:

This is a generic event notification system. The only two places this is currently used are for when the Delete key is pressed or the Delete menu item is selected, and when the Backspace key is pressed. The usage can be seen in `\MAXSDK\SAMPLES\MODIFIERS\EDITPAT.CPP`, where the Edit Patch modifier sets up for notification of Delete operations. It is also used in `EDITSP.L.CPP` where it deals with deletion of selected items.

To use it:

- 1 Create an EventUser object.
- 2 Register the EventUser object with the appropriate router.
- 3 The EventRouter will call the EventUser's **Notify()** method when the event occurs.
- 4 When you're done with the EventUser object, call the EventRouter's **UnRegister()** method. This will delete the EventUser from the router's notification system.
- 5 If your code is part of a window proc, call the router's Register and UnRegister methods when the window receives WM\_ACTIVATE messages. This will properly uncouple the notification system when the window is deactivated.

## Methods:

### Prototype:

```
virtual void Notify()=0;
```

### Remarks:

Implemented by the Plug-In.

This is the proc called by the **EventRouter** when the event occurs.

## Class ArcballDialog

See Also: [Class ArcballCallback](#).

class ArcballDialog

### Description:

This class is available in release 2.0 and later only.

An instance of this class is created when the global function **ArcballDialog \*CreateArcballDialog()** is called. The **DeleteThis()** method of this class is used to free the memory allocated by **CreateArcballDialog()**. Call it when you are done using the dialog box.

### Methods:

#### Prototype:

**virtual void DeleteThis()=0;**

### Remarks:

This method is called to delete the instance of the class.

## Class TrackViewPick

See Also: [Class ReferenceTarget](#), [Class Interface](#) (see the method **TrackViewPickDlg**).

### Description:

This class stores the result of a selection from the Track View Pick dialog.

### Data Members:

**ReferenceTarget \*anim;**

The item the user picked.

**ReferenceTarget \*client;**

The owner of the **anim**.

**int subNum;**

Sub-animatable number of the **anim**.

# Class TrackViewFilter

See Also: [Class Animatable](#).

```
class TrackViewFilter : public InterfaceServer
```

## Description:

This is the callback object used to filter selections in the track view.

## Methods:

### Prototype:

```
virtual BOOL proc(Animatable *anim, Animatable *client,int  
subNum)=0;
```

### Remarks:

Implemented by the Plug-In.

This is the callback object proc used to filter selections in the track view.

### Parameters:

**Animatable \*anim**

The item the user picked.

**Animatable \*client**

The owner of the **anim**.

**int subNum**

The sub-animatable number of the **anim**.

### Return Value:

Return TRUE to accept the anim as selectable; otherwise FALSE.

### Prototype:

```
virtual BOOL TextColor(Animatable *anim, Animatable *client,  
int subNum, COLORREF& color);
```

### Remarks:

This method is available in release 4.0 and later only.

This method allows the filter to control the color of the label text used for the anim.

### Parameters:

**Animatable \*anim**

The item the user picked.

**Animatable \*client**

The owner of the **anim**.

**int subNum**

The sub-animatable number of the **anim**.

**COLORREF& color**

The color for the label text. See [COLORREF-DWORD format](#).

**Return Value:**

TRUE for the Treeview to use the color in the **color** argument, FALSE to ignore that color and use the system default.

**Default Implementation:**

```
{ return FALSE; }
```

## Class ExclList

See Also: [Class INode](#), [Class ILoad](#), [Class ISave](#), [Class IMergeManager](#)

class ExclList : public InterfaceServer

### Description:

This class is available in release 4.0 and later only.

This class represents an exclusion list and is a direct parallel to the NameTab, and converting from using one to the other is fairly simple.

### Methods:

public:

### Prototype:

**ExclList();**

### Remarks:

Constructor.

### Prototype:

**void SetFlag(ULONG f, BOOL b=1);**

### Remarks:

Sets the specified flag to the specified value.

### Parameters:

**ULONG f**

The flag(s) to set. One or more of the following values:

**NT\_INCLUDE**

This bit is used to indicate "Include" mode.

**NT\_AFFECT\_ILLUM**

This bit is used to indicate the "Illumination" check box in the exclusion list dialog.

**NT\_AFFECT\_SHADOWCAST**

This bit is used to indicate the "Shadow Casting" check box in the exclusion list dialog.

**BOOL b=1**

The value to set.

**Prototype:**

**BOOL TestFlag(ULONG f);**

**Remarks:**

Returns TRUE if the specified flag(s) are set; otherwise FALSE.

**Parameters:**

**ULONG f**

The flag(s) to set. One or more of the following values:

**NT\_INCLUDE**

This bit is used to indicate "Include" mode.

**NT\_AFFECT\_ILLUM**

This bit is used to indicate the "Illumination" check box in the exclusion list dialog.

**NT\_AFFECT\_SHADOWCAST**

This bit is used to indicate the "Shadow Casting" check box in the exclusion list dialog.

**Prototype:**

**int Count();**

**Remarks:**

This method returns the number of handles in the table.

**Prototype:**

**void Set(int i, INode \*node);**

**Remarks:**

This method allows you to set a specified entry in the table to the specified node.

**Parameters:**

**int i**

The index in the table.

**INode \*node**

The node to set.

**Prototype:**

**int FindNode(INode \*node);**

**Remarks:**

Returns the index of the node passed; otherwise returns -1.

**Parameters:**

**INode \*node**

The node to find.

**Prototype:**

**int AddNode(INode \*node);**

**Remarks:**

Appends the specified node to the end of the list.

**Parameters:**

**INode \*node**

The node to add.

**Return Value:**

Returns the number of items in the list prior to appending.

**Prototype:**

**void RemoveNode(INode \*node);**

**Remarks:**

Removes this node from the list.

**Parameters:**

**INode \*node**

The node to remove.

**Prototype:**

**void RemoveNode(int i);**

**Remarks:**

Removes the 'i-th' name from the list.

**Parameters:**

**int i**

Specifies the index of the node to remove.

**Prototype:**

**void SetSize(int num);**

**Remarks:**

Sets the size of the list. If the new size is smaller than the current size entries are deleted.

**Parameters:**

**int num**

Specifies the size of the list.

**Prototype:**

**SetCount(int num);**

**Remarks:**

Sets the size of the list. If the new size is smaller than the current size entries are deleted.

**Parameters:**

**int num**

Specifies the size of the list.

**Prototype:**

**IOResult Load(ILoad \*iload);**

**Remarks:**

Loads this ExclList from disk.

**Parameters:**

**ILoad \*iload**

This class provides methods to load data from disk.

**Return Value:**

See Also: [List of IO Results](#).

**Prototype:**

**IOResult Save(ISave \*isave);**

**Remarks:**

Saves this ExclList to disk.

**Parameters:**

**ISave \*isave**

This class provides methods to save data to disk.

**Return Value:**

See Also: [List of IO Results](#).

**Prototype:**

**void OnMerge(IMergeManager\* imm);**

**Remarks:**

This method takes care of setting the merge manager interface.

**Parameters:**

**IMergeManager\* imm**

A pointer to the merge manager interface.

**Prototype:**

**INode\* operator[] (const int i);**

**Remarks:**

Index operator.

**Prototype:**

**ExclList& operator=(const ExclList& e);**

**Remarks:**

Assignment operator.

**Prototype:**

**ExclList& operator=(const NameTab& n);**

**Remarks:**

Assignment operator.

## List of Material Browser Flags

One or more of the following values:

**BROWSE\_MATSONLY**

Materials only.

**BROWSE\_MAPSONLY**

Maps only.

**BROWSE\_INCNONE**

Include 'None' as an option.

**BROWSE\_INSTANCEONLY**

Only allow instances, not copies.

## Class HitByNameDlgCallback

See Also: [Class Interface](#).

class HitByNameDlgCallback

### Description:

This is the callback object used with **Interface::DoHitByNameDialog()**.

### Methods:

#### Prototype:

**virtual TCHAR \*dialogTitle()**

#### Remarks:

Implemented by the Plug-In.

Returns the title string displayed in the dialog.

#### Default Implementation:

```
{ return _T(""); }
```

#### Prototype:

**virtual TCHAR \*buttonText()**

#### Remarks:

Implemented by the Plug-In.

Returns the text displayed in the 'Select' or 'Pick' button.

#### Default Implementation:

```
{ return _T(""); }
```

#### Prototype:

**virtual BOOL singleSelect()**

#### Remarks:

Implemented by the Plug-In.

Returns TRUE if the user may only make a single selection in the list at one time; otherwise FALSE.

#### Default Implementation:

```
{ return FALSE; }
```

**Prototype:**

```
virtual BOOL useFilter()
```

**Remarks:**

Implemented by the Plug-In.

This gives the callback the opportunity to filter out items from the list. This is called before the dialog is presented. It returns TRUE if the **filter()** method (below) should be called; otherwise FALSE.

**Default Implementation:**

```
{ return TRUE; }
```

**Prototype:**

```
virtual int filter(INode *node)
```

**Remarks:**

Implemented by the Plug-In.

This method will be called if **useFilter()** above returned TRUE. This gives the callback the chance to filter out items from the list before they are presented to the user in the dialog. This is called once for each node that would otherwise be presented. Return nonzero to accept the item and zero to skip it.

**Parameters:**

**INode \*node**

The node to check for inclusion in the list.

**Return Value:**

Nonzero to accept the item and zero to skip it.

**Default Implementation:**

```
{ return TRUE; }
```

**Prototype:**

```
virtual BOOL useProc()
```

**Remarks:**

Implemented by the Plug-In.

Normally, when the user selects OK from the dialog, the system selects all the chosen nodes in the scene. At times a developer may want to do something other than select the chosen nodes. If this method returns TRUE then the nodes in the list will not be selected, but the **proc()** method is called instead (see below). If this method returns FALSE, then the nodes are selected in the scene and **proc()** is not called.

**Default Implementation:**

```
{ return TRUE; }
```

**Prototype:**

```
virtual void proc(INodeTab &nodeTab)
```

**Remarks:**

Implemented by the Plug-In.

This allows the plug-in to process the nodes chosen from the dialog in any manner. For example if the developer wanted to delete the nodes chosen using this dialog, they would implement **useProc()** to return TRUE and this method to delete all the nodes in the table passed.

**Parameters:**

**INodeTab &nodeTab**

A table of those nodes selected by the user. See [Template Class Tab](#).

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual BOOL doCustomHilite()
```

**Remarks:**

Implemented by the Plug-In.

Normally, when the dialog is entered, the nodes in the scene that are selected are highlighted in the list. If this method returns TRUE, the developer may control which items are highlighted by implementing **doHilite()** (see below). If this method returns FALSE the selected nodes will have their names highlighted in the list.

**Default Implementation:**

```
{ return FALSE; }
```

**Prototype:**

```
virtual BOOL doHilite(INode *node)
```

**Remarks:**

Implemented by the Plug-In.

This method is called for each item in the list if **doCustomHilite()** returns TRUE. This method returns TRUE or FALSE to control if each item is highlighted.

**Parameters:**

**INode \*node**

The node to check.

**Return Value:**

TRUE to highlight the node in the list; FALSE to not highlight it.

**Default Implementation:**

```
{ return FALSE; }
```

**Prototype:**

```
virtual BOOL showHiddenAndFrozen();
```

**Remarks:**

This method is available in release 2.0 and later only.

This defaults to returning FALSE, which means that hidden and frozen objects will not be included in the select by name dialog list. If this method is overridden to return TRUE, then hidden and frozen nodes will be sent through the user-supplied filter as in version 1.x. (Note that, apart from Unhide by Name and Unfreeze by Name, the new default behavior is likely to be correct for all uses of this class.)

**Default Implementation:**

```
{ return FALSE; }
```

## Class SpaceArrayCallback

See Also: [Class Interface](#), [Class ShapeObject](#), [Class Spline3D](#), [Class Point3](#).

class SpaceArrayCallback

### Description:

This class is available in release 3.0 and later only.

This is the callback object for the method

**Interface::DoSpaceArrayDialog(SpaceArrayCallback \*sacb=NULL)=0**

This is the method which brings up the Spacing tool. This lets the user distribute objects based on the current selection along a path defined by a spline or a pair of points.

The callback is mostly for use for plug-ins that need to use the spacing tool as a way of generating spacing information. If one wants to customize the default behaviour of the dialog, they derive a class from this one and implement the virtual methods. The non-virtuals simply provide access to the spacing information. This is both for setting the defaults before calling the spacing tool as well as getting out the information after using the spacing tool.

### Methods:

public:

### Prototype:

**SpaceArrayCallback();**

### Remarks:

Constructor. The data members are initialized as follows:

**path = NULL; start = end = space = 0.0f; count = 1; oType = NODE\_COPY; sType = SPACE\_CENTER; follow = false; context = CTXT\_FREE; width = 0.0f; countLimit = INT\_MAX;**

### Prototype:

**virtual ~SpaceArrayCallback();**

### Remarks:

Destructor.

**Prototype:**

**virtual bool isModal();**

**Remarks:**

Implemented by the Plug-in.

If this method returns false, the dialog is presented as a modeless dialog.

**Default Implementation:**

**{ return true; }**

**Prototype:**

**virtual bool doPickPath();**

**Remarks:**

Implemented by the Plug-in.

If this method returns true, the path picking buttons are turned on.

**Default Implementation:**

**{ return false; }**

**Prototype:**

**virtual TCHAR \*dialogTitle();**

**Remarks:**

Implemented by the Plug-in.

Returns the title for the dialog (e.g. Space Array Tool).

**Default Implementation:**

**{ return \_T(""); }**

**Prototype:**

**virtual TCHAR \*startMessage();**

**Remarks:**

Implemented by the Plug-in.

Returns the message to be displayed in the static display right after the dialog comes up.

**Default Implementation:**

```
{ return _T(""); }
```

**Prototype:**

```
virtual TCHAR *buttonText();
```

**Remarks:**

Implemented by the Plug-in.

Returns the button text.

**Default Implementation:**

```
{ return _T("OK"); }
```

**Prototype:**

```
virtual bool isSilent();
```

**Remarks:**

Implemented by the Plug-in.

If this method returns true, the spacing tool generates points, but the actual dialog is not presented to the user. This is currently used, for example, by the Stairs in VIZ to generate spacing information for the mesh.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual bool doObjectType();
```

**Remarks:**

Implemented by the Plug-in.

If this method returns false, then the Instance, Copy, Reference radio buttons are disabled (greyed out).

**Default Implementation:**

```
{ return true; }
```

**Prototype:**

```
virtual void proc();
```

**Remarks:**

Implemented by the Plug-in.

This method is called after the spacing information is generated. It is here that a developer using this callback could get the updated values, perform some calculation of their own, etc.

**Default Implementation:**

```
{}
```

**Prototype:**

```
ShapeObject *getPath();
```

**Remarks:**

Implemented by the System.

Returns a pointer to the path ShapeObject.

**Prototype:**

```
void setPath(ShapeObject *p);
```

**Remarks:**

Implemented by the System.

Sets the path used (as a ShapeObject).

**Parameters:**

```
ShapeObject *p
```

Points to the shape object to use as a path.

**Prototype:**

```
void setPath(Point3 pt1, Point3 pt2);
```

**Remarks:**

Implemented by the System.

Sets the points for the path.

**Parameters:**

```
Point3 pt1
```

One of the endpoints.

```
Point3 pt2
```

The other endpoint.

**Prototype:**

**void setPath(Spline3D \*s);**

**Remarks:**

Implemented by the System.

Sets the path used.

**Parameters:**

**Spline3D \*s**

Points to the path to use.

**Prototype:**

**float getStart();**

**Remarks:**

Implemented by the System.

Returns the start offset.

**Prototype:**

**float getEnd();**

**Remarks:**

Implemented by the System.

Returns the end offset.

**Prototype:**

**float getSpace();**

**Remarks:**

Implemented by the System.

Returns the spacing.

**Prototype:**

**int getCount();**

**Remarks:**

Implemented by the System.

Returns the object count.

**Prototype:**

```
void setContext(CTYPE c);
```

**Remarks:**

Implemented by the System.

Sets the context.

**Parameters:**

**CTYPE c**

One of the following values:

**CTXT\_FREE** - Free Center

**CTXT\_CNTRCOUNT** - Divide Evenly, Objects at Ends

**CTXT\_CNTRSPACE** - Centered, Specify Spacing

**CTXT\_END** - End Offset

**CTXT\_ENDCOUNT** - End Offset, Divide Evenly

**CTXT\_ENDSPACE** - End Offset, Specify Spacing

**CTXT\_START** - Start Offset

**CTXT\_STARTCOUNT** - Start Offset, Divide Evenly

**CTXT\_STARTSPACE** - Start Offset, Specify Spacing

**CTXT\_FULLSPACE** - Specify Offset and Spacing

**CTXT\_FULLCOUNT** - Specify Offsets, Divide Evenly

**CTXT\_ENDLOCK** - Space from End, Unbounded

**CTXT\_ENDLOCKCOUNT** - Space from End, Specify Number

**CTXT\_ENDLOCKSPACE** - Space from End, Specify Spacing

**CTXT\_STARTLOCK** - Space from Start, Unbounded

**CTXT\_STARTLOCKCOUNT** - Space from Start, Specify Number

**CTXT\_STARTLOCKSPACE** - Space from Start, Specify Spacing

**CTXT\_FULLLOCKSPACE** - Specify Spacing, Matching Offsets

## CTXT\_FULLLOCKCOUNT - Divide Evenly, No Objects at Ends

### Prototype:

**int getContext();**

### Remarks:

Implemented by the System.

Returns the context. See **setContext()** above.

### Prototype:

**float getWidth();**

### Remarks:

Implemented by the System.

Returns the width. This is the width of the object to be arrayed. It is a single value so can be calculated any way the user wishes. In the default spacing tool this is calculated based on the x size of the bounding box.

### Prototype:

**void setWidth(float nWidth);**

### Remarks:

Implemented by the System.

Sets the width. See **getWidth()** above.

### Parameters:

**float nWidth**

The width to set.

### Prototype:

**void setStart(float f);**

### Remarks:

Implemented by the System.

Sets the start offset.

### Parameters:

**float f**

The start offset to set.

**Prototype:**

**void setEnd(float f);**

**Remarks:**

Implemented by the System.

Sets the end offset.

**Parameters:**

**float f**

The end offset to set.

**Prototype:**

**void setSpace(float f);**

**Remarks:**

Implemented by the System.

Sets the spacing.

**Parameters:**

**float f**

The spacing to set.

**Prototype:**

**void setCount(int n);**

**Remarks:**

Implemented by the System.

Sets the count.

**Parameters:**

**int n**

The count to set.

**Prototype:**

**bool getFollow();**

**Remarks:**

Implemented by the System.

Returns true if Follow is set (checked); otherwise false.

**Prototype:**

**void setFollow(bool t);**

**Remarks:**

Implemented by the System.

Sets the Follow state (checkbox).

**Parameters:**

**bool t**

Use true for checked; false for un-checked.

**Prototype:**

**OTYPE getObjectCreationType();**

**Remarks:**

Implemented by the System.

Returns the object creation type. One of the following values:

**NODE\_CPY** -- Copy

**NODE\_INST** -- Instance

**NODE\_REF** -- Reference

**Prototype:**

**void setObjectCreationType(OTYPE t);**

**Remarks:**

Implemented by the System.

Sets the object creation type. One of the following values:

**NODE\_CPY** -- Copy

**NODE\_INST** -- Instance

**NODE\_REF** -- Reference

**Prototype:**

**STYPE** getSpacingType();

**Remarks:**

Implemented by the System.

Returns the spacing type. One of the following values:

**SPACE\_CENTER**

**SPACE\_EDGE**

**Prototype:**

**void** setSpacingType(**STYPE** s);

**Remarks:**

Implemented by the System.

Sets the spacing type.

**Parameters:**

**STYPE** s

One of the following values:

**SPACE\_CENTER**

**SPACE\_EDGE**

**Prototype:**

**void** setMessage(**char** \*buf);

**Remarks:**

Implemented by the System.

Sets the message string.

**Prototype:**

**void** setCountLimit(**int** limit);

**Remarks:**

Implemented by the System.

Sets a limit on the count.

**Parameters:**

**int limit**

The limit to set.

**Prototype:**

**int getCountLimit();**

**Remarks:**

Implemented by the System.

Returns the limit on the count.

## List of Directory Names

See Also: [Class Interface](#).

The following is a list of the various standard 3ds max directories whose name may be retrieved. See the method **Interface::GetDir()**.

### **APP\_FONT\_DIR**

Sample result = **D:\3dsmax\Fonts**

### **APP\_SCENE\_DIR**

Sample result = **D:\3dsmax\Scenes**

### **APP\_IMPORT\_DIR**

Sample result = **D:\3dsmax\Meshes**

### **APP\_EXPORT\_DIR**

Sample result = **D:\3dsmax\Meshes**

### **APP\_HELP\_DIR**

Sample result = **D:\3dsmax\Help**

### **APP\_EXPRESSION\_DIR**

Sample result = **D:\3dsmax\Express**

### **APP\_PREVIEW\_DIR**

Sample result = **D:\3dsmax\Previews**

### **APP\_IMAGE\_DIR**

Sample result = **D:\3dsmax\Images**

### **APP\_SOUND\_DIR**

Sample result = **D:\3dsmax\Sounds**

### **APP\_PLUGCFG\_DIR**

Sample result = **D:\3dsmax\PlugCFG**

### **APP\_MAXSTART\_DIR**

Sample result = **D:\3dsmax\Scenes**

### **APP\_VPOST\_DIR**

Sample result = **D:\3dsmax\VPost**

### **APP\_DRIVERS\_DIR**

Sample result = **D:\3dsmax\Drivers**

### **APP\_AUTOBACK\_DIR**

Sample result = **D:\3dsmax\AutoBack**

### **APP\_MATLIB\_DIR**

This option is available in release 3.0 and later only.

Sample result =**D:\3dsmax\MatLibs**

### **APP\_SCRIPTS\_DIR**

This option is available in release 3.0 and later only.

Sample result =**D:\3dsmax\Scripts**

### **APP\_STARTUPSCRIPTS\_DIR**

This option is available in release 3.0 and later only.

Sample result =**D:\3dsmax\Scripts\Startup**

### **APP\_UI\_DIR**

This option is available in release 3.0 and later only.

Sample result=**D:\3dsmax\UI**

### **APP\_MAXROOT\_DIR**

Sample result = **d:\3dsmax\**

## Class DllDir

See Also: [Class DllDesc](#), [Class ClassDirectory](#), [Class ClassDesc](#), [Class ClassEntry](#), [Class Interface](#).

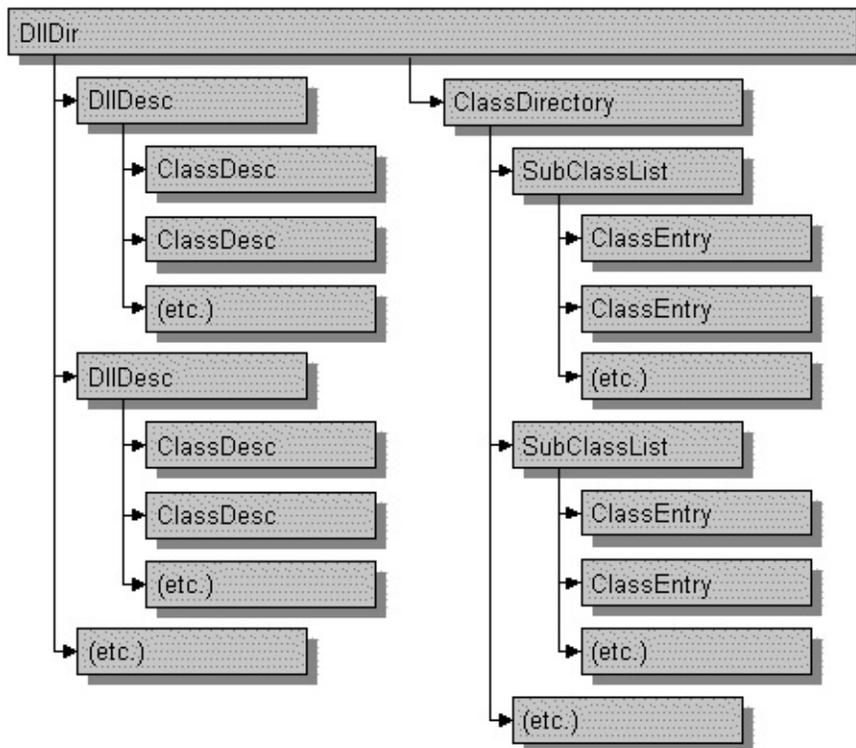

class DllDir

### Description:

This class is available in release 2.0 and later only.

It provides access to the DLL Directory which is a list of every DLL loaded in 3ds max. It also contains the Class Directory which maintains lists of all classes implemented in these DLLs.

The following diagram shows the relationship between the classes that make up the Dll Directory structure. The lines in the diagram indicate how the objects are accessed. Class **DllDir** provides access to a list of **DllDesc** objects. Each of these has a list of **ClassDesc** objects. The **ClassDesc** is the object implemented by the plug-in to let 3ds max know about its classification and capabilities. Class **DllDir** also provides access to the **ClassDirectory** which provides access to the a table of **SubClassList** objects which are grouped by super class ID. Each **SubClassList** has a series of **ClassEntry** objects. The **ClassEntry** object provides information about the plug-in classes (some of the same information as the class descriptor, usage counts, etc.).

Note: To get a reference to the central DLL directory see the method **Interface::GetDllDir()**.

All methods of this class are implemented by the system.

**Methods:**

**Prototype:**

**int Count();**

**Remarks:**

Returns the number of DLLs currently loaded.

**Prototype:**

**int LoadDllsFromDir(TCHAR \*directory, TCHAR \*wildcard, HWND hwnd=NULL);**

**Remarks:**

This method may be called to load DLLs from the specified directory.

**Parameters:**

**TCHAR \*directory**

Point to a null-terminated string that specifies a valid directory or path to load

the DLLs from.

**TCHAR \*wildcard**

Points to a null-terminated string that contains wildcard characters (\* and ?).

**HWND hwnd=NULL**

This parameter is not currently used.

**Return Value:**

Nonzero if successful; zero on error.

**Prototype:**

**ClassDirectory& ClassDir();**

**Remarks:**

Returns a reference to the **ClassDirectory** for this DLL directory.

**Prototype:**

**void UnloadAllDlls();**

**Remarks:**

This method unloads every DLL 3ds max has loaded. This calls the Win32 function **FreeLibrary()** on every DLL handle in the DLL directory.

**Prototype:**

**bool LoadADll(TCHAR \*d, bool late);**

**Remarks:**

This method is available in release 3.0 and later only.

This method is for internal use only.

**Operators:**

**Prototype:**

**DllDesc& operator[](int i);**

**Remarks:**

Access operator. This returns a reference to the 'i-th' **DllDesc**.

**Parameters:**

**int i**

Zero based index of specifying which **DllDesc** to return.

## Class LogSys

See Also: [Class Interface](#).

class LogSys

### Description:

MAX maintains a log file that contains the text of error / warning / information / debug messages generated by the system and plug-ins. This class is used to work with the log and send messages to it. The log file is placed in the **Network** directory and is called **Max.Log**. To access this facility from anywhere in MAX use the pointer returned from the method **Interface::Log()**. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

**virtual DWORD LogTypes();**

#### Remarks:

This method is used to find out what log types are enabled . See [List of System Error Log Message Types](#). The type values are ORed together to create the value returned.

#### Prototype:

**virtual void SetLogTypes(DWORD types);**

#### Remarks:

This method is used to set the log types that are enabled.

#### Parameters:

**DWORD types**

See [List of System Error Log Message Types](#).

#### Prototype:

**virtual void LogEntry(DWORD type, BOOL dialogue, TCHAR \*title, TCHAR \*text,... )=0;**

#### Remarks:

This method is used to log the error.

#### Parameters:

## **DWORD type**

Defines the type of log entry. See [List of System Error Log Message Types](#).

## **BOOL dialogue**

One of the following values:

### **NO\_DIALOG**

If this entry is just some information you don't want a dialogue for, or if you are handling the dialogue yourself use this value.

### **DISPLAY\_DIALOG**

Use this value if you want the message to be displayed in a dialogue. The system will determine if displaying a dialogue is appropriate based on network rendering mode.

## **TCHAR \*title**

This title string is optional. If non NULL, it will be used to define the module.

## **TCHAR \*text,...**

This parameter (and any other additional arguments that follow) make up the format specification. The format matches the standard C printf() function.

## **Sample Code:**

```
TheManager->Max()->Log()->LogEntry(SYSLOG_ERROR,  
NO_DIALOG, NULL, _T("%s - %s\n"), ShortDesc(), errText);
```

## **Prototype:**

```
virtual int Longevity();
```

## **Remarks:**

Returns the conditions under which the log is deleted.

## **Return Value:**

One of the following values:

### **SYSLOG\_LIFE\_EVER**

The log is never deleted.

### **SYSLOG\_LIFE\_DAYS**

This log is maintained for this number of days.

### **SYSLOG\_LIFE\_SIZE**

The log is maintained until it reaches this many kilobytes (KB).

**Prototype:****virtual void SetLongevity(int type);****Remarks:**

Sets the conditions under which the log is deleted.

**Parameters:****int type**

One of the following values:

**SYSLOG\_LIFE\_EVER**

The log is never deleted.

**SYSLOG\_LIFE\_DAYS**

This log is maintained for this number of days.

**SYSLOG\_LIFE\_SIZE**

The log is maintained until it reaches this many kilobytes (KB).

**Prototype:****virtual DWORD LogDays();****Remarks:**

Returns the conditions under which the log is cleared.

**Return Value:**

One of the following values:

**SYSLOG\_LIFE\_EVER**

The log is never deleted.

**SYSLOG\_LIFE\_DAYS**

This log is maintained for this number of days.

**SYSLOG\_LIFE\_SIZE**

The log is maintained until it reaches this many kilobytes (KB).

**Prototype:****virtual DWORD LogSize();****Remarks:**

Returns the size of the current log file in kilobytes (KB).

**Prototype:**

**virtual void SetLogDays(DWORD days);**

**Remarks:**

Set the number of days the log is maintained.

**Parameters:**

**DWORD days**

The number of days to maintain the log. After this many days after creation the log is deleted.

**Prototype:**

**virtual void SetLogSize(DWORD size);**

**Remarks:**

Set the maximum size in kilobytes (KB) of the log file. After this size is reached the log file is deleted.

**Parameters:**

**DWORD size**

The maximum size in kilobytes (KB) of the log file.

**Prototype:**

**void SetQuietMode(bool quiet);**

**Remarks:**

This method is available in release 3.0 and later only.

Enables or disables 'quiet' mode. When set to quiet mode, the

**LogSys::LogEntry(...)** method will not bring up any dialog boxes -- it will act as it does in network rendering mode. Note: After setting quiet mode, do not forget to clear it when you are done, since the user will not see any error messages from the renderer while quiet mode is enabled.

**Parameters:**

**bool quiet**

TRUE to enable; FALSE to disable.

**Prototype:**

**bool GetQuietMode();**

**Remarks:**

This method is available in release 3.0 and later only.

Returns TRUE if 'quiet' mode is enabled or FALSE if it's disabled. See **SetQuietMode()** above.

**Prototype:**

**virtual void SaveState()=0;**

**Remarks:**

This method is used internally.

**Prototype:**

**virtual void LoadState()=0;**

**Remarks:**

This method is used internally.

## List of MAX Command IDs

See Also: [Class Interface](#).

The following command IDs may be passed to the method:

**Interface::ExecuteMAXCommand(int id);**

**MAXCOM\_RESET\_FILE**  
**MAXCOM\_TIME\_CONFIG**  
**MAXCOM\_UNFREEZE\_BY\_HIT**  
**MAXCOM\_BOX\_TOGGLE**

## List of Interface::Execute Command Options

See Also: [Class Interface](#)

In MAX 2.5, the following **#defines** may be passed as the **cmd** argument to the method **Interface::Execute()**.

Note that these may be removed from MAX 3.0. Developers may wish to use the API provided by [Structure NotifyInfo](#) for pre and post save callbacks.

### **I\_EXEC\_REGISTER\_POSTSAVE\_CB**

This command registers a callback which is called after a File / Save operation has occurred.

For example, here's how you would use it:

```
static GenericCallback mycb;
```

```
GetCOREInterface()-
```

```
>Execute(I_EXEC_REGISTER_POSTSAVE_CB,&mycb);
```

and when you are done:

```
GetCOREInterface()-
```

```
>Execute(I_EXEC_UNREGISTER_POSTSAVE_CB,&mycb);
```

For another way to do this, see [Structure NotifyInfo](#).

### **I\_EXEC\_UNREGISTER\_POSTSAVE\_CB**

This command un-registers a callback which is called after a File / Save operation has occurred.

### **I\_EXEC\_REGISTER\_PRESAVE\_CB**

This command registers a callback which is called before a File / Save operation has occurred.

### **I\_EXEC\_UNREGISTER\_PRESAVE\_CB**

This command un-registers a callback which is called before a File / Save operation has occurred.

## List of Extended Display Modes

See Also: [Class Interface](#) (methods **SetExtendedDisplayMode()** and **GetExtendedDisplayMode()**).

Extended display modes. One or more of the following values:

**EXT\_DISP\_NONE**

None in effect.

**EXT\_DISP\_SELECTED**

The object is selected.

**EXT\_DISP\_TARGET\_SELECTED**

The object's target is selected.

**EXT\_DISP\_LOOKAT\_SELECTED**

The object's lookat node is selected.

**EXT\_DISP\_ONLY\_SELECTED**

The object is the only thing selected.

**EXT\_DISP\_DRAGGING**

The object is being "dragged".

**EXT\_DISP\_ZOOM\_EXT**

The object is being tested for zoom extents.

## Class MAXFileOpenDialog

See Also: [Class Interface](#).

class MAXFileOpenDialog

### Description:

This class is available in release 3.0 and later only.

This class allows a custom file open dialog to be used. This object is set using the method **Interface::SetMAXFileOpenDlg()**.

### Methods:

public:

### Prototype:

```
virtual BOOL BrowseMAXFileOpen(TSTR& fileName, TSTR*  
defDir, TSTR* defFile)=0;
```

### Remarks:

Implemented by the Plug-In.

This method is called to bring up the custom file open dialog. It request a file name from the user and stores the result in **fileName**.

### Parameters:

**TSTR& fileName**

Set this to the file name choosen by the user.

**TSTR\* defDir**

The default directory to look in.

**TSTR\* defFile**

The default file name to use.

### Return Value:

TRUE if the user OKed the dialog; FALSE on cancel.

## Class MAXFileSaveDialog

See Also: [Class Interface](#).

class MAXFileSaveDialog

### Description:

This class is available in release 3.0 and later only.

This class allows a custom file save dialog to be used. This object is set using the method **Interface::SetMAXFileSaveDlg()**.

### Methods:

public:

### Prototype:

**virtual BOOL BrowseMAXFileSave(TSTR& fileName)=0;**

### Remarks:

This method is called to bring up the custom file save dialog. It request a file name from the user and stores the result in **fileName**.

### Parameters:

**TSTR& fileName**

Set this to the file name chosen by the user.

### Return Value:

TRUE if the user OKed the dialog; FALSE on cancel.

# Class Material

See Also: [Class TextureInfo](#), [Template Class Tab](#), [Class Point3](#), [Rendering Limits](#).

```
class Material : public BaseInterfaceServer
```

## Description:

This class describes the properties of a material used by the interactive renderer.

## Data Members:

public:

### **Point3 Ka;**

Ambient color setting. The values for x, y, and z range from 0.0 to 1.0. These correspond to red, green, and blue respectively.

### **Point3 Kd;**

Diffuse color setting. The values for x, y, and z range from 0.0 to 1.0. These correspond to red, green, and blue respectively.

### **Point3 Ks;**

Specular color setting. The values for x, y, and z range from 0.0 to 1.0. These correspond to red, green, and blue respectively.

### **float shininess;**

Shininess setting. This value ranges from 0.0 to 1.0.

### **float shinStrength;**

Shininess strength setting. This value ranges from 0.0 to 1.0.

### **float opacity;**

Opacity setting. This value ranges from 0.0 to 1.0.

### **float selfIllum;**

Self Illumination setting. This value ranges from 0.0 to 1.0.

### **int dblSided;**

Double sided material setting. Nonzero indicates double sided material; otherwise single sided.

### **int shadeLimit;**

Shading limit setting. See [Rendering Limits](#).

### **Tab<TextureInfo> texture;**

The table of textures used by this material.

**Methods:****Prototype:****Material();****Remarks:**

Class constructor. The data members are initialized as follows:

**Ka[0] = Ka[1] = Ka[2] = 0.3f;****Kd[0] = Kd[1] = Kd[2] = 0.9f;****Ks[0] = Ks[1] = Ks[2] = 0.9f;****shininess = 10.0f;****shinStrength = 1.0f;****opacity = 1.0f;****selfIllum = 0.0f;****dblSided = 0;****shadeLimit = 3;****TextureInfo texInfo;****texture.Append(1, &texInfo);****Prototype:****~Material();****Remarks:**

Class destructor.

## Class ModContextList

See Also: [Template Class Tab](#), [Class Interface](#) (method **GetModContexts()**)

```
class ModContextList : public Tab<ModContext*>;
```

### **Description:**

A modifier may be applied to several objects in the scene. The

**Interface::GetModContexts()** method retrieves a list of all the ModContexts for the current place in the history. This class is used as a table to hold the list of ModContexts.

# Class NameMaker

See Also: [Class Interface](#).

class NameMaker

## Description:

This class is used with method **Interface::NewUniqueName()**. All methods of this class are implemented by the system.

## Methods:

### Prototype:

```
virtual void MakeUniqueName(TSTR &name)=0;
```

### Remarks:

This method is used to make a unique version of the name passed and return it. This method is much more efficient than

**Interface::MakeNameUnique()**, which does a brute force enumeration of the scene hierarchy for every call. On creation, the **NameMaker** builds a directory which has one entry for each "base" name, such as "Sphere", "Camera", "Block", and along with each the maximum number suffix for that base name in the scene. When you call:

```
nm->MakeNameUnique
```

it only has to look at this relatively small list. It also caches the last hit, for further efficiency.

### Parameters:

**TSTR &name**

This is the name that is made unique (it contains both the source and the result).

### Prototype:

```
virtual void AddName(TSTR &name)=0;
```

### Remarks:

This method is available in release 2.0 and later only.

This method allows you to seed the name maker table with your own names.

This was used, for example, because 3ds max uses NameMakers to name sub-

objects in the NURBS object, and it's not appropriate to have the table seeded with top-level object names, but only with the existing sub-object names.

**Parameters:**

**TSTR &name**

The name to add.

## Class PickNodeCallback

See Also: [Class Interface](#).

class PickNodeCallback

### Description:

This class is used to filter nodes during a hit test. See the methods **Interface::PickNode()** and **PickModeCallback::GetFilter()**.

### Methods:

### Prototype:

```
virtual BOOL Filter(INode *node)=0;
```

### Remarks:

Implemented by the Plug-In.

This method should return TRUE if the node passed is an acceptable hit and FALSE otherwise.

### Parameters:

**INode \*node**

The node to test.

### Return Value:

Return TRUE if this is an acceptable hit, FALSE otherwise.

## Class PickModeCallback

See Also: [Class IObjParam](#), [Class ViewExp](#), [Class Interface](#), [Class IPoint2](#).

class PickModeCallback : public InterfaceServer

### Description:

This class is the callback object passed to **Interface::SetPickMode()**.

### Methods:

### Prototype:

```
virtual BOOL HitTest(IObjParam *ip, HWND hWnd, ViewExp *vpt, IPoint2 m, int flags)=0;
```

### Remarks:

Implemented by the Plug-In.

This method is called whenever the pick mode needs to hit test.

### Parameters:

#### **IObjParam \*ip**

An interface pointer available to call functions defined by 3ds max.

#### **HWND hWnd**

The window handle.

#### **ViewExp \*vpt**

An interface pointer that may be used to call methods associated with the viewports.

#### **IPoint2 m**

Point to check in screen coordinates.

#### **int flags**

The flags for hit testing. See [List of Hit Test Flags](#).

### Return Value:

Return TRUE if something was hit; otherwise FALSE.

### Sample Code:

```
// This implementation use the Interface::PickNode method  
// to perform the hit test.  
{  
    return ip->PickNode(hWnd,m,&thePickFilt)?TRUE:FALSE;
```

}

**Prototype:**

**virtual BOOL Pick(IObjParam \*ip,ViewExp \*vpt)=0;**

**Remarks:**

Implemented by the Plug-In.

This method is called when the user picks something.

**Parameters:**

**IObjParam \*ip**

An interface pointer available to call functions defined by 3ds max.

**ViewExp \*vpt**

An interface pointer that may be used to call methods associated with the viewports. The **vpt** should have the result of the hit test in it.

**Return Value:**

Return TRUE to end the pick mode; FALSE to stay in the pick mode. Note that returning TRUE will set the command mode to MOVE. When a plug-in is in the create branch, setting the command mode to move ends the creation process.

**Prototype:**

**virtual BOOL PickAnimatable(Animatable\* anim);**

**Remarks:**

This method is available in release 4.0 and later only.

This method gets called when a node or controller is picked from Trackview or Schematic view The track will not be selected in trackview if the this function returns FALSE. Override this function if you wish to support and receive nodes or controllers picked from trackview.

**Parameters:**

**Animatable\* anim**

A pointer to the animatable object.

**Return Value:**

TRUE if the Pick Mode callback accepts the animatable object, otherwise FALSE.

**Default Implementation:**

```
{ return TRUE; }
```

**Prototype:**

```
virtual BOOL RightClick(IObjParam *ip,ViewExp *vpt);
```

**Remarks:**

Implemented by the Plug-In.

This method is called when the user right-clicks or presses ESC.

**Parameters:**

**IObjParam \*ip**

An interface pointer available to call functions defined by 3ds max.

**ViewExp \*vpt**

An interface pointer that may be used to call methods associated with the viewports. The **vpt** should have the result of the hit test in it.

**Return Value:**

TRUE to end the pick mode, FALSE to continue picking.

**Default Implementation:**

```
{ return FALSE; }
```

**Prototype:**

```
virtual void EnterMode(IObjParam *ip)
```

**Remarks:**

Implemented by the Plug-In.

Called when the mode is entered. The developer may provide any pre-processing here.

**Parameters:**

**IObjParam \*ip**

An interface pointer available to call functions defined by 3ds max.

**Prototype:**

```
virtual void ExitMode(IObjParam *ip)
```

**Remarks:**

Implemented by the Plug-In.

Called when the mode is exited. The developer may provide any post-processing here.

**Parameters:**

**IObjParam \*ip**

An interface pointer available to call functions defined by 3ds max.

**Prototype:**

**virtual HCURSOR GetDefCursor(IObjParam \*ip)**

**Remarks:**

Implemented by the Plug-In.

Called to get the default cursor to use.

**Return Value:**

The handle of the default cursor.

**Default Implementation:**

```
{return NULL;}
```

**Prototype:**

**virtual HCURSOR GetHitCursor(IObjParam \*ip)**

**Remarks:**

Implemented by the Plug-In.

Called to get the hit test cursor to use.

**Return Value:**

The handle of the hit test cursor.

**Default Implementation:**

```
{return NULL;}
```

**Prototype:**

**virtual PickNodeCallback \*GetFilter()**

**Remarks:**

Implemented by the Plug-In.

This method is called if the user hits the H key while in your pick mode. You can provide a filter to filter the name list. See [Class PickNodeCallback](#).

**Return Value:**

A pointer to an instance of **PickNodeCallback**.

**Default Implementation:**

```
{return NULL;}
```

**Prototype:**

```
virtual BOOL AllowMultiSelect();
```

**Remarks:**

This method is available in release 2.0 and later only.

Implement this method to return TRUE to allow the user to pick more than one thing. In that case the **Pick()** method may be called more than once.

**Return Value:**

TRUE to allow multiple picks; otherwise FALSE.

**Default Implementation:**

```
{return FALSE;}
```

# Class PreviewParams

See Also: [Class Interface](#).

## Description:

The data members of this class are used to specify the options for creating a preview of the active viewport. A pointer to an instance of this class is passed into the **Interface** method:

```
virtual void CreatePreview(PreviewParams *pvp=NULL)=0;
```

## Data Members:

public:

### **BOOL outputType;**

Specifies the output file or device. This value may be either **0**, **1** or **2**.

**0** specifies the default AVI codec.

**1** specifies the user picks a file.

**2** specifies the user picks device.

### **nit pctSize;**

Specifies the percentage (0-100) of current rendering output resolution.

### **int start;**

The start frame limits.

### **int end;**

The end frame limit.

### **int skip;**

Specifies how many frames are skipped between rendered frames. The is similar to the 'Every Nth Frame' parameter in the user interface.

### **int fps;**

The frames per second setting.

### **BOOL dspGeometry;**

If TRUE is displayed in the viewports; otherwise it is not shown.

### **BOOL dspShapes;**

If TRUE shapes are displayed in the preview; otherwise they are not shown.

### **BOOL dspLights;**

If TRUE lights are displayed in the preview; otherwise they are not shown.

**BOOL dspCameras;**

If TRUE cameras are displayed in the preview; otherwise they are not shown.

**BOOL dspHelpers;**

If TRUE helper objects are displayed in the preview; otherwise they are not shown.

**BOOL dspSpaceWarps;**

If TRUE space warp helper objects are displayed in the preview; otherwise they are not shown.

**BOOL dspGrid;**

If TRUE the grid lines are displayed in the preview; otherwise they are not shown.

**BOOL dspSafeFrame;**

If TRUE the safe frames are displayed in the preview; otherwise they are not shown.

**BOOL dspFrameNums;**

If TRUE frame numbers are shown in the preview; otherwise they are not shown.

**int rndLevel;**

Specifies the rendering level used (these are the same options available to the user when setting viewport rendering levels). Valid values are

**0,1,2,3,4,6,7.**

**0** specifies smooth with highlights.

**1** specifies smooth without highlights.

**2** specifies faceted with highlights

**3** specifies faceted without highlights.

**4** specifies lit wireframe mode.

**6** specifies unlit wireframe.

**7** specifies box mode.

**int dspBkg;**

If nonzero the background image is displayed; otherwise it is not used.

## List of Render Types

See Also: [Class Interface](#).

One of the following values:

### **RENDTYPE\_NORMAL**

The currently selected viewport (the same as the MAX 'View' option).

### **RENDTYPE\_REGION**

This is the same as the MAX 'Region' option.

### **RENDTYPE\_BLOWUP**

This is the same as the MAX 'Blowup' option.

### **RENDTYPE\_SELECT**

This renders the selected objects only (the same as the MAX 'Selected' option).

### **RENDTYPE\_REGIONCROP**

This is the same as the MAX 'Crop' option.

### **RENDTYPE\_REGION\_SEL**

This type is available in release 4.0 and later only.

Does a region render using the bounding rectangle of the selection.

Note: Not to be passed into plugin renderers. The purpose is for passing to

**Interface::OpenCurRenderer()**, which converts them into

RENDTYPE\_REGION and RENDTYPE\_REGIONCROP, respectively.

### **RENDTYPE\_CROP\_SEL**

This type is available in release 4.0 and later only.

Does a crop render using the bounding rectangle of the selection

Note: Not to be passed into plugin renderers. The purpose is for passing to

**Interface::OpenCurRenderer()**, which converts them into

RENDTYPE\_REGION and RENDTYPE\_REGIONCROP, respectively.

# Class ViewParams

See Also: [Class Matrix3](#), [Class Renderer](#), [Class RendParams](#).

```
class ViewParams : public BaseInterfaceServer
```

## Description:

This class describes the properties of a view that is being rendered. These are properties such as the type of view (parallel or perspective), its clipping distances, width, height, zoom factor, field-of-view, etc.

## Data Members:

public:

### **Matrix3 prevAffineTM;**

This is the world space to camera space transformation matrix computed 2 ticks before the **affineTM** matrix below.

### **Matrix3 affineTM;**

This matrix will take a point in world space and convert it to camera space (or world to view space if it's a viewport). The camera coordinates are set up looking down the -Z axis, X is to the right, and Y is up.

### **int projType;**

One of the following values:

#### **PROJ\_PERSPECTIVE**

The view is a perspective projection.

#### **PROJ\_PARALLEL**

The view is a parallel projection.

### **float hither, yon;**

The hither and yon clipping distances.

### **float distance;**

This data member is available in release 3.0 and later only.

The distance from the view point to the image (view) plane.

### **float zoom;**

The zoom factor of the viewport for parallel projection. The zoom factor gives the amount of magnification relative to a standard view width of 400 pixels.

This is best explained via the following code fragment:

**ComputeViewParams()** computes the projection factors for a given view,

and **MapToScreen()** applies these factors to map a point from 3D camera coordinates to 2D screen coordinates.

```
#define VIEW_DEFAULT_WIDTH ((float)400.0)
void SRendParams::ComputeViewParams(const
ViewParams&vp) {
    if (vp.projType == PROJ_PERSPECTIVE) {
        float fac = -(float)(1.0 / tan(0.5*(double)vp.fov));
        xscale = fac*dw2; // dw2 = float(devWidth)/2.0
        yscale = -devAspect*xscale;
    }
    else {
        xscale =
(float)devWidth/(VIEW_DEFAULT_WIDTH*vp.zoom);
        yscale = -devAspect*xscale;
    }
}
Point2 SRendParams::MapToScreen(Point3 p) {
    Point2 s;
    if (proj_type==PROJ_PERSPECTIVE) {
        s.x = dw2 + xscale*p.x/p.z;
        s.y = dh2 + yscale*p.y/p.z;
    }
    else {
        s.x = dw2 + xscale*p.x;
        s.y = dh2 + yscale*p.y;
    }
    return s;
}
```

**float fov;**

Field of view in radians for perspective projections.

**float nearRange;**

This data member is available in release 2.0 and later only.

The near environment range setting (used for fog effects).

**float farRange;**

This data member is available in release 2.0 and later only.  
The far environment setting (used for fog effects).

**Methods:**

**Prototype:**

**virtual INT\_PTR Execute(int cmd, ULONG arg1=0, ULONG arg2=0, ULONG arg3=0);**

**Remarks:**

This method is available in release 2.0 and later only.

This is a general purpose function that allows the API to be extended in the future. The 3ds max development team can assign new **cmd** numbers and continue to add functionality to this class without having to 'break' the API.

**Parameters:**

**int cmd**

The index of the command to execute.

**ULONG arg1=0**

Optional argument 1. See the documentation where the **cmd** option is discussed for more details on these parameters.

**ULONG arg2=0**

Optional argument 2.

**ULONG arg3=0**

Optional argument 3.

**Return Value:**

An integer return value. See the documentation where the **cmd** option is discussed for more details on the meaning of this value.

# Class RendProgressCallback

See Also: [Class Renderer](#).

class RendProgressCallback

## Description:

This class is a callback passed in to the renderer. The system passes this callback to the renderer, and the renderer will use these methods whenever it is doing something that is going to take some time. For instance when transforming objects it can update the progress bar. This is also passed in to the shadow buffer code so the shadow buffer can show its progress. All methods of this class are implemented by the system. They are called by a plug-in renderer.

## Methods:

### Prototype:

**virtual void SetTitle(const TCHAR \*title)=0;**

### Remarks:

Allows the plug-in to set the string displayed in renderer dialog.

### Parameters:

**const TCHAR \*title**

The string to display.

### Prototype:

**virtual int Progress(int done, int total)=0;**

### Remarks:

Allows the plug-in to update the renderer progress display.

### Parameters:

**int done**

The number of items completed so far.

**int total**

The total number of items to process.

### Return Value:

**RENDPROG\_CONTINUE**

Continue to process.

## **RENDPROG\_ABORT**

Stop processing.

### **Prototype:**

**virtual void SetCurField(int which);**

### **Remarks:**

Sets the field number display.

### **Parameters:**

**int which**

**FIELD\_FIRST**

**FIELD\_SECOND**

**FIELD\_NONE**

### **Prototype:**

**virtual void SetSceneStats(int nlights, int nrayTraced, int nshadowed, int nobj, int nfaces)**

### **Remarks:**

The plug-in renderer should call this on every frame, passing in values for the various parameters. These are displayed in the rendering in progress dialog.

### **Parameters:**

**int nlights**

The total number of lights.

**int nrayTraced**

The number of lights using raytraced shadows.

**int nshadowed**

The number of lights using shadows.

**int nobj**

The total number of objects.

**int nfaces**

The total number of faces.

## List of Render Setting IDs

See Also: [Class Interface](#).

One of the following values:

### **RS\_Production**

The MAX Production renderer.

### **RS\_Draft**

The MAX Draft renderer.

### **RS\_IReshade**

The MAX Interactive Renderer.

## Hit Test Types

The following are the various type of hit testing:

### **HITTYPE\_POINT**

Hit test by a single pick point.

### **HITTYPE\_BOX**

Hit test by a rectangular area.

### **HITTYPE\_CIRCLE**

Hit test by circular selection area.

### **HITTYPE\_FENCE**

Hit testing by an arbitrary polygon fence.

### **HITTYPE\_SOLID**

Hit test a face as if it was solid (even in wireframe mode). Treating an item as solid means the face will be hit if the mouse is anywhere inside the face region and not just over a visible edge. For example in 3ds max when an object is not selected and you put the mouse over it to select it, you need to put it over the wireframe. When an object is selected however you can put the mouse anywhere over the object and the system still considers this a valid area for hit testing. This later case is treating the faces of the selected object as solids.

## Hit Test Flags

The following are the various hit test flags. You may use these flags in combination, for example: **HIT\_SELONLY | HIT\_SELSOLID**.

### **HIT\_SELONLY**

Hit test selected items only.

### **HIT\_UNSELONLY**

Hit test unselected items only.

### **HIT\_ABORTONHIT**

Abort the process of hit testing after finding any hit.

### **HIT\_SELSOLID**

This treats selected items as solid and unselected items as not solid. Treating an item as solid means the face will be hit if the mouse is anywhere inside the face region and not just over a visible edge.

### **HIT\_ANYSOLID**

This treats any item as solid.

### **HIT\_TRANSFORMGIZMO**

This option is available in release 3.0 and later only.

Hit test the transform gizmo.

### **HIT\_SWITCH\_GIZMO**

This option is available in release 3.0 and later only.

The selection processor that does the hit-testing will include this flag when hit-testing on a `MOUSE_POINT` message, because when this flag is active and the transform gizmo's hit-testing hits the manipulator, it should switch the axis mode to the axis that is hit. Normally the transform gizmo hit-testing will only highlight the axis if it hits it - but when this flag is active it should also set the axis mode (using `PushAxisMode()` or `SetAxisMode()`)

### **HIT\_MANIP\_SUBHIT**

This option is available in release 4.0 and later only.

Hit test sub-manipulators.

## List of PropertySet Options

See Also: [Class Interface](#).

One of the following values:

### **PROPSET\_SUMMARYINFO**

This corresponds to the File Properties Summary tab properties

### **PROPSET\_DOCSUMMARYINFO**

This corresponds to the File Properties Contents tab properties (Document Contents)

### **PROPSET\_USERDEFINED**

This corresponds to the File Properties Custom tab properties

## List of Marker Types

See Also: [Class GraphicsWindow](#).

The following are the available marker types:

### **POINT\_MRKR**

This marker is a single pixel on the display.

### **HOLLOW\_BOX\_MRKR**

This marker is a small box centered on the point.

### **PLUS\_SIGN\_MRKR**

This marker is a plus sign (+) at the point.

### **ASTERISK\_MRKR**

This marker is an asterisk (\*) at the point.

### **X\_MRKR**

This marker is an X at the point.

### **BIG\_BOX\_MRKR**

This marker is a large box centered on the point.

### **CIRCLE\_MRKR**

This marker is a circle at the point.

### **TRIANGLE\_MRKR**

This marker is triangle centered on the point.

### **DIAMOND\_MRKR**

This marker is diamond centered on the point.

### **SM\_HOLLOW\_BOX\_MRKR**

This marker is a hollow box at the point.

### **SM\_CIRCLE\_MRKR**

This marker is small circle at the point.

### **SM\_TRIANGLE\_MRKR**

This marker is small triangle centered on the point.

### **SM\_DIAMOND\_MRKR**

This marker is small diamond centered on the point.

### **DOT\_MRKR**

This option is available in release 3.0 and later only.

This marker is a large dot.

**SM\_DOT\_MRKR**

This option is available in release 3.0 and later only.

This marker is a smaller dot.

# Class ParticleSys

See Also: [Class GraphicsWindow](#), [Marker Types](#), [Class HitRegion](#).

class ParticleSys

## Description:

This class describes a particle system. Methods are available to display, hit test, and compute the bounding box of the particle system. Other methods allocate and free the particles and allow custom particle drawing procedures to be used.

## Data Members:

public:

**Tab<Point3> points;**

The location of each particle.

**Tab<Point3> vels;**

The velocity of each particle (optional).

**Tab<TimeValue> ages;**

The age of each particle (optional).

**float size;**

The world space radius of a particle.

## Methods:

### Prototype:

```
void Render(GraphicsWindow *gw, MarkerType  
type=POINT_MRKR);
```

### Remarks:

Implemented by the System.

Draws the particle system into the GraphicsWindow.

### Parameters:

**GraphicsWindow \*gw**

The graphics window into which to particle system is to be drawn.

**MarkerType type=POINT\_MRKR**

One of the following values:

See [Marker Types](#).

**Prototype:**

```
BOOL HitTest(GraphicsWindow *gw, HitRegion *hr,  
int abortOnHit=FALSE, MarkerType type=POINT_MRKR);
```

**Remarks:**

Implemented by the System.

This method hit tests the particle system and returns TRUE if the particle system was hit.

**Parameters:**

**GraphicsWindow \*gw**

The graphics window to hit test in.

**HitRegion \*hr**

Pointer to an instance of HitRegion describing the hit test region.

**int abortOnHit=FALSE**

If TRUE the hit testing should be aborted upon the first successful hit; otherwise hit testing should continue through all particles.

**MarkerType type=POINT\_MRKR**

The type of particle marker being used. One of the following values:

See [Marker Types](#).

**Return Value:**

TRUE if a particle is hit; otherwise FALSE.

**Prototype:**

```
Box3 BoundBox(Matrix3 *tm=NULL);
```

**Remarks:**

Implemented by the System.

Returns the 3D bounding box of the particles.

**Parameters:**

**Matrix3 \*tm=NULL**

If not NULL, this is the optional space to compute the bounding box in.

**Prototype:**

```
void FreeAll();
```

**Remarks:**

Implemented by the System.

Sets all the counts to 0. This will be the points, and if used, the velocities and ages.

**Prototype:**

```
void SetCount(int c, DWORD flags);
```

**Remarks:**

Implemented by the System.

Sets the size of the particle system. This is to at least set the number of points in the particle system. The flags indicate if optional parameters velocities and ages should be allocated as well.

**Parameters:**

**int c**

The size for each allocated table.

**DWORD flags**

One or more of the following values:

**PARTICLE\_VELS** - Velocities should be allocated.

**PARTICLE\_AGES** - Particles ages should be allocated.

**Prototype:**

```
int Count();
```

**Remarks:**

Implemented by the System.

Returns the number of points in the particle system.

**Prototype:**

```
BOOL Alive(int i)
```

**Remarks:**

Implemented by the System.

Determines if particle **i** is alive (has not expired).

**Parameters:**

**int i**

The index of the particle to check.

**Return Value:**

TRUE if the 'i-th' particle is alive; otherwise FALSE.

**Prototype:**

**void SetCustomDraw(CustomParticleDisplay \*d);**

**Remarks:**

Implemented by the System.

Establishes a custom draw callback object. This allows the particles to be displayed in any manner desired (not just using the standard point markers).

See [Class CustomParticleDisplay](#).

**Parameters:**

**CustomParticleDisplay \*d**

The custom draw callback object.

**Operators:**

**Prototype:**

**Point3& operator[](int i)**

**Remarks:**

Implemented by the System.

Returns the 'i-th' point of the particle system.

## Class ISubMtlAPI

See Also: [Working with Materials](#).

### Description:

This class is available in release 2.5 and later only.

In 3ds max 2.5 this is only supported for objects flowing down the geometry pipeline.

This class is used if you wish to support the direct assignment of sub materials to selected faces. For a reference implementation of this class, please refer to the code in

**\\MAXSDK\\SAMPLES\\MESH\\EDITABLEMESH\\TRIOBJED.CPP.**

### Methods:

public:

### Prototype:

**virtual MtlID GetNextAvailMtlID()=0;**

### Remarks:

This method returns a material ID that is currently not used by the object. If the current face selection share one single MtlID that is not used by any other faces, you should use it.

### Prototype:

**virtual BOOL HasFaceSelection()=0;**

### Remarks:

This method indicates if you are active in the modifier panel and have an active face selection. Return TRUE if so, otherwise FALSE.

### Prototype:

**virtual void SetSelFaceMtlID(MtlID id, BOOL bResetUnsel = FALSE)=0;**

### Remarks:

This method sets the selected faces to the specified material ID..

### Parameters:

**MtlID id**

The material id to set for the selected faces.

**BOOL bResetUnsel = FALSE**

If TRUE, then you should set the remaining unselected face material IDs to 0.

**Prototype:**

**virtual int GetSelFaceUniqueMtlID()=0;**

**Remarks:**

This method returns the material ID of the selected face(s). If multiple faces are selected they should all have the same MtlID -- otherwise you should return -1. If faces other than the selected share the same material ID, then return -1.

**Prototype:**

**virtual int GetSelFaceAnyMtlID()=0;**

**Remarks:**

This method returns the material ID of the selected face(s). If multiple faces are selected they should all have the same MtlID, otherwise return -1.

**Prototype:**

**virtual int GetMaxMtlID()=0;**

**Remarks:**

This method returns the highest MtlID on the object.

## Class AttachMatDlgUser

See Also: [Class Object](#), [Class Modifier](#).

class AttachMatDlgUser

### Description:

This class is available in release 3.0 and later only.

This class provides a general way for objects to handle the attach materials dialog presented when users attach objects to each other. To use this class do the following:

- 1) Subclass your modifier or editable object off this class as shown below. Implement the four functions that give access to the attach/condense options.
- 2) Now your class simply calls the global **DoAttachMatOptionDialog()** function, which deals with the parameters uniformly for all users. The implementation in Edit Spline is like so:

```
class EditSplineMod : public Modifier, ..., AttachMatDlgUser {  
...  
    static int attachMat;  
    static BOOL condenseMat;  
...  
    // from AttachMatDlgUser  
    int GetAttachMat() { return attachMat; }  
    void SetAttachMat(int value) { attachMat = value; }  
    BOOL GetCondenseMat() { return condenseMat; }  
    void SetCondenseMat(BOOL sw) { condenseMat = sw; }
```

And the statics are defined as:

```
int EditSplineMod::condenseMat = FALSE;  
int EditSplineMod::attachMat = ATTACHMAT_NEITHER;
```

### Function:

```
    BOOL DoAttachMatOptionDialog(IObjParam *ip,  
    AttachMatDlgUser *user);
```

**Remarks:**

This global function is available in release 3.0 and later only.

This displays the dialog that you currently get in Edit(able) mesh when you attach objects to each other. It gives options for how to deal with combining materials, and whether or not to condense materials which have excess material slots.

**Parameters:**

**IObjParam \*ip**

The interface pointer.

**AttachMatDlgUser \*user**

Points to the AttachMatDlgUser object.

**Return Value:**

TRUE if the user OKed the dialog; FALSE if the user Cancelled.

**Methods:**

public:

**Prototype:**

**virtual int GetAttachMat()=0;**

**Remarks:**

Returns the attach material setting. One of the following values:

**ATTACHMAT\_IDTOMAT**

Match material IDs to material.

**ATTACHMAT\_MATTOID**

Match Material to Material IDs.

**ATTACHMAT\_NEITHER**

Do not modify Material IDs or Material.

**Prototype:**

**virtual void SetAttachMat(int value)=0;**

**Remarks:**

Sets the attach material value.

**Parameters:**

**int value**

One of the following values:

**ATTACHMAT\_IDTOMAT**

Match material IDs to material.

**ATTACHMAT\_MATTOID**

Match Material to Material IDs.

**ATTACHMAT\_NEITHER**

Do not modify Material IDs or Material.

**Prototype:**

**virtual BOOL GetCondenseMat()=0;**

**Remarks:**

Returns the condense material and IDs settings.

**Prototype:**

**virtual void SetCondenseMat(BOOL sw)=0;**

**Remarks:**

Sets the condense material and IDs setting.

**Parameters:**

**BOOL sw**

TRUE for on; FALSE for off.

## List of Display Flags

One or more of the following values:

### **USE\_DAMAGE\_RECT**

If this flag is set, only the damaged area needs to be displayed. The damaged rectangle may be retrieved using **INode::GetDamagedRect()**. See [Class INode](#).

### **DISP\_SHOWSUBOBJECT**

This indicates if an item should display its sub-object selection state. The system will set this flag if the item is selected, the user is in the modify branch, and the item is in sub-object selection mode.

## Class RemapDir

See Also: [Class ReferenceTarget](#).

class RemapDir

### Description:

This class is used for remapping references during a Clone. It is used when cloning items that are instanced so that the plug-in can maintain the same instance relationship within the clone. All methods of this class are implemented by the system.

### Methods:

### Prototype:

**virtual RefTargetHandle CloneRef(RefTargetHandle oldTarg);**

### Remarks:

In the **ReferenceTarget::Clone()** procedure when an item is cloning itself it should clone all its references. Instead of calling **Clone()** on all of its references it should instead call this method passing it the item to copy. This method will return a copy of the item or a pointer to a copy of the item if it was already copied.

### Parameters:

**RefTargetHandle oldTarg**

This is the item that is to be copied.

### Return Value:

A copy of the item or a pointer to a copy of the item if it was already copied.

### Prototype:

**virtual void PatchPointer(RefTargetHandle\* patchThis,  
RefTargetHandle oldTarg)=0;**

### Remarks:

This method is used to patch the pointer for cloned items. This method is used by system plug-ins for example. The Ring Array system has an array of nodes it maintains. When the system is cloned this method is used to clone the table of nodes. The new ring array master controller will also have a table of nodes,

but it does not want the pointer to point to the old nodes, it should point to the new cloned nodes. The nodes may not be cloned yet at the time the master controller was cloned however. This method allows the pointer to be changed to point at the new nodes.

**Parameters:**

**RefTargetHandle\* patchThis**

The pointer should point at this item.

**RefTargetHandle oldTarg**

The original target.

**Sample Code:**

The following sample code demonstrates the use of this method to patch the pointer to the table of nodes maintained by the ring array system.

```
RefTargetHandle RingMaster::Clone(RemapDir& remap) {  
    int i;  
    RingMaster* newm = new RingMaster();  
    newm->ReplaceReference(0,pblock->Clone(remap));  
    newm->numNodes = numNodes;  
    newm->nodeTab.SetCount(numNodes);  
    for (i=0; i<numNodes; i++) newm->nodeTab[i] = NULL;  
    for (i=0; i<numNodes; i++) {  
        remap.PatchPointer((RefTargetHandle*)&newm->nodeTab[i],  
            (RefTargetHandle)nodeTab[i]);  
    }  
    return(newm);  
}
```

**Prototype:**

**virtual RefTargetHandle FindMapping(RefTargetHandle from)=0;**

**Remarks:**

If an item has been cloned, this method will return the cloned copy of it. If it has not been cloned, NULL will be returned.

**Parameters:**

**RefTargetHandle from**

The item to check.

**Prototype:**

**virtual void AddEntry(RefTargetHandle hfrom, RefTargetHandle hto)=0;**

**Remarks:**

This method is used internally.

**Prototype:**

**virtual void Backpatch()=0;**

**Remarks:**

This method is used internally.

**Prototype:**

**virtual void Clear()=0;**

**Remarks:**

This method is used internally.

**Prototype:**

**virtual void DeleteThis()=0;**

**Remarks:**

This method is used internally.

## Class CreateMouseButton

See Also: [Class BaseObject](#) (method `GetCreateMouseButton()`), [Class ViewExp](#), [Class Matrix3](#), [Class IPoint2](#).

class CreateMouseButton

### Description:

This is the callback object for handling the creation process of a plug-in object.

### Methods:

### Prototype:

```
virtual int proc(ViewExp *vpt, int msg, int point, int flags, IPoint2 m, Matrix3& mat)=0;
```

### Remarks:

Implemented by the Plug-In.

This is the method where the developer defines the user / mouse interaction that takes place during the creation phase of an object.

### Parameters:

#### **ViewExp \*vpt**

The viewport the creation process is taking place in.

#### **int msg**

This message describes the type of event that occurred. See [List of Mouse Callback Messages](#).

#### **int point**

The point number. this is 0 for the first click, 1 for the second, etc.

#### **int flags**

These flags describe the state of the mouse button and keyboard Shift/Ctrl/Alt keys. See [List of Mouse Callback Flags](#).

#### **IPoint2 m**

The 2D screen point that the user clicked on. Methods in the viewport interface allow this point to be converted into a world space ray or a 3D view space point. A world space ray can be intersected with the active construction plane which results in a point on the active construction plane. See [Class ViewExp](#).

## **Matrix3& mat**

This represents the transformation of the object relative to the construction plane. Typically the plug-in would get a point on the construction plane based on the screen point that the user clicked on and set the translation component of this matrix based on that point.

### **Return Value:**

Return one of the following value to indicate the state of the creation process:

#### **CREATE\_CONTINUE**

The creation process should continue. In this case the mouse is captured.

#### **CREATE\_STOP**

The creation process has terminated normally. In this case the mouse is no longer captured and input is then allowed again from any viewport.

#### **CREATE\_ABORT**

The creation process has been aborted. The system will delete the created object and node.

### **Prototype:**

**virtual int override(int mode)**

### **Remarks:**

Implemented by the Plug-In.

This method is used to override the default drag mode. Most plug-in will not need to replace the default implementation of this method. What this does is change the way the messages are sent relative to the mouse clicking.

Normally the messages are sent as follows: When the user clicks down this generates a **MOUSE\_POINT** message. Then the user drags the mouse with the button down and a series of **MOUSE\_MOVE** messages are sent. When they let up on the mouse button a **MOUSE\_POINT** messages is generated. Then as the mouse is moved a series of **MOUSE\_MOVE** messages are sent. Then they click down on the mouse again, but this time a point message is not generated until the button is released. All future points are then only sent after the mouse button has been pressed and released.

### **Parameters:**

#### **int mode**

The current drag mode. See below.

**Return Value:**

One of the following drag modes should be returned:

**CLICK\_MODE\_DEFAULT**

Returned to indicate the use of the system mouse mode.

**CLICK\_DRAG\_CLICK**

This is the default behavior as described above.

**CLICK\_MOVE\_CLICK**

In this mode, the first point is entered by clicking the mouse button down and then letting it up. This generates point 0. In other words, a

**MOUSE\_POINT** message is only generated after the user has pressed and released the mouse button.

**CLICK\_DOWN\_POINT**

In this mode, point messages are sent on mouse-down only.

**Default Implementation:**

```
{ return mode; }
```

**Sample Code:**

A sample program that uses the override method is **\MAXSDK\SAMPLES\OBJECTS\SPLINE.CPP**. It uses **CLICK\_DOWN\_POINT**.

**Prototype:**

```
virtual BOOL StartNewCreation();
```

**Remarks:**

This method is available in release 3.0 and later only.

This gets called by the CreationManager to determine if the mouse proc is really starting a new object. The mouse proc for creating always returns **CREATE\_STOP**, which is how it keeps the mouse from being captured, and this function tells the system if it is really ready to start a new object. Thus, this is called only if the mouse proc returned **CREATE\_STOP** to see if the object is really in a state to start a new node.

**Return Value:**

TRUE if the mouse proc is ready to start a new object; otherwise FALSE.

**Default Implementation:**

```
{ return TRUE; }
```

**Prototype:**

```
virtual BOOL TolerateOrthoMode();
```

**Remarks:**

This method is available in release 3.0 and later only.

Called by the system to determine if ortho mode makes sense for this creation.

Typcially this only makes sense for splines and NURBS curves.

**Return Value:**

TRUE if ortho mode is okay; otherwise FALSE.

**Default Implementation:**

```
{ return FALSE; }
```

## List of Parameter Types for Shape Interpolation

See Also: [Class ShapeObject](#).

One of the following values:

### **PARAM\_SIMPLE**

Parameter space based on segments. This simple interpolation is interpolating based on parameter space -- If a spline has 4 segments, the first segment is parameter values 0-0.25, the second 0.25-0.5, the third 0.5-0.75 and the fourth 0.75-1.0. This is regardless of the length of each segment.

### **PARAM\_NORMALIZED**

Parameter space normalized to curve length. This interpolation normalizes the parameter space to distance along the length of a spline. So parameter space 0 is the start, 1.0 is the end and 0.5 is halfway along the actual length of the curve.

## Structure CameraState

See Also: [Class GenCamera](#).

```
struct CameraState {
```

```
    BOOL isOrtho;
```

Flag to indicate if the camera uses orthographic projection (TRUE) or perspective (FALSE).

```
    float fov;
```

The camera field-of-view in radians.

```
    float tdist;
```

Target distance for free cameras.

```
    BOOL horzLine;
```

Horizon line display state.

```
    int manualClip;
```

Flag to indicate if camera has manual clipping enabled.

```
    float hither;
```

Hither clipping plane distance.

```
    float yon;
```

Yon clipping plane distance.

```
    float nearRange;
```

Near camera range radius.

```
    float farRange;
```

Far camera range radius.

```
};
```

Note: The camera looks down the negative Z axis, with X to the right and Y up.

## Class ModContextEnumProc

See Also: [Class ModContext](#).

class ModContextEnumProc

### Description:

Callback object used with **Modifier::EnumModContexts()**. The **proc()** method is called by the system.

### Methods:

### Prototype:

```
virtual BOOL proc(ModContext *mc)=0
```

### Remarks:

Implemented by the Plug-In.

This is called by **Modifier::EnumModContexts()**.

### Parameters:

**ModContext \*mc**

The ModContext.

### Return Value:

Return FALSE to stop, TRUE to continue.

See Also: **Modifier::EnumModContexts()**, [Modifier](#).

## Structure TMComponentsArg

See Also: [Class Control](#), [Class Matrix3](#), [Class Point3](#), [Class Interval](#), [Class Quat](#), [Class ScaleValue](#).

```
struct TMComponentsArg
```

### Description:

This structure is available in release 4.0 and later only.

This structure is for collecting the return results of

**Control::GetLocalTMComponents**. Position, Rotation, or Scale, controllers will put results at the respective component when the corresponding pointer is not NULL.

### Function:

**TMComponentsArg():position(0),rotation(0),scale(0),rotRep(kUnkn**

### Remarks:

Constructor.

### Function:

**TMComponentsArg(Point3\* pos, Interval\* posInv, float\* rot, Interval\* rotInv, ScaleValue\* scl, Interval\* sclInv) : position(pos),posValidity(posInv),rotation(rot),rotValidity(rotInv), scale(scl),sclValidity(sclInv);**

### Remarks:

Constructor.

### Data:

**Point3\* position;**

If not NULL this is the position.

**Interval\* posValidity;**

If not NULL this points to the validity interval for the position.

**float\* rotation;**

If not NULL this is the rotation and should be a float[4].

**Interval\* rotValidity;**

If not NULL this points to the validity interval for the rotation.

**RotationRep rotRep;**

The rotation representation. This defines what the 4 numbers in the **rotation** array mean. One of the following enum values:

**kXYZ** - Same as **EULERTYPE\_XYZ**

**kXZY** - Same as **EULERTYPE\_XZY**

**kYZX** - Same as **EULERTYPE\_YZX**

**kYXZ** - Same as **EULERTYPE\_YXZ**

**kZXY** - Same as **EULERTYPE\_ZXY**

**kZYG** - Same as **EULERTYPE\_ZYG**

**kXYX** - Same as **EULERTYPE\_XYX**

**kYZY** - Same as **EULERTYPE\_YZY**

**kZXZ** - Same as **EULERTYPE\_ZXZ**

**kQuat** - A quaternion representation.

**kUnknown** – An unknown representation.

**ScaleValue\* scale;**

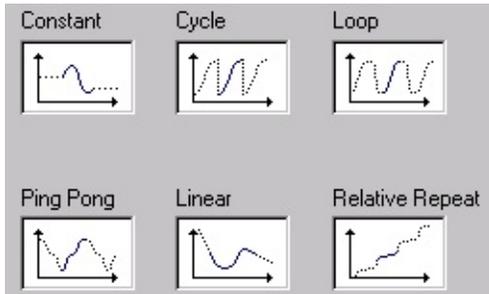

If non-NULL this is the ScaleValue.

**Interval\* sclValidity;**

The validity interval for the ScaleValue.

## List of Out of Range Types.

Out of Range Types provide several methods of extrapolating the pattern of key dots in a track. These patterns are applied to the animation outside the range of all keys in the track. The list of options is below:

One of the following values:

### **ORT\_CONSTANT**

The tracks values before or after the range of keys remains constant.

### **ORT\_CYCLE**

This causes the key pattern to repeat cyclically.

### **ORT\_LOOP**

This is the same as **ORT\_CYCLE** with continuity.

### **ORT\_OSCILLATE**

This is referred to as "Ping-Pong" in the 3ds max user interface. This reverses the range of keys values to cause the pattern to oscillate.

### **ORT\_LINEAR**

This takes the slope at the end key in the range and extrapolate with that slope.

### **ORT\_IDENTITY**

3ds max will only set this ORT for Ease Curves. This only is used when mapping time to time. The slope will be set to one (a 45 degree diagonal starting at the end of the key range).

### **ORT\_RELATIVE\_REPEAT**

This causes the key pattern to repeat with the first key taking off where the last key left off.

## Class InitJointData

See Also: [Class Control](#).

class InitJointData

### Description:

This class is passed to **Control::InitIKJoints()** which is called when importing R4 3DS files that have IK joint data.

### Data Members:

public:

**BOOL active[3];**

The joint active settings. Index 0=X, 1=Y, 2=Z.

**BOOL limit[3];**

The joint limit settings. Index 0=X, 1=Y, 2=Z.

**BOOL ease[3];**

The joint ease settings. Index 0=X, 1=Y, 2=Z.

**Point3 min, max, damping;**

The joint min, max and damping settings.

## Class InitJointData2

See Also: [Class InitJointData](#)

```
class InitJointData2 : public InitJointData
```

### Description:

This class is passed to **Control::InitIKJoints2()** which is called when importing R4 3DS files that have IK joint data. This class contains the added preferredAngle parameter.

### Data Members:

public:

**Point3 preferredAngle;**

The preferred angle.

**DWORD flags;**

Not used (must be 0), reserved for future expansion.

### Prototype:

**InitJointData2();**

### Remarks:

Constructor.

## Class DOFParams

See Also: [Class Control](#).

```
class DOFParams
```

### Description:

This class is available in release 2.0 and later only.

This structure is passed to the method **Control::GetDOFParams()**.

Controllers that support IK can provide information about their Degree Of Freedoms (DOFs) so that bones can display this information. The first 3 DOFs are assumed to be position and the next 3 are assumed to be rotation

### Data Members:

public:

**BOOL display[6];**

Indicates if this DOF should be displayed.

**Point3 axis[6];**

Specifies the DOF axis.

**Point3 pos[6];**

Specifies the base of the axis.

**BOOL limit[6];**

Indicates if the joint is limited at all.

**float min[6];**

Specifies the minimum limit.

**float max[6];**

Specifies the maximum limit.

**float curval[6];**

Specifies the current value of the parameter.

**BOOL sel[6];**

Indicates if the DOF should be highlighted.

**BOOL endEffector;**

Indicates if there is an end effector for this controller.

**Matrix3 eeTM;**

Specifies the world transformation matrix of the end effector (if present).

## Class IKClipObject

See Also: [Class Control](#).

class IKClipObject

### Description:

This class is used to store IK parameters that have been copied to a clipboard. The plug-in derives a class from this class to store their data and implements the methods that describe the creator object. The plug-in should also implement the **DeleteThis()** method to delete the instance of the class.

### Methods:

#### Prototype:

**virtual SClass\_ID SuperClassID()=0;**

#### Remarks:

Implemented by the Plug-In.

Returns the super class ID of the creator of the clip object.

#### Prototype:

**virtual Class\_ID ClassID()=0;**

#### Remarks:

Implemented by the Plug-In.

Returns the class ID of the creator of the clip object.

#### Prototype:

**virtual void DeleteThis()=0;**

#### Remarks:

Implemented by the Plug-In.

The system calls this method to delete the clip object after it has been used.

## Class CtrlHitRecord

class CtrlHitRecord

### Description:

This class provides a data structure used during controller gizmo hit-testing. All methods are implemented by the system.

### Friend Class:

class CtrlHitLog;

### Data Members:

public:

**INode \*nodeRef;**

This identifies the node the user has clicked on.

**DWORD distance;**

The 'distance' of the hit. What the distance actually represents depends on the rendering level of the viewport. For wireframe modes, it refers to the distance in the screen XY plane from the mouse to the sub-object component. In a shaded mode, it refers to the Z depth of the sub-object component. In both cases, smaller values indicate that the sub-object component is 'closer' to the mouse cursor.

**ulong hitInfo;**

A general unsigned long value. Most controllers will just need this to identify the sub-object element. The meaning of this value (how it is used to identify the element) is up to the plug-in.

**DWORD infoExtra;**

If the above **hitInfo** data member is not sufficient to describe the sub-object element this data member may be used as well.

### Methods:

### Prototype:

**CtrlHitRecord()**

### Remarks:

Constructor. The data members are initialized as follows: **next=NULL;**  
**distance=0;**

**hitInfo=0; nodeRef=NULL;**

**Prototype:**

**CtrlHitRecord(CtrlHitRecord \*nxt,INode \*nr, DWORD d,  
ulong inf, DWORD extra)**

**Remarks:**

Constructor. The data members are initialized to the data passed.

**Prototype:**

**CtrlHitRecord \*Next()**

**Remarks:**

Each **CtrlHitRecord** maintains a pointer to another **CtrlHitRecord**. This method returns the next hit record.

## List of Miscellaneous Control Functions and Templates

See Also: [Class StdControl](#), [List of Additional Controller Related Functions](#).

### Description:

The following functions are available for help with Out of Range Type (ORT) processing. All functions are implemented by the system.

### Prototype:

```
inline TimeValue CycleTime(Interval i,TimeValue t)
```

### Remarks:

Returns a TimeValue that is the specified time mod the interval length. The returned time is somewhere within the interval passed. This cycles the time so that it appears within the interval.

### Parameters:

#### **Interval i**

The interval the returned time is within.

#### **TimeValue t**

The time to cycle.

### Prototype:

```
inline int NumCycles(Interval i,TimeValue t)
```

### Remarks:

Returns the number of times the TimeValue cycles through the interval.

### Parameters:

#### **Interval i**

The interval the time is checked against.

#### **TimeValue t**

The time to check.

Note: Types that use these template functions must support the following operators:

**T + T, T - T, T \* float, T + float**

**Prototype:**

```
template <class T> T LinearExtrapolate(TimeValue t0, TimeValue  
t1,  
T &val0, T &val1, T &endVal)
```

**Remarks:**

Performs a linear extrapolation and returns the result.

**Parameters:**

**TimeValue t0**

The time you are extrapolating from.

**TimeValue t1**

The time you are extrapolating to.

**T &val0**

The first value you want to use to extrapolate from.

**T &val1**

The second value you want to use to extrapolate from.

**T &endVal**

The value at time **t0**.

**Return Value:**

The extrapolated value associated with time **t1**.

**Prototype:**

```
template <class T> T RepeatExtrapolate(Interval range,  
TimeValue t,  
T &startVal, T &endVal, T &cycleVal);
```

**Remarks:**

Performs a repeat extrapolation and returns the result. This will cycle the time **t** into the interval **range**.

**Parameters:**

**Interval range**

The range for which you are repeating over.

**TimeValue t**

The time you are extrapolating to.

**T &startVal**

The value at the start of the range.

**T &endVal**

The value at the end of the range.

**T &cycleVal**

The value of the function at the cycled point.

**Prototype:**

```
template <class T> T IdentityExtrapolate(TimeValue endPoint,  
TimeValue t,  
T &endVal);
```

**Remarks:**

Performs a linear extrapolation using a slope of one and a point and returns the result.

**Parameters:****TimeValue endPoint**

The end point time.

**TimeValue t**

The time to evaluate.

**T &endVal**

The value of the **endPoint** time.

**Prototype:**

```
Quat LinearExtrapolate(TimeValue t0, TimeValue t1, Quat &val0,  
Quat &val1, Quat &endVal);
```

**Remarks:**

The Quat version of above.

**Prototype:**

```
Quat RepeatExtrapolate(Interval range, TimeValue t, Quat  
&startVal,  
Quat &endVal, Quat &cycleVal);
```

**Remarks:**

The Quat version of above.

**Prototype:**

**Quat IdentityExtrapolate(TimeValue endPoint, TimeValue t, Quat &endVal );**

**Remarks:**

The Quat version of above.

**Prototype:**

**template <class T> T LinearInterpolate(const T &v0,const T &v1,float u)**

**Remarks:**

The functions performs a linear interpolation between **v0** and **v1** using **u** as the interpolation parameter.

**Parameters:**

**const T &v0**

The first value.

**const T &v1**

The second value.

**float u**

The interpolation parameter in the range 0 to 1.

**Prototype:**

**inline Quat LinearInterpolate(const Quat &v0,const Quat &v1,float u)**

**Remarks:**

The Quat version of above.

**Prototype:**

**inline ScaleValue LinearInterpolate(const ScaleValue &v0, const ScaleValue &v1,float u)**

**Remarks:**

The ScaleValue version of above.

**Prototype:**

**inline Interval TestInterval(Interval iv, DWORD flags)**

**Remarks:**

This function take the interval passed and checks the flags and modifies the interval based on the state of the flags.

**Parameters:****Interval iv**

The interval to modify.

**DWORD flags**

One of the following values:

**TIME\_INCLEFT**

**TIME\_INCRIGHT**

**Return Value:**

The revised interval.

**Prototype:**

**inline Quat ScaleQuat(Quat q, float s)**

**Remarks:**

Returns a quaternion scaled by the specified factor. This scales the 'angle' of the quaternion by **s**.

**Parameters:****Quat q**

The quaternion to scale.

**float s**

The scale factor.

## Class ImpInterface

See Also: [Class ImpNode](#), [Class Interval](#), [Class\\_ID](#), [Class GenLight](#), [Class GenCamera](#).

class ImpInterface

### Description:

Import Interface class. Methods of this class allow the plug-in to create nodes in the scene, create camera and light objects, and create objects by specifying a super class ID and Class ID. Methods are also available to bind target nodes to their Look At nodes. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

**virtual ImpNode \*CreateNode() = 0;**

#### Remarks:

Creates a new node. Methods of **ImpNode** may be used to assign properties to the node. See **AddNodeToScene()** to add a node to the scene given its **ImpNode** pointer.

#### Return Value:

An **ImpNode** pointer that may be used to set properties of the node.

#### Prototype:

**virtual void RedrawViews() = 0;**

#### Remarks:

Redraws the 3ds max viewports.

#### Prototype:

**virtual GenCamera \*CreateCameraObject(int type) = 0;**

#### Remarks:

Creates a camera object and returns a pointer to it. The GenCamera pointer may be used to set the properties of the camera object.

#### Parameters:

**int type**

One of the following values:

**FREE\_CAMERA**

**TARGETED\_CAMERA**

**Prototype:**

**virtual Object \*CreateTargetObject() = 0;**

**Remarks:**

Creates a target object and returns a pointer to it.

**Prototype:**

**virtual GenLight \*CreateLightObject(int type) = 0;**

**Remarks:**

Creates a light object and returns a pointer to it. The GenLight pointer may be used to set the properties of the light object.

**Parameters:**

**int type**

One of the following values:

**OMNI\_LIGHT** - Omnidirectional

**TSPOT\_LIGHT** - Targeted

**DIR\_LIGHT** - Directional

**FSPOT\_LIGHT** - Free

**Prototype:**

**virtual void \*Create(SClass\_ID sclass, Class\_ID classid)=0;**

**Remarks:**

Creates an object given its Super Class ID and its Class ID.

**Parameters:**

**SClass\_ID sclass**

The super class ID of the node to create.

**Class\_ID classid**

The unique class ID of the node to create.

**Return Value:**

A pointer to the item.

**Prototype:**

```
virtual int BindToTarget(ImpNode *laNode, ImpNode  
*targNode)=0;
```

**Remarks:**

This method binds a node to a target using a Look At controller. This is typically used with target spotlights and cameras to bind them to their target node.

**Parameters:**

**ImpNode \*laNode**

The node that will have the Look At controller assigned.

**ImpNode \*targNode**

The target node.

**Return Value:**

Nonzero if successful; otherwise 0.

**Prototype:**

```
virtual void AddNodeToScene(ImpNode *node)=0;
```

**Remarks:**

Adds a node to the scene given its ImpNode pointer.

**Parameters:**

**ImpNode \*node**

The node to add to the scene.

**Prototype:**

```
virtual void SetAnimRange(Interval& range)=0;
```

**Remarks:**

Sets the animation range for the node.

**Parameters:**

**Interval& range**

Specifies the animation range.

**Prototype:**

**virtual Interval GetAnimRange()=0;**

**Remarks:**

Retrieves the animation range for the node (as an Interval).

**Prototype:**

**virtual void SetEnvironmentMap(Texture \*txm)=0;**

**Remarks:**

Sets the current environment map to the specified map.

**Parameters:**

**Texture \*txm**

The map to set.

**Prototype:**

**virtual void SetAmbient(TimeValue t, Point3 col)=0;**

**Remarks:**

Sets the ambient light color at the specified time.

**Parameters:**

**TimeValue t**

The time to set the color.

**Point3 col**

The light color to set.

**Prototype:**

**virtual void SetBackGround(TimeValue t,Point3 col)=0;**

**Remarks:**

Sets the background color at the specified time.

**Parameters:**

**TimeValue t**

The time to set the color.

**Point3 col**

The light color to set.

**Prototype:**

**virtual void SetUseMap(BOOL onoff)=0;**

**Remarks:**

Sets the state of the environment 'Use Map' toggle.

**Parameters:**

**BOOL onoff**

TRUE to turn on; FALSE to turn off.

**Prototype:**

**virtual void AddAtmosphere(Atmospheric \*atmos)=0;**

**Remarks:**

Adds the specified atmospheric effect to the environment.

**Parameters:**

**Atmospheric \*atmos**

The atmospheric effect. See [Class Atmospheric](#).

**Prototype:**

**virtual int NewScene()=0;**

**Remarks:**

This method deletes all existing geometry in the scene.

## Class ExpInterface

See Also: [Class IScene](#).

class ExpInterface

### **Description:**

Export Interface class. A data member of this class allows the plug-in to enumerate all nodes in the scene.

### **Data Members:**

**IScene \*theScene;**

A pointer to the scene. See [Class IScene](#).

## Class SFXParamDlg

See Also: [Class Effect](#), [Class Atmospheric](#) , [Class Sampler](#).

class SFXParamDlg : public InterfaceServer

### Description:

This class is available in release 3.0 and later only.

An instance of this class is returned by a rendering effect, atmospheric plug-in, or sampler when it is asked to put up its rollout page in the user interface.

### Methods:

public:

### Prototype:

**virtual Class\_ID ClassID()=0;**

### Remarks:

Implemented by the Plug-In.

Returns the unique Class\_ID of this item.

### Prototype:

**virtual void SetThing(ReferenceTarget \*m)=0;**

### Remarks:

Implemented by the Plug-In.

This sets the current filter, sampler, atmospheric or rendering effect being edited to the one passed and updates the user interface controls to reflect the state of the new 'thing'.

### Parameters:

**ReferenceTarget \*m**

The effect to save as current.

### Prototype:

**virtual ReferenceTarget\* GetThing()=0;**

### Remarks:

Implemented by the Plug-In.

This returns the current filter, sampler, atmospheric or rendering effect being edited.

**Prototype:**

**virtual void SetTime(TimeValue t);**

**Remarks:**

Implemented by the Plug-In.

This method is called when the current time has changed. This gives the developer an opportunity to update any user interface data that may need adjusting due to the change in time.

**Parameters:**

**TimeValue t**

The new current time.

**Default Implementation:**

```
{}
```

**Prototype:**

**virtual void DeleteThis()=0;**

**Remarks:**

Implemented by the Plug-In.

Deletes this instance of the class.

**Prototype:**

**virtual INT\_PTR Execute(int cmd, ULONG arg1=0, ULONG arg2=0, ULONG arg3=0);**

**Remarks:**

This is a general purpose function that allows the API to be extended in the future. The 3ds max development team can assign new cmd numbers and continue to add functionality to this class without having to 'break' the API.

**Parameters:**

**int cmd**

The index of the command to execute.

**ULONG arg1=0**

Optional argument 1. See the documentation where the **cmd** option is discussed for more details on these parameters.

**ULONG arg2=0**

Optional argument 2.

**ULONG arg3=0**

Optional argument 3.

**Return Value:**

An integer return value. See the documentation where the **cmd** option is discussed for more details on the meaning of this value.

**Default Implementation:**

```
{ return 0; }
```

## Class IRendParams

See Also: [Class TimeChangeCallback](#), [Class RendPickProc](#).

class IRendParams : public InterfaceServer

### Description:

This is the interface given to a renderer, or atmospheric effect when it needs to display its parameters. For a renderer, the Render Scene dialog may be extended using this class. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

**virtual TimeValue GetTime()=0;**

#### Remarks:

Returns the current position of the frame slider.

#### Prototype:

**virtual void RegisterTimeChangeCallback(TimeChangeCallback \*tc)=0;**

#### Remarks:

Register a callback object that will get called every time the user changes the frame slider.

#### Parameters:

**TimeChangeCallback \*tc**  
The callback object to register.

#### Prototype:

**virtual void  
UnRegisterTimeChangeCallback(TimeChangeCallback \*tc)=0;**

#### Remarks:

Un-registers a callback object registered using  
**RegisterTimeChangeCallback()**.

#### Parameters:

## **TimeChangeCallback \*tc**

The callback object to un-register.

### **Prototype:**

```
virtual MtlBase *DoMaterialBrowseDlg(HWND hParent,DWORD  
flags,BOOL &newMat,BOOL &cancel)=0;
```

### **Remarks:**

Brings up the material browse dialog allowing the user to select a material.

### **Parameters:**

#### **HWND hParent**

The parent window handle.

#### **DWORD flags**

See [List of Material Browser Flags](#).

#### **BOOL &newMat**

Set to TRUE if the material is new OR cloned; otherwise FALSE.

#### **BOOL &cancel**

Set to TRUE if the user cancels the dialog; otherwise FALSE.

### **Return Value:**

The material returned will be NULL if the user selects 'None'

### **Prototype:**

```
virtual HWND AddRollupPage(HINSTANCE hInst, TCHAR  
*dlgTemplate, DLGPROC dlgProc, TCHAR *title, LPARAM  
param=0,DWORD flags=0, int category =  
ROLLUP_CAT_STANDARD)=0;
```

### **Remarks:**

This method adds rollup pages to the dialog and returns the window handle of the page.

### **Parameters:**

#### **HINSTANCE hInst**

The DLL instance handle of the plug-in.

#### **TCHAR \*dlgTemplate**

The dialog template for the rollup page.

**DLGPROC dlgProc**

The dialog proc to handle the message sent to the rollup page.

**TCHAR \*title**

The title displayed in the title bar.

**LPARAM param=0**

Any specific data to pass along may be stored here. This may be later retrieved using the GetWindowLong() call from the Windows API.

**DWORD flags=0**

**APPENDROLL\_CLOSED**

Starts the page in the rolled up state.

**int category = ROLLUP\_CAT\_STANDARD**

The category parameter provides flexibility with regard to where a particular rollup should be displayed in the UI. RollupPanels with lower category fields will be displayed before RollupPanels with higher category fields. For RollupPanels with equal category value the one that was added first will be displayed first. Although it is possible to pass any int value as category there exist currently 5 different category defines: **ROLLUP\_CAT\_SYSTEM**, **ROLLUP\_CAT\_STANDARD**, and **ROLLUP\_CAT\_CUSTATTRIB**.

When using **ROLLUP\_SAVECAT**, the rollup page will make the provided category sticky, meaning it will not read the category from the **RollupOrder.cfg** file, but rather save the category field that was passed as argument in the **CatRegistry** and in the **RollupOrder.cfg** file.

The method will take the category of the replaced rollup in case the flags argument contains **ROLLUP\_USERREPLACEDCAT**. This is mainly done, so that this system works with param maps as well.

**Return Value:**

The window handle of the rollup page.

**Prototype:**

```
virtual HWND AddRollupPage(HINSTANCE hInst,  
DLGTEMPLATE *dlgTemplate, DLGPROC dlgProc, TCHAR  
*title, LPARAM param=0,DWORD flags=0, int category =  
ROLLUP_CAT_STANDARD)=0;
```

**Remarks:**

This method is available in release 4.0 and later only.

This method adds rollup pages to the dialog and returns the window handle of the page. This method is currently not being used.

**Parameters:****HINSTANCE hInst**

The DLL instance handle of the plug-in.

**DLGTEMPLATE \*dlgTemplate**

The dialog template for the rollup page.

**DLGPROC dlgProc**

The dialog proc to handle the message sent to the rollup page.

**TCHAR \*title**

The title displayed in the title bar.

**LPARAM param=0**

Any specific data to pass along may be stored here. This may be later retrieved using the GetWindowLong() call from the Windows API.

**DWORD flags=0****APPENDROLL\_CLOSED**

Starts the page in the rolled up state.

**int category = ROLLUP\_CAT\_STANDARD**

The category parameter provides flexibility with regard to where a particular rollup should be displayed in the UI. RollupPanels with lower category fields will be displayed before RollupPanels with higher category fields. For RollupPanels with equal category value the one that was added first will be displayed first. Although it is possible to pass any int value as category there exist currently 5 different category defines: **ROLLUP\_CAT\_SYSTEM**, **ROLLUP\_CAT\_STANDARD**, and **ROLLUP\_CAT\_CUSTATTRIB**.

When using **ROLLUP\_SAVECAT**, the rollup page will make the provided category sticky, meaning it will not read the category from the

**RollupOrder.cfg** file, but rather save the category field that was passed as argument in the **CatRegistry** and in the **RollupOrder.cfg** file.

The method will take the category of the replaced rollup in case the flags argument contains **ROLLUP\_USEREPLACEDCAT**. This is mainly

done, so that this system works with param maps as well.

**Return Value:**

The window handle of the rollup page.

**Prototype:**

**virtual void DeleteRollupPage(HWND hRollup)=0;**

**Remarks:**

Removes a rollup page and destroys it.

**Parameters:**

**HWND hRollup**

The handle of the rollup window. This is the handle returned from **AddRollupPage()**.

**Prototype:**

**virtual void RollupMouseMessage(HWND hDlg, UINT message, WPARAM wParam, LPARAM lParam)=0;**

**Remarks:**

This allows hand cursor scrolling when the user clicks the mouse in an unused area of the dialog. When the user mouses down in dead area of the dialog, the plug-in should pass mouse messages to this function which will pass them on to the rollup.

Note: In 3ds max 2.0 and later only use of this method is no longer required -- the functionality happens automatically.

**Parameters:**

**HWND hDlg**

The window handle of the dialog.

**UINT message**

The message sent to the dialog proc.

**WPARAM wParam**

Passed in to the dialog proc. Pass along to this method.

**LPARAM lParam**

Passed in to the dialog proc. Pass along to this method.

**Prototype:**

```
virtual void SetPickMode(RendPickProc *proc)=0;
```

**Remarks:**

This will set the command mode to a standard pick mode. The callback implements hit testing and a method that is called when the user actually picks an item.

**Parameters:**

**RendPickProc \*proc**

The callback object. See [Class RendPickProc](#).

**Prototype:**

```
virtual void EndPickMode()=0;
```

**Remarks:**

If a plug-in is finished editing its parameters it should not leave the user in a pick mode. This method will flush out any pick modes in the command stack.

**Prototype:**

```
virtual void PutMtlToMtlEditor(MtlBase *mb)=0;
```

**Remarks:**

When a plugin has a Texmap, clicking on the button associated with that map should cause this routine to be called.

**Parameters:**

**MtlBase \*mb**

The **MtlBase** (**Texmap** or **Mtl**) to put to the materials editor.

**Prototype:**

```
virtual float GetMaxPixelSize() = 0;
```

**Remarks:**

This method is used internally.

**Prototype:**

```
virtual INT_PTR Execute(int cmd, ULONG arg1=0, ULONG  
arg2=0, ULONG arg3=0);
```

**Remarks:**

This method is available in release 2.0 and later only.

This is a general purpose function that allows the API to be extended in the future. The 3ds max development team can assign new **cmd** numbers and continue to add functionality to this class without having to 'break' the API.

**Parameters:**

**int cmd**

The index of the command to execute.

**ULONG arg1=0**

Optional argument 1. See the documentation where the **cmd** option is discussed for more details on these parameters.

**ULONG arg2=0**

Optional argument 2.

**ULONG arg3=0**

Optional argument 3.

**Return Value:**

An integer return value. See the documentation where the **cmd** option is discussed for more details on the meaning of this value.

## Class ShadeOutput

See Also: [Class ShadeContext](#), [Class Color](#).

```
class ShadeOutput : public BaseInterfaceServer
```

### Description:

An instance of this class is a data member of the **ShadeContext**. This is used to contain the computed color and transparency of the pixel being shaded by a material. All methods of this class are implemented by the system.

### Data Members:

public:

**ULONG flags;**

These flags are not currently used.

**Color c;**

Shaded color of the pixel.

**Color t;**

Transparency of the pixel.

**float ior;**

Index of refraction of the pixel.

**int gbufId;**

The G-buffer ID. This allows the **MixIn()** method to pick the id of the material which was blended in the highest proportion.

### Methods:

#### Prototype:

```
void MixIn(ShadeOutput& a, float f);
```

#### Remarks:

This method is used to blend the output of two texmaps, for example, in the Mix texmap. The function is :

```
void ShadeOutput::MixIn(ShadeOutput &a, float f) {  
    if (f<=0.0f) {  
        (*this) = a;  
        return;  
    }  
}
```

```

else if (f>=1.0f) {
    return;
}
else {
    float s = 1.0f - f;
    flags |= a.flags;
    c = s*a.c + f*c;
    t = s*a.t + f*t;
    ior = s*a.ior + f*ior;
    if (f<=0.5f) gbufId = a.gbufId;
}
}

```

This does a blend of **a** with (**\*this**). This blend is applied to the color, transparency, and index of refraction. The flags of are OR'ed together.

**Parameters:**

**ShadeOutput& a**

The output of the texmap to blend in.

**float f**

The amount to blend in, i.e.:

**a.MixIn(b, 1.0f)** results in 100% of **a** and none of **b**.

**Prototype:**

**void Reset(int n = -1)**

**Remarks:**

Implemented by the System.

This method resets the data member such that: **c** is set to black, **t** is set to black, **ior** is set to 1.0, **gbufId** is set to 0, and the **flags** are set to 0.

**Parameters:**

**int n = -1**

By supplying a negative value this method will clear elements but leave the number of elements unchanged.

# Class TexHandleMaker

See Also: [Class TexHandle](#), [Class Bitmap](#), [Class BitmapInfo](#).

class TexHandleMaker

## Description:

This class provides several ways to create a texture handle. The handle may be created from a 3ds max bitmap or a Windows Device Independent Bitmap. This class also provides methods to determine the desired size of the bitmap.

## Methods:

### Prototype:

```
virtual TexHandle* CreateHandle(Bitmap *bm, int symflags=0,  
int extraFlags=0)=0;
```

### Remarks:

Implemented by the System

This method is called to create a texture handle from a 3ds max bitmap.

### Parameters:

**Bitmap \*bm**

The bitmap to create a handle to.

**int symflags=0**

See [List of Texture Symmetry Flags](#).

**int extraFlags=0;**

One of the following values:

**EX\_MULT\_ALPHA**

Set this flag if alpha is **not** premultiplied in the Bitmap.

**EX\_RGB\_FROM\_ALPHA**

Set this flag to make the map using the alpha channel of the bitmap to define the gray level.

**EX\_OPAQUE\_ALPHA**

Specifies to make the map using opaque alpha.

**EX\_ALPHA\_FROM\_RGB**

Specifies to make alpha from the intensity of the map.

**Return Value:**

A pointer to the texture handle.

**Prototype:**

```
virtual TexHandle* CreateHandle(BITMAPINFO *bminf, int  
symflags=0, int extraFlags=0)=0;
```

**Remarks:**

Implemented by the System

This method is called to create a texture handle from a 32 bit Windows Device Independent Bitmap.

**Parameters:**

**BITMAPINFO \*bminf**

The bitmap to create a handle to.

**int symflags=0**

See [List of Texture Symmetry Flags](#).

**int extraFlags=0;**

One of the following values:

**EX\_MULT\_ALPHA**

Set this flag if alpha is **not** premultiplied in the Bitmap.

**EX\_RGB\_FROM\_ALPHA**

Set this flag to make the map using the alpha channel of the bitmap to define the gray level.

**EX\_OPAQUE\_ALPHA**

Specifies to make the map using opaque alpha.

**EX\_ALPHA\_FROM\_RGB**

Specifies to make alpha from the intensity of the map.

**Return Value:**

A pointer to the texture handle.

**Prototype:**

```
virtual BITMAPINFO *BitmapToDIB(Bitmap *bm, int symflags,  
int extraFlags, BOOL forceW=0, BOOL forceH=0)=0;
```

**Remarks:**

This method is available in release 4.0 and later only.

This method creates a 32 bit Windows Device Independent Bitmap with the specified symflags and extraflags already incorporated and returns a pointer to the associated BitmapInfo.

**Parameters:****Bitmap \*bm**

Points to the bitmap to create the handle to.

**int symflags**

See [List of Texture Symmetry Flags](#).

**int extraFlags**

One of the following values:

**EX\_MULT\_ALPHA**

Set this flag if alpha is **not** premultiplied in the Bitmap.

**EX\_RGB\_FROM\_ALPHA**

Set this flag to make the map using the alpha channel of the bitmap to define the gray level.

**EX\_OPAQUE\_ALPHA**

Specifies to make the map using opaque alpha.

**EX\_ALPHA\_FROM\_RGB**

Specifies to make alpha from the intensity of the map.

**BOOL forceW=0**

If this parameter is non-zero it is used as the width of the final DIB.

**BOOL forceH=0**

If this parameter is non-zero it is used as the height of the final DIB

**Prototype:**

```
virtual TexHandle* MakeHandle(BITMAPINFO* bminf)=0;
```

**Remarks:**

This method is available in release 4.0 and later only.

Returns a texture handle made from a 32 bit DIB that has the symflags, and extraflags already incorporated. This takes ownership of the BITMAPINFO\*.

**Parameters:****BITMAPINFO\* bminf**

Points to the BitmapInfo for the DIB.

**Prototype:****virtual BOOL UseClosestPowerOf2()=0;****Remarks:**

This method is available in release 4.0 and later only.

Returns TRUE if the bitmap does not need to be square and FALSE if it does need to be square.

**Prototype:****virtual int Size()=0;****Remarks:**

Implemented by the System.

This method may be called to determine the desired size for the bitmap. The system ultimately needs a square bitmap that is a power of 2 in width and height. If you already have a bitmap around, just pass it in to

**CreateHandle()** and it will be converted. If you are creating a bitmap from scratch (i.e. a procedural texture), then you should make it **Size()** in width in height, and save the system an extra step. In either case you own your bitmap, and are responsible for ultimately freeing it.**Return Value:**

The size of the desired bitmap.

## Class NameAccum

See Also: [Class Texmap](#).

class NameAccum

### Description:

This class provides a method **AddMapName()** that is called when a Texmap is attempting to load its map and it cannot be found.

### Methods:

#### Prototype:

```
virtual void AddMapName(TCHAR *name)=0;
```

#### Remarks:

Implemented by the System.

This method is called to add the name of a map that was not found.

#### Parameters:

**TCHAR \*name**

The name to add.

# List of Procedural Texture Clamping, Noise and Misc Functions

See Also: [Class Texmap](#), [Class AColor](#), [Class Color](#), [Class Point2](#), [Class Point3](#).

The following functions are available for use in the creation of procedural textures. These are based on the code provided in the book:

Kenton Musgrave, Darwyn Peachey, Ken Perlin, Steven Worley, Texturing and Modeling A Procedural Approach (Cambridge, MA: Academic Press, Inc., 1994). ISBN: 0-12-228760-6.

Consult this book for additional insight into the use of these functions.

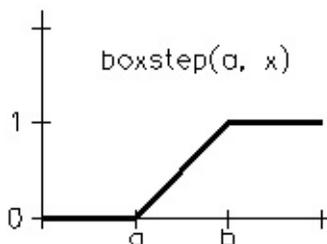

## Prototype:

```
float boxstep(float a, float b, float x);
```

## Remarks:

This function returns 0 if  $x$  is less than  $a$ , a linear interpolation between 0 and 1 if  $x$  is greater than or equal to  $a$  and less than or equal to  $b$ , and 1 if  $x$  is greater than  $b$ . This function is a smoother version of `step()` using a linear ramp. The function `boxstep()` is defined like this:

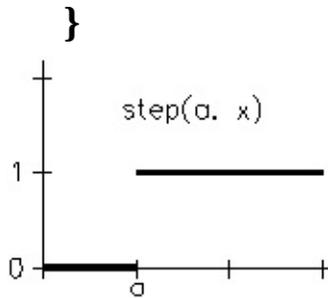

```
float boxstep(float a, float b, float x) {  
    return clamp((x-a)/(b-a),0.0f, 1.0f);  
}
```

## The `boxstep()` function.

For comparison, note that `step()` returns values of 0 when  $x$  is less than  $a$  and 1 when  $x$  is greater than or equal to  $a$ . This function is not part of the SDK but `step()` is defined like this:

```
float step(float a, float x) {  
    return (float)(x >= a);  
}
```

**The step() function.**

**Parameters:**

**float a**

The limit for the **x** value where the function will return 0.

**float b**

The limit for the **x** value where the function will return 1.

**float x**

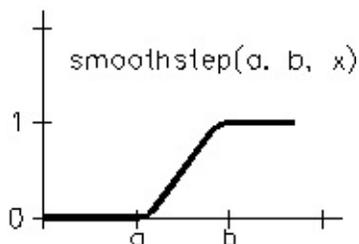

A floating point value.

**Prototype:**

**float smoothstep(float a, float b, float x);**

**Remarks:**

This function is similar to **step()**, but instead of a sharp transition from 0 to 1 at a specified threshold, it makes a gradual transition from 0 to 1 beginning at threshold **a** and ending at threshold **b**. To do this, this function uses a cubic function whose slope is 0 at **a** and **b** and whose value is 0 at **a** and 1 at **b**. This function thus provides a still smoother version of **step()** using a cubic spline. The **smoothstep()** function is used (instead of **step()**) in many procedural textures because sharp transitions often result in artifacts.

**The smoothstep() function.**

**Parameters:**

**float a**

The limit for the **x** value where the function will return 0.

**float b**

The limit for the **x** value where the function will return 1.

**float x**

A floating point value.

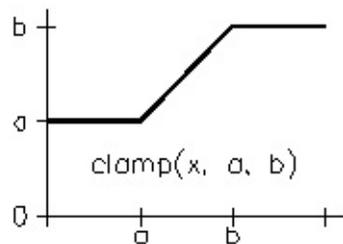

**Prototype:**

**float clamp(float x, float a, float b);**

**Remarks:**

This function returns **a** when **x** is less than **a**, the value of **x** when **x** is between **a** and **b**, and the value **b** when **x** is greater than **b**. The function **clamp()** is defined as follows:

```
float clamp( float x, float a, float b) {  
    return (x < a ? a : (x > b ? b : x));  
}
```

**The clamp() function.**

**Parameters:**

**float x**

A floating point value.

**float a**

A floating point value.

**float b**

A floating point value.

**Prototype:**

**float mod(float x, float m);**

**Remarks:**

This function returns **x Mod m** and handles negatives correctly. The standard

math functions **fmod()** and **fmodf()** return negative results if the first operand, **x**, is negative. This function will return the positive remainder when dividing **x** by **m**.

**Parameters:**

**float x**

A floating point value.

**float m**

A floating point value.

**Prototype:**

**int mod(int x, int m);**

**Remarks:**

This function returns  $x \text{ Mod } m$  and handles negatives correctly.

This function returns  $x \text{ Mod } m$  and handles negatives correctly. The standard C remainder operator `%` return negative results if the first operand, **x**, is negative. This function will return the positive remainder when dividing **x** by **m**.

**Parameters:**

**int x**

An integer value.

**int m**

An integer value.

**Prototype:**

**float sramp(float x, float a, float b, float d);**

**Remarks:**

This function makes a sort of straight segment S curve.

**sramp()** is **a** for  $x$  less than **a-d** and **b** for  $x$  greater than **b+d**.

for  $a+d < x < b-d$  **sramp(x) = x**

for  $a-d < x < a+d$  **sramp()** makes a smooth transition (parabolic) from  $\text{sramp}' = 0$  to  $\text{sramp}' = 1$

for  $b-d < x < b+d$  **sramp()** makes a smooth transition (parabolic) from  $\text{sramp}' = 1$  to  $\text{sramp}' = 0$

**Parameters:****float x**

A floating point value.

**float a**

A floating point value.

**float b**

A floating point value.

**float d**

A floating point value.

**Prototype:****float threshold(float x, float a, float b);****Remarks:**

This function returns 0 if **x** is less than **a**, 1 if **x** is greater than **b**, otherwise it returns **x**.

**Parameters:****float x**

A floating point value.

**float a**

A floating point value.

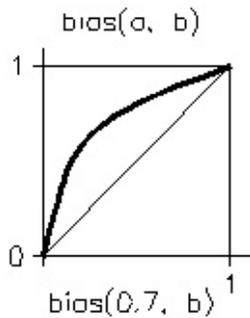

**float b**

A floating point value.

**Prototype:****float bias(float a, float b);****Remarks:**

This function performs a mapping across the unit interval [0, 1] where the result is within the unit interval. That is, if **b** is within the interval 0 to 1, the result of **bias()** is within the interval 0 to 1. This function is defined such that **bias(a, 0.5)=a**. The function looks like:

```
float bias(float a, float b) {  
    return (float)pow(a, log(b) / log(0.5f));  
}
```

**The bias() function.**

**Parameters:**

**float a**

The parameter that determines the shape of the mapping.

**float b**

A floating point value.

**Prototype:**

**float gain(float a, float b);**

**Remarks:**

This function performs a mapping across the unit interval  $[0, 1]$  where the result is within the unit interval. That is, if **b** is within the interval 0 to 1, the result of **gain()** is within the interval 0 to 1. This function is defined such that **gain(a, 0.5)=a**. Above and below 0.5, this function consists of two scaled down **bias()** curves forming an S-shaped curve. The function looks like:

```

float gain(float a, float b)
{
  float p = (float)log(1.0f - b) / (float)log(0.5f);

  if (a < .001f)
    return 0.f;
  else if (a > .999f)
    return 1.0f;
  if (a < 0.5f)
    return (float)pow(2 * a, p) / 2;
  else

```

```

    return 1.0f - (float)pow(2.0 * (1. - a), (double)p) / 2;
}
gain(a, b)

```

**The gain() function.**

**Parameters:**

**float a**

The parameter that determines the shape of the mapping.

**float b**

A floating point value.

**The following are noise functions over 1, 2, and 3 dimensions:**

These are all simply noise functions of different dimension. They return values in the range [-1,1].

**Prototype:**

**float noise1(float arg);**

**Remarks:**

This function is an approximation of white noise blurred to dampen frequencies beyond some value. The return value is in the range [-1, 1].

**Parameters:**

**float arg**

A floating point value.

**Prototype:**

**float noise2(Point2 p);**

**Remarks:**

This function is an approximation of white noise blurred to dampen frequencies beyond some value. The return value is in the range [-1, 1].

**Parameters:**

**Point2 p**

A Point2 value.

**Prototype:**

**float noise3(Point3 p);**

**Remarks:**

This is a noise function over R3 -- implemented by a pseudo-random tricubic spline. This function is an approximation of white noise blurred to dampen frequencies beyond some value. The return value is in the range [-1, 1].

**Parameters:**

**Point3 p**

A Point3 value.

**Prototype:**

**float noise4(Point3 p, float time);**

**Remarks:**

This function is an approximation of white noise blurred to dampen frequencies beyond some value. The return value is in the range [-1, 1].

**Parameters:**

**Point3 p**

A Point3 value.

**float time**

A floating point value.

**Prototype:**

**float noise3DS(Point3 p);**

**Remarks:**

This is 3DStudio's Noise function: its only slightly different from **noise3()** scaled up by factor of 1.65 and clamped to -1,+1.

The following **#define** is also available:

```
#define NOISE(p) ((1.0f+noise3DS(p))*0.5f)
```

Macro to map the value returned from the **noise3DS()** function into interval [0,1].

**Parameters:**

**Point3 p**

A Point3 value.

**Prototype:**

**float turbulence(Point3& p, float freq);**

**Remarks:**

This turbulence function is a simple fractal generating loop built on top of the noise function. It is used to make marble, clouds, explosions, etc. It returns a value in the range [0, 1].

**Parameters:**

**Point3& p**

The input point.

**float freq**

A floating point frequency.

**Prototype:**

**int Perm(int v);**

**Remarks:**

This function simply uses **v** as a lookup into a table to return a different number. It only uses the low 9 bits of the number (0-512) and returns a number in that range.

**Parameters:**

**int v**

An integer value.

**Prototype:**

**float fBm1(float point, float H, float lacunarity, float octaves);**

**Remarks:**

This function is a fractional Brownian motion fractal (or fBm for short) that returns a floating point value. This version of the fBm is said to be "homogeneous" (the same everywhere) and "isotropic" (the same in all directions).

**Parameters:**

**float point**

The function is evaluated at this value.

**float H**

The fractal increment parameter. When  $H = 1$ , the function is relatively smooth; as  $H$  goes to 0, the function approaches white noise.

**float lacunarity**

The gap between successive frequencies. This is usually set to 2.0.

**float octaves**

The number of frequencies in the function.

**Prototype:**

**float fBm1(Point2 point, float H, float lacunarity, float octaves);**

**Remarks:**

This function is a fractional Brownian motion fractal (or fBm for short) that returns a floating point value.

**Parameters:****Point2 point**

The function is evaluated at this point.

**float H**

The fractal increment parameter. When  $H = 1$ , the function is relatively smooth; as  $H$  goes to 0, the function approaches white noise.

**float lacunarity**

The gap between successive frequencies. This is usually set to 2.0.

**float octaves**

The number of frequencies in the function.

**Prototype:**

**float fBm1(Point3 point, float H, float lacunarity, float octaves);**

**Remarks:**

This function is a fractional Brownian motion fractal (or fBm for short) that returns a floating point value.

**Parameters:****Point3 point**

The function is evaluated at this point.

### **float H**

The fractal increment parameter. When  $H = 1$ , the function is relatively smooth; as  $H$  goes to 0, the function approaches white noise.

### **float lacunarity**

The gap between successive frequencies. This is usually set to 2.0.

### **float octaves**

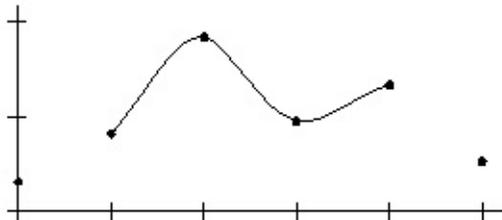

The number of frequencies in the function.

### **Prototype:**

**float spline(float x, int nknots, float \*knot);**

### **Remarks:**

This function is used to map a number into another number. The function is a one-dimensional Catmull-Rom interpolating spline through a set of knot values. The parameter of the spline is a floating point value. If  $x$  is 0, the result is the second knot value. If  $x$  is 1, the result is the final knot value. For values between 0 and 1, the value interpolates smoothly between the values of the knots from the second knot to the second to last knot. The first and last knot values determine the derivatives of the spline at the endpoint.

`spline(float x, int nknots, float *knot)`

### **The spline () function.**

### **Parameters:**

#### **float x**

A floating point value.

#### **int nknots**

The number of knots. Because the spline is a cubic polynomial there must be at least four knots.

#### **float \*knot**

An array of floating point knot values.

**Prototype:****Color color\_spline(float x, int nknots, Color \*knot);****Remarks:**

This function is used to map a number into a color. The function is a one-dimensional Catmull-Rom interpolating spline through a set of knot values. The parameter of the spline is a floating point value. If **x** is 0, the result is the second knot value. If **x** is 1, the result is the final knot value. For values between 0 and 1, the value interpolates smoothly between the values of the knots from the second knot to the second to last knot. The first and last knot values determine the derivatives of the spline at the endpoint.

**Parameters:****float x**

A floating point value.

**int nknots**

The number of knots. Because the spline is a cubic polynomial there must be at least four knots.

**Color \*knot**An array of **Color** knot values.**Prototype:****inline int FLOOR(float x);****Remarks:**

This function provides a faster version of the standard C function **floor()**. It returns a floating-point value representing the largest integer that is less than or equal to **x**.

**Parameters:****float x**

A floating point value.

**Prototype:****inline float frac(float x)****Remarks:**

This function returns the fraction (non-integer) part of the value passed. This is defined as:

```
{ return x - (float)FLOOR(x); }
```

**Parameters:**

**float x**

The value whose fractional portion is to be returned.

**Prototype:**

```
inline float fmax(float x, float y);
```

**Remarks:**

This function returns **x** if it is greater than **y**; otherwise it returns **y**.

**Parameters:**

**float x**

One of the floating point values used in the comparison.

**float y**

One of the floating point values used in the comparison.

**Prototype:**

```
inline float fmin(float x, float y);
```

**Remarks:**

This function returns **x** if it is less than **y**; otherwise it returns **y**.

**Parameters:**

**float x**

One of the floating point values used in the comparison.

**float y**

One of the floating point values used in the comparison.

**Prototype:**

```
inline AColor AComp(AColor cbot, AColor ctop);
```

**Remarks:**

This function performs an alpha-composite of **ctop** on top of **cbot**, assuming pre-multiplied alpha.

This is defined as:

```
{
```

```
    float ia = 1.0f - ctop.a;
```

```
    return (ctop + ia*cbot);  
}
```

**Parameters:**

**AColor cbot**

The color that is composited over.

**AColor ctop**

The color to composite on top.

**Return Value:**

The composited color.

**Prototype:**

```
void CellFunction(Point3 v,int n,float *dist,int  
*celIDs=NULL,Point3 *grads=NULL,float gradSmooth=0.0f);
```

**Remarks:**

This is the noise function used by the 3ds max Cellular texture. The idea is that there is a set of cells randomly distributed through space. This function returns the distances to the closest cells.

Developers using this function should refer to the following paper upon which this function is based. A Cellular Basis Function by Steven Worley in the SIGGRAPH 1996 Conference Proceedings.

**Parameters:**

**Point3 v**

The 3D input point.

**int n**

The number of elements in the arrays below.

**float \*dist**

A set of distances are returned here. This is the distance to the closest cell, the second closest cell, etc.

**int \*celIDs=NULL**

An optional array of integers to store cell IDs. This returns a value used to identify the cell. Since the functions works with a set of cells distributed through space, if two input points returned the same closest cell, then they would both have this same cell ID for their closest cell.

This is used in the Cellular texture to modulate the color. The cell color is varied by some random amount by using this value is used as the random seed. Thus the value is constant throughout the cell. See the function

**RandFromCellID(int id)** below.

**Point3 \*grads=NULL**

An optional array point Point3s used to get the partial derivatives with respect to X, Y and Z for the function. This is used for bump mapping.

**float gradSmooth=0.0f**

This equate to the 'Bump Smoothing' spinner in the Cellular texmap UI. The derivative of the function (the distance to the closest cell) has a discontinuity as it switches from cell to cell. Thus the gradients above have a discontinuity. This value basically smoothes off the discontinuity. The range is 0.0 to 1.0.

**Prototype:**

```
void FractalCellFunction(Point3 v,float iterations, float  
lacunarity,int n,float *dist,int *celIDs=NULL,Point3  
*grads=NULL,float gradSmooth=0.0f);
```

**Remarks:**

This is a fractal version of above. It has additional parameter for **iterations** and **lacunariy**.

**Parameters:**

**Point3 v**

The 3D input point.

**float iterations**

This corresponds to the 'Iterations' parameter in the Cellular UI. Varying this value gives different results.

**float lacunarity**

The is the 'Roughness' parameter in the Cellular UI. Varying this value gives different results.

**int n**

The number of elements in the arrays below.

**float \*dist**

A set of distances are returned here. This is the distance to the closest cell, the

second closest cell, etc.

**int \*celIDs=NULL**

An optional array of integers to store cell IDs. This returns a value used to identify the cell. Since the functions works with a set of cells distributed through space, if two input points returned the same closest cell, then they would both have this same cell ID for their closest cell.

This is used in the Cellular texture to modulate the color. The cell color is varied by some random amount by using this value is used as the random seed. Thus the value is constant throughout the cell. See the function **RandFromCellID(int id)** below.

**Point3 \*grads=NULL**

An optional array point Point3s used to get the partial derivatives with respect to X, Y and Z for the function. This is used for bump mapping.

**float gradSmooth=0.0f**

This equate to the 'Bump Smoothing' spinner in the Cellular texmap UI. The derivative of the function (the distance to the closest cell) has a discontinuity as it switches from cell to cell. Thus the gradients above have a discontinuity. This value basically smoothes off the discontinuity. The range is 0.0 to 1.0.

**Prototype:**

**float RandFromCellID(int id);**

**Remarks:**

Returns a random number in the range 0.0 to 1.0 based on the **cellID** passed.

**Parameters:**

**int id**

The seed for the random number generator.

**Prototype:**

**void setdebug(int i);**

**Remarks:**

This function is used internally.

## List of Texture Symmetry Flags

See Also: [Class StdUVGen](#), [Class TexHandleMaker](#).

One or more of the following flag bit values. These may be ORed together.

### **U\_WRAP**

If set this indicates the texture map is tiled in the U direction.

### **V\_WRAP**

If set this indicates the texture map is tiled in the V direction.

### **U\_MIRROR**

If set this indicates the texture map is mirrored in the U direction.

### **V\_MIRROR**

If set this indicates the texture map is mirrored in the V direction.

## List of Map Slot Types

See Also: [Class MtlBase](#).

One of the following values:

### **MAPSLOT\_TEXTURE**

Identifies a slot which holds a texture map.

### **MAPSLOT\_ENVIRON**

Identifies a slot which holds an environment map.

### **MAPSLOT\_DISPLACEMENT**

This option is available in release 3.0 and later only.

Identifies a slot which holds a displacement map.

### **MAPSLOT\_BACKGROUND**

This option is available in release 4.0 and later only.

Identifies a slot which holds a background map.

# Class TimeChange

See Also: [Class TimeChangeCallback](#), [Class ImageFilter](#).

```
class TimeChange : public TimeChangeCallback
```

## Description:

This class is available in release 2.0 and later only.

This class provides a callback when the user moves the Video Post time slider.

This happens internally, developers must only respond to the

**FLT\_TIMECHANGED** message. See [List of ImageFilter Related Messages](#).

## Data Members:

public:

**BOOL set;**

Indicate the callback is register with 3ds max.

**ImageFilter \*filter;**

Points to the filter who's notified on the time change.

## Methods:

### Prototype:

**TimeChange();**

### Remarks:

Constructor. The data member **set** is made FALSE.

### Prototype:

**void TimeChanged(TimeValue t);**

### Remarks:

This method is called when the user moves the 3ds max time slider to a new time.

### Parameters:

**TimeValue t**

The current time (position of the time slider).

## Class UndoNotify

See Also: [Class TVNodeNotify](#).

```
class UndoNotify : public TVNodeNotify
```

### Description:

This class is available in release 2.0 and later only.

This class can be used so an **ImageFilter** plug-in can get notified on a change to one of its Track View Nodes.

This class provides an implementation of the **NotifyRefChanged()** method of class **TVNodeNotify**. The constructor of this class stores a window handle. Usually this is the control dialog window handle of the ImageFilter plug-in using this class. Upon receipt of a message via

**TVNodeNotify::NotifyRefChanged()** this implementation sends a **FLT\_UNDO** message to the ImageFilter control dialog window proc and invalidates the window. Most filters will set a flag indicating that an undo has occurred when they get the **FLT\_UNDO** message, and actually update the UI controls when they process the **WM\_PAINT** message. This is because the **FLT\_UNDO** message may be sent many time and the controls shouldn't be updated each time (as they might appear to 'flicker'). See the code for the Negative filter in `\MAXSDK\SAMPLES\FILTERS\NEGATIVE\NEGATIVE.CPP` for details.

All methods of this class are implemented by the system.

### Methods:

#### Prototype:

```
UndoNotify(HWND hwnd);
```

#### Remarks:

Constructor.

#### Parameters:

**HWND hwnd**

The control dialog window handle where the **FLT\_UNDO** message will be sent. This window handle is also passed to **InvalidateRectangle()** so a

**WM\_PAINT** message will be sent.

## List of Image Filter Capability Flags

One or more of the following values. These flags may be ORed together.

### **IMGFLT\_NONE**

Indicates the plug-in has none of the capabilities below. Use this constant for the capability if this is the case.

### **IMGFLT\_MASK**

Indicates the plug-in supports masking.

### **IMGFLT\_CONTROL**

Indicates the plug-In has a control panel. This informs the system to call the plug-ins **ShowControl()** method when the user selects the Setup button. If the filter does not have a control panel do not set this bit and the setup button will be grayed out in the 3ds max user interface.

### **IMGFLT\_FILTER**

Indicates the plug-in is a filter.

### **IMGFLT\_COMPOSITOR**

Indicates the plug-In is a compositor. If the plug-in is a layer type of filter, it should set this bit.

### **IMGFLT\_THREADED**

Indicates the plug-in is thread aware. If this flag is NOT set, 3ds max will avoid multithreading this plug-in.

## List of ImageFilter Related Messages

See Also: [Class ImageFilter](#).

The following message are sent to 3ds max from an Image Filter plug-in. This can be done using the **SendMessage()** Win32 function:

```
LRESULT SendMessage(  
    HWND hwnd, // handle of destination window  
    UINT uMsg, // message to send  
    WPARAM wParam, // first message parameter  
    LPARAM lParam // second message parameter  
);
```

### **FLT\_PROGRESS**

Sent by the plug-in to notify 3ds max of its current progress.

**wParam:** Current amount processed

**lParam:** Total amount to process.

### **FLT\_CHECKABORT**

Sent by the plug-in to check for process interruption. The host should return FALSE (by setting \*lParam) if it's OK to continue or TRUE to abort processing.

**wParam:** Pass 0.

**lParam:** Pointer to a BOOL.

### **FLT\_TEXTMSG**

Sent by the plug-in to display a text message to the user.

**wParam:** 0

**lParam:** LPCTSTR

The following message are sent by 3ds max to a Image Filter plug-in or to 3ds max from an Image Filter. These may be processed inside a dialog proc (for example the filter's **Control()** method).

### **Sample Code:**

```
BOOL ImageFilter_Negative::Control(HWND hWnd,UINT  
message,WPARAM wParam,LPARAM lParam) {  
    switch (message) {  
        case FLT_UNDO:
```

```
undo = true;  
break;  
case FLT_TIMECHANGED:  
// ...
```

## **FLT\_TIMECHANGED**

Sent by 3ds max to the plug-in to notify the time has changed (the user moved the time slider in 3ds max).

**wParam:** 0

**lParam:** TimeValue t

## **FLT\_UNDO**

Sent by 3ds max to the plug-in to notify that an Undo operation has been done. The plugin will set some boolean internally and wait for the next WM\_PAINT message in order to update any spinners or other values that may have been undone. The filter manager sends this message (if you register for the notification with RegisterTVNodeNotify()) and an undo operation was performed.

**wParam:** 0

**lParam:** 0

## Class GBufWriter

See Also: [Class GBuffer](#), [Class GBufReader](#), [Structure GBufData](#), [List of GBuffer Channels Indexes](#).

```
class GBufWriter : public InterfaceServer
```

### Description:

This class is available in release 3.0 and later only.

This is the writer object returned from **GBuffer::CreateWriter()**. This class assumes pixels are created in increasing order of x.

Here is an example of writing multiple layer data to the G-Buffer using methods of this class.

```
GBuffer *gb = NewDefaultGBuffer();  
gb->SetRasterSize(100,10);  
gb->CreateChannels((1<<GB_Z)|(1<<GB_MTL_ID)|(1<<GB_BG));  
gb->InitBuffer();
```

```
GBufWriter *wrt = gb->CreateWriter();  
for (int y=0; y<10; y++) {  
  wrt->StartLine(y);  
  BOOL bb = 0;  
  for (int x=5; x<100; x+=4) {  
    wrt->StartPixel(x);  
    wrt->StartNextLayer();  
    float z = 5.0f*float(x)*float(y);  
    wrt->WriteChannelData(GB_Z,(void *)&z);  
    UBYTE mid = 36+x;  
    wrt->WriteChannelData(GB_MTL_ID,(void *)&mid);  
    Color24 c;  
    c.r = 10+x; c.g = 20+x; c.b = 30+x;  
    wrt->WriteChannelData(GB_BG,(void *)&c);  
  
    wrt->StartNextLayer();  
    z = 15.0f*float(x)*float(y);  
    wrt->WriteChannelData(GB_Z,(void *)&z);
```

```

mid = 26+x;
wrt->WriteChannelData(GB_MTL_ID,(void *)&mid);
c.r = 30+x; c.g = 20+x; c.b = 10+x;
wrt->WriteChannelData(GB_BG,(void *)&c);

if (bb) {
wrt->StartNextLayer();
z = 17.0f*float(x)*float(y);
wrt->WriteChannelData(GB_Z,(void *)&z);
mid = 64+x;
wrt->WriteChannelData(GB_MTL_ID,(void *)&mid);
c.r = 130+x; c.g = 120+x; c.b = 110+x;
wrt->WriteChannelData(GB_BG,(void *)&c);
}
bb = !bb;
}
wrt->EndLine();
}
gb->DestroyWriter(wrt);

```

All methods of this class are implemented by the System.

### Methods:

public:

### Prototype:

**virtual void StartLine(int y)=0;**

### Remarks:

This method should be called before writing every line.

### Parameters:

**int y**

The zero based index of the scan line to start.

### Prototype:

**virtual void StartPixel(int x)=0;**

**Remarks:**

This method must be called before writing each pixel and must be called with increasing x values on a line.

**Parameters:**

**int x**

The zero based index of the pixel to start.

**Prototype:**

**virtual void StartNextLayer()=0;**

**Remarks:**

This method must be called before writing the first layer.

**Prototype:**

**virtual BOOL WriteChannelData(int chan, void \*data)=0;**

**Remarks:**

Call this method to write a data element to the specified channel of the G-Buffer to the current scan line and pixel.

**Parameters:**

**int chan**

See [List of GBuffer Channels Indexes](#).

**void \*data**

Points to the G-Buffer data to write.

**Return Value:**

TRUE on success; FALSE on failure.

**Prototype:**

**virtual BOOL WriteAllData(GBufData \*data)=0;**

**Remarks:**

This method writes all the channel data from the GBufData structure passed to the current scan line and pixel.

**Parameters:**

**GBufData \*data**

Points to the G-Buffer data to write. See [Structure GBufData](#).

**Return Value:**

TRUE on success; FALSE on failure.

**Prototype:**

**virtual BOOL EndLine()=0;**

**Remarks:**

This method should be called after writing each line.

**Return Value:**

TRUE on success; FALSE on failure.

**Prototype:**

**virtual void DeleteThis()=0;**

**Remarks:**

Deletes this writer object. Call this method when finished using it.

## List of G-Buffer Channel Types

See Also: [List of Image Channels](#), [List of G-Buffer Channel Indexes](#).

These are the recognized types of G-Buffer channels. The types are defined by the number of bits per pixel for the channel. One of the following values:

**BMM\_CHAN\_TYPE\_8**

1 byte per pixel

**BMM\_CHAN\_TYPE\_16**

1 word per pixel (2 bytes)

**BMM\_CHAN\_TYPE\_24**

3 bytes per pixel

**BMM\_CHAN\_TYPE\_32**

2 words per pixel (4 bytes)

**BMM\_CHAN\_TYPE\_48**

3 words per pixel (6 bytes)

**BMM\_CHAN\_TYPE\_64**

4 words per pixel (8 bytes)

**BMM\_CHAN\_TYPE\_96**

6 words per pixel (12 bytes)

**BMM\_CHAN\_TYPE\_UNKNOWN**

Channel is not of a known type.

# Class RenderInfo

See Also: [Class Ray](#), [Class Point2](#), [Class Point3](#).

class RenderInfo

## Description:

This class provides information about the rendering environment. All methods of this class are implemented by the system.

## Data Members:

public:

**ProjectionType projType;**

The projection type: One of the following values:

**ProjPerspective**

**ProjParallel**

**float kx,ky;**

3D to 2D projection scale factor.

**float xc,yc;**

The screen origin.

**BOOL fieldRender;**

Indicates if the image is field rendered.

**BOOL fieldOdd;**

If TRUE, the first field is Odd lines.

**TimeValue renderTime[2];**

Render time for the 2 fields, if field rendering. If not, use **renderTime[0]**.

**Matrix3 worldToCam[2];**

The world to camera transformation matrix; **worldToCam[0]** is for field 0, **worldToCam[1]** is for field 1. Use **worldToCam[0]** if not field rendering.

**Matrix3 camToWorld[2];**

The camera to world transformation matrix; **camToWorld[0]** is for field 0, **camToWorld[1]** is for field 1. Use **camToWorld[0]** if not field rendering.

**Rect region;**

This data member is available in release 4.0 and later only.

This rectangle holds the sub-region in the image that was rendered if the last

render was a region render. If it was not a region render then the rectangle is empty.

**Methods:**

**Prototype:**

**RenderInfo();**

**Remarks:**

Constructor. The data members are initialized as follows:

```
renderTime[0] = renderTime[1] = 0;  
worldToCam[0].IdentityMatrix();  
worldToCam[1].IdentityMatrix();  
camToWorld[0].IdentityMatrix();  
camToWorld[1].IdentityMatrix();  
fieldRender = fieldOdd = FALSE;  
projType = ProjPerspective;  
kx = ky = 1.0f;  
xc = yc = 400.0f;
```

**Prototype:**

**Point2 MapWorldToScreen(Point3 p, int field=0)**

**Remarks:**

Maps the specified world point to a screen point.

**Parameters:**

**Point3 p**

The world point.

**int field=0**

The field order. This specifies which **camToWorld** matrix is used in the conversion.

**Return Value:**

The 2D screen point.

**Prototype:**

**Point2 MapCamToScreen(Point3 p);**

**Remarks:**

Maps the specified point in camera space to screen space and returns it.

**Parameters:**

**Point3 p**

The point to convert.

**Prototype:**

**Ray MapScreenToCamRay(Point2 p);**

**Remarks:**

Returns the viewing ray through the screen point, in camera space.

**Parameters:**

**Point2 p**

The screen point.

**Prototype:**

**Ray MapScreenToWorldRay(Point2 p, int field=0);**

**Remarks:**

Returns the viewing ray through the specified screen point, in world space.

**Parameters:**

**Point2 p**

The screen space point.

**int field=0**

The field order - specifies which **camToWorld** matrix is used in the conversion.

## List of G-Buffer Channels Indexes

See Also: [List of Image Channels](#), [List of G-Buffer Channel Types](#).

These #defines are indexes to the GBuffer methods such as **GBDataSize(int i)**, **GBChannelName(int i)**, etc.

One of the following values:

### **GB\_Z**

Z-Buffer depth

### **GB\_MTL\_ID**

Material ID assigned via the Material Editor.

### **GB\_NODE\_ID**

Node ID assigned via the Properties dialog.

### **GB\_UV**

UV coordinates.

### **GB\_NORMAL**

Normal vector in view space.

### **GB\_REALPIX**

Non clamped colors in "RealPixel" format.

### **GB\_COVERAGE**

Pixel coverage of the front surface.

### **GB\_BG**

The RGB color of what's behind the front object.

### **GB\_NODE\_RENDER\_ID**

System node number (valid during a render).

### **GB\_COLOR**

The color returned by the material shader for the fragment.

### **GB\_TRANSP**

The transparency returned by the material shader for the fragment.

### **GB\_VELOC**

Velocity vector of the fragment relative to the screen.

### **GB\_WEIGHT**

Weight of layers contribution to pixel color.

### **GB\_MASK**

Sub pixel coverage mask

# Class CheckAbortCallback

See Also: [Class Effect](#).

class CheckAbortCallback

## Description:

This class is available in release 3.0 and later only.

Implemented by the System (for Render Effect plug-ins inside the **Effect::Apply()** method).

The **Check()** method of this class may be called to check if the user did something to abort the application of the effect.

## Methods:

### Prototype:

**virtual BOOL Check()=0;**

### Remarks:

Returns TRUE if user has done something to cause an abort; otherwise FALSE.

### Prototype:

**virtual int Progress(int done, int total)=0;**

### Remarks:

This method is should be called by each Effect plug-in as it proceeds through the image to update the progress bar.

### Parameters:

#### **int done**

The amount done, i.e. the current state of the image processing. This is usually the number of scan lines processed so far.

#### **int total**

The total number of updates. This is usually the number of pixels in height of the image.

### Return Value:

Returns TRUE if user has done something to cause an abort; otherwise FALSE.

**Prototype:**

**virtual void SetTitle(const TCHAR \*title)=0;**

**Remarks:**

This method is called internally by the calling code -- plug-ins don't need to call this method.

## Bitmap Open Mode Types

The following values indicate the open mode for an image:

**BMM\_NOT\_OPEN**

Image not opened yet.

**BMM\_OPEN\_R**

Image opened in Read-only mode.

**BMM\_OPEN\_W**

Image opened in Write-only mode. No reads will occur.

## BitmapIO Capability Flags

These flags describe the capabilities of the IO module. These should be OR'ed together as required to define the properties of the IO module. For example:

```
return BMMIO_WRITER | BMMIO_RANDOM_WRITES |  
BMMIO_EXTENSION |  
BMMIO_INFODLG | BMMIO_CONTROLWRITE;
```

### **BMMIO\_NONE**

Not defined yet.

### **BMMIO\_READER**

Reads files.

### **BMMIO\_WRITER**

Writes files.

### **BMMIO\_RANDOM\_WRITES**

Can write frames in any order.

### **BMMIO\_MULTIFRAME**

File contains multiple frames (i.e. FLC, AVI, ...)

### **BMMIO\_EXTENSION**

Uses file extension (File Filter Type), i.e. **.EPS**, **.PS**. Plug-In's returning this will be expected to implement **ExtCount()**, and **Ext(int i)**. This is also used to identify a plug-in as a "File Type" as opposed to a "Device Type".

### **BMMIO\_FRAMEBUFFER**

Frame Buffer Driver.

### **BMMIO\_GRABBER**

Device Grabs Video.

### **BMMIO\_THREADED**

This is not used. All plug-ins are expected to be thread aware.

### **BMMIO\_RANDOM\_ACCESS**

This is not used.

### **BMMIO\_NON\_CONCURRENT\_ACCESS**

Device cannot handle multiple, concurrent requests (FLC, AVI, VTR's, etc.).

### **BMMIO\_OWN\_VIEWER**

If this flag is set, 3ds max will call the driver's own **ShowImage()** method to

handle displaying the image as opposed to using the generic Virtual Frame Buffer

### **BMMIO\_INFODLG**

If the device is able to show its own image information dialog this flag should be set. Otherwise, the 3ds max must call

**BitmapManager::GetImageInfo()** and display a generic information dialog.

### **BMMIO\_UNINTERRUPTIBLE**

If a driver cannot be started and stopped this flag should be set. This is an 'Uninterruptible Driver'. For example the AVI, FLIC, etc. cannot stop and go and thus define this flag.

### **BMMIO\_EVALMATCH**

Drivers that may have a different image for the same given 3ds max frame and same file/device name should set this flag and implement the

**BitmapIO::EvalMatch()** method.

### **BMMIO\_IFL**

If this flag is set, instead of calling the **Load()** method 3ds max will call the **GetImageName()** method. 3ds max will then process the given image name accordingly.

The following flags relate to the plug-in's control dialog. There is only a single call to the plug-in's control panel but the call specifies the nature of the operation going on. It's up to the plug-in to provide different interfaces if needed. If one control serves two or more services, all the pertinent flags should be set.

#### **BMMIO\_CONTROLREAD**

Device Driver has a Control Panel for Read Operations

#### **BMMIO\_CONTROLWRITE**

Device Driver has a Control Panel for Write Operations

#### **BMMIO\_CONTROLGENERIC**

This flag is no longer used.

## Bitmap Error Codes

The following error codes are used by the functions that use or return

**BMMRES** types:

### **BMMRES\_SUCCESS**

Success - No error occurred.

### **BMMRES\_ERRORTAKENCARE**

Error - The function has already taken appropriate action to process the error.

**The errors below require the user to be informed.**

**BMMRES\_FILENOTFOUND**

The file being accessed was not found.

**BMMRES\_MEMORYERROR**

Insufficient memory for the requested operation.

**BMMRES\_NODRIVER**

Device driver responsible for the image not present.

**BMMRES\_IOERROR**

Input / Output error.

**BMMRES\_INVALIDFORMAT**

The file being access was not of the proper format for the requested operation.

**BMMRES\_CORRUPTFILE**

The file being accessed was corrupt.

**BMMRES\_SINGLEFRAME**

Results from a goto request on a single frame image.

**BMMRES\_INVALIDUSAGE**

Bad argument passed to function (developer mistake).

**BMMRES\_ERRORRETRY**

This is no longer used. Use **BMMRES\_RETRY** below.

**BMMRES\_NUMBEREDFILENAMEERROR**

This may be passed as an errorcode to  
**BitmapIO::ProcessImageIOError()**.

**BMMRES\_INTERNALERROR**

An internal error occurred.

**BMMRES\_BADFILEHEADER**

A file header error occurred.

**BMMRES\_CANTSTORAGE**

This is used internally.

**BMMRES\_RETRY**

This is returned if the user selects Retry from the 3ds max Image IO Error dialog box. This dialog is presented by the method  
**BitmapIO::ProcessImageIOError()**.

**BMMRES\_BADFRAME**  
Invalid Frame Number Requested

## List of Bitmap Close Types

One of the following values:

### **BMM\_CLOSE\_COMPLETE**

Close and save the image.

### **BMM\_CLOSE\_ABANDON**

Close but abandon the image.

Many bitmap loader / savers do not make use of these flags. An example of one that does is the FLC saver. When a FLC file is closed, it goes through each image and calculates the palette. This can take a long time. If the user cancels the operation they will not want to wait for this to happen. Thus this flag is passed to indicate that the user has canceled and this processing should not occur.

## Class IUtil

See Also: [Class UtilityObj](#).

class IUtil

### **Description:**

This class provides a single method to allow the developer to close their utility plug-in in the command panel.

### **Methods:**

### **Prototype:**

**virtual void CloseUtility()=0;**

### **Remarks:**

Implemented by the System.

A developer may call this method to close the current utility in the command panel. If a plug-in developer chooses to use a Close button in one of their rollup pages this method should be called when the user has selected the Close button. This method simply tells the system that the plug-in should be closed. A developer does not need to use this method. It is just available if a developer wants to have a specific termination point to their utility plug-in.

## Class ITreeEnumProc

See Also: [Class IScene](#), [Class INode](#).

class ITreeEnumProc

### Description:

This is the callback object used by **IScene::EnumTree()**. To use it, derive a class from this class, and implement the callback method.

### Methods:

### Prototype:

```
virtual int callback( INode *node )=0;
```

### Remarks:

Implemented by the Plug-In.

This method may flag the node passed based on some property of the node.

### Parameters:

**INode \*node**

The node. The **INode** class has a method **FlagForeground()** that may be used to flag this node to go into the foreground.

### Return Value:

One of the following values may be returned to control how enumeration continues:

**TREE\_CONTINUE**

Continue enumerating.

**TREE\_IGNORECHILDREN**

Don't enumerate the children of this node, but continue enumerating.

**TREE\_ABORT**

Stop enumerating.

## Class ITVUtility

See Also: [Class Animatable](#), [Class TrackViewUtility](#), [Class Interval](#), [Class Interface](#), [Class Control](#).

class ITVUtility

### Description:

This class is an interface that is given to track view utilities that allows them to access the track view they were launched from. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

**virtual int GetNumTracks()=0;**

#### Remarks:

Returns the total number of visible (open) tracks in Track View. This determines valid values to use for 'i' in the methods below.

#### Prototype:

**virtual Animatable \*GetAnim(int i)=0;**

#### Remarks:

Returns a pointer to the Animatable for the 'i-th' track.

#### Parameters:

**int i**

Specifies the track.

#### Prototype:

**virtual Animatable \*GetClient(int i)=0;**

#### Remarks:

Returns a pointer to the client of the 'i-th' track. This is the 'parent' or 'owner' of the 'i-th' item.

#### Parameters:

**int i**

Specifies the track.

**Prototype:**

**virtual int GetSubNum(int i)=0;**

**Remarks:**

Returns the sub-anim number of the 'i-th' track.

**Parameters:**

**int i**

Specifies the track.

**Prototype:**

**virtual TSTR GetTrackName(int i)=0;**

**Remarks:**

Returns the name of the 'i-th' track.

**Parameters:**

**int i**

The index of the track whose name is returned.

**Prototype:**

**virtual BOOL IsSelected(int i)=0;**

**Remarks:**

Returns TRUE if the 'i-th' track is selected; otherwise FALSE.

**Parameters:**

**int i**

The index of the track to test.

**Prototype:**

**virtual void SetSelect(int i,BOOL sel)=0;**

**Remarks:**

Sets the selected state of the 'i-th' track to the state passed.

**Parameters:**

**int i**

The index of the track whose selected state is set.

**BOOL sel**

Specifies the selected state. TRUE for selected; FALSE for not selected.

**Prototype:**

**virtual HWND GetTrackViewHWND()=0;**

**Remarks:**

Returns the windows handle of the main Track View window.

**Prototype:**

**virtual int GetMajorMode()=0;**

**Remarks:**

Returns a value to indicate the current mode Track View is operating in. This is one of five modes.

**Return Value:**

One of the following values:

**TVMODE\_EDITKEYS**

**TVMODE\_EDITTIME**

**TVMODE\_EDITRANGES**

**TVMODE\_POSRANGES**

**TVMODE\_EDITFCURVE**

**Prototype:**

**virtual Interval GetTimeSelection()=0;**

**Remarks:**

Returns the current interval of selected time.

**Prototype:**

**virtual BOOL SubTreeMode()=0;**

**Remarks:**

Returns TRUE if 'Modify Subtree' mode is active; otherwise FALSE.

**Prototype:**

**virtual Animatable \*GetTVRoot()=0;**

**Remarks:**

Returns a pointer to the Track View Root.

**Prototype:**

**virtual void TVUtilClosing(TrackViewUtility \*util)=0;**

**Remarks:**

This must be called when a track view utility is closing so that it can be unregistered from notifications

**Parameters:**

**TrackViewUtility \*util**

Points to the utility that is closing. This is usually called by passing the **this** pointer as in: **TVUtilClosing(this);**

## Class RendParamDlg

See Also: [Class Renderer](#).

class RendParamDlg

### Description:

An instance of this class is created by **Renderer::CreateParamDlg()**. Since this dialog is modeless and non-interactive, as the user changes parameters in the dialog, the renderer does not need to update its state. When the user is through, they may choose 'OK' or 'Cancel' from the dialog. If the user selects OK then the **AcceptParams()** method will be called. If the user selects Cancel, then the **RejectParams()** method is called.

### Methods:

#### Prototype:

**virtual void AcceptParams()=0;**

#### Remarks:

Implemented by the Plug-In.

If the user selects OK from the dialog, this method will be called, at which time the renderer can read the parameters out of the UI and modify its state.

#### Prototype:

**virtual void RejectParams();**

#### Remarks:

Implemented by the Plug-In.

If this method is called, typically the renderer will not have to do anything since it has not yet modified its state, but if for some reason it has, it should restore its state.

#### Default Implementation:

**{}**

#### Prototype:

**virtual void DeleteThis()=0;**

**Remarks:**

Implemented by the Plug-In.

Deletes this instance of the class. The instance is allocated by

**Renderer::CreateParamDialog()**.

## Class BaseShader

See Also: [Class SpecialFX](#), [Class ShaderParamDlg](#), [Class ShadeContext](#), [Class IllumParams](#), [Class IMtlParams](#), [Class StdMat2](#), [Class Mtl](#), [Class Color](#), [Class ILoad](#), [Class ISave](#).

```
class BaseShader : public SpecialFX
```

### Description:

This class is available in release 3.0 and later only.

This is one of the base classes for the creation of Shaders which plug-in to the Standard material. Note: Developers should derive their plug-in Shader from [Class Shader](#) rather than this class directly since otherwise the interactive renderer won't know how to render the Shader in the viewports.

Developers of this plug-in type need to understand how the Standard material and the Shader work together.

Every material has a Shader. The Shader is the piece of code which controls how light is reflected off the surface. The Standard material is basically the mapping mechanism. It handles all the texturing for the material. It also manages the user interface. This simplifies things so the Shader plug-in only needs to worry about the interaction of light on the surface.

Prior to release 3 developers could write Material plug-ins that performed their own shading, however this was usually a major programming task. Release 3 provides the simpler Shader plug-in that would benefit from sharing all the common capabilities. The Standard material, with its 'blind' texturing mechanism, makes this possible. It doesn't know what it is texturing -- it simply textures 'stuff'. The shader names the channels (map), fills in the initial values, specifies if they are a single channel (mono) or a triple channel (color). The Standard material handles the rest including managing the user interface.

Most of the code in a Shader has to do with supplying this information to a Standard material. The values are passed and received back in class

**IllumParams**. There is a single method in a shader which actually does the shading. This is the **Illum()** method.

### Plug-In Information:

Class Defined In SHADER.H

Super Class ID SHADER\_CLASS\_ID

Standard File Name Extension DLB

Extra Include File Needed SHADERS.H

### **Methods Groups:**

The hyperlinks below take you to the start of groups of related methods within the class:

[Mapping Channel Access](#)

[Dialog \(Rollup\) Access](#)

[Illumination Related Methods](#)

[Standard Parameter Access](#)

[Compositing Method](#)

[Load / Save Methods](#)

### **Methods:**

public:

### **Dialog (Rollup) Access**

#### **Prototype:**

```
virtual ShaderParamDlg* CreateParamDialog(HWND  
hOldRollup, HWND hwMtlEdit, IMtlParams *imp, StdMtl2*  
theMtl, int rollupOpen, int n=0)=0;
```

#### **Remarks:**

This method creates and returns a pointer to a **ShaderParamDlg** object and puts up the dialog which lets the user edit the Shader's parameters.

#### **Parameters:**

##### **HWND hOldRollup**

The window handle of the old rollup. If non-NULL the IMtlParams method ReplaceRollup method is usually used instead of AddRollup() to present the rollup.

##### **HWND hwMtlEdit**

The window handle of the material editor.

## **IMtlParams \*imp**

The interface pointer for calling methods in 3ds max.

## **StdMtl2\* theMtl**

Points to the Standard material being edited.

## **int rollupOpen**

TRUE to have the UI rollup open; FALSE if closed.

## **int n=0**

This parameter is available in release 4.0 and later only.

Specifies the number of the rollup to create. Reserved for future use with multiple rollups.

### **Prototype:**

```
virtual ShaderParamDlg* GetParamDlg(int n=0)=0;
```

### **Remarks:**

Returns a pointer to the **ShaderParamDlg** object which manages the user interface.

### **Parameters:**

#### **int n=0**

This parameter is available in release 4.0 and later only.

Specifies the rollup to get **ShaderParamDlg** for. Reserved for future use with multiple rollups.

### **Prototype:**

```
virtual void SetParamDlg(ShaderParamDlg* newDlg, int n=0)=0;
```

### **Remarks:**

Sets the **ShaderParamDlg** object which manages the user interface to the one passed.

### **Parameters:**

#### **ShaderParamDlg\* newDlg**

Points to the new ShaderParamDlg object.

#### **int n=0**

This parameter is available in release 4.0 and later only.

Specifies the rollup to set **ShaderParamDlg** for. Reserved for future use with multiple rollups.

## Standard Parameter Access

### Prototype:

**virtual ULONG SupportStdParams()=0;**

### Remarks:

Returns a value which indicates which of the standard parameters are supported.

### Return Value:

See [List of Shader Standard Parameter Flags](#).

### Prototype:

**virtual void ConvertParamBlk(ParamBlockDescID \*descOld, int oldCount, IParamBlock \*oldPB)=0;**

### Remarks:

This method is only required for R2.5 shaders to convert the previous Standard material parameter blocks to the current version.

### Parameters:

**ParamBlockDescID \*descOld**

Points to the old parameter block descriptor.

**int oldCount**

The number in the array of parameters above.

**IParamBlock \*oldPB**

Points to the old parameter block.

### Prototype:

**virtual int NParamDlgs();**

### Remarks:

This method is available in release 4.0 and later only.

Returns the number of rollups this shader is requesting.

### Default Implementation:

```
{ return 1; }
```

## Illumination Related Methods

### Prototype:

```
virtual void Illum(ShadeContext &sc, IllumParams &ip)=0;
```

### Remarks:

This is the illumination function for the Shader.

Developers will find it very helpful to review the **Mtl::Shade()** method of the Standard material. This is the main method of the material which computes the color of the point being rendered. This code is available in **\MAXSDK\SAMPLES\MATERIALS\STDMTL2.CPP**. This code shows how the Standard calls **Shader::GetIllumParams()**, sets up mapping channels, calls this **Illum()** method, and calls the **Shader::CombineComponents()** method when all done.

### Parameters:

#### **ShadeContext &sc**

The ShadeContext which provides information on the pixel being shaded.

#### **IllumParams &ip**

The object whose data members provide communication between 3ds max and the shader. Input values are read from here and output values are stored here.

Note that the **XOut (ambIllumout, etc)** data members of this class are initialized to 0 before the first call to this method.

The input to this method has the textured illumination parameters, the bump perturbed normal, the view vector, the raw (unattenuated) colors in the reflection and refraction directions, etc.

### Sample Code:

Below is a brief analysis of the standard Blinn shader Illum() method. This is the standard 'computer graphics look' type shader supplied with 3ds max. The entire method follows:

```
void Blinn2::Illum(ShadeContext &sc, IllumParams &ip) {  
    LightDesc *l;
```

**Color lightCol;**

**// Blinn style phong**

**BOOL is\_shiny= (ip.channels[ID\_SS].r > 0.0f) ? 1:0;**

**double phExp = pow(2.0, ip.channels[ID\_SH].r \* 10.0) \* 4.0;**

**for (int i=0; i<sc.nLights; i++) {**

**l = sc.Light(i);**

**register float NL, diffCoef;**

**Point3 L;**

**if (l->Illuminate(sc,ip.N,lightCol,L,NL,diffCoef)) {**

**if (l->ambientOnly) {**

**ip.ambIllumOut += lightCol;**

**continue;**

**}**

**if (NL<=0.0f)**

**continue;**

**// diffuse**

**if (l->affectDiffuse)**

**ip.diffIllumOut += diffCoef \* lightCol;**

**// specular (Phong2)**

**if (is\_shiny&&l->affectSpecular) {**

**Point3 H = Normalize(L-ip.V);**

**float c = DotProd(ip.N,H);**

**if (c>0.0f) {**

**if (softThresh!=0.0 && diffCoef<softThresh) {**

**c \*= Soften(diffCoef/softThresh);**

**}**

**c = (float)pow((double)c, phExp);**

**ip.specIllumOut += c \* ip.channels[ID\_SS].r \* lightCol;**

**}**

**}**

**}**

**}**

```

// Apply mono self illumination
if ( ! selfIllumClrOn ){
    float si = ip.channels[ID_SI].r;
    ip.diffIllumOut = (si>=1.0f) ? Color(1.0f,1.0f,1.0f) :
        ip.diffIllumOut * (1.0f-si) + si;
} else {
    // colored self illum,
    ip.selfIllumOut += ip.channels[ID_SI];
}
// now we can multiply by the clr,
ip.ambIllumOut *= ip.channels[ID_AM];
ip.diffIllumOut *= ip.channels[ID_DI];
ip.specIllumOut *= ip.channels[ID_SP];

// the following is applicable only in R4
    int chan = ip.stdIDToChannel[ ID_RL ];
    ShadeTransmission(sc, ip, ip.channels[chan], ip.refractAmt);
    chan = ip.stdIDToChannel[ ID_RR ];
    ShadeReflection( sc, ip, ip.channels[chan] );
    CombineComponents( sc, ip );
}

```

Some of the key parts of this method are discussed below:

The **is\_shiny** line sets a boolean based on if the Shader has a shininess setting > 0. Note that the Blinn shader uses the same channel ordering as the original Standard material so it can index its channels using the standard ID **ID\_SS**.

```
BOOL is_shiny= (ip.channels[ID_SS].r > 0.0f) ? 1:0;
```

Next the 'Phong Exponent' is computed. This is just a function that is used to give a certain look. It uses  $2^{(\text{Shininess} * 10)} * 4$ . This calculation simply 'feels right' and gives a good look.

```
double phExp = pow(2.0, ip.channels[ID_SH].r * 10.0) * 4.0;
```

The following loop sums up the effect of each light on this point on surface.

```
for (int i=0; i<sc.nLights; i++) {
```

Inside the loop, the light descriptor is grabbed from the ShadeContext:

```
l = sc.Light(i);
```

The **LightDesc::Illuminate()** method is then called to compute some data:

```
if (l->Illuminate(sc,ip.N,lightCol,L,NL,diffCoef) {
```

To **Illuminate()** is passed the ShadeContext (**sc**), and the normal to the surface (**ip.N**) (pointing away from the surface point).

The method returns the light color (**lightCol**), light vector (**L**) (which points from the surface point to the light), the dot product of N and L (**NL**) and the diffuse coefficient (**diffCoef**). The diffuse coefficient is similar to NL but has the atmosphere between the light and surface point taken into account as well.

The next piece of code checks if the light figures into the computations:

```
if (NL<=0.0f)
    continue;
```

If  $NL < 0$  then the cosine of the vectors is greater than 90 degrees. This means the light is looking at the back of the surface and is therefore not to be considered.

The next statement checks if the light affect the diffuse channel (lights may toggle on or off their ability to affect the diffuse and specular channels.)

```
if (l->affectDiffuse)
    ip.diffIllumOut += diffCoef * lightCol;
```

If the light affects the diffuse channel then the diffuse illumination output component of the **IllumParams** is added to. This is done by multiplying the diffuse coefficient (returned by **LightDesc::Illuminate()**) times the light color (also returned by **LightDesc::Illuminate()**). Notice that the **diffIllumOut** is being accumulated with each pass of the light loop.

The next section of code involves the specular component. If the light is shiny, and it affects the specular channel a vector **H** is computed.

```
if (is_shiny && l->affectSpecular) {
```

Note the following about this **H** vector computation. Most vectors are considered pointing **from** the point on the surface. The view vector (**IllumParams::V**) does not follow this convention. It points from the 'eye' towards the surface. Thus it's reversed from the usual convention.

**H** is computed to be the average of **L** and **V**. This is  $(\mathbf{L} + \mathbf{V})/2$ . Since we normalize this we don't have to divide by the 2. So, if **V** followed the standard convention this would be simply  $\mathbf{L} + \mathbf{V}$ . Since it doesn't it is  $\mathbf{L} + (-\mathbf{ip.V})$  or  $\mathbf{L} - \mathbf{ip.V}$ .

```
Point3 H = Normalize(L-ip.V);
```

Next the dot product of **N** and **H** is computed and stored in **c**. When you take the dot product of two normalized vectors what is returned is the cosine of the angle between the vectors.

```
float c = DotProd(ip.N,H);
```

If  $c > 0$  and the diffuse coefficient is less than the soften threshold then **c** is modified by a 'softening' curve.

```
if (c>0.0f) {  
  if (softThresh!=0.0 && diffCoef<softThresh) {  
    c *= Soften(diffCoef/softThresh);  
  }  
}
```

Note that the **Soften()** function is defined in `\MAXSDK\SAMPLES\MATERIALS\SHADERUTIL.CPP` and developers can copy this code.

```
c = (float)pow((double)c, phExp);
```

Next, **c** is raised to the power of the Phong exponent. This is effectively taking a cosine (a smooth S curve) and raising it to a power. As it is raised to a power it becomes a sharper and sharper S curve. This is where the shape of the highlight curve in the Materials Editor UI comes from.

That completes the pre computations for the specular function. Then **c** is multiplied by the specular strength (**ip.channels[ID\_SS].r**) times the light color (**lightCol**). The result is summed in specular illumination out (**ip.specIllumOut**).

```
ip.specIllumOut += c * ip.channels[ID_SS].r * lightCol;  
}  
}  
}
```

That completes the light loop. It happens over and over for each light.

Next the self illumination is computed. If the Self Illumination Color is not on, then the original code for doing mono self illumination is used.

```
// Apply mono self illumination  
if ( ! selfIllumClrOn ){  
  float si = ip.channels[ID_SI].r;  
  ip.diffIllumOut = (si>=1.0f) ? Color(1.0f,1.0f,1.0f) :  
    ip.diffIllumOut * (1.0f-si) + si;  
} else {
```

Otherwise the self illumination color is summed in to the Self Illumination Out (**ip.selfIllumOut**).

```
// colored self illum,  
ip.selfIllumOut += ip.channels[ID_SI];  
}
```

Then, we multiply by the colors for ambient, diffuse and specular.

```
ip.ambIllumOut *= ip.channels[ID_AM];  
ip.diffIllumOut *= ip.channels[ID_DI];  
ip.specIllumOut *= ip.channels[ID_SP];
```

The results are **ambIllumOut**, **diffIllumOut**, and **specIllumOut**. Note that these components are not summed. In R3 and earlier these results would be returned to the Standard material. However, R4 introduces a couple extra steps. Finally, we call **ShadeTransmission()** and **ShadeReflection()** to apply the transmission/refraction and reflection models. The core implementation of 3ds max provides the standard models, but the shader can override these methods to compute its own models.

```
int chan = ip.stdIDToChannel[ ID_RL ];  
ShadeTransmission(sc, ip, ip.channels[chan], ip.refractAmt);  
chan = ip.stdIDToChannel[ ID_RR ];  
ShadeReflection( sc, ip, ip.channels[chan] );
```

In R4, It is a shader's responsibility to combine the components of the shading process prior to exiting **Illum()** (in R3, this was the responsibility of the Standard material). In order to combine these values together to produce the final color for that point on the surface (**IllumParams.finalC**), the shader should call **CombineComponents()** method. The Shader base class provides a default implementation which simply sums everything together and multiplies by the opacity.

```
virtual void CombineComponents( IllumParams& ip )  
{  
ip.finalC = ip.finalOpac *  
(ip.ambIllumOut + ip.diffIllumOut + ip.selfIllumOut)  
+ ip.specIllumOut + ip.reflIllumOut + ip.transIllumOut ;  
}
```

**Prototype:**

```
virtual void AffectReflection(ShadeContext &sc, IllumParams  
&ip, Color &rcol)=0;
```

**Remarks:**

Note: This method has been superceded by **ShadeReflection()** and is **obsolete** in release 4.0 and later.

This method provides the shader with an opportunity to affect the reflection code.

**Parameters:****ShadeContext &sc**

The ShadeContext which provides information on the pixel being shaded.

**IllumParams &ip**

The object whose data members provide communication between 3ds max and the shader.

**Color &rcol**

The input reflection color is passed in here and the resulting 'affected' color is stored here.

**Sample Code:**

A simple example like Phong does the following:

```
void AffectReflection(ShadeContext &sc, IllumParams &ip, Color  
&rcol)  
{  
    rcol *= ip.channels[ID_SP];  
};
```

If a color can affect the reflection of light off a surface than it can usually affect the reflection of other things off a surface. Thus some shaders influence the reflection color using the specular color and specular level. For instance the Multi Layer Shader does the following:

```
#define DEFAULT_GLOSS2 0.03f
```

```
void MultiLayerShader::AffectReflection(ShadeContext &sc,  
IllumParams &ip, Color &rcol)  
{
```

```

float axy = DEFAULT_GLOSS2;
float norm = 1.0f / (4.0f * PI * axy );
rcol *= ip.channels[_SPECLEV1].r * ip.channels[_SPECCLR1] *
norm;
}

```

**Prototype:**

```
virtual void GetIllumParams(IllumParams* ip)=0;
```

**Remarks:**

This method updates the **channels** (as well as other) data member of the **IllumParams** object passed to it with the **local** variables of the material for possible mapping prior to being given to the Shader's **Illum()** method. The shader plug-in copies the state of all its parameters (at their current animation state) into the data members of the **IllumParams** passed.

**Parameters:**

**IllumParams\* ip**

Points to the IllumParams to update.

**Prototype:**

```
virtual void ShadeReflection(ShadeContext &sc, IllumParams
&ip, Color &mapClr);
```

**Remarks:**

This method is available in release 4.0 and later only.

Compute the reflected color from the **sc**, **ip**, and reflection map (or ray) color. The core implementation of this provides the standard 3ds max reflection model. To support the standard reflection model, a shader may call this default implementation.

**Parameters:**

**ShadeContext& sc**

The context which provides information on the pixel being shaded.

**IllumParams& ip**

The object whose data members provide communication between 3ds

max and the shader.

### **Color &mapClr**

The input reflection (or ray) color is passed in here and the resulting 'affected' color is stored here.

### **Prototype:**

**virtual void ShadeTransmission(ShadeContext &sc, IllumParams &ip, Color &mapClr, float amount);**

### **Remarks:**

This method is available in release 4.0 and later only.

Compute the transmission/refraction color for the sample.. The core implementation of this provides the standard 3ds max reflection model. To support the standard transmission/refraction model, a shader may call this default implementation.

### **Parameters:**

#### **ShadeContext& sc**

The context which provides information on the pixel being shaded.

#### **IllumParams& ip**

The object whose data members provide communication between 3ds max and the shader.

#### **Color &mapClr**

The input refraction (or ray) color is passed in here and the resulting 'affected' color is stored here.

#### **float amount**

The level of the amount spinner for the refraction channel.

## **Mapping Channel Access**

### **Prototype:**

**virtual long nTexChannelsSupported()=0;**

### **Remarks:**

Returns the number of texture map map channels supported by this Shader.

**Prototype:**

```
virtual TSTR GetTexChannelName(long nTextureChan)=0;
```

**Remarks:**

Returns the name of the specified texture map channel.

**Parameters:**

**long nTextureChan**

The zero based index of the texture map channel whose name is returned.

**Prototype:**

```
virtual TSTR GetTexChannelInternalName(long nTextureChan);
```

**Remarks:**

Returns the internal name of the specified texture map. The Standard material uses this to get the fixed, parsable internal name for each texture channel it defines.

**Parameters:**

**long nTextureChan**

The zero based index of the texture map whose name is returned.

**Default Implementation:**

```
{ return GetTexChannelName(nTextureChan); }
```

**Prototype:**

```
virtual long ChannelType(long nTextureChan)=0;
```

**Remarks:**

Returns the channel type for the specified texture map channel. There are four channels which are part of the Material which are not specific to the Shader. All other channels are defined by the Shader (what they are and what they are called.) The four which are not the province of the Shader are Bump, Reflection, Refraction and Displacement. For example, Displacement mapping is really a geometry operation and not a shading one. The channel type returned from this method indicates if the specified channel is one of these, or if it is a monochrome channel, a color channel, or is not a supported channel.

**Parameters:**

## **long nTextureChan**

The zero based index of the texture map whose name is returned.

### **Return Value:**

Texture channel type flags. One or more of the following values:

#### **UNSUPPORTED\_CHANNEL**

Indicates the channel is not supported (is not used).

#### **CLR\_CHANNEL**

A color channel. The **Color.r**, **Color.g** and **Color.b** parameters are used.

#### **MONO\_CHANNEL**

A monochrome channel. Only the **Color.r** is used.

#### **BUMP\_CHANNEL**

The bump mapping channel.

#### **REFL\_CHANNEL**

The reflection channel.

#### **REFR\_CHANNEL**

The refraction channel.

#### **DISP\_CHANNEL**

The displacement channel.

#### **ELIMINATE\_CHANNEL**

Indicates that the channel is not supported. For example, a certain Shader might not support displacement mapping for some reason. If it didn't, it could use this channel type to eliminate the support of displacement mapping for itself. It would be as if displacement mapping was not included in the material. None of the 3ds max shaders use this.

#### **SKIP\_CHANNELS**

This is used internally to indicate that the channels to be skipped.

### **Prototype:**

```
virtual long StdIDToChannel(long stdID)=0;
```

### **Remarks:**

Returns the index of this Shader's channels which corresponds to the specified Standard materials texture map ID. This allows the Shader to arrange its channels in any order it wants in the **IllumParams::channels** array but

enables the Standard material to access specific ones it needs (for instance the Bump channel or Reflection channel).

**Parameters:**

**long stdID**

The ID whose corresponding channel to return. See [List of Texture Map Indices](#).

**Return Value:**

The zero based index of the channel. If there is not a corresponding channel return -1.

**Sample Code:**

This can be handled similar to below where an array is initialized with the values of this plug-in shader's channels that correspond to each of the standard channels. Then this method just returns the correspond index from the array.

```
static int stdIDToChannel[N_ID_CHANNELS] = {  
    0, 1, 2, 5, 4, -1, 7, 8, 9, 10, 11, 12  
};  
  
long StdIDToChannel(long stdID){ return  
stdIDToChannel[stdID]; }
```

**Prototype:**

```
virtual void Reset()=0;
```

**Remarks:**

This method is called when the Shader is first activated in the dropdown list of Shader choices. The Shader should reset itself to its default values.

## **Compositing Method**

**Prototype:**

```
virtual void CombineComponents(ShadeContext &sc,  
IllumParams& ip);
```

**Remarks:**

This method does the final compositing of the various illumination components. A default implementation is provided which simply adds the

components together. Developers who want to do other more specialized composition can override this method. For example, a certain Shader might want to composited highlights over the underlying diffuse component since the light is reflected and the diffuse color wouldn't fully show through. Such a Shader would provide its own version of this method.

**Parameters:**

**ShadeContext &sc**

The ShadeContext which provides information on the pixel being shaded.

**IllumParams& ip**

The illumination parameters to composite and store.

**Default Implementation:**

```
virtual void CombineComponents(IllumParams& ip)
{
    ip.finalC = ip.finalOpac *
        (ip.ambIllumOut + ip.diffIllumOut + ip.selfIllumOut)
        + ip.specIllumOut + ip.reflIllumOut + ip.transIllumOut ;
}
```

**Prototype:**

```
virtual ULONG GetRequirements(int subMtlNum)=0;
```

**Remarks:**

Returns the requirements of the Shader for the specified sub-material. Many objects in the rendering pipeline use the requirements to tell the renderer what data needs to be available. The Shader's requirements are OR'd with the combined map requirements and returned to the renderer via the Stdmtl2's **GetRequirements()** function.

**Parameters:**

**int subMtlNum**

This parameter is not used.

**Return Value:**

One or more of the following flags:

See [List of Material Requirement Flags](#).

## **Load / Save Methods**

### **Prototype:**

**IOResult Save(ISave \*isave)=0;**

### **Remarks:**

Saves the plug-in's name. This should be called at the start of a plug-in's **Save()** method.

### **Parameters:**

**ISave \*isave**

An interface for saving data.

### **Prototype:**

**IOResult Load(ILoad \*iload)=0;**

### **Remarks:**

Loads the plug-in's name. This should be called at the start of a plug-in's **Load()** method.

### **Parameters:**

**ILoad \*iload**

An interface for loading data.

## Class SamplingCallback

See Also: [Class Sampler](#), [Class ShadeContext](#), [Class Color](#), [Class Point2](#).

```
class SamplingCallback : public InterfaceServer
```

### Description:

This class is available in release 3.0 and later only.

This is the callback object for the **DoSamples()** method of class **Sampler**. The **SampleAtOffset()** method is the one that actually computes the shading value for the Sampler.

### Methods:

public:

### Prototype:

```
virtual BOOL SampleAtOffset(Color &col, Color &trans, Point2& sample, float sampleScale)=0;
```

### Remarks:

This is the method that integrates the sampler into the renderer. The plug-in Sampler calls this method to actually perform a sample at the specified 2D point. This method computes the output color and transparency.

### Parameters:

#### **Color &col**

The output color.

#### **Color &trans**

The output transparency.

#### **Point2& sample**

The 2D sample point.

#### **float sampleScale**

The scale of the sample. This parameter is the way a sampler tells the shader to use the whole pixel (sampleScale=1) size for texture samples or some fraction. This scale is an **edge** scale not an **area** scale, so if you want samples 1/4 pixel large the sampleScale should be 1/2.

### Return Value:

TRUE if the sample was processed; FALSE if the clipped sample was ignored.

## Class HSVCallback

See Also: [Class ColorPicker](#), [List of Color Conversion Utilities](#).

class HSVCallback

### Description:

This class provides methods that are called when using the modeless color picker. All methods of this class are implemented by the Plug-In.

### Methods:

### Prototype:

**virtual void ColorChanged(DWORD col, BOOL buttonUp)=0;**

### Remarks:

Implemented by the Plug-In.

This callback proc gets called after the user changes the color. Implement this method to handle interactive updates.

### Parameters:

**DWORD col**

The new color.

**BOOL buttonUp**

Indicates if the mouse button has been released (is up). TRUE if the button is up; FALSE if it is down.

### Prototype:

**virtual void BeingDestroyed(IPoint2 pos)=0;**

### Remarks:

Implemented by the Plug-In.

This callback proc gets called when the color picker is closed:

### Parameters:

**IPoint2 pos**

The last screen position of the color picker before it was closed.

### Prototype:

## **virtual void ButtonDown()**

### **Remarks:**

Implemented by the Plug-In.

This method is called when the user has pressed the mouse button.

### **Default Implementation:**

```
{}
```

### **Prototype:**

**virtual void ButtonUp(BOOL accept)**

### **Remarks:**

Implemented by the Plug-In.

This method is called when the user has released the mouse button.

### **Parameters:**

**BOOL accept**

TRUE if the mouse button was released normally; FALSE if the user canceled.

### **Default Implementation:**

```
{}
```

## Class MCDeviceBinding

See Also: [Class ReferenceTarget](#), [Class MCInputDevice](#), [Class IMCParamDlg](#), [Class IRollupWindow](#).

```
class MCDeviceBinding : public ReferenceTarget
```

### Description:

An instance of this class is created when a motion capture controller binds one of its parameters to a device. The main purpose of this class is to store any parameters that describe the binding.

### Methods:

#### Prototype:

```
virtual MCInputDevice *GetDevice()=0;
```

#### Remarks:

Returns a pointer to the bound input device.

#### Prototype:

```
virtual void DeleteThis()=0;
```

#### Remarks:

Deletes this instance of the class.

#### Prototype:

```
virtual TSTR BindingName()=0;
```

#### Remarks:

Returns the name of the bound input device.

#### Prototype:

```
virtual float Eval(TimeValue t)=0;
```

#### Remarks:

A device binding is the thing that the controller evaluates to get the value of the device. Everything is simply a scalar parameter. So for example even for a device like a mouse that has X and Y motion the device binding will break down into simply X or Y. This method is used to return the value of the device

at the instant this method is called.

**Parameters:**

**TimeValue t**

The time at which this method is called.

**Prototype:**

**virtual void AddRollup(IMCParamDlg \*dlg)=0;**

**Remarks:**

This method is called to allow the binding to put up any user interface it has into the command panel via rollup pages.

**Parameters:**

**IMCParamDlg \*dlg**

The **IRollupWindow** data member of this class may be used to add the rollup page.

**Sample Code:**

```
dlg->iRoll->AppendRollup(  
    hInstance,  
    MAKEINTRESOURCE(IDD_MC_MOUSE),  
    MouseDeviceDlgProc,  
    GetString(IDS_RB_MOUSEDEVICE),  
    (LPARAM)dlg);
```

**Prototype:**

**virtual void UpdateRollup(IRollupWindow \*iRoll)=0;**

**Remarks:**

This method is called to allow the plug-in to update the values in its user interface rollup.

**Parameters:**

**IRollupWindow \*iRoll**

The interface into the command panel rollups. The **GetPanelDlg()** method may be used to return the window handle of the dialog and this **HWND** may be used to update the controls.

**Prototype:**

**virtual void BeginActivate(BOOL reset=TRUE);**

**Remarks:**

This method is called when the binding becomes active.

**Parameters:**

**BOOL reset=TRUE**

If TRUE 3ds max is being reset; otherwise this is the first time the binding is becoming active.

**Default Implementation:**

**{}**

**Prototype:**

**virtual void EndActivate();**

**Remarks:**

This method is called when the binding has been released.

**Default Implementation:**

**{}**

**Prototype:**

**virtual void Accumulate(TimeValue t);**

**Remarks:**

This method is called 50 times per second during motion capture.

To understand how this is used consider the following two situations for a motion capture device:

1. The motion capture device is a joystick, and the position of the joystick directly maps to a range of some parameter. In this case, if you need to evaluate the parameter, you simply evaluate the joystick (inside the **Eval()** method). The position establishes the value.
2. A different case is where you have a parameter at a starting value, and if the joystick is moved, to say the right, the value is incremented. If the joystick is moved to the left the value is decremented. In this case the value can theoretically reach any value. What is needed is for the value to be incremented and decremented in a consistent fashion. If the joystick is

polled only during the **Eval()** method, and the value is incremented or decremented there, it may be a problem. If two things are using the same motion capture device, the value will be incremented or decremented twice inside **Eval()**. This will cause the value to grow or shrink twice as fast. If three things evaluated the same joystick it would move three times as fast because it would get incremented three times per frame. The solution is to use this method. It is called 50 times per second. The increments are done inside this method, and when the **Eval()** method is called the accumulated state is simply returned. This works because the method is called a fixed number of times per second regardless of the number of items evaluating the device.

**Parameters:**

**TimeValue t**

The current time when this method is called.

**Default Implementation:**

```
{}
```

## Class IMCapManager

See Also: [Class MCDeviceBinding](#), [Class IMCapManager](#).

class IMCapManager

### Description:

This class is available in release 2.0 and later only.

This is an interface into the motion capture manager. This interface is passed to plug-ins derived from class **MCDeviceBinding**. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

**virtual void MidiNote(int channel, int note)=0;**

#### Remarks:

This method is obsolete.

#### Prototype:

**virtual TimeValue GetTime()=0;**

#### Remarks:

This method returns the current time at which it is called. This is an aide for devices where interaction is happening asynchronously (the MIDI interface is an example of this). The MIDI motion capture device uses a separate thread to track the MIDI keyboard. When the user presses a key, the MIDI device plug-in needs to record which key was pressed and when. It calls this method to grab the current 3ds max time at which it happened.

## Class DPoint3

class DPoint3

### Description:

This class describes a 3D point using double precision x, y and z coordinates. Methods are provided to add and subtract points, multiply and divide by scalars, and element by element multiply and divide two points. All methods are implemented by the system.

### Data Members:

public:

**double x,y,z;**

### Methods:

### Prototype:

**DPoint3()**

### Remarks:

Constructor. No initialization is performed.

### Prototype:

**DPoint3(double X, double Y, double Z)**

### Remarks:

Constructor. x, y, and z are initialized to the values specified.

### Prototype:

**DPoint3(const DPoint3& a)**

### Remarks:

Constructor. x, y, and z are initialized to the DPoint3 specified.

### Prototype:

**DPoint3(double af[3])**

### Remarks:

Constructor. x, y, and z are initialized to. af[0], af[1], and af[2] respectively.

**Operators:**

**Prototype:**

**double& operator[](int i)  
const double& operator[](int i) const**

**Remarks:**

Allows access to x, y and z using the subscript operator.

**Return Value:**

An index of 0 will return x, 1 will return y, 2 will return z.

**Prototype:**

**operator double\*()**

**Remarks:**

Conversion function. Returns the address of the DPoint3.x

**Prototype:**

**DPoint3 operator-() const**

**Remarks:**

Unary - operator. Negates both x, y and z.

**Prototype:**

**DPoint3 operator+() const**

**Remarks:**

Unary +. Returns the point unaltered.

**Prototype:**

**DPoint3& operator-=(const DPoint3&);**

**Remarks:**

Subtracts a DPoint3 from this DPoint3.

**Prototype:**

**DPoint3& operator+=(const DPoint3&);**

**Remarks:**

Adds a DPoint3 to this DPoint3.

**Prototype:**

**DPoint3& operator\*=(double);**

**Remarks:**

Each element of this DPoint3 is multiplied by the specified double.

**Prototype:**

**DPoint3& operator/=(double);**

**Remarks:**

Each element of this DPoint3 is divided by the specified double.

**Prototype:**

**DPoint3 operator-(const DPoint3&) const;**

**Remarks:**

Subtracts a DPoint3 from a DPoint3.

**Prototype:**

**DPoint3 operator+(const DPoint3&) const;**

**Remarks:**

Adds a DPoint3 to a DPoint3.

**Prototype:**

**double operator\*(const DPoint3&) const;**

**Remarks:**

Computes the dot product of this DPoint3 and the specified DPoint3.

**Prototype:**

**DPoint3 operator^(const DPoint3&) const;**

**Remarks:**

Computes the cross product of this DPoint3 and the specified DPoint3.

The following functions are not methods of DPoint3 but are available for use:

**Prototype:**

**double Length(const DPoint3&);**

**Remarks:**

Returns the 'Length' of the point. This is  $\text{sqrt}(v.x*v.x+v.y*v.y+v.z*v.z)$

**Prototype:**

**int MaxComponent(const DPoint3&);**

**Remarks:**

Returns the component with the maximum absolute value. 0=x, 1=y, 2=z.

**Prototype:**

**int MinComponent(const DPoint3&);**

**Remarks:**

Returns the component with the minimum absolute value. 0=x, 1=y, 2=z.

**Prototype:**

**DPoint3 Normalize(const DPoint3&);**

**Remarks:**

Returns a unit vector. This is a DPoint3 with each component divided by the point **Length()**.

**Prototype:**

**DPoint3 CrossProd(const DPoint3& a, const DPoint3& b);**

**Remarks:**

Returns the cross product of two DPoint3s.

**Prototype:**

**double DotProd(const DPoint3& a, const DPoint3& b);**

**Remarks:**

Returns the dot product of two DPoint3s.

## Class IKey

See Also: [Class IKeyControl](#), [Class Animatable](#).

class IKey

### Description:

This is the base class for keys that are part of the controller interface. This class stores the time of the key, and some flags that describe the properties of the key.

### Data Members:

public:

#### **TimeValue time;**

The time of the key.

#### **DWORD flags;**

The flag bits for keys. One or more of the following values:

General flags

#### **IKEY\_SELECTED**

The key is selected.

#### **IKEY\_XSEL**

In the function curve editor X is selected.

#### **IKEY\_YSEL**

In the function curve editor Y is selected.

#### **IKEY\_ZSEL**

In the function curve editor Z is selected.

#### **IKEY\_FLAGGED**

The key is flagged. See **Animatable::FlagKey()**.

#### **IKEY\_TIME\_LOCK**

The key is locked in time so it won't move.

TCB specific key flags:

#### **TCBKEY\_QUATVALID**

The quaternion TCB key has inside it both a quaternion and an angle axis. When this bit is set the angle/axis is derived from the quaternion instead of vice/versa.

Bezier specific key flags:

## **BEZKEY\_CONSTVELOCITY**

This key is interpolated using arclength as the interpolation parameter.

## **BEZKEY\_XBROKEN**

## **BEZKEY\_YBROKEN**

## **BEZKEY\_ZBROKEN**

Indicates if the tangent handles are locked together. Broken means not locked.

The following macros may be used to test and set the tangent locks:

**TangentsLocked(f,j);**

**SetTangentLock(f,j,l);**

The following macros may be used to access the hybrid tangent types:

**GetInTanType(f);**

**GetOutTanType(f);**

**SetINTanType(f,t);**

**SetOutTanType(f,t);**

### **Methods:**

### **Prototype:**

**IKey();**

### **Remarks:**

Constructor. The time and flags are set to zero.

## Class ITCBKey

See Also: [Class IKey](#).

```
class ITCBKey : public IKey
```

### Description:

This is the base class for Tension Continuity and Bias keys.

### Data Members:

public:

#### **float tens;**

The tension setting. Values are in the range -1.0 to 1.0, where 0.0 is the default.

#### **float cont;**

The continuity setting. Values are in the range -1.0 to 1.0, where 0.0 is the default.

#### **float bias;**

The bias setting. Values are in the range -1.0 to 1.0, where 0.0 is the default.

#### **float easeIn;**

The ease in value. Values are in the range 0.0 to 50.0, where 25.0 is the default.

#### **float easeOut;**

The ease out value. Values are in the range 0.0 to 50.0, where 25.0 is the default.

## List of Mapping Channel Index Values

See Also: [Class Object](#), [Class Mesh](#).

The mesh mapping channel may be specified as one of the following:

**0**: Vertex Color channel.

**1**: Default mapping channel (the **TVert** array).

**2** through **MAX\_MESHMAPS-1**: The new mapping channels available in release 3.0.

## Class Ray

See Also: [Class Point3](#).

class Ray

### Description:

This class describes a vector in space using an origin point **p**, and a unit direction vector **dir**.

### Data Members:

public:

**Point3 p;**

Point of origin.

**Point3 dir;**

Unit direction vector.

## List of Object Channel Numbers

See Also: [List of Channel Bits](#).

The following are the indices that may be used for the object channels. These values are used in the methods **Object::UpdateValidity()**, **Object::SetChannelValidity()** and **Object::ChannelValidity()**.

### **TOPO\_CHAN\_NUM**

The topology channel number. The actual value is 0.

### **GEOM\_CHAN\_NUM**

The geometry channel number. The actual value is 1.

### **TEXMAP\_CHAN\_NUM**

The texture vertices and procedural mappings channels number. The actual value is 2.

### **MTL\_CHAN\_NUM**

This is no longer used. Materials are rolled into the topology channel number. The actual value is 3.

### **SELECT\_CHAN\_NUM**

The sub-object selection channel number. The actual value is 4.

### **SUBSEL\_TYPE\_CHAN\_NUM**

This is the current level of selection number. The actual value is 5.

### **DISP\_ATTRIB\_CHAN\_NUM**

The display channel number. The actual value is 6.

### **VERT\_COLOR\_CHAN\_NUM**

The vertex colors number. This is also used for the second mapping channel. The actual value is 7.

### **GFX\_DATA\_CHAN\_NUM**

The stripping, edge list, etc. channel number. The actual value is 8.

### **DISP\_APPROX\_CHAN\_NUM**

The displacement approximation channel number. The actual value is 9.

### **EXTENSION\_CHAN\_NUM**

This channel number is available in release 4.0 and later only.

The extension object channel number. The actual value is 10.

Note: Developers must not get confused between these object channel numbers (**TOPO\_CHAN\_NUM**, **GEOM\_CHAN\_NUM**, etc.) and the

channel bits (**TOPO\_CHANNEL**, **GEOM\_CHANNEL**, etc.). Some methods refer to the channel by number and some by bit. Developers must not confuse these two as the compiler will not catch this as an error. See [List of Channel Bits](#).

# Class RNormal

See Also: [Class Mesh](#), [Class RVertex](#), [Class GraphicsWindow](#).

class RNormal

## Description:

The 'rendered' normal class. **RNormals** are stored as unit vectors in object space. An instance of this class is maintained by the **RVertex** class since the **RVertex** is what gets rendered (lit), and the lighting methods need to know about the normals. All methods of this class are implemented by the system.

**Note:** This class is used internally by 3ds max. Developers who need to compute face and vertex normals for a mesh should instead refer to the Advanced Topics section [Computing Face and Vertex Normals](#).

## Data Members:

private:

### **Point3 normal;**

The normal as a unit vector. Note that if you set this normal, you should call the method **normalize()** if you are not sure the normal is already unit length.

### **DWORD smGroup;**

The smoothing group. Normals are attached to smoothing groups in the sense that one vertex, if it is shared by two triangles with different smoothing groups, will have two normals associated with it -- one for each smoothing group.

### **MtlID mtlIndex;**

The material index. If one vertex is shared between two materials, there will be two normals. Therefore the material index is stored with the normal as well.

Note: **typedef unsigned short MtlID;**

### **Point3 rgb;**

The RGB value.

## Methods:

## Prototype:

**RNormal();**

**Remarks:**

Constructor. The smoothing group and material index are set to zero.

**Prototype:**

```
void setNormal(const Point3 &nor);
```

**Remarks:**

Sets the normal to the specified value.

**Parameters:**

```
const Point3 &nor
```

The normal value to set.

**Prototype:**

```
void addNormal(const Point3 &nor);
```

**Remarks:**

Adds the specified value to the value of the normal.

**Parameters:**

```
const Point3 &nor
```

The normal value to add to the existing value.

**Prototype:**

```
void normalize();
```

**Remarks:**

Converts the normal to a unit vector.

**Prototype:**

```
Point3 &getNormal();
```

**Remarks:**

Returns the normal.

**Prototype:**

```
void setSmGroup(DWORD g);
```

**Remarks:**

Sets the smoothing group to the specified value.

**Parameters:**

**DWORD g**

The smoothing group value to set.

**Prototype:**

**void addSmGroup(DWORD g);**

**Remarks:**

ORs the specified smoothing group value to the existing value.

**Parameters:**

**DWORD g**

The smoothing group bits to set.

**Prototype:**

**DWORD getSmGroup();**

**Remarks:**

Returns the smoothing group value.

**Prototype:**

**void setMtlIndex(MtlID i);**

**Remarks:**

Sets the material index to the specified value.

**Parameters:**

**MtlID i**

The material index value to set.

**Prototype:**

**MtlID getMtlIndex();**

**Remarks:**

Returns the material index.

**Prototype:**

**void setRGB(Point3 &clr);**

**Remarks:**

Sets the RGB value.

**Parameters:**

**Point3 &clr**

The RGB color to set.

**Prototype:**

**Point3 &getRGB();**

**Remarks:**

Returns the RGB value.

## Class RVertex

See Also: [Class RNormal](#), [Class Mesh](#), [Class GraphicsWindow](#).

class RVertex

### Description:

A **RVertex** is a rendered vertex. A vertex becomes a **RVertex** after it has been transformed. A **RVertex** has a position (x, y, z coordinate) that is stored in device coordinates. These are stored in the data member **fPos[3]**.

One vertex in a **Mesh** can be shared between many different smoothing groups. In the 3ds max **Mesh** database, the vertices are shared, however the normals are not. This is why an **RVertex** has a **RNormal** data member. For example, if you had a sphere that had the top and bottom hemi-spheres smoothed separately (i.e. not smoothed across the equator), then the vertices across the equator would have two **RNormals** for each **RVertex** while the other vertices would have one. There may be as many **RNormals** as there are smoothing groups colliding at a vertex. However, it is by far the most common case to have one, and anything other than one or two is very rare.

For purposes of smoothing, as many **RNormals** are allocated as required and are stored in this class. **RNormals** are kept in this **RVertex** class since the **RVertex** is what gets rendered (lit). When you light a vertex you need to know its normal direction. Thus the **RNormal(s)** are stored in this class (using data member **rn** or **\*ern**).

All methods of this class are implemented by the system.

**Note:** This class is used internally by 3ds max. Developers who need to compute face and vertex normals for a mesh should instead refer to the Advanced Topics section [Computing Face and Vertex Normals](#).

### Data Members:

public:

#### **DWORD rFlags;**

The flags contain the clip flags, the number of normals at the vertex, and the number of normals that have already been rendered. These are used internally. For example, the clipping flags are used to see if the RVertex can be either trivially accepted or rejected when rendering.

```

#define NORCT_MASK  0x000000ffUL
#define SPECIFIED_NORMAL 0x00004000UL
#define OUT_LEFT  0x00010000UL
#define OUT_RIGHT  0x00020000UL
#define OUT_TOP    0x00040000UL
#define OUT_BOTTOM 0x00080000UL
#define RECT_MASK  0x000f0000UL
#define RND_MASK   0xfff00000UL
#define RND_NOR0   0x00100000UL
#define RND_NOR(n) (RND_NOR0 << (n))
union {
  int iPos[3];
  // This position is no longer used.
  float fPos[3];
  // This is used to store the position in device coordinates, [0]=x, [1]=y,
  // [2]=z.
};

```

**RNormal rn;**

If a single RNormal is used, it is stored here.

**RNormal \*ern;**

In some cases, there may be two or more RNormals per vertex. If this is the case, these 'extra' RNormals are allocated and the pointer to the memory is stored here. If these are used, then data member **rn** is not used (**rn** is copied into **ern[0]**).

**Methods:**

**Prototype:**

**RVertex();**

**Remarks:**

Constructor. The flags are set to zero and the **ern** pointer is set to NULL.

**Prototype:**

**~RVertex();**

**Remarks:**  
Destructor.

## Class MeshMap

See Also: [Class Mesh](#).

class MeshMap

### Description:

This class is available in release 3.0 and later only.

In 3ds max 3.0 and later the user may work with more than 2 mapping channels. When the mapping channel is set to a value greater than 1 (by using a UVWMap Modifier for example) then an instance of this class is allocated for each channel up to the value specified. It maintains the mapping information for a single channel.

An array of instances of this class is carried by the Mesh class in the public data member:

**MeshMap \*maps;**

All methods of this class are implemented by the system.

### Data Members:

public:

**DWORD flags;**

The mapping flags. One or more of the following values:

**MESHMAP\_USED**

Indicates this mapping channel is actually used (carries mapping information).

**MESHMAP\_TEXTURE**

Indicates this is a texture mapping channel.

**MESHMAP\_VERTCOLOR**

Indicates this is a vertex color channel.

**MESHMAP\_USER**

Indicates the channel is used for a developer purpose.

**UVVert \*tv;**

Array of texture vertices. This stores the UVW coordinates for the mapping channel. **Note: typedef Point3 UVVert;**

**TVFace \*tf;**

The texture vertex faces. There needs to be one TVFace for every face in the

Mesh, but there can be three indices into the UVVert array that are any UV's.

**int vnum;**

The number of elements in the **UVVert** array.

**int fnum;**

The number of elements in the **TVFace** array.

**The following global functions are not part of the class but are available for use**

**Prototype:**

**DWORD MapChannelID (int mp);**

**Remarks:**

This method is available in release 4.0 and later only.

Returns the Channel ID of the map channel. if mp>=1, this always returns **TEXMAP\_CHANNEL**. For mp<1, including the hidden map channels, this is currently always **VERTCOLOR\_CHANNEL**. In the future it may include map channels that are actually part of **GEOM\_CHANNEL** or something.

**Parameters:**

**int mp**

The map channel.

**Prototype:**

**int MapChannelNum (int mp);**

**Remarks:**

This method is available in release 4.0 and later only.

Similar to MapChannelID, but this returns the CHAN\_NUM version: **TEXMAP\_CHAN\_NUM**, **VERTCOLOR\_CHAN\_NUM**, etc.

**Parameters:**

**int mp**

The map channel.

**Methods:**

public:

**Prototype:**

**MeshMap();**

**Remarks:**

Constructor. The flags are cleared, the vertex and face numbers are set to 0, and the tv and tf pointers are set to NULL.

**Prototype:**

**~MeshMap();**

**Remarks:**

Destructor. If the tv and tf arrays are allocated they are deleted.

**Prototype:**

**int getNumVerts();**

**Remarks:**

Returns the number of **UVVerts**.

**Prototype:**

**void setNumVerts(int vn, BOOL keep=FALSE);**

**Remarks:**

Sets the number of UVVerts allocated to the specified value.

**Parameters:**

**int vn**

The new number of UVVerts to allocate.

**BOOL keep=FALSE**

If TRUE any previously allocated UVVerts are maintained (up to the maximum set by **vn**). If FALSE they are discarded.

**Prototype:**

**int getNumFaces();**

**Remarks:**

Returns the number of TVFaces.

**Prototype:**

```
void setNumFaces(int fn, BOOL keep=FALSE);
```

**Remarks:**

Set the number of TVFaces allocated to the specified value.

**Parameters:**

**int fn**

The new number of TVFaces to allocate.

**BOOL keep=FALSE**

If TRUE any previously allocated TVFaces are maintained (up to the maximum set by **fn**). If FALSE they are discarded.

**Prototype:**

```
void Clear();
```

**Remarks:**

Clears (deletes) the **tv** and **tf** arrays and sets the counts to zero.

**Prototype:**

```
BitArray GetIsoVerts();
```

**Remarks:**

This method returns a BitArray with size vnum, where isolated (unused) vertices are selected.

**Prototype:**

```
void DeleteVertSet(BitArray set, BitArray *delFace=NULL);
```

**Remarks:**

This method is used to delete vertices from a mesh map.

**Parameters:**

**BitArray set**

The array of bits where mapping vertices you want to delete are set.

**BitArray \*delFace=NULL**

This is an optional parameter. If non-NULL, it's filled with a record of which faces, if any, were using the specified map verts and should therefore be deleted or considered invalid. (Note: in normal usage, it's preferable to remove any compromised faces *\_before\_* deleting vertices, so this parameter would rarely be used.)

**Prototype:**

**void DeleteFaceSet(BitArray set, BitArray \*isoVert=NULL);**

**Remarks:**

This method is used to delete faces from a mesh map.

**Parameters:**

**BitArray set**

This is a list of mapping faces to delete.

**BitArray \*isoVert=NULL**

If non-NULL, this BitArray is filled with a list of map vertices that were used by the deleted faces but not by any remaining faces. (This is a list of "newly isolated" map vertices.)

NOTE: The number and arrangement of faces in a MeshMap should always agree with the "parent" mesh. It's safest in most cases to just let this be handled by **Mesh::DeleteFaceSet()**.

**Prototype:**

**void SetFlag(DWORD fl);**

**Remarks:**

Sets the specified flag(s).

**Parameters:**

**DWORD fl**

The flags to set. See the public data member **flags** above.

**Prototype:**

**void ClearFlag(DWORD fl);**

**Remarks:**

Clears the specified flag(s).

**Parameters:**

**DWORD fl**

The flags to clear. See the public data member **flags** above.

**Prototype:**

**BOOL GetFlag(DWORD fl);**

**Remarks:**

Returns TRUE if the specified flag(s) are set; otherwise FALSE.

**Parameters:**

**DWORD fl**

The flags to check. See the public data member **flags** above.

**Prototype:**

**BOOL IsUsed();**

**Remarks:**

Returns TRUE if this mapping channel is being used; otherwise FALSE.

**Prototype:**

**void SwapContents(MeshMap &from);**

**Remarks:**

Exchanges the data between this MeshMap object and the specified one. The **flags**, **vnum** and **fnum** values are exchanged. The **UVVert** and **TVFace** pointers are swapped.

**Parameters:**

**MeshMap &from**

The MeshMap instance to swap with.

**Prototype:**

**MeshMap & operator=(MeshMap & from);**

**Remarks:**

Assignment operator.

**Parameters:**

**MeshMap &from**

The MeshMap to assign.

# Class PerData

See Also: [Class Mesh](#).

class PerData

## Description:

This class is available in release 3.0 and later only.

This class is used for per-'something' floating-point information. For example, it is used with Meshes to keep track of such per-**vertex** information as weighted (Affect Region or Soft) selections and vertex weights. It is used in MNMesh to store per-**edge** data (edge weights).

Currently there's only one "type" of data supported, floating point values, but this may be extended in the future. PerData arrays in Meshes and MNMeshes cannot be reserved for plug-ins at this time; 3ds max maintains the list in MESH.H of the reserved vertex data channels, and in MNMESH.H for the MNEdge data channels.

The methods of this class are deliberately made to look like Tab<> methods. All methods of this class are implemented by the system.

## Data Members:

All data members are public.

### **int dnum;**

The number of elements of per-vertex data.

### **int type;**

The type of data held by this class. At present the only 3ds max defined option is:

**PERDATA\_TYPE\_FLOAT**

### **int alloc;**

The number of elements currently allocated in the **data** array.

### **void \*data;**

Points to the actual data.

**The following functions are not methods of this class but are available for use:**

## Function:

**int VertexDataType(int vdID);**

**Remarks:**

Returns the type of data supported, i.e. **PERDATA\_TYPE\_FLOAT**.

**Parameters:**

**int vdID**

This parameter is ignored.

**Function:**

**void \*VertexDataDefault(int vdID);**

**Remarks:**

Returns a pointer to a default floating point value for the specified channel.

**Parameters:**

**int vdID**

One of the following values:

**VDATA\_SELECT** - Soft Selection

**VDATA\_WEIGHT** - Vertex weights (for NURMS MeshSmooth)

**VDATA\_ALPHA** - Vertex Alpha values (R4 and later only)

**VDATA\_CORNER** - Cornering values for subdivision use (R4 and later only)

**Methods:**

public:

**Prototype:**

**PerData();**

**Remarks:**

Constructor. The number of elements is set to 0, the type is set to 0 and the data pointer is set to NULL.

**Prototype:**

**PerData(int n, int tp);**

**Remarks:**

Constructor. The data members are initialized as follows:

**data=NULL; dnum=0; alloc=0; type=tp;**

**Parameters:**

**int n**

The number of elements to allocate.

**int tp**

The type to set.

**Prototype:**

**~PerData();**

**Remarks:**

Destructor. Any allocated data is freed and the count and type are set to 0.

**Prototype:**

**int DataSize();**

**Remarks:**

Returns the number of bytes used by the base data type for the vertex data.

This is only implemented for a type of **VDATA\_TYPE\_FLOAT** in which case it returns **sizeof(float)**. Other cases simply return 0.

**Prototype:**

**void \*AllocData(int num);**

**Remarks:**

Allocates and returns a pointer to an array of floats of the specified size.

**Parameters:**

**int num**

The number of floats to allocate.

**Prototype:**

**void FreeData(void \*addr);**

**Remarks:**

Deletes the specified array of floats.

**Parameters:**

**void \*addr**

Points to the array of floats to free.

**Prototype:**

**void \*Addr(void \*ptr, int at);**

**Remarks:**

Returns the address of the specified element in the array passed.

**Parameters:**

**void \*ptr**

The array whose **at**-th element address is returned.

**int at**

The zero based index of the element.

**Prototype:**

**void \*Addr(int at);**

**Remarks:**

Returns the address of the specified element in the **data** array.

**Parameters:**

**int at**

The zero based index of the element.

**Prototype:**

**void CopyData(void \*to, void \*from, int num=1);**

**Remarks:**

Copies the specified number of elements between the two data arrays.

**Parameters:**

**void \*to**

Points to the destination data array.

**void \*from**

Points to the source data array.

**int num=1**

The number of elements to copy.

**Prototype:**

**void CopyData(int to, int from, int num=1);**

**Remarks:**

Copies the specified number of elements between the two specified locations in the **data** array.

**Parameters:**

**int to**

The zero based index into the **data** array of the destination.

**int from**

The zero based index into the **data** array of the source.

**int num=1**

The number of elements to copy.

**Prototype:**

**void WeightedSum(void \*to, void \*fr1, float prop1, void \*fr2, float prop2);**

**Remarks:**

Computes the weighted sum of the arguments passed. This is effectively  $c = a*prop1 + b*prop2$ .

This is used, for example, in splitting an edge, where we would want to interpolate the vertex weight values from the edge's endpoints to create the weight for the new vertex.

**Parameters:**

**void \*to**

A pointer to the location in which the result should be stored.

**void \*fr1**

A pointer to the first value to be summed.

**float prop1**

The weight given to the first value.

**void \*fr2**

A pointer to the second value.

**float prop2**

The weight given to the second value.

**Prototype:**

**void WeightedSum(int to, int fr1, float prop1, int fr2, float prop2);**

**Remarks:**

Computes the weighted sum of the arguments passed. This is similar to the method above except to, fr1, and fr2 are indices of the values in the PerData array. That is, PerData::WeightedSum (c, a, prop1, b, prop2), where a, b, and c are ints between 0 and PerData::dnum-1, is equivalent to the call PerData::WeightedSum (PerData::Addr(c), PerData::Addr(a), prop1, PerData::Addr(b), prop2).

**Parameters:**

**int to**

The index in the PerData array of the location in which the result should be stored.

**int fr1**

The index of the first value to be summed in the PerData array.

**float prop1**

The weight given to the first value.

**int fr2**

The index of the second value to be summed in the PerData array.

**float prop2**

The weight given to the second value.

**Prototype:**

**void setAlloc(int num, BOOL keep=TRUE);**

**Remarks:**

Sets the number of elements allocated in the **data** array.

**Parameters:**

**int num**

The number of elements to allocate.

**BOOL keep=TRUE**

If TRUE previous values are kept (copied to the new storage); otherwise they are discarded.

**Prototype:**

**void SetCount(int num, BOOL keep = FALSE);**

**Remarks:**

Sets the number of elements allocated in the **data** array and sets the **dnum** member to **num**.

**Parameters:**

**int num**

The number of elements to allocate.

**BOOL keep = FALSE**

If TRUE previous values are kept (copied to the new storage); otherwise they are discarded.

**Prototype:**

**void Shrink();**

**Remarks:**

Reduces the size of the **data** array to contain **dnum** elements.

**Prototype:**

**int Count();**

**Remarks:**

Returns the number of elements used (**dnum**)

**Prototype:**

**void Clear();**

**Remarks:**

Clears (deletes) any allocated data and sets the count and type to 0.

**Prototype:**

**void DeleteSet(BitArray del);**

**Remarks:**

Removes any element whose corresponding element in the BitArray is not set.

**Parameters:**

**BitArray del**

Specifies which elements to delete. Data elements corresponding to bits that are on remain; for bits that are off the elements are deleted.

**Prototype:**

**void Delete(int at, int num);**

**Remarks:**

Deletes the specified number of elements from the specified location in the data array.

**Parameters:**

**int at**

The location to delete elements.

**int num**

The number of elements to delete.

**Prototype:**

**void Insert(int at, int num, void \*el);**

**Remarks:**

Inserts the specified number of data elements into the specified location in the **data** array.

**Parameters:**

**int at**

The zero based index of the location for the insert.

**int num**

The number of elements to insert.

**void \*el**

The data to insert.

**Prototype:**

**void Append(int num, void \*el);**

**Remarks:**

Appends the specified elements to the **data** array.

**Parameters:**

**int num**

The number of elements to append.

**void \*el**

The data to append.

**Prototype:**

**void InsertCopies(int at, int num, void \*el);**

**Remarks:**

Inserts the specified number of elements into the **data** array at the given location.

**Parameters:**

**int at**

The zero based index of the location to insert the data.

**int num**

The number of elements to insert.

**void \*el**

**Prototype:**

**void AppendCopies(int num, void \*el);**

**Remarks:**

Appends the specified number of elements to the **data** array.

**Parameters:**

**int num**

The number of elements to append.

**void \*el**

The data to append.

**Prototype:**

**void SwapContents(PerData &from);**

**Remarks:**

Swaps the contents of this PerData object and the specified one.

**Parameters:**

**PerData &from**

The object to swap with.

**Prototype:**

**PerData &operator=(PerData &from);**

**Remarks:**

Assignment operator.

**Parameters:**

**PerData &from**

The VertexData source.

## List of Vertex Data Index Options

See Also: [Class Mesh](#), [Class MNMesh](#), [Class PerData](#).

The following are the vertex data channel index values for use with the vertex data methods of class **Mesh**, class **EPoly**, and class **MNMesh**.

**VDATA\_SELECT**: The vertex soft selection data. This is index 0.

**VDATA\_WEIGHT**: The vertex weight data. This is index 1.

2 through **MAX\_VERTDATA-1**: Developer defined data. Note: **#define MAX\_VERTDATA 100**

## Class SubObjHitList

See Also: [Class MeshSubHitRec](#).

class SubObjHitList

### Description:

This class describes a list of sub-object hit records. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

**SubObjHitList();**

#### Remarks:

Constructor. The list is set to NULL.

#### Prototype:

**~SubObjHitList()**

#### Remarks:

Destructor. All the hit records are deleted.

#### Prototype:

**MeshSubHitRec \*First();**

#### Remarks:

Returns the first item in the hit list.

#### Prototype:

**void AddHit( DWORD dist, int index );**

#### Remarks:

Allocates and adds a new hit record to the list.

#### Parameters:

**DWORD dist**

The distance of the hit.

**int index**

The index of the hit.

## List of Mesh Flags

See Also: [Class Mesh](#).

One or more of the following values:

### **MESH\_EDGE\_LIST**

This flag is obsolete.

### **MESH\_LOCK\_RENDDATA**

Setting this flag prevents render data from being deleted (except when the mesh is deleted).

### **MESH\_BEEN\_DSP**

This flag is reserved for internal use.

## Class MeshOpProgress

See Also: [Class Mesh](#).

class MeshOpProgress

### Description:

A callback used while doing a lengthy operation to a mesh. A developer creates an instance of this class and passes a pointer to it into the **CalcBoolOp()** or **Optimize()** function.

### Methods:

#### Prototype:

**virtual void Init(int total)=0;**

#### Remarks:

Implemented by the Plug-In.

This method is called once with the total number of increments.

#### Parameters:

**int total**

The total number of increments.

#### Prototype:

**virtual BOOL Progress(int p)=0;**

Implemented by the Plug-In.

This method is called over and over with a new value for **p**. The percentage complete is **p/total**.

#### Parameters:

**int p**

The number completed so far.

#### Return Value:

If TRUE processing will continue. If FALSE processing is aborted.

## Class MeshRenderData

See Also: [Class Mesh](#).

class MeshRenderData

### Description:

A developer may derive a class from this class, put any required data in it, and then hang this data off a Mesh. This is done using the methods of Class Mesh:

**void SetRenderData(MeshRenderData \*p);**

Sets the mesh render data hung off this Mesh.

**MeshRenderData \* GetRenderData();**

Gets a pointer to the MeshRenderData.

### Methods:

### Prototype:

**virtual void DeleteThis()=0;**

### Remarks:

Implemented by the Plug-In.

Deletes this instance of the class.

## Class FlyOffData

See Also: [Custom Controls](#), [Class ICustButton](#).

class FlyOffData

### Description:

This class uses four indices into the image list to describe the button in each of the possible states: Out&Enabled, In&Enabled, Out&Disabled and In&Disabled. An array of instances of this class are passed into the method

**ICustButton::SetFlyOff()**.

### Data Members:

These four data members are indices into the image list. They indicate which images to use for each of the four possible button states:

You may specify a unique image for each one of these states by passing a different index for each state. Or you may supply a single image to be used for all the states by specifying the same index four times.

public:

**int iOutEn;**

Out&Enabled.

**int iInEn;**

In&Enabled

**int iOutDis;**

Out&Disabled.

**int iInDis;**

In&Disabled.

## Class MaxBmpFileIcon

See Also: [Class MaxIcon](#), [Class ICustButton](#).

class MaxBmpFileIcon: public MaxIcon

### Description:

This class is available in release 4.0 and later only.

This implementation of MaxIcon is for the icon images that are stored as ".bmp" files in 3ds max's UI directory. This is used by the macroScript facility in MAXScript to specify icons. See the MAXScript documentation for "macroScript" for the exact meaning of the filename and index and details.

### Methods:

public:

### Prototype:

**MaxBmpFileIcon(TCHAR\* pFilePrefix, int index);**

### Remarks:

Constructor.

### Parameters:

**TCHAR\* pFilePrefix**

The file prefix to initialize with.

**int index**

The index of the icon.

### Prototype:

**MaxBmpFileIcon(SClass\_ID sid, Class\_ID cid);**

### Remarks:

Constructor.

### Parameters:

**SClass\_ID sid**

The superclass ID

**Class\_ID cid**

The class ID/

**Prototype:**

**HIMAGELIST GetDefaultImageList();**

**Remarks:**

Returns the handle to the image list for the size of icons that the user has chosen.

**Prototype:**

**HIMAGELIST GetSmallImageList();**

**Remarks:**

Returns the image list for small icons.

**Prototype:**

**HIMAGELIST GetLargeImageList();**

**Remarks:**

Returns the image list for large icons.

**Prototype:**

**int GetSmallImageIndex(bool enabledVersion = true, COLORREF  
backgroundColor = GetCustSysColor(COLOR\_BTNFACE));**

**Remarks:**

Returns the zero based index into the image list for the small version of this particular icon.

**Parameters:**

**bool enabledVersion = true**

Pass true for the enabled version of the icon; false for the disabled version.

**COLORREF backgroundColor =  
GetCustSysColor(COLOR\_BTNFACE)**

The background color for use in alpha blending. The files that define these icons always have an alpha mask, and so a background color is needed to blend it with.

**Prototype:**

```
int GetLargeImageIndex(bool enabledVersion = true,  
COLORREF backgroundColor =  
GetCustSysColor(COLOR_BTNFACE));
```

**Remarks:**

Returns the zero based index into the image list for the large version of this particular icon.

**Parameters:**

**bool enabledVersion = true**

Pass true for the enabled version of the icon; false for the disabled version.

**COLORREF backgroundColor =  
GetCustSysColor(COLOR\_BTNFACE)**

The background color for use in alpha blending. The files that define these icons always have an alpha mask, and so a background color is needed to blend it with.

**Prototype:**

```
bool UsesAlphaMask();
```

**Remarks:**

Returns true if the icon uses an alpha mask; otherwise false.

**Prototype:**

```
TSTR& GetFilePrefix();
```

**Remarks:**

Returns the directory of the icon.

**Prototype:**

```
int GetIndex();
```

**Remarks:**

Returns the index of the icon in the image file list.

## Class SplineKnot

See Also: [Class Spline3D](#).

class SplineKnot

### Description:

This class describes a single knot in a spline.

In 3ds max 2.0 and later there are methods which provide full access to the private data members of the class.

All methods of this class are implemented by the system.

### Description:

private:

**int ktype;**

The knot type.

**int ltype;**

The line type.

**Point3 point;**

The point location.

**Point3 inVec;**

The in vector.

**Point3 outVec;**

The out vector.

**int aux;**

This is simply an integer value which may be used for temporary storage of data associated with the knot. This data will be overwritten by the internal EditSpline code.

**int aux2;**

Used to track topo changes in spline editing.

### Spline Knot Summary:

**Picture a bezier spline with three knots, going from left to right:**

**A--->AB----BA<---B--->BC----CB<---C**

The knot points are A, B and C. The vectors are labeled the same as patch vectors (AB is the vector from A going toward B, the vector from B to A is labeled BA, and so on).

In this diagram, AB is the OUT vector for knot A. BA is the IN vector for knot B. BC is the OUT vector for knot B, and CB is the IN vector for knot C. Because this is an open spline, knot A doesn't use its IN vector, and knot C doesn't use its OUT vector.

The IN and OUT terminology is based on the way a spline flows from the first knot to the last. If the spline is reversed, the IN and OUT sense is reversed, as well.

Regarding the vectors, the only difference between a circle and a square is that the square has vectors that are at the same location as the knot point (in other words, zero length vectors) causing sharp corners. The circle uses vectors which cause each segment to bulge to form a quarter-circle.

Take a look at the `\MAXSDK\SAMPLES\OBJECTS\NGON.CPP` source file for an example of how the vectors are generated to form a linear NGON versus a circular one.

**Friend Classes:**

```
friend class Spline3D;  
friend class SplineKnotAssy;
```

**Methods:**

**Prototype:**

```
SplineKnot(int k, int l, Point3 p, Point3 in, Point3 out, int a1= -1,  
int a2= -1, int a3= -1, int Ia1= -1, int Ia2= -1, int Ia3= -1, int Oa1=  
-1, int Oa2= -1, int Oa3= -1, DWORD f=0);
```

**Remarks:**

This method is available in release 2.0 and later only.

Constructor. The data members are initialized to the values passed.

**Prototype:**

```
inline int Ktype();
```

**Remarks:**

Returns the knot type.

**Return Value:**

See [List of Spline Knot Types](#).

**Prototype:**

**inline void SetKtype(int t);**

**Remarks:**

This method is available in release 2.0 and later only.  
Sets the knot type.

**Parameters:**

**int t**

The type to set. See [List of Spline Knot Types](#).

**Prototype:**

**inline int Ltype();**

**Remarks:**

Returns the line type.

**Return Value:**

See [List of Spline Line Types](#).

**Prototype:**

**inline void SetLtype(int t);**

**Remarks:**

This method is available in release 2.0 and later only.  
Sets the line type.

**Parameters:**

**int t**

The type to set. See [List of Spline Line Types](#).

**Prototype:**

**inline int Aux();**

**Remarks:**

This method is available in release 2.0 and later only.  
Provides access to the first integer chunk of auxiliary data for the knot.

**Prototype:**

**inline void SetAux(int a);**

**Remarks:**

This method is available in release 2.0 and later only.

Sets the first integer of auxiliary data for the knot.

**Parameters:**

**int a**

The value to set.

**Prototype:**

**inline int Aux2();**

**Remarks:**

This method is available in release 2.0 and later only.

Provides access to the second integer of auxiliary data for the knot.

**Prototype:**

**inline void SetAux2(int a);**

**Remarks:**

This method is available in release 2.0 and later only.

Sets the second integer of auxiliary data for the knot.

**Parameters:**

**int a**

The value to set.

**Prototype:**

**inline Point3 Knot();**

**Remarks:**

This method is available in release 2.0 and later only.

Returns the point location for the knot.

**Prototype:**

**inline void SetKnot(Point3 p);**

**Remarks:**

This method is available in release 2.0 and later only.  
Sets the point location for the knot.

**Parameters:**

**Point3 p**

The point to set.

**Prototype:**

**inline Point3 InVec();**

**Remarks:**

This method is available in release 2.0 and later only.  
Returns the in vector for the knot.

**Prototype:**

**inline void SetInVec(Point3 p);**

**Remarks:**

This method is available in release 2.0 and later only.  
Sets the in vector for the knot.

**Parameters:**

**Point3 p**

The in vector to set.

**Prototype:**

**inline Point3 OutVec();**

**Remarks:**

This method is available in release 2.0 and later only.  
Returns the out vector for the knot.

**Prototype:**

**inline void SetOutVec(Point3 p);**

**Remarks:**

This method is available in release 2.0 and later only.

Sets the out vector for the knot.

**Parameters:**

**Point3 p**

The out vector to set.

## Structure Knot

See Also: [Class Spline3D](#).

This structure holds data about a single knot.

```
typedef struct {
```

```
    int ktype;
```

See [List of Spline Knot Types](#).

```
    int ltype;
```

See [List of Spline Line Types](#).

```
    float du;
```

This parameter is used internally.

```
    int aux;
```

This auxiliary data is used internally in capping to link the knot point to a point on the patch mesh. A developer may use this data member to store information with the knot, but this data will be overwritten if any capping is done.

```
} Knot;
```

## List of Spline Knot Types

Knot types. One of the following values:

### **KTYPE\_AUTO**

This type of knot generates the bezier handles automatically to produce a smooth curve. With this knot type the bezier handles are invisible.

### **KTYPE\_CORNER**

This knot type produces a sharp corner.

### **KTYPE\_BEZIER**

This knot type produces bezier handles that are collinear (the bezier vectors coming out of the knot are collinear). These handles are constrained to be collinear so if the user moves one handle the other will move to remain collinear. Also if the user moves the handle towards or away from the knot the other handle will move the corresponding amount in the proper scale.

### **KTYPE\_BEZIER\_CORNER**

This knot type has bezier handles but they are not constrained to be opposite each other.

## List of Spline Line Types

Line types. One of the following values:

### **LTYPE\_CURVE**

This specifies that the segment should interpolate based on the bezier handles for the segment.

### **LTYPE\_LINE**

This specifies that the segment should go straight from knot to knot and ignore the bezier handles.

## Class ShapeHierarchy

See Also: [Class GenericHierarchy](#), [Class BitArray](#).

class ShapeHierarchy

### Description:

This class stores the hierarchy tree of a shape object. In addition it stores a **BitArray** with an entry for each polygon in the shape which indicates whether that polygon should be reversed in order to provide the proper clockwise/counterclockwise ordering for the nested shapes. All methods of this class are implemented by the system.

### Data Members:

public:

#### **GenericHierarchy hier;**

Describes the hierarchy.

#### **BitArray reverse;**

Indicates whether that polygon should be reversed in order to provide the proper clockwise / counterclockwise ordering for the nested shapes. There is one bit in the bit array for every polygon in the shape. For example, if you pass in two nested circles and they are both clockwise, the outermost circle will have its reverse bit set to indicate it should be reversed in order to be properly extruded or lofted. This is because for nested shapes the outermost circle should be counterclockwise.

### Methods:

#### **Prototype:**

**ShapeHierarchy();**

#### **Remarks:**

Constructor. No initialization is performed.

#### **Prototype:**

**ShapeHierarchy(int polys);**

#### **Remarks:**

Constructor. This constructor clears out the hierarchy, sets the number of

polygons to **poly** and clears all the bits in the BitArray.

**Parameters:**

**int polys**

The number of polygons in the hierarchy.

**Prototype:**

**void New(int polys = 0);**

**Remarks:**

This methods clears out the hierarchy, sets the number of polygons to **poly** and clears all the bits in the BitArray.

**Parameters:**

**int polys = 0**

The number of polygons in the hierarchy.

**Operators:**

**Prototype:**

**ShapeHierarchy &operator=(ShapeHierarchy &from);**

**Remarks:**

Assignment operator.

**Parameters:**

**ShapeHierarchy &from**

The source shape hierarchy.

## List of Shape Capping Types

The following are the capping types supported:

### **CAPTYPE\_MORPH**

This type of cap only uses the existing vertices in the PolyShape to generate the cap. The capping code does the best job it can given this constraint however it is possible to wind up with long sliver-like faces on the cap. This is referred to as a morph cap because if you cap a shape using this method it does not generate any new vertices and you can then morph between shapes with the same number of vertices.

### **CAPTYPE\_GRID**

This type of cap generates new vertices in the interior of the shape in a grid pattern. This helps to break up the shape and helps reduce slivering. Grid capping will generate different number of vertices based on the shape and thus the shapes are not morphable.

## Class AnimPropertyList

See Also: [Class AnimProperty](#), [Class Animatable](#), [Class Tab](#).

```
class AnimPropertyList : public Tab<AnimProperty*>
```

### Description:

This class is simply a table of anim properties. It has a single method to locate a given id in the list. See [Class Tab](#) for details on how to manipulate the table.

### Methods:

#### Prototype:

```
int FindProperty(DWORD id,int start=0);
```

#### Remarks:

Implemented by the System.

Returns the table index of the property whose id is passed.

#### Parameters:

##### **DWORD id**

The id to find.

##### **int start=0**

A table index that may be used to define an alternate starting point for the search. This is a index into the table of properties.

#### Return Value:

The table index of the property, or if not found, -1.

# Class TrackClipObject

See Also: [Class Animatable](#).

class TrackClipObject

## Description:

If a plug-in supports track view copy/paste operations this object is used. A plug-in should derive a class from this base class to store the data associated with the objects tracks, and implement the methods that identify the creator of the clip object.

## Data Members:

public:

### **Interval clip;**

Specifies the interval of time clipped.

## Methods:

### Prototype:

**TrackClipObject(Interval iv);**

### Remarks:

Constructor.

### Parameters:

#### **Interval iv**

The interval of the time clip.

### Prototype:

**virtual int NumKeys();**

### Remarks:

This method is available in release 2.0 and later only.

Implemented by the Plug-In.

Returns the number of keys in the clip object.

### Default Implementation:

**{return 0;}**

**Prototype:**

**virtual BOOL GetKeyVal(int i, void \*val);**

**Remarks:**

This method is available in release 2.0 and later only.

Implemented by the Plug-In.

Retrieves the value of the 'i-th' key.

**Parameters:**

**int i**

Specifies the key to return.

**void \*val**

The value of the key is stored here.

**Return Value:**

TRUE if the value was retrieved; otherwise FALSE.

**Default Implementation:**

**{return FALSE;}**

**Prototype:**

**virtual BOOL SetKeyVal(int i, void \*val);**

**Remarks:**

This method is available in release 2.0 and later only.

Implemented by the Plug-In.

Sets the value of the 'i-th' key.

**Parameters:**

**int i**

Specifies the key to store.

**void \*val**

The value of the key is passed here.

**Return Value:**

TRUE if the value was stored; otherwise FALSE.

**Default Implementation:**

**{return FALSE;}**

**Prototype:**

**virtual SClass\_ID SuperClassID()=0;**

**Remarks:**

Implemented by the Plug-In.

This method is used to identify the creator of the clip object by returning the SuperClassID of the creator.

**Prototype:**

**virtual Class\_ID ClassID()=0;**

**Remarks:**

Implemented by the Plug-In.

Returns the ClassID of the creator of the clip object.

**Prototype:**

**virtual void DeleteThis()=0;**

**Remarks:**

Implemented by the Plug-In.

This method is called to delete this instance of the clip object.

# Class TimeMap

See Also: [Class Animatable](#).

class TimeMap

## Description:

This class is used by **Animatable::MapKeys()**. It provides a method **map()** that is used to apply the mapping required by the system to the TimeValue passed.

## Methods:

### Prototype:

**virtual TimeValue map(TimeValue t)=0;**

### Remarks:

Implemented by the System.

This is a time map function that takes a TimeValue and returns a TimeValue. A plug-in developer just calls this map method to alter the TimeValue.

### Parameters:

**TimeValue t**

This is the input time.

### Return Value:

The modified time.

### Prototype:

**virtual TimeValue prevmap(TimeValue t)=0;**

### Remarks:

This method is not used.

## Class TrackHitRecord

See Also: [Class Animatable](#), [Template Class Tab](#).

class TrackHitRecord

### Description:

When hit testing is done, this class has data members used to identify the key that was hit. The manner these are used is up to the developer. For example, the hit member may be used as an index into the table of keys. If a developer needed additional information, the flags could be used. The system does not use these itself - the developer just needs to establish a consistent way to recognize its own keys and tag them as hit.

There is a typedef that defines a table of these **TrackHitRecords**. It is defined as:

```
typedef Tab<TrackHitRecord> TrackHitTab;
```

### Data Members:

public:

```
DWORD hit;
```

```
DWORD flags;
```

### Methods:

### Prototype:

```
TrackHitRecord(DWORD h=0,DWORD f=0)
```

### Remarks:

Constructor. The data members are initialized to the values passed.

## Class ParamDimensionBase

See Also: [Class ParamDimension](#).

### Description:

This class (along with ParamDimension) describes the dimension of a parameter. This dimension can be considered a unit of measure. It describes the parameter's type and order of magnitude.

The dimension type and possibly the dimension scale (if the type is custom) are used to determine a scale factor for the parameter. When a controller is drawing a function curve, it only needs to use the Convert() function - the scale factor is rolled into the single 'vzoom' parameter passed to

**Animatable::PaintFCurves()**. So, for a controller to plot a value 'val' at time t it would do the following:

```
int x = TimeToScreen(t,tzoom,tscroll);  
int y = ValueToScreen(dim-  
>Convert(val),rect.h()-1,vzoom,vscroll);
```

### Methods:

#### Prototype:

```
virtual DimType DimensionType()=0;
```

#### Remarks:

Implemented by the Plug-In.

Returns the dimension type of the parameter. See [List of Dimension Types](#).

#### Prototype:

```
virtual float Convert(float value)=0;
```

#### Remarks:

Implemented by the Plug-In.

When a controller needs to display the parameter values (for example in the function curve editor) it converts the value using this method.

#### Parameters:

**float value**

The value to convert.

**Return Value:**

The converted value.

**Prototype:**

```
virtual float UnConvert(float value)=0;
```

**Remarks:**

Implemented by the Plug-In.

This method is used to un-converted a converted value.

**Parameters:**

**float value**

The value to un-convert.

**Return Value:**

The un-converted value.

## Class AnimEnum

See Also: [Class Animatable](#).

class AnimEnum

### Description:

This class is the callback object for **Animatable::EnumAnimTree()**. This keeps track of the depth of the enumeration.

### Methods:

### Prototype:

```
virtual int proc(Animatable *anim, Animatable *client, int  
subNum)=0;
```

### Remarks:

Implemented by the Plug-In.

This is the method called by **EnumAnimTree()**.

### Parameters:

**Animatable \*anim**

The sub anim.

**Animatable \*client**

The client anim. This is the parent with a sub-anim of **anim**.

**int subNum**

The index of the sub-anim that **anim** is to **client**. For example, if you were to call **client->SubAnim(subNum)** it would return **anim**.

### Return Value:

One of the following values:

**ANIM\_ENUM\_PROCEED**

Continue the enumeration process.

**ANIM\_ENUM\_STOP**

Stop the enumeration process at this level.

**ANIM\_ENUM\_ABORT**

Abort the enumeration processing.

**Prototype:**

**AnimEnum(int s = SCOPE\_OPEN, int deep = 0)**

**Remarks:**

Constructor. Sets default scope and depth if specified.

**Return Value:**

A new AnimEnum object.

**Prototype:**

**void SetScope(int s)**

**Remarks:**

Implemented by the System.

Sets the scope. See below for possible values.

**Parameters:**

**int s**

Specifies the scope to set. See below.

**Prototype:**

**int Scope()**

**Remarks:**

Implemented by the System.

Returns the scope.

**Return Value:**

One or more of the following scope values:

**SCOPE\_DOCLOSED**

Do closed animatables.

**SCOPE\_SUBANIM**

Do the sub anims

**SCOPE\_CHILDREN**

Do the node children

**SCOPE\_OPEN**

Do all open animatables

Equal to **(SCOPE\_SUBANIM|SCOPE\_CHILDREN)**

## **SCOPE\_ALL**

Do all animatables.

Equal to (**SCOPE\_OPEN|SCOPE\_DOCLOSED**)

### **Prototype:**

**void IncDepth()**

### **Remarks:**

Implemented by the System.

Increments the depth count.

### **Prototype:**

**void DecDepth()**

### **Remarks:**

Implemented by the System.

Decrements the depth count.

### **Prototype:**

**int Depth()**

### **Remarks:**

Implemented by the System.

Returns the depth count.

## Class DefNoteTrack

See Also: [Class NoteKeyTab](#), [Class Animatable](#).

```
class DefNoteTrack : public NoteTrack
```

### Description:

This class is available in release 3.0 and later only.

This class is 3ds max's implementation of Note Tracks. It provides implementation for the Animatable methods that let the keys work in Track View. Developers use this class to access the table of keys associated with a track. Methods of class Animatable are available to get access to this class.

### Function:

```
NoteTrack *NewDefaultNoteTrack();
```

### Remarks:

This global function is not part of this class but is available for use. It creates and returns a pointer to a new Note Track.

### Data Members:

public:

```
NoteKeyTab keys;
```

The table of note keys for the track.

### Methods:

The methods of this class are all implemented and used internally.

## List of Schematic View AddAnimatable Flags

See Also: [Class Animatable](#).

These are bit flags which can be passed to **IGraphObjectManager::AddAnimatable(...)** and **Animatable::SvTraverseAnimGraph(...)**.

One or more of the following values:

### **SV\_INITIALLY\_HIDDEN**

If set, newly created node will be in the hidden state. If the node already exists in the graph, the flag is ignored.

### **SV\_DUPLICATE\_INSTANCES**

If set, shared instances of an animatable will produce multiple graph nodes in the schematic view instead of a single shared graph node.

### **SV\_INITIALLY\_CLOSED**

If set, the newly created children of the newly created node will be in the hidden state. If the node already exists in the graph, the flag is ignored. Children of this node that already exist in the graph will not have their visibility state changed.

## Class MultiSelectCallback

See Also: [Class Animatable](#).

class MultiSelectCallback

### Description:

This class is available in release 3.0 and later only.

This is the callback object used to perform the (de)selection via **Animatable::SvGetMultiSelectCallback()**.

Schematic view supports multiple selection. When the user selects a set of objects in the schematic view and then "transfers" that selection set to the rest of max (either by having "synchronize selection" on or by manually moving the selection out), there are a number of ambiguities that can arise. For example, some of the objects in the schematic view cannot be selected in the viewports, material editor, or modifier stack. Another example: the material editor only supports one active material/map but many materials and maps can be selected simultaneously in the schematic view. The "MultiSelectCallback" system exists order to handle these cases and to handle selection synchronization between SV and future editors in 3ds max. When the schematic view attempts to synchronize selection by moving the SV selection set to the "outside" world, it follows this procedure:

1. First SV calls SvGetMultiSelectCallback(...) on all the visible SV nodes to "collect" MultiSelectCallback objects. Objects that want to synchronize their selection state with the schematic view (not a common or trivial operation -- this is really more associated with adding a new editor in 3ds max rather than adding new plugin) return a pointer to a static instance of a MultiSelectCallback derived object. There is only one instance of a MultiSelectCallback per editor.

Furthermore, if an editor displays objects of many classes, all the classes should override SvGetMultiSelectCallback(...) to return the same MultiSelectCallback instance. This implies that, as far as the schematic view is concerned, there is never more than one primary editor class associated with any particular object class (currently, viewports for nodes, material editor for materials and maps and the modifier panel for modifiers).

For example, here is the code in BaseNode that returns the MultiSelectCallback instance for nodes (this is the MultiSelectCallback used for viewports):

```
class BaseNodeMSelCB : public MultiSelectCallback
```

```

{
private:
bool clear;
BaseNodeTab selNodeTab;
BaseNodeTab deselNodeTab;

public:
int Priority() { return 1000; }
void Begin(IGraphObjectManager *gom, bool clear);
void Select(IGraphObjectManager *gom, IGraphNode *gNode,
bool isSelected);
void End(IGraphObjectManager *gom);
};
static BaseNodeMSELCB baseNodeMSELCB;
MultiSelectCallback*
BaseNode::SvGetMultiSelectCallback(IGraphObjectManager
*gom, IGraphNode *gNode)
{
return &baseNodeMSELCB;
}

```

2. For each selection class (unique MultiSelectCallback instance), the schematic views calls "Begin(...)". This is the spot where any "pre-selection" preparation takes place. The order that the MultiSelectCallback instances are called in is determined by their priority. The priority is returned by the "Priority()" method. MultiSelectCallback's with a higher priority (lower value) are called before those with a lower priority (higher value). For example, here is the Begin associated with the viewports:

```

void BaseNodeMSELCB::Begin(IGraphObjectManager *gom, bool
clear)
{
this->clear = clear;
//
// If the "clear" bool is true, the current viewport selection set is
cleared...

```

```

//
if (clear)
  GetActiveSelSet()->Clear(FALSE);
//
// Some housekeeping in preparation for the select...
//
selNodeTab.Resize(0);
deselNodeTab.Resize(0);
}

```

3. For each of objects in the schematic view whose selection state is changing, the object's MultiSelectCallback instance is retrieved (again) and the "Select" method is called. Here is where the actual selection/deselection work can take place. I say "can" because, in practice, the select method usually just collects all the objects to be selected and all the objects to be deselected into lists which are then processed in the "End(...)" method. This is simply for performance -- it is often more efficient to set the selection state of a group of objects all at once. Here's the "Select(...)" method from BaseNode:

```

void Select(IGraphObjectManager *gom, IGraphNode *gNode, bool
isSelected)
{
  BaseNode *baseNode = (BaseNode *) gNode->GetAnim();

  if (isSelected)
  {
    if (!baseNode->IsRootNode() && !baseNode->IsFrozen() &&
!baseNode->IsHidden())
      selNodeTab.AppendNode(baseNode, FALSE);
    }
  else
  {
    if (baseNode->Selected())
      deselNodeTab.AppendNode(baseNode, FALSE);
    }
  }

```

4. Finally, for each selection class (unique MultiSelectCallback instance), the schematic views calls "End(...)". This is the spot where any "post-selection" operations take place. For example, here is the "End(...)" for the BaseNode (viewports):

```
void End(IGraphObjectManager *gom)  
{  
  if (selNodeTab.Count() > 0 || deselNodeTab.Count() > 0)  
  {  
    theHold.Begin();  
    if (selNodeTab.Count() > 0)  
      GetActiveSelSet()->SelectMultiple(selNodeTab, FALSE);  
  
    if (deselNodeTab.Count() > 0)  
      GetActiveSelSet()->DeselectMultiple(deselNodeTab, FALSE);  
  
    theHold.Accept(getResMgr().getString(IDS_SV_SELECT,  
appInst));  
    RedrawViewports(GetCurTime(), VP_DONT_SIMPLIFY);  
  }  
  else  
  {  
    if (clear)  
      RedrawViewports(GetCurTime(), VP_DONT_SIMPLIFY);  
  }  
}
```

**Methods:**

public:

**Prototype:**

**virtual int Priority()=0;**

**Remarks:**

Returns the priority of the callback. MultiSelectCallback's with a higher priority (lower value) are called before those with a lower priority (higher value).

**Prototype:**

**virtual void Begin(IGraphObjectManager \*gom, bool clear)=0;**

**Remarks:**

Called to begin the multi-selection process. This is the spot where any "pre-selection" operations take place.

**Parameters:**

**IGraphObjectManager \*gom**

Points to the schematic view window manager.

**bool clear**

true to clear the previous selection; false to leave intact.

**Prototype:**

**virtual void Select(IGraphObjectManager \*gom, IGraphNode \*gNode, bool isSelected)=0;**

**Remarks:**

This method selects or deselects the node passed.

**Parameters:**

**IGraphObjectManager \*gom**

Points to the schematic view window manager.

**IGraphNode \*gNode**

Points to the node in schematic view.

**bool isSelected**

true if select; false if deselect.

**Prototype:**

**virtual void End(IGraphObjectManager \*gom)=0;**

**Remarks:**

Called when done. This is the spot where any "post-selection" operations take place.

**Parameters:**

**IGraphObjectManager \*gom**

Points to the schematic view window manager.

## Class ICustAttribContainer

See Also: [Class CustAttrib](#) , [Class RemapDir](#) , [Class ReferenceTarget](#)

class ICustAttribContainer : public ReferenceTarget

### Description:

This class is available in release 4.0 and later only.

This class represents the interface class to a custom attributes container.

### Methods:

public:

### Prototype:

**virtual int GetNumCustAttribs()=0;**

### Remarks:

This method returns the number of custom attributes.

### Prototype:

**virtual CustAttrib \*GetCustAttrib(int i)=0;**

### Remarks:

This method allows you to retrieve the custom attribute by its specified index.

### Parameters:

**int i**

The index of the custom attribute you wish to obtain.

### Prototype:

**virtual void AppendCustAttrib(CustAttrib \*attribute)=0;**

### Remarks:

This method allows you to append a custom attribute.

### Parameters:

**CustAttrib \*attribute**

A pointer to the custom attribute you wish to add.

**Prototype:**

**virtual void SetCustAttrib(int i, CustAttrib \*attribute)=0;**

**Remarks:**

This method allows you to set the custom attribute at the specified index.

**Parameters:**

**int i**

The index for which to set the custom attribute.

**CustAttrib \*attribute**

A pointer to the custom attribute you wish to set.

**Prototype:**

**virtual void InsertCustAttrib(int i, CustAttrib \*attribute)=0;**

**Remarks:**

This method allows you to insert a custom attribute at the specified index.

**Parameters:**

**int i**

The index at which to insert the custom attribute.

**CustAttrib \*attribute**

A pointer to the custom attribute you wish to insert.

**Return Value:**

**Prototype:**

**virtual void RemoveCustAttrib(int i)=0;**

**Remarks:**

This method allows you to remove a custom attribute.

**Parameters:**

**int i**

The index of the custom attribute to remove.

**Prototype:**

**virtual ParamDlg\* CreateParamDlg(HWND hwMtlEdit, IMtlParams \*imp)=0;**

**Remarks:**

This method gets called when the material or texture is to be displayed in the material editor parameters area. The plug-in should allocate a new instance of a class derived from ParamDlg to manage the user interface.

**Parameters:**

**HWND hwMtlEdit**

The window handle of the materials editor.

**IMtlParams \*imp**

The interface pointer for calling methods in 3ds max.

**Return Value:**

A pointer to the created instance of a class derived from **ParamDlg**.

**Prototype:**

**virtual void CopyParametersFrom(ReferenceMaker \*from, RemapDir &remap)=0;**

**Remarks:**

This method will copy the parameters from a specified reference maker.

**Parameters:**

**ReferenceMaker \*from**

A pointer to the reference maker to copy the parameters from.

**RemapDir &remap**

This class is used for remapping references during a Clone. See [Class RemapDir](#).

**Prototype:**

**virtual Animatable \*GetOwner()=0;**

**Remarks:**

This method returns a pointer to the owner of the custom attributes.

**Prototype:**

```
virtual void DeleteThis()=0;
```

**Remarks:**

Self deletion.

## Class NotifyCollapseEnumProc

See Also: [Class GeomPipelineEnumProc](#), [Class BaseObject](#), [Class Object](#), [Class IDerivedObject](#).

```
class NotifyCollapseEnumProc : public GeomPipelineEnumProc
```

### Description:

This class is available in release 4.0 and later only.

Whenever the modifier stack is collapsed the code has to notify all objects in the stack with a Pre and a Post notification. In order to do this, this class can be used in conjunction with the method **EnumGeomPipeLine()**. In the constructor one can specify, if it is a pre- or post- collapse notification. In case it is a post collapse the object that represents the result of the collapse has to be provided as well. The INode pointer to the beginning of the pipeline that was collapsed has to be provided in both cases.

All methods of this class are implemented by the System.

### Methods:

public:

### Prototype:

```
NotifyCollapseEnumProc(bool preCollapse, INode *n, Object  
*collapsedObj = NULL) : bPreCollapse(preCollapse), node(n),  
collapsedObject(collapsedObj);
```

### Remarks:

Constructor. The private data members are initialized by the passed parameters.

### Parameters:

#### **bool preCollapse**

Indicates if this is a pre- collapse or a post- collapse. Pass true for pre and false for post.

#### **INode \*n**

Points to the node at the beginning of the pipeline that was collapsed.

#### **Object \*collapsedObj = NULL**

If this is a post- collapse then points to the object which is the result of the collapse.

**Sample Code:**

The following code fragment shows using this constructor and then the EnumGeomPipeline with this object:

```
NotifyCollapseEnumProc PreNCEP(true,node);  
EnumGeomPipeline(&PreNCEP,node);
```

**Prototype:**

```
virtual PipeEnumResult proc(ReferenceTarget  
*object, IDerivedObject *derObj, int index);
```

**Remarks:**

This is the implementation of the EnumGeomPipeline callback method proc() which calls BaseObject::NotifyPreCollapse or BaseObject::NotifyPostCollapse as required.

## Transform Lock Types

See Also: [Class INode](#).

One of the following values:

**INODE\_LOCKPOS**

Position locked.

**INODE\_LOCKROT**

Rotate locked.

**INODE\_LOCKSCL**

Scale locked.

## Transform Lock Axis

See Also: [Class INode](#).

One of the following values:

**INODE\_LOCK\_X**

X axis locked.

**INODE\_LOCK\_Y**

Y axis locked.

**INODE\_LOCK\_Z**

Z axis locked.

## Class RenderData

See Also: [Class INode-Access To Render Data](#), [Class LightDesc](#).

```
class RenderData : public InterfaceServer
```

### Description:

This class has a single virtual method to delete the class. For example, when **LightDesc** objects are deleted this is the method to do so.

### Methods:

#### Prototype:

```
virtual void DeleteThis();
```

#### Remarks:

Implemented by the Plug-In.

This method is used to delete an instance of the class.

#### Default Implementation:

```
{delete this; }
```

#### Prototype:

```
virtual INT_PTR Execute(int cmd, ULONG arg1=0, ULONG  
arg2=0, ULONG arg3=0);
```

#### Remarks:

This method is available in release 3.0 and later only.

This is a general purpose function that allows the API to be extended in the future. The 3ds max development team can assign new **cmd** numbers and continue to add functionality to this class without having to 'break' the API.

This is reserved for future use.

#### Parameters:

**int cmd**

The command to execute.

**ULONG arg1=0**

Optional argument 1 (defined uniquely for each **cmd**).

**ULONG arg2=0**

Optional argument 2.

**ULONG arg3=0**

Optional argument 3.

**Return Value:**

An integer return value (defined uniquely for each **cmd**).

**Default Implementation:**

```
{ return 0; }
```

## List of XRef Flag Bits

See Also: [Class INode](#).

The following flags are used by the methods **INode::SetXRefFlags** and **GetXRefFlags**.

### **XREF\_UPDATE\_AUTO**

Indicates automatic XRef file updating is on.

### **XREF\_BOX\_DISP**

Indicates the Box display option is set.

### **XREF\_HIDDEN**

Indicates the XRef is hidden.

### **XREF\_DISABLED**

Indicates the XRef is disabled.

### **XREF\_IGNORE\_LIGHTS**

Indicates the XRef will ignore the lights in the file.

### **XREF\_IGNORE\_CAMERAS**

Indicates the XRef will ignore the cameras in the file.

### **XREF\_IGNORE\_SHAPES**

Indicates the XRef will ignore the shapes in the file.

### **XREF\_IGNORE\_HELPERS**

Indicates the XRef will ignore the helpers in the file.

### **XREF\_IGNORE\_ANIM**

Indicates the XRef will ignore the animation in the file.

### **XREF\_FILE\_CHANGE**

This bit is set when a change notification is sent indicating that the file may have changed. We don't know for sure if the file actually changed but the ref should be reloaded.

### **XREF\_LOAD\_ERROR**

This bit will be set when a ref can't be resolved.

## Class ISubMap

See Also: [Class MtlBase](#), [Class Texmap](#), [Class ParamDlg](#), [Class ReferenceTarget](#).

class ISubMap

### Description:

This class is available in release 4.0 and later only.

The methods of this class provide access to the sub-textures of a MtlBase. These properties include the number of sub-maps, the slot type, on / off state, etc.

The MtlBase class sub-classes from this class. If a developer is creating a plug-in derived from MtlBase (for instance a Material or Texture) then implementations of these methods are required. Developers may call these methods on an existing MtlBase sub-class.

### Methods:

public:

### Prototype:

**virtual int NumSubTexmaps()**

### Remarks:

Implemented by the Plug-In.

Returns the number of sub-textures managed by this material or texture.

### Default Implementation:

**{ return 0; }**

### Prototype:

**virtual Texmap\* GetSubTexmap(int i)**

### Remarks:

Implemented by the Plug-In.

Returns a pointer to the 'i-th' sub-texmap managed by the material or texture.

Note: For the 3ds max Standard material, the sub-texmap index used with this method is shown in [List of Texture Map Indices](#).

### Parameters:

**int i**

Specifies the texmap to return.

**Default Implementation:**

```
{ return NULL; }
```

**Prototype:**

```
virtual int MapSlotType(int i)
```

**Remarks:**

Implemented by the Plug-In.

In the Coordinates rollup in the user interface for a texture map are two options. These options are Texture or Environment. The slot type is one of these two options, texture coordinates or environment coordinates. There are a variety of texture coordinate types. There are the type assigned to the object and the environment type (Spherical, Cylindrical, Shrink-wrap, Screen). This method is used to determine the type required by the particular sub-texture. This is either texture coordinates (**MAPSLOT\_TEXTURE**) or environment coordinates (**MAPSLOT\_ENVIRON**).

**Parameters:**

**int i**

The index of the sub-texture whose slot type to return.

**Return Value:**

See [List of Map Slot Types](#).

**Default Implementation:**

```
{ return MAPSLOT_TEXTURE; }
```

**Prototype:**

```
virtual void SetSubTexmap(int i, Texmap *m);
```

**Remarks:**

Implemented by the Plug-In.

Stores the 'i-th' sub-texmap managed by the material or texture.

Note: For the 3ds max Standard material, the sub-texmap index used with this method is shown in [List of Texture Map Indices](#).

**Parameters:**

**int i**

The index of the storage for the texmap.

**Texmap \*m**

The texmap to store.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual int SubTexmapOn(int i)
```

**Remarks:**

Implemented by the Plug-In.

Returns nonzero if the specified sub-texmap is on; otherwise zero. Some materials may have user interface controls to toggle the sub-maps on and off. The Standard material has such controls for example.

**Parameters:**

**int i**

The index of the sub-texmap to check.

**Default Implementation:**

```
{ return 1; }
```

**Prototype:**

```
virtual TSTR GetSubTexmapSlotName(int i);
```

**Remarks:**

Implemented by the Plug-In.

This method returns the slot name of the 'i-th' sub-texmap. This name appears in the materials editor dialog. For instance, if you are in a material and then you go down into a map, this is the name that appears just below the 'Get Material' icon. For example, in the Standard material when you choose one of the maps, the map name appears to let you know which slot you are working on. For the Standard material, this may be "Ambient", "Diffuse", "Specular", etc.

**Parameters:**

**int i**

Specifies the slot whose name is returned.

**Default Implementation:**

The default implementation returns an empty ("" ) string.

**Prototype:**

**TSTR GetSubTexmapTVName(int i);**

**Remarks:**

Implemented by the Plug-In.

Returns the name to appear in Track View of the 'i-th' sub-texmap.

**Parameters:**

**int i**

Specifies the sub-texmap whose name is returned.

**Prototype:**

**virtual BOOL SetDlgThing(ParamDlg\* dlg);**

**Remarks:**

This method is called by the ParamMap2 **AUTO\_UI** system if the material/texmap is letting the system build an **AutoMParamDlg** for it. This method is called on a material/texmap coming into an existing set of ParamDlgs, once for each secondary **ParamDlg** and it should set the appropriate 'thing' into the given dlg (the 'thing' being, for example, a **Texout\*** or **UVGen\***). Return **FALSE** if **dlg** is unrecognized.

Note: See the discussion above in **CreateParamDlg()** for additional details on this method.

**Parameters:**

**ParamDlg\* dlg**

Points to the ParamDlg to check. See [Class ParamDlg](#).

**Return Value:**

**TRUE** if the **dlg** passed is recognized; **FALSE** if unrecognized.

**Default Implementation:**

```
{ return FALSE; }
```

**Sample Code:**

```

BOOL Gradient::SetDlgThing(ParamDlg* dlg)
{
    if (dlg == uvGenDlg)
        uvGenDlg->SetThing(uvGen);
    else if (dlg == texoutDlg)
        texoutDlg->SetThing(texout);
    else
        return FALSE;
    return TRUE;
}

```

**Prototype:**

```

void CopySubTexmap(HWND hwnd, int ifrom, int ito);

```

**Remarks:**

Implemented by the System.

This method is used to handle the drag-and-drop of texmaps. A developer implements the logic to handle the drag and drop. Once they have the information about what slot was dropped on what other slot, this method may be called to handle the copying. This is used by the 3ds max Standard material.

**Parameters:**

**HWND hwnd**

The rollup page window handle.

**int ifrom**

The source texmap.

**int ito**

The destination texmap.

**Prototype:**

```

virtual ReferenceTarget *GetRefTarget()=0;

```

**Remarks:**

Implemented by the System.

The implementation of this method is provided by **MtlBase**. It returns its **this** pointer.

## Class RenderMapsContext

See Also: [Class INode](#), [Class ViewParams](#), [Structure SubRendParams](#), [Class Matrix3](#), [Class Box3](#), [Class Point4](#), [Class Bitmap](#), [Class RenderGlobalContext](#).

class RenderMapsContext

### Description:

An instance of this class is passed into the **MtlBase::BuildMaps()** method. This is used for the Mirror and Automatic Cubic maps. These maps callback to methods of this class to perform a rendering from a particular view. Sample code using these methods is available in **\MAXSDK\SAMPLES\MATERIALS\MIRROR.CPP** and **ACUBIC.CPP**. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

```
virtual INode *GetNode()=0;
```

#### Remarks:

Returns the INode pointer of the node being rendered. This pointer allows a developer to access the properties of the node. See [Class INode](#).

#### Prototype:

```
virtual int NodeRenderID()=0;
```

#### Remarks:

Returns the node ID for the item being rendered or -1 if not set. This ID is assigned when the scene is being rendered - each node is simply given an ID: 0, 1, 2, 3, etc. The **NodeRenderID()** is simply a number automatically assigned to every node being rendered so that they can be differentiated in texture maps such as the Auto-cubic, which needs to store a cubic map for each node it is applied to.

#### Prototype:

```
virtual void GetCurrentViewParams(ViewParams &vp)=0;
```

#### Remarks:

Retrieves the current view dependent parameters.

**Parameters:**

**ViewParams &vp**

The **ViewParams** instance to update.

**Prototype:**

**virtual void GetSubRendParams(SubRendParams &srp)=0;**

**Remarks:**

Retrieves the sub-render parameters.

**Parameters:**

**SubRendParams &srp**

The **SubRendParams** instance to update.

**Prototype:**

**virtual int SubMtlIndex()=0;**

**Remarks:**

Returns the current sub material index or -1 if at node material level.

**Prototype:**

**virtual void FindMtlPlane(float pl[4])=0;**

**Remarks:**

Computes the plane containing the current material or sub material. This is used by the Flat Mirror material.

**Parameters:**

**float pl[4]**

The plane containing the current material or sub material. The four float values in **pl[4]** represent the plane equation. If you call the four values A,B,C and D, then the plane equation of the plane is  $Ax + By + cZ + D = 0$ .

**Prototype:**

**virtual void FindMtlScreenBox(Rect &sbox, Matrix3\* viewTM=NULL, int mtlIndex=-1)=0;**

**Remarks:**

This method computes the rectangle in screen space of the specified material. This uses the viewTM, but assumes the remaining view params (devWidth, devHeight, devAspect, fov) are the same as the main render. This method is specific to the Flat Mirror material.

**Parameters:****Rect & sbox**

The resulting 2D box.

**Matrix3\* viewTM=NULL**

The view matrix.

**int mtlIndex=-1**

The material index, or -1 if a node level material.

**Prototype:**

**virtual Box3 CameraSpaceBoundingBox()=0;**

**Remarks:**

This method is available in release 2.0 and later only.

This method computes the bounding box in camera space of the object associated with the reflection or refraction map being built in a call to a map's **BuildMaps()** method.

**Prototype:**

**virtual Box3 ObjectSpaceBoundingBox()=0;**

**Remarks:**

This method is available in release 2.0 and later only.

This method computes the bounding box in object space of the object associated with the reflection or refraction map being built in a call to a map's **BuildMaps()** method.

**Prototype:**

**virtual Matrix3 ObjectToWorldTM()=0;**

**Remarks:**

This method is available in release 2.0 and later only.

This method returns the object to world transformation.

**Prototype:**

**virtual RenderGlobalContext \*GetGlobalContext();**

**Remarks:**

This method is available in release 2.0 and later only.

Returns a pointer to a class that describes properties of the rendering environment.

**Prototype:**

**virtual int Render(Bitmap \*bm, ViewParams &vp,  
SubRendParams &srp, Point4 \*clipPlanes=NULL, int  
nClipPlanes=0)=0;**

**Remarks:**

Renders the scene and stores in the result into **bm**.

**Parameters:**

**Bitmap \*bm**

The Bitmap to render the result to. The properties of this bitmap define the properties of the render (such as the width and height).

**ViewParams &vp**

The ViewParams.

**SubRendParams &srp**

The SubRendParams.

**Point4 \*clipPlanes=NULL**

This revised parameter is available in release 2.0 and later only.

This is a pointer to an array of Point4s, each of which represents a clip plane. If it is non-null, the renderer will clip all objects against these planes in addition to the normal left/right/top/bottom clipping. This is used by the Mirror material to clip away stuff that is behind the mirror. If not needed this may default to NULL.

**int nClipPlanes=0**

This parameter is available in release 2.0 and later only.

The number of clipping planes above. A maximum of 6 is possible.

**Return Value:**

Nonzero on success; otherwise zero.

**Prototype:**

```
virtual INT_PTR Execute(int cmd, ULONG arg1=0, ULONG  
arg2=0, ULONG arg3=0);
```

**Remarks:**

This method is available in release 2.0 and later only.

This is a general purpose function that allows the API to be extended in the future. The 3ds max development team can assign new **cmd** numbers and continue to add functionality to this class without having to 'break' the API.

**Parameters:****int cmd**

The index of the command to execute.

**ULONG arg1=0**

Optional argument 1. See the documentation where the **cmd** option is discussed for more details on these parameters.

**ULONG arg2=0**

Optional argument 2.

**ULONG arg3=0**

Optional argument 3.

**Return Value:**

An integer return value. See the documentation where the **cmd** option is discussed for more details on the meaning of this value.

# Class PStamp

See Also: [Class AnimProperty](#).

class PStamp: public AnimProperty

## Description:

This class is available in release 2.0 and later only.

This is used internally by the Material / Map Browser which supports the display of small and large icon images for material and texture maps. This class is the postage stamp image object.

The width in bytes of the image pixel array is given by the following macro, where w is pixel width.

```
#define ByteWidth(w) (((w*3+3)/4)*4)
```

## Methods:

### Prototype:

```
virtual int Width()=0;
```

### Remarks:

Returns the width of the image in pixels.

### Prototype:

```
virtual int Height()=0;
```

### Remarks:

Returns the height of the image in pixels.

### Prototype:

```
virtual void SetImage(UBYTE *img)=0;
```

### Remarks:

Sets the image for the postage stamp.

### Parameters:

```
UBYTE *img
```

This is an array of RGB triplets.

**Prototype:**

**virtual void GetImage(UBYTE \*img)=0;**

**Remarks:**

Retrieves the image bytes of the postage stamp.

**Parameters:**

**UBYTE \*img**

This is an array of RGB triplets.

**Prototype:**

**virtual void DeleteThis()=0;**

**Remarks:**

This method is called to delete this instance of the class.

**Prototype:**

**virtual IOResult Load(ILoad \*iload)=0;**

**Remarks:**

This method is used to load the postage stamp image.

**Prototype:**

**virtual IOResult Save(ISave \*isave)=0;**

**Remarks:**

This method is used to save the postage stamp image.

## List of Material Flags

See Also: [Class MtlBase](#).

One or more of the following values:

### **MTL\_IN\_SCENE**

The material is being used in the scene.

### **MTL\_BEING\_EDITED**

The material's parameters are being displayed in the Material Editor.

### **MTL\_SUB\_BEING\_EDITED**

This material OR sub-material texmap is being displayed in the Material Editor.

### **MTL\_TEX\_DISPLAY\_ENABLED**

Interactive texture display is enabled.

### **MTL\_MEDIT\_BACKGROUND**

The material has the background shown in Material Editor.

### **MTL\_MEDIT\_BACKLIGHT**

The material is backlight in Material Editor.

### **MTL\_MEDIT\_OBJTYPE**

The object type displayed in Material Editor.

### **MTL\_MEDIT\_TILING**

The tiling setting of the Material Editor.

### **MTL\_MEDIT\_VIDCHECK**

The video check state of the Material Editor.

### **MTL\_BROWSE\_OPEN1**

This is for internal use only.

### **MTL\_BROWSE\_OPEN2**

This is for internal use only.

## Class IAutoMParamDlg

See Also: [Class ParamDlg](#), [Class IParamMap2](#), [Class IMtlParams](#), [Class ParamMap2UserDlgProc](#).

```
class IAutoMParamDlg : public ParamDlg
```

### Description:

This class is available in release 3.0 and later only.

This is the Auto ParamDlg class for Material Editor auto-UI, instanced by **ClassDesc2::CreateParamDlg()**. It maintains a table of secondary ParamDlgs for master ParamDlgs (eg, the one returned from CreateParamDlg()) and will broadcast appropriate method calls to them as the master receives them.

### Methods:

public:

### Prototype:

```
virtual void InvalidateUI()=0;
```

### Remarks:

This method causes the user interface controls to be re-drawn.

### Prototype:

```
virtual void MtlChanged()=0;
```

### Remarks:

This method may be called to causes the viewports to be redrawn. It should be called when any parameter that affects the look of the material in the viewport has been altered. If the material is not on a visible node in a shaded view, nothing will happen. This method should **not** be called as a spinner is being dragged, but only upon release of the mouse button.

### Prototype:

```
virtual int NumDlgs()=0;
```

### Remarks:

Returns the number of secondary dialogs.

**Prototype:**

**virtual void AddDlg(ParamDlg\* dlg)=0;**

**Remarks:**

Adds the specified dialog as another secondary dialog.

**Parameters:**

**ParamDlg\* dlg**

Points to the parameter dialog to add.

**Prototype:**

**virtual ParamDlg\* GetDlg(int i)=0;**

**Remarks:**

Returns a pointer to the 'i-th' secondary dialog.

**Parameters:**

**int i**

The zero based index of the dialog to return.

**Prototype:**

**virtual void SetDlg(int i, ParamDlg\* dlg)=0;**

**Remarks:**

Sets the 'i-th' dialog to the one passed.

**Parameters:**

**int i**

The zero based index of the dialog to set.

**ParamDlg\* dlg**

Points to the parameter dialog to set.

**Prototype:**

**virtual void DeleteDlg(ParamDlg\* dlg)=0;**

**Remarks:**

This method is used for deleting secondary dialogs from a master **IAutoMParamDlg**. Use this along with **AddDlg()** if you are dynamically changing the set of rollups for the plugin, so that the **P\_AUTO\_UI** system

can correctly manage all current secondary rollups.

**Parameters:**

**ParamDlg\* dlg**

Points to the ParamDlg to delete.

**Prototype:**

**virtual IParamMap2\* GetMap()=0;**

**Remarks:**

Returns a pointer to the parameter map2 of this primary (master) dialog.

**This function is not part of this class but is available for use.**

**Function:**

**IAutoMParamDlg\* CreateAutoMParamDlg(HWND hMedit, IMtlParams \*i, MtlBase\* mtl, IParamBlock2\* pb, ClassDesc2\* cd, HINSTANCE inst, TCHAR\* dlgTemplate, TCHAR\* title, int rollFlags, ParamMap2UserDlgProc\* dlgProc=NULL);**

**Remarks:**

This function may be called to create a parameter map2 for use in the material editor dialog.

Note, in version 4.0 and later, this actually maps to a call on the explicit map ID overload of **CreateAutoMParamDlg()** with default map ID of 0.

**Parameters:**

**HWND hMedit**

The window handle of the materials editor.

**IMtlParams \*i**

The interface pointer for materials. See [Class IMtlParams](#).

**MtlBase\* mtl**

Points to the material calling this function.

**IParamBlock2\* pb**

Points to the parameter block instance associated with the parameter map.

**ClassDesc2\* cd**

The class descriptor2 for the plug-in creating the parameter map.

**HINSTANCE inst**

The plug-ins DLL instance handle.

**TCHAR\* dlgTemplate**

Dialog template for the rollup page (created using the resource editor)

**TCHAR\* title**

The title displayed in the rollup page title bar.

**int rollFlags**

A set of flags to control settings of the rollup page.

**APPENDROLL\_CLOSED**

Starts the page in the rolled up state.

**ParamMap2UserDlgProc\* dlgProc=NULL**

If there is some custom handling required by a particular control, the client can derive a class from ParamMap2UserDlgProc and set it as the parameter map's user callback.

**HWND hOldRollup=NULL**

An optional window handle to allow supplying an existing rollup that will be **replaced** by the newly created one.

**Return Value:**

A pointer to an interface for managing the parameter map2.

**Function:**

```
IAutoMParamDlg* CreateAutoMParamDlg(MapID map_id,  
HWND hMedit, IMtlParams *i, MtlBase* mtl, IParamBlock2* pb,  
ClassDesc2* cd, HINSTANCE inst, TCHAR* dlgTemplate,  
TCHAR* title, int rollFlags, ParamMap2UserDlgProc*  
dlgProc=NULL);
```

**Remarks:**

This function is available in release 4.0 and later only.

This function may be called to create a parameter map2 for use in the material editor dialog. This overload of **CreateAutoMParamDlg()** has a new parameter, **map\_id**, that specifies the ID of the parameter map/rollup to be created for this particular parameter block. See original function for the rest of the description.

**Function:**

**IAutoEParamDlg\* CreateAutoEParamDlg(IRendParams \*i, Effect\* e, IParamBlock2\* pb, ClassDesc2\* cd, HINSTANCE inst, TCHAR\* dlgTemplate, TCHAR\* title, int rollFlags, ParamMap2UserDlgProc\* dlgProc=NULL);**

**Remarks:**

This function creates an AutoEParamDlg for render effects.

Note, in version 4.0 and later, this actually maps to a call on the explicit map ID overload of **CreateAutoEParamDlg()** with default map ID of 0.

**Parameters:**

**IRendParams \*i**

An interface pointer for rendering effects.

**Effect\* e**

Points to the rendering effect calling this function.

**IParamBlock2\* pb**

Points to the parameter block instance associated with the parameter map.

**ClassDesc2\* cd**

The class descriptor2 for the plug-in creating the parameter map.

**HINSTANCE inst**

The plug-ins DLL instance handle.

**TCHAR\* dlgTemplate**

Dialog template for the rollup page (created using the resource editor)

**TCHAR\* title**

The title displayed in the rollup page title bar.

**int rollFlags**

A set of flags to control settings of the rollup page.

**APPENDROLL\_CLOSED**

Starts the page in the rolled up state.

**ParamMap2UserDlgProc\* dlgProc=NULL**

If there is some custom handling required by a particular control, the client can derive a class from ParamMap2UserDlgProc and set it as the parameter map's user callback.

**Return Value:**

A pointer to an interface for managing the parameter map2.

**Function:**

```
IAutoEParamDlg* CreateAutoEParamDlg(MapID map_id,  
IRendParams *i, Effect* e, IParamBlock2* pb, ClassDesc2* cd,  
HINSTANCE inst, TCHAR* dlgTemplate, TCHAR* title, int  
rollFlags, ParamMap2UserDlgProc* dlgProc=NULL);
```

**Remarks:**

This function is available in release 4.0 and later only.

This function creates an AutoEParamDlg for render effects. This overload of **CreateAutoEParamDlg()** has a new parameter, **map\_id**, that specifies the ID of the parameter map/rollup to be created for this particular parameter block. See original function for the rest of the description.

## Class MtlMakerCallback

See Also: [Class TexHandleMaker](#), [Class TextureInfo](#), [Class MtlBase](#), [Class Texmap](#), [Class Material](#).

class MtlMakerCallback: public TexHandleMaker

### Description:

This class is available in release 4.0 and later only.

This is the callback used with the new multi-texture interface provided by method **MtlBase::SetupGfxMultiMaps()**.

### Methods:

public:

### Prototype:

```
virtual void GetGfxTexInfoFromTexmap(TimeValue t,  
TextureInfo& texinf, Texmap *txm)=0;
```

### Remarks:

This method updates all the fields of the TextureInfo instance except the texture handle and the texture ops.

### Parameters:

#### **TimeValue t**

The time at which the texture is evaluated.

#### **TextureInfo& texinf**

The texture info which is updated.

#### **Texmap \*txm**

Points to the texmap as the source for the texture info update.

### Prototype:

```
virtual BOOL NumberTexturesSupported()=0;
```

### Remarks:

This method returns the number of textures that the hardware+driver supports.

## List of IOResults

One of the following values:

### **IO\_OK**

The result was acceptable - no errors.

### **IO\_END**

This is returned from **ILoad::OpenChunk()** when the end of the chunks at a certain level have been reached. It is used as a signal to terminate the processing of chunks at that level.

### **IO\_ERROR**

This is returned if an error occurred. Note that the plug-in should not put up a message box if a read error occurred. It should simply return the error status. This prevents a excess of messages from appearing.

## Class RefList

See Also: [Class RefListItem](#).

class RefList

### Description:

The method **GetRefList()** returns a list of references to a reference target. This class is linked list of references. All methods of this class are implemented by the system.

### Data Members:

public:

**RefListItem\* first;**

### Methods:

#### Prototype:

**RefList()**

#### Remarks:

Constructor. The list is set to NULL.

#### Prototype:

**RefListItem\* FirstItem()**

#### Remarks:

Returns the first item in the list.

#### Prototype:

**RefResult DeleteItem(RefMakerHandle hmaker, int eval);**

#### Remarks:

Deletes the specified item from the list.

#### Parameters:

**RefMakerHandle hmaker**

The item to delete.

**int eval**

If nonzero then when inside of **NotifyDependents()**, just set **maker** to

NULL.

**Return Value:**

If the item was deleted **REF\_SUCCEED** is returned; otherwise **REF\_INVALID** is returned.

**Prototype:**

**RefResult AddItem(RefMakerHandle hmaker);**

**Remarks:**

Adds the specified item to the list.

**Parameters:**

**RefMakerHandle hmaker**

The item to add.

**Return Value:**

Returns **REF\_SUCCEED**.

**Prototype:**

**void Cleanup();**

**Remarks:**

This method removes null entries from the list.

## Class DependentEnumProc

See Also: [Class ReferenceTarget](#).

class DependentEnumProc

### Description:

This class is a callback object for the

**ReferenceTarget::EnumDependents()** method. The **proc()** method is called by the system.

### Methods:

### Prototype:

```
virtual int proc(ReferenceMaker *rmaker)=0;
```

### Remarks:

Implemented by the Plug-In.

This is the method called by system from

**ReferenceTarget::EnumDependents()**.

### Parameters:

**ReferenceMaker \*rmaker**

A pointer to the reference maker

### Return Value:

One of the following values:

**DEP\_ENUM\_CONTINUE**

This continues the enumeration.

**DEP\_ENUM\_HALT**

The stops the enumeration.

**DEP\_ENUM\_SKIP**

This option is available in release 3.0 and later only.

Reference Targets can have multiple Reference Makers (dependents). In certain instances when EnumDependents() is used to enumerate them you may not want to travel up all of the "branches". By returning DEP\_ENUM\_SKIP from this method you tell the enumerator to not enumerate the current Reference Maker's dependents but not to halt the enumeration completely.

## List of Snap Flags

See [Structure SnapInfo](#).

One or more of the following values:

### **SNAP\_IN\_3D**

Snap to all points.

### **SNAP\_IN\_PLANE**

Snap only to points on the construction (or optionally specified) plane.

### **SNAP\_UNSEL\_OBJS\_ONLY**

Ignore selected nodes when considering snap points.

### **SNAP\_SEL\_OBJS\_ONLY**

Ignore unselected nodes when considering snap points.

### **SNAP\_UNSEL\_SUBOBJ\_ONLY**

Ignore selected sub-object geometry when considering snap points.

### **SNAP\_SEL\_SUBOBJ\_ONLY**

Ignore unselected sub-object geometry when considering snap points.

### **SNAP\_FORCE\_3D\_RESULT**

Override user settings to force snap in 3D.

### **SNAP\_OFF\_PLANE**

This is used internally to snap only to points off the plane.

Many of the objects call **GetCPDisp()** when they want to snap lengths etc.

This method knew nothing about the snapping that was added in 3ds max 2.0

so it had to be retrofited to call **SnapPoint()**. This is where

**SNAP\_OFF\_PLANE** is called. It forces the osnapmanager to only consider points which are OFF the current construction plane.

### **SNAP\_TRANSPARENTLY**

This is used internally to suppresses any display in the viewports. This can be used to provide a way of snapping to arbitray screen points without giving feedback.

### **SNAP\_APPLY\_CONSTRAINTS**

This is used internally to suppresses any display in the viewports.

### **SNAP\_PROJ\_XAXIS**

This is used internally to suppresses any display in the viewports.

**SNAP\_PROJ\_YAXIS**

This is used internally to suppresses any display in the viewports.

**SNAP\_PROJ\_ZAXIS**

This is used internally to suppresses any display in the viewports.

## Class HitData

See Also: [Class HitRecord](#).

class HitData

### Description:

This class is used during sub-object hit testing to identify sub-object components. If the 4 bytes available in the **info** data member of **HitRecord** are insufficient to identify the sub-object component an instance of this class can be created to contain the necessary data.

### Methods:

### Prototype:

```
virtual ~HitData();
```

### Remarks:

Implemented by the Plug-In.

The virtual destructor allows the instance of **HitData** to be deleted when the **HitRecord** that points to it is deleted.

## List of Mouse Callback Flags

One or more of the following values describing the state of the Shift/Ctrl/Alt keys and mouse buttons:

### **MOUSE\_SHIFT**

Indicates the Shift key is pressed.

### **MOUSE\_CTRL**

Indicates the Ctrl key is pressed.

### **MOUSE\_ALT**

Indicates the Alt key is pressed.

### **MOUSE\_LBUTTON**

Indicates the Left button is down.

### **MOUSE\_MBUTTON**

Indicates the Middle button is down.

### **MOUSE\_RBUTTON**

Indicates the Right button is down.

## Class CtrlHitLog

class CtrlHitLog

### Description:

This class provides a data structure for keeping a log of hits during controller gizmo hit-testing. It provides a list of **CtrlHitRecords** that may be added to and cleared. A developer may also request the 'closest' hit record in the list. All methods are implemented by the system.

### Methods:

#### Prototype:

**CtrlHitLog()**

#### Remarks:

Constructor.

#### Prototype:

**void Clear();**

#### Remarks:

Clears the list of hits.

#### Prototype:

**CtrlHitRecord\* First()**

#### Remarks:

Returns the first hit record in the list.

#### Prototype:

**CtrlHitRecord\* ClosestHit();**

#### Remarks:

Returns the **CtrlHitRecord** that was 'closest' to the mouse position when hit testing was performed.

#### Prototype:

**void LogHit(INode \*nr,DWORD dist,ulong info,DWORD infoExtra);**

**Remarks:**

This method is called to log a hit. It creates a new **CtrlHitRecord** object using the data passed and adds it to the hit log.

**Parameters:**

**INode \*nr**

The node whose gizmo was hit.

**DWORD dist**

The 'distance' of the hit. What the distance actually represents depends on the rendering level of the viewport. For wireframe modes, it refers to the distance in the screen XY plane from the mouse to the sub-object component. In a shaded mode, it refers to the Z depth of the sub-object component. In both cases, smaller values indicate that the sub-object component is 'closer' to the mouse cursor.

**ulong hitInfo;**

A general unsigned long value. Most controllers will just need this to identify the sub-object element. The meaning of this value (how it is used to identify the element) is up to the plug-in.

**DWORD infoExtra;**

If the above **hitInfo** data member is not sufficient to describe the sub-object element this data member may be used as well.

# Class PostLoadCallback

See Also: [Class ILoad](#), [References](#).

```
class PostLoadCallback : public InterfaceServer
```

## Description:

This is the callback object used by **ILoad::RegisterPostLoadCallback()**. The **proc()** method will be called when everything has been loaded and all the references are in place. It is assumed that if the callback needs to be deleted, the **proc()** method will do it.

## Methods:

### Prototype:

```
virtual void proc(ILoad *iLoad)=0;
```

### Remarks:

Implemented by the Plug-In.

This method will be called when loading is complete.

### Parameters:

**ILoad \*iLoad**

This class provides methods to load data from disk.

### Prototype:

```
virtual int Priority();
```

### Remarks:

This method is available in release 3.0 and later only.

This method determines the order that the various registered callbacks execute. This method is overridden, for example, by the ParamBlock2 PostLoadCallbacks to return 1 so it can execute before the others.

### Return Value:

The allowable return values are **0** to **10**, with 5 being the default. **0** is reserved for ParamBlock2PLCB and ParamBlockPLCB..

### Default Implementation:

```
{ return 5; }
```

**Prototype:**

```
virtual INT_PTR Execute(int cmd, ULONG arg1=0, ULONG  
arg2=0, ULONG arg3=0);
```

**Remarks:**

This method is available in release 3.0 and later only.

This is a general purpose function that allows the API to be extended in the future. The 3ds max development team can assign new **cmd** numbers and continue to add functionality to this class without having to 'break' the API.

This is reserved for future use.

**Parameters:****int cmd**

The command to execute.

**ULONG arg1=0**

Optional argument 1 (defined uniquely for each **cmd**).

**ULONG arg2=0**

Optional argument 2.

**ULONG arg3=0**

Optional argument 3.

**Return Value:**

An integer return value (defined uniquely for each **cmd**).

**Default Implementation:**

```
{ return 0; }
```

## Class ClassDirectory

See Also: [Class DllDir](#), [Class SubClassList](#), [Class Class\\_ID](#), [Class ClassDesc](#).

class ClassDirectory

### Description:

This class is available in release 2.0 and later only.

It provides a table of **SubClassList** objects, one for each pluggable super class. Methods are provided for accessing specific sub class lists by specifying a super class ID, and retrieving the class descriptors or class entries of the classes in the lists.

All methods of this class are implemented by the system.

### Methods:

#### Prototype:

**int Count();**

#### Remarks:

Returns the number of class lists in the class directory.

#### Prototype:

**SubClassList\* GetClassList(SClass\_ID superClassID);**

#### Remarks:

Returns a pointer to the list of sub-classes derived from the specified super class ID.

#### Parameters:

**SClass\_ID superClassID**

The super class ID whose list of sub-classes are to be returned.

#### Prototype:

**ClassDesc\* FindClass(SClass\_ID superClassID, Class\_ID subClassID);**

#### Remarks:

Returns a pointer to the class descriptor for the class whose super class ID and class ID are passed.

**Parameters:****SClass\_ID superClassID**

The super class ID which specifies which sub class list to search.

**Class\_ID subClassID**

The class ID of the class to find.

**Prototype:****ClassEntry \*FindClassEntry(SClass\_ID superClassID, Class\_ID subClassID);****Remarks:**

Returns a pointer to the class entry for the class whose super class ID and class ID are passed.

**Parameters:****SClass\_ID superClassID**

The super class ID which specifies which sub class list to search.

**Class\_ID subClassID**

The class ID of the class to find.

**Prototype:****void AddSuperClass(SClass\_ID superClassID);****Remarks:**

This method is used internally **only** to add a new Super Class ID to the list maintained by this class.

**Important Note:** It is illegal to create your own Super Class of persistent objects in 3ds max. 3ds max will crash if a scene is saved and later loaded into a system that doesn't have a plug-in added Super Class. The problem is that 3ds max needs a stand-in class for each 'plug-able' Super Class and if a plug-in is loaded that requires (but doesn't have) a stand-in, an assertion is fired.

The only legal Super Classes that you can derive your plug-in from are listed [List of Super Class IDs](#).

**Prototype:****int AddClass(ClassDesc \*cdesc, int dllNum, int index);**

**Remarks:**

This method is used internally to add a class descriptor to the list maintained by this class.

**Operators:****Prototype:**

```
SubClassList& operator[](int i){ return(*cl[i]);}
```

**Remarks:**

Returns a reference to the 'i-th' sub class list.

**Parameters:**

**int i**

Specifies which sub class list to return a reference to. This value is between **0** and **Count()-1**.

## Class PickObjectProc

See Also: [Class IMtlParams](#), [Class INode](#).

class PickObjectProc

### Description:

This class is available in release 2.0 and later only.

This is the callback object passed to **IMtlParams::SetPickMode()**. It gets set so the user can pick objects in the scene. Its methods allow for filtering the picks, changing cursors over valid hits, and allowing multiple picks.

All methods of this class are implemented by the plug-in.

### Methods:

#### Prototype:

**virtual BOOL Pick(INode \*node)=0;**

#### Remarks:

This method is called when the user picks something.

#### Parameters:

**INode \*node**

This is the node that was selected.

#### Return Value:

Return TRUE to end the pick mode; FALSE to ignore the pick and to continue to allow the user to pick.

#### Prototype:

**virtual BOOL Filter(INode \*node)=0;**

#### Remarks:

This method is called to allow the callback to filter hits. It should return TRUE if this is an acceptable hit; FALSE otherwise.

#### Parameters:

**INode \*node**

This is the node that was selected.

**Prototype:****virtual void EnterMode();****Remarks:**

This method is called when the pick mode has been entered. The developer may provide any pre-processing here.

**Default Implementation:****{}****Prototype:****virtual void ExitMode();****Remarks:**

This method is called when the pick mode has been exited. The developer may provide any post-processing here.

**Default Implementation:****{}****Prototype:****virtual HCURSOR GetDefCursor();****Remarks:**

This method is called to get the default (non-hit) cursor to use.

**Return Value:**

The handle of the non-pickable object cursor or NULL if the default cursor should be used.

**Default Implementation:****{return NULL;}****Prototype:****virtual HCURSOR GetHitCursor();****Remarks:**

This method is called to get the pickable object cursor to use.

**Return Value:**

The handle of the pickable object cursor or NULL if the default cursor should

be used.

**Default Implementation:**

```
{return NULL;}
```

**Prototype:**

```
virtual BOOL AllowMultiSelect();
```

**Remarks:**

This method determines if multiple objects can be picked. Returning TRUE allows the user to pick more than one thing. In this case the **Pick()** method may be called more than once.

**Default Implementation:**

```
{return FALSE;}
```

## Class LayerProperty

See Also: [Class ReferenceTarget](#), [Class ILayerManager](#).

```
class LayerProperty : public ReferenceTarget
```

### Description:

This class is available in release 3.0 and later only.

The methods of this class are currently unused and reserved for internal use as of release 3.0.

```
class LayerProperty : public ReferenceTarget
```

### Methods:

```
public:
```

### Prototype:

```
    LayerProperty();
```

### Remarks:

Constructor.

This will set the layer ID to -1 and an empty name string.

### Default Implementation:

```
{ }
```

### Prototype:

```
    LayerProperty(const TSTR & name, int id);
```

### Remarks:

Constructor.

This will initialize the layer property with the name and ID of the property.

### Default Implementation:

```
{ }
```

### Prototype:

```
    virtual ~LayerProperty();
```

### Remarks:

Destructor.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void SetProperty(const int d) = 0;
```

**Remarks:**

This method allows you to set the integer property.

**Parameters:**

**const int d**

The property to set.

**Prototype:**

```
virtual void SetProperty(const float d) = 0;
```

**Remarks:**

This method allows you to set the floating point property.

**Parameters:**

**const float d**

The property to set.

**Prototype:**

```
virtual void SetProperty(const Point3 & d) = 0;
```

**Remarks:**

This method allows you to set the Point3 property.

**Parameters:**

**const Point3 & d**

The property to set.

**Prototype:**

```
virtual void SetProperty(const TSTR & d) = 0;
```

**Remarks:**

This method allows you to set the string property.

**Parameters:**

**const TSTR & d**

The property to set.

**Prototype:**

**virtual void SetProperty(void \* d) = 0;**

**Remarks:**

This method allows you to set the property.

**Parameters:**

**void \* d**

A pointer to the property data to set.

**Prototype:**

**virtual bool GetProperty(int & i) const = 0;**

**Remarks:**

This method returns the layer property.

**Parameters:**

**int & i**

The property data.

**Return Value:**

TRUE if successful, otherwise FALSE.

**Prototype:**

**virtual bool GetProperty(float & f) const = 0;**

**Remarks:**

This method returns the layer property.

**Parameters:**

**float & f**

The property data.

**Return Value:**

TRUE if successful, otherwise FALSE.

**Prototype:**

**virtual bool GetProperty(Point3 & p) const = 0;**

**Remarks:**

This method returns the layer property.

**Parameters:**

**Point3 & p**

The property data.

**Return Value:**

TRUE if successful, otherwise FALSE.

**Prototype:**

**virtual bool GetProperty(TSTR & n) const = 0;**

**Remarks:**

This method returns the layer property.

**Parameters:**

**TSTR & n**

The property data.

**Return Value:**

TRUE if successful, otherwise FALSE.

**Prototype:**

**virtual bool GetProperty(void \* v) const = 0;**

**Remarks:**

This method returns the layer property.

**Parameters:**

**void \* v**

The property data.

**Return Value:**

TRUE if successful, otherwise FALSE.

**Prototype:**

**int GetID() const;**

**Remarks:**

This method returns the property ID.

**Prototype:**

**void SetID(int id);**

**Remarks:**

This method allows you to set the property ID.

**Parameters:**

**int id**

The ID to set.

**Prototype:**

**TSTR GetName() const;**

**Remarks:**

This method returns the property name.

**Prototype:**

**void SetName(const TSTR & name);**

**Remarks:**

This method allows you to set the property name.

**Parameters:**

**const TSTR & name**

The property name to set.

## Class GenericNamedSelSetList

See Also: [Class BitArray](#).

### Description:

This class is available in release 3.0 and later only.

This class is a tool for manipulating lists of named selection sets. This class is used by modifiers such as the edit mesh, mesh select, spline select and edit patch.

All methods of this class are implemented by the system.

### Data Members:

public:

**Tab<TSTR\*> names;**

A table of names, one for each selection set.

**Tab<BitArray\*> sets;**

The bit array pointers for the selection sets.

**Tab<DWORD> ids;**

A table of Ids, one for each selection set.

### Methods:

public:

### Prototype:

**~GenericNamedSelSetList();**

### Remarks:

Destructor. The names and sets are deleted.

### Prototype:

**BitArray \*GetSet(TSTR name);**

### Remarks:

Returns a pointer to the bit array corresponding to the specified name. If the set is not found NULL is returned.

### Parameters:

**TSTR name**

The name of the selection set to retrieve.

**Prototype:**

**BitArray \*GetSet(DWORD id);**

**Remarks:**

Returns a pointer to the bit array corresponding to the specified ID. If the set is not found NULL is returned.

**Parameters:**

**DWORD id**

The id of the selection set to retrieve.

**Prototype:**

**BitArray \*GetSetByIndex(int index);**

**Remarks:**

Returns a pointer to the bit array corresponding to the specified index in the list. If the set is not found NULL is returned.

**Parameters:**

**int index**

The zero based index of the selection set to retrieve ( $\geq 0$  and  $< \text{sets.Count}()$ ).

**Prototype:**

**int Count();**

**Remarks:**

Returns the number of selection sets.

**Prototype:**

**void AppendSet(BitArray &nset, DWORD id=0, TSTR name=\_T(""));**

**Remarks:**

Appends the named selection set data to the list of sets maintained by this class.

**Parameters:**

**BitArray &nset**

The selection set data to append.

**DWORD id=0**

An ID for the selection set.

**TSTR name=\_T("")**

The name for the selection set.

**Prototype:**

```
void InsertSet(int pos, BitArray &nset, DWORD id=0, TSTR  
&name=TSTR(""));
```

**Remarks:**

Inserts the named selection set data into the list of sets maintained by this class.

**Parameters:****int pos**

The position in the list where this named selection set should be inserted. If pos >= Count(), AppendSet() is automatically used instead.

**BitArray &nset**

The selection set data to insert.

**DWORD id=0**

An ID for the selection set.

**TSTR &name=TSTR("")**

The name for the selection set.

**Prototype:**

```
int InsertSet(BitArray &nset,DWORD id=0,TSTR  
&name=TSTR(""));
```

**Remarks:**

This method is similar to **InsertSet()** above, however instead of accepting an explicit location this method inserts the new set alphabetically in the list. (Of course, this requires an alphabetized list to work properly, although there's no problem if the list is not alphabetized.)

**Parameters:**

**BitArray &nset**

The selection set data to insert.

**DWORD id=0**

An ID for the selection set.

**TSTR &name=TSTR("")**

The name for the selection set.

**Return Value:**

The position where the set was inserted.

**Prototype:**

**BOOL RemoveSet(TSTR name);**

**Remarks:**

Removes the selection set whose name is passed.

**Parameters:****TSTR name**

The name of the selection set to remove.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

**BOOL RemoveSet(DWORD id);**

**Remarks:**

Removes the selection set whose ID is passed.

**Parameters:****DWORD id**

The id of the selection set to retrieve.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

**void SetSize(int size);**

**Remarks:**

Resizes the selection set bit arrays to the specified number of bits. The old selection set data is preserved.

**Parameters:**

**int size**

The new size for the bit arrays in bits.

**Prototype:**

**void DeleteSetElements(BitArray &set,int m=1);**

**Remarks:**

This method is not currently used. What it does however, is go through all of the named selection sets and deletes array elements according to which bits are set in the given bit array. It could be used to keep the named selection set bit arrays in line with the vertex array (for example).

**Prototype:**

**void DeleteSet(int i);**

**Remarks:**

Deletes the named selection set whose index is passed.

**Parameters:**

**int i**

The zero based index of the set to delete ( $\geq 0$  and  $< \text{sets.Count}()$ ).

**Prototype:**

**BOOL RenameSet(TSTR &oldName, TSTR &newName);**

**Remarks:**

This locates the named selection set **oldName** and renames it to **newName**.

**Parameters:**

**TSTR &oldName**

The old name of the set.

**TSTR &newName**

The new name for the set.

**Return Value:**

TRUE if the operation succeeded; otherwise FALSE. It will only fail if the **oldName** set is not present.

**Prototype:**

**void Alphabetize();**

**Remarks:**

Alphabetizes the list of names.

**Prototype:**

**IOResult Load(ILoad \*iload);**

**Remarks:**

This method is used internally to load the selection sets from disk.

**Prototype:**

**IOResult Save(ISave \*isave);**

**Remarks:**

This method is used internally to save the selection sets to disk.

**Prototype:**

**BitArray &operator[](int i);**

**Remarks:**

Returns a reference to the 'i-th' selection set.

**Parameters:**

**int i**

The zero based index of the selection set to return.

**Prototype:**

**GenericNamedSelSetList& operator=(GenericNamedSelSetList& from);**

**Remarks:**

Assignment operator. This list of sets is emptied and then copied from the list passed.

**Parameters:**

**GenericNamedSelSetList& from**

The list of selection sets to copy.

## List of Parameter Types

See Also: [Class IParamBlock](#), [Class ParamBlockDesc](#), [Class ParamBlockDescID](#).

The Parameter Type - One of the following types may be used:

- **TYPE\_INT** - Integers values.
- **TYPE\_FLOAT** - Floating point value.
- **TYPE\_POINT3** - Point values.
- **TYPE\_RGBA** - Colors values - Red, Green, Blue and Alpha.
- **TYPE\_BOOL** - Boolean values.
- **TYPE\_MATRIX3** - A Matrix3 data type value. This type is available in 4.0 and later only.
- **TYPE\_MATRIX3\_TAB** - A table of Matrix3 data type values. is available in 4.0 and later only.

## Class ParamBlockDesc2

See Also: [Class ClassDesc2](#), [Class ParamMap2UserDlg](#), [Class Mtl](#), [Class Texmap](#), [Class PBBitmap](#), [Class PBAccessor](#), [Class INode](#), [Class Color](#), [Class Point3](#), [Class ReferenceTarget](#), [Structure ParamDef](#), [List of ParamType Choice](#), [List of ParamTags Choices](#).

```
class ParamBlockDesc2 : public BaseInterfaceServer
```

### Description:

This class is available in release 3.0 and later only.

In the Parameter Block2 scheme there is one ParamBlockDesc2 object per entire Parameter Block2.

This class is used when adding a paramblock descriptor for each parameter block2. This is usually done in the form of a static instance of this class. The constructor takes a number of fixed, block-related arguments and then a varargs-based variable list of arguments that define the block and its parameters.

All methods of this class are implemented by the System.

### Method / Specification Groups:

The hyperlinks below take you to the start of groups of related methods or constructor vararg specifications within the class:

[Constructors](#)

[<required block specs>](#)

[<auto construct block refno>](#)

[<auto ui parammap specs>](#)

[<required param specs>](#)

[<optional tagged param specs>](#)

### Data Members:

public:

**ParamDef\* paramdefs;**

Array of parameter definitions.

**ClassDesc2\* cd;**

This is the class descriptor of the class which owns this parameter block descriptor.

**TCHAR\* int\_name;**

This is the internal name of this parameter descriptor. This name is not localized. Internal names are meant to be parsable as identifiers. As such they should begin with an alpha character, have only alphanumerics, and have no spaces, punctuations, etc. The convention for multi-word names is to use study-caps, eg, paintRadius.

**int local\_name;**

This is the string table resource ID for the localized (sub-anim) name.

**BlockID ID;**

The permanent parameter block ID.

**USHORT count;**

The number of parameters in block.

**ULONG version;**

This is the parameter block version.

**BYTE flags;**

One or more of the following values (see the constructor argument **flags** below for details):

**P\_CLASS\_PARAMS**

**P\_AUTO\_CONSTRUCT**

**P\_AUTO\_UI**

**P\_USE\_PARAMS**

**P\_INCLUDE\_PARAMS**

**P\_SCRIPTED\_CLASS**

**P\_TEMPORARY**

**P\_HASCATEGORY**

**P\_CALLSETS\_ON\_LOAD**

**P\_TEMPLATE\_UI**

Note: The following data members are optional and used by the auto-construct code:

**int ref\_no;**

The reference number for the auto-constructed parameter block.

**int dlg\_template;**

The rollout dialog template resource.

**int title;**

String table resource ID of the rollout title.

**int test\_flags;**

The **ClassDesc2::Begin/EndEditParams()** test flags. See the **flag\_mask** parameter description below for details.

**int rollup\_flags;**

This is used to control rollup creation. See the **rollup\_flags** parameter description below for details.

**ParamMap2UserDlgProc\* dlgProc;**

Points to the parameter map user dialog proc (if used).

**MSPluginClass\* pc;**

If this ParamBlockDesc2 belongs to a scripted plug-in this points to the scripted class (or NULL otherwise). See [MAXScript SDK](#).

**Value\* rollout;**

If this ParamBlockDesc2 belongs to a scripted plug-in this points to rollout name. See [MAXScript SDK](#).

**IParamBlock2\* class\_params;**

Pointer to class parameter block if the **CLASS\_PARAM** flag is specified for the block. See the flags descriptions below for details.

**Prototype:**

**void AddParam(ParamID id, ...);**

**Remarks:**

This method is used for building descriptors incrementally. It adds a parameter to an existing descriptor.

Note that you must not modify a descriptor with this function once it has been used to construct a ParamBlock2 (for instance in object creation); there is no version control in place and crashes or unpredictable results can occur.

**Parameters:**

**ParamID id, ...**

This function takes a single parameter definition in exactly the same varargs format as the ParamBlockDesc2 constructor. See [Constructors](#).

**Prototype:**

**void ReplaceParam(ParamID id, ...);**

**Remarks:**

This method is used for modifying a descriptors incrementally. It overrides an existing parameter definition of same ID passed. Note: You must not modify a descriptor with this method once it has been used to construct a ParamBlock2.

**Parameters:**

**ParamID id, ...**

This function takes a single parameter definition in exactly the same varargs format as the ParamBlockDesc2 constructor. See [Constructors](#).

**Prototype:**

**void DeleteParam(ParamID id);**

**Remarks:**

Deletes the specified parameter from the descriptor.

**Parameters:**

**ParamID id**

The permanent ID of the parameter to delete.

**Prototype:**

**void ParamOption(ParamID id, int option\_tag, ...);**

**Remarks:**

This method is used for modifying a descriptor incrementally. It alters a parameter definition optional information tag of an existing descriptor. Note: You must not modify a descriptor with this method once it has been used to construct a ParamBlock2.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**int option\_tag, ...**

This method takes a single tagged option in the same varargs format as the tagged parameter options in the ParamBlockDesc2 constructor. See

[<optional\\_tagged\\_param\\_specs>](#)

**Prototype:**

```
void SetClassDesc(ClassDesc2* cd);
```

**Remarks:**

This method sets the ClassDesc2 pointer maintained by this class. You can only call this method once on a descriptor and then only if it has been constructed initially with a NULL **cd**. See the notes in the constructor.

**Parameters:**

**ClassDesc2\* cd**

Points to the ClassDesc to set.

**Constructors****Prototype:**

```
ParamBlockDesc2(BlockID ID, TCHAR* int_name, int  
local_name, ClassDesc2* cd, BYTE flags, ...);
```

**Remarks:**

This constructor takes a number of fixed, block-related arguments and then a varargs-based variable list of arguments that define the block and its parameters.

The format of the definitions in this shown below, but basically is in the form of a sequence of fixed specs followed by a variable number of tagged optional specs for each parameter.

**Parameters:**

The generic form for the parameters of this constructor is shown below:

```
ParamBlockDesc2(<required_block_specs>,  
[<auto_construct_block_refno>],  
[<auto_ui_parammap_specs>],  
{<required_param_specs>,  
 {<optional_tagged_param_specs>},  
end  
,}  
end);
```

That is:

1. Required block specs & per-block flags, followed by,
2. Optional owning object reference number for the block if auto-construct, followed by,
3. Optional parameter map specs if auto-ui, followed by,
4. Zero or more parameter specs, comprising:
  - a. Required parameter specs, followed by,
  - b. Zero or more optional parameter specs, each with its own leading tag, the list terminated by an 'end' tag, followed by,
5. an 'end' tag

### <required\_block\_spec>

The following required first arguments to the constructor form the "required\_block\_spec" and "per block flags":

#### **BlockID ID**

The permanent block ID for the parameter block2.

#### **TCHAR\* int\_name**

The internal name string. This name is not localized. Internal names are meant to be parsable as identifiers. As such they should begin with an alpha character, have only alphanumerics, and have no spaces, punctuations, etc. The convention for multi-word names is to use studly-caps, eg, paintRadius.

#### **int local\_name**

The resource ID of the localized (sub-anim) name string.

#### **ClassDesc2\* cd**

Points to the class descriptor2 of the owning class. This is used to add this descriptor to the ClassDesc2's table of block descriptors for the class. Note: This value may be passed as NULL for situations where the blocks owning ClassDesc2 is not available for static initializations (such as in a separate file). Before using the descriptor for any block construction, the ClassDesc2\* must be initialized with the method:

```
void ParamBlockDesc2::SetClassDesc(ClassDesc2* cd);
```

You can only call this method once on a descriptor and then only if it has been constructed initially with a NULL **cd**.

#### **BYTE flags**

Per block/descriptor flags. One or more of the following values (they may be added together as in **P\_AUTO\_CONSTRUCT + P\_AUTO\_UI**).

## **P\_CLASS\_PARAMS**

Indicates this block holds class-level parameters which are attached to the **ClassDesc2** for the plug-in. Such class level parameters are shared by each instance of the class. The block is automatically allocated by and stored in the descriptor. You get at its parameters via **GetValue()/SetValue()** calls on the descriptor.

## **P\_AUTO\_CONSTRUCT**

Indicates the parameter block will be constructed and referenced automatically to its owner in the call to **ClassDesc2::MakeAutoParamBlocks()**. If this flag is set, the parameter block's reference number in the owning object should be given immediately following the flag word in the descriptor constructor. See [<auto\\_construct\\_block\\_refno>](#).

## **P\_AUTO\_UI**

Indicates this block supports automatic UI rollout management in calls to **ClassDesc2::BeginEditParams()**, **ClassDesc2::EndEditParams()**, **ClassDesc2::CreateParamDlg()**, **ClassDesc2::CreateParamDialog()**, etc.

If set, the [<auto\\_ui\\_parammap\\_specs>](#) must be supplied in the descriptor constructor.

## **P\_HASCATEGORY**

This parameter is available in release 4.0 and later only.

The category field that can be used to order rollups (see [Class IRollupWindow](#)) to various Parameter Map creation methods. In order to use the category field with AutoUI, this flag has to be declared together with **P\_AUTO\_UI** in the ParamBlockDesc2. An additional int, that describes the category has to be appended to the parameter list after the **ParamMap2UserDlgProc\* proc** parameter. The same thing is true for multimaps. The **P\_HASCATEGORY** field can only be declared for the whole pblock. That means, that every multimap has to have the category parameter. To use the standard value

**ROLLUP\_CAT\_STANDARD** can be used. In the example below 4900 is used as the integer describing the category;

```
static ParamBlockDesc2 std2_shader_blk ( std2_shader,
```

```

    _T("shaderParameters"), 0, &stdmtl2CD,
    P_AUTO_CONSTRUCT + P_AUTO_UI +
P_HASCATEGORY, SHADER_PB_REF,
    //rollout
    IDD_DMTL_SHADER4, IDS_KE_SHADER, 0, 0,
&shaderDlgProc, 4900,
    // params
    std2_shader_type, _T("shaderType"), TYPE_INT, 0,
IDS_JW_SHADERTYPE,

```

### **P\_USE\_PARAMS**

Indicates that this block shares (exactly) the paramdefs from another descriptor. This is used to specify an already established ParamBlockDesc2 instance whose parameters you wish to share. This effectively gives the referring descriptor a pointer to the established descriptors 'paramdefs' array. In this case no other parameters definition can be supplied to referencing descriptors constructor. See the sample code below.

### **P\_INCLUDE\_PARAMS**

Indicates that this block loads in a copy the paramdefs from another descriptor. This is used to take a copy of an already established descriptor's parameters, to which you can add extra parameter definitions in the referencing descriptors constructor. This provides a kind of poor-man's factoring of common parameters, but note it is a copy; any subsequent changes to the established descriptor's parameter definitions are not reflected in the referencing descriptor.

You give the pointer to the ParamBlockDesc2 supplying the existing parameter definitions following the other optional block-level parameters: following the flag word is the block's reference number if

**P\_AUTO\_CONSTRUCT** is specified, then the rollout dialog template info if **P\_AUTO\_UI** is specified, then the pointer to the sourcing descriptor if **P\_USE\_PARAMS** or **P\_INCLUDE\_PARAMS** is specified. For example:

```

    static ParamBlockDesc2 metal2_param_blk ( shdr_params,

```

```

    _T("shaderParameters"), 0, &metalCD,
    P_AUTO_CONSTRUCT + P_USE_PARAMS,
    // pblock refno
    0,
    // use params from existing descriptor
    &const_param_blk
);

```

### **P\_SCRIPTED\_CLASS**

This is for internal use only. It means that the descriptor was defined on the fly as a side-effect of writing a scripted plug-in.

### **P\_TEMPORARY**

This is for internal use only.

### **P\_TEMPLATE\_UI**

This indicates that dialog templates will be provided or constructed.

### **P\_CALLSETS\_ON\_LOAD**

Signals that this block should have **CallSets()** called on it during post-load processing on scene loads & merges. This effectively ensures that all **PBAccessor::Set()** methods will be called after the flagged pblock2 is fully loaded, so that they can track loaded param values, for example. This allows a single point of param value tracking in the **PBAccessor::Set()** and precludes the need for individual objects to implement PLCBs to do this tracking themselves.

### **P\_MULTIMAP**

This flag is available in release 4.0 and later only.

Indicates that the block being described will have more than one rollup/map. If you specify this flag, the constructor interprets the rollup template and parameter definitions arguments in a modified syntax. Here's a sample rework of the main pblock in GeoSphere into two rollups:

```

enum { geo_map_1, geo_map_2 }; // enum IDs for the 2
parammaps

```

```

static ParamBlockDesc2 geo_param_blk ( geo_params,
    _T("GeosphereParameters"), 0, &gsphereDesc,
    P_AUTO_CONSTRUCT +
    P_AUTO_UI + P_MULTIMAP, PBLOCK_REF_NO,
    // map rollups
    2,
    geo_map_1, IDD_GSPHERE_1, IDS_PARAMETERS_1, 0, 0,
    NULL,
    geo_map_2, IDD_GSPHERE_2, IDS_PARAMETERS_2, 0, 0,
    NULL,
    // params
    geo_hemi, _T("hemisphere"), TYPE_BOOL,
    P_ANIMATABLE, IDS_HEMI,
    p_default, FALSE,
    p_ui, geo_map_2, TYPE_SINGLECHECKBOX, IDC_HEMI,
    end,
    geo_segs, _T("segs"), TYPE_INT, P_ANIMATABLE,
    IDS_RB_SEGS,
    p_default, 4,
    p_range, MIN_SEGMENTS, MAX_SEGMENTS,
    p_ui, geo_map_1, TYPE_SPINNER, EDITTYPE_INT,
    IDC_SEGMENTS, IDC_SEGSPINNER, 0.05f,
    end,
    geo_radius, _T("radius"), TYPE_FLOAT, P_ANIMATABLE +
    P_RESET_DEFAULT, IDS_RB_RADIUS,
    p_default, 0.0,
    p_ms_default, 25.0,
    p_range, MIN_RADIUS, MAX_RADIUS,
    p_ui, geo_map_1, TYPE_SPINNER, EDITTYPE_UNIVERSE,
    IDC_RADIUS, IDC_RADSPINNER, 1.0,
    p_uix, geo_map_2,

```

**end,**

...

First, there is an enum to provide IDs for the two maps in the main block, **geo\_map\_1** and **geo\_map\_2**. The **P\_MULTIMAP** flag is added to the block flags in the main descriptor constructor arguments to indicate multiple pmaps present. If **P\_AUTO\_UI** is specified, the usual single rollup template spec is replaced by a count (of rollups) followed by that many sets of rolup specs, each beginning with the associated mapID. The auto UI mechanism will add the rollups in the order given in this list.

In the parameter definition section, the only change is to the **p\_ui** option, which now requires a map ID before the rest of the UI specification to say which rollup/map the spec relates to. In this case, we've put the hemisphere checkbox in the 2nd rollup and the segs and radius spinners in the first.

There is also a new option, **p\_uix**, which is used to say that the parameter is to appear in more than one rollup. In this case, the radius spinner also shows up in the 2nd rollup, **geo\_map\_2**. When you do this, all the controls that connect to this parameter are ganged together; they all change when any one of them changes and all show keyframe highlights and so on. The current limitations on this are that the type of UI control and its various dialog template item IDs must be the same in each rollup in which it appears.

<auto\_construct\_block\_refno>

If **P\_AUTO\_CONSTRUCT** is specified in the required per block / descriptor flags (**BYTE flags** above) then the integer reference number of the parameter block2 in the plug-in needs to be specified:

**int ref\_no**

This is the same number that the plug-in would use to get and set the parameter block reference in **GetReference()** and **SetReference()**.

<auto\_ui\_parammap\_specs>

If **P\_AUTO\_UI** is specified in the required per block / descriptor flags (**BYTE flags** above) then the following arguments to the constructor are required:

**int dialog\_template\_ID, int dialog\_title\_res\_ID, int flag\_mask, int**

**rollup\_flags, ParamMap2UserDlgProc\* proc**

Each of these is described below:

**int dialog\_template\_ID**

The ID of the dialog template (eg IDD\_something).

**int dialog\_title\_res\_ID**

The string table resource ID for the title of the dialog.

**int flag\_mask**

This is used by **ClassDesc2::BeginEditParams()** and **ClassDesc2::EndEditParams()** to determine whether the ParamMap2 should be created/deleted on this call. All the bits in the supplied mask must be on in the Begin/EndEditParams flag longword for the action to take place.

**int rollup\_flags**

This flag is used to control rollup creation. You may pass:

**APPENDROLL\_CLOSED**

to have the rollup added in the closed (rolled up) state. Otherwise pass 0.

**ParamMap2UserDlgProc\* proc**

If there are controls in the dialog that require special processing this user dialog proc can be implemented to process them. See [Class ParamMap2UserDlgProc](#). If not used then NULL should be passed.

**<required\_param\_specs>**

The required parameter spec is formatted as shown below. There is one of these for each of the controls managed by the parameter map. They are followed by an [<optional\\_tagged\\_param\\_spec>](#).

**ParamID id, TCHAR\* internal\_name, ParamType type, [int table\_size,] int flags, int local\_name\_res\_ID,**

Each of these is described below:

**ParamID id**

The permanent, position-independent ID for the parameter.

**TCHAR\* internal\_name**

The internal name for the parameter.

**ParamType type**

The type of parameter. See [List of ParamType Choices](#).

## **[int table\_size]**

If the type is one of the Tab<> types, you need to supply an initial table size which can be 0.

## **int flags**

The per parameter flag bits. This should be a bitwise OR of one or more of the following:

### **P\_ANIMATABLE**

Indicates the parameter is animatable.

### **P\_TRANSIENT**

Indicates the parameter should not be saved in the scene file. One might do this, for example, for virtual parameters that don't actually hold data but reflect data held elsewhere in the object (and accessed via a PBAccessor) which is saved explicitly by it. This might save file space. In some cases, parameters might be provided that are derived from other state in the object that is computed each time you load the object and made available say as a help to script authors. In these cases also, you might decide not to take up file space.

### **P\_NO\_INIT**

This is obsolete.

### **P\_COMPUTED\_NAME**

Indicates to call a compute name function to get a dynamically-computed name. This allows a plug-in to provide a dynamically-created local name for a parameter or Tab<> parameter entry. If you specify this parameter flag, you also need to supply a **p\_accessor PBAccessor** instance pointer that has the **GetLocalName()** method implemented.

### **P\_COMPUTED\_DIM**

Indicates to call a compute dimension function to get a dynamically-computed dimension. See the [optional tagged param spec p\\_dim](#).

### **P\_RESET\_DEFAULT**

Indicates to not make creation parameters sticky, rather always reset to default values.

### **P\_SUBANIM**

Indicates this is a non-animatable reference target parameter to be

published as a sub-anim (which makes it visible in Track View)

### **P\_TV\_SHOW\_ALL**

This is used for Tab<> animatables, and indicates to show all entries in Track View even if no controller assigned.

### **P\_NO\_REF**

For reference target parameters, this indicates to not maintain the reference automatically (rather simply keep a copy of the pointer).

### **P\_OWNERS\_REF**

Indicates this is a reference target parameter owned by the parameter block's owner not the block itself. Make sure to supply the owner's reference number in a [p\\_refno](#) specification. If neither **P\_REF\_NO** or **P\_OWNERS\_REF** is set, the parameter block owns and maintains the reference.

### **P\_SUBTEX**

Indicates a texmap parameter is kept by the owner using the `MtlBase::xSubTexmap` methods. Provide the integer index of the sub-texmap using the param tag [p\\_subtexno](#).

You would use this flag in materials or texmaps that contain other texmaps as parameters, in which these 'sub' maps are not stored in the `ParamBlock2` and are **not** accessible as direct references on the parent map or material, but are accessible via the `MtlBase::GetSubTexmap()/SetSubTexmap()` protocol.

Specifying this **P\_SUBTEX** flag signals this situation and looks for a `p_subtexno` parameter option to give the sub-texmap number for the map. For example, the Standard material stores all its maps in a separate structure that appears as a single reference in the Standard material. In this case, the individual texmaps are not direct references on the material, but are accessible on the material via `GetSubTexmap()/SetSubTexmap()`.

Note that **P\_OWNERS\_REF** and **P\_SUBTEX** are both primarily intended for use when re-coding existing plug-ins in which the sub-maps are already managed by the owner in some way. If you are implementing a new plug-in, you should just let the `ParamBlock2` host them for you and then you don't have to bother with either of these flags.

### **P\_CAN\_CONVERT**

Indicates the **p\_classID** validator is used in a **CanConvertTo()** call, rather than as exact classID match.

### **P\_VARIABLE\_SIZE**

Indicates a Tab<> parameter is variable in size. This allows scripted changes.

### **P\_NO\_AUTO\_LABELS**

Disables the automatic setting of button text for texmaps, materials, files, etc. You can use the method **IParamMap2::SetText()** to set it by hand.

### **P\_SHORT\_LABELS**

This is for use with **TYPE\_TEXMAP**, **TYPE\_MTL** and **TYPE\_BITMAP** parameters that are associated with ParamMap2 picker buttons. If you specify this flag, a shortened form of the object name is installed in the picker button label. For texmaps and materials, the **MtlBase::GetName()** rather than **MtlBase::GetFullName()** is used, and for bitmaps just the filename rather than the full pathname is used.

### **int local\_name\_res\_ID**

The localized name for the parameter. This is a ID for the resource in the string table.

### **<optional\_tagged\_param\_specs>**

There may be zero or more optional tagged parameter specs, each with its own leading tag, with the entire list terminated by an 'end' tag. This list of tagged arguments has the following form:

**<tag>**, **<optional\_param\_spec>**,

For the possible tags and the specification arguments see [List of ParamTags Choices](#).

### **Methods:**

public:

### **Prototype:**

**USHORT Count();**

### **Remarks:**

Returns the number of parameters in the block.

**Prototype:**

**DWORD Version();**

**Remarks:**

Returns the version of the parameter block.

**Prototype:**

**int IDtoIndex(ParamID id);**

**Remarks:**

Returns the index into the parameter definition array of the parameter whose ID passed.

**Parameters:**

**ParamID id**

The permanent parameter ID.

**Prototype:**

**ParamID IndextoID(int i);**

**Remarks:**

Returns the permanent parameter ID of the parameter whose index is passed.

**Parameters:**

**int i**

The zero based index of the parameter in the **paramdefs** array.

**Prototype:**

**ParamDef& GetParamDef(ParamID id);**

**Remarks:**

This method is used for accessing a parameter's ParamDef structure.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**Prototype:**

**BOOL SetValue(ParamID id, TimeValue t, float v, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.  
Sets the floating point value of the specified parameter at the specified time.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to set the value.

**float v**

The value to set.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to set.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

**BOOL SetValue(ParamID id, TimeValue t, int v, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.  
Sets the integer value of the specified parameter at the specified time.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to set the value.

**int v**

The value to set.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the

value to set.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

**BOOL SetValue(ParamID id, TimeValue t, Point3& v, int  
tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Sets the Point3 value of the specified parameter at the specified time.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to set the value.

**Point3& v**

The value to set.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to set.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

**BOOL SetValue(ParamID id, TimeValue t, Color& v, int  
tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Sets the Color value of the specified parameter at the specified time.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to set the value.

**Color& v**

The value to set.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to set.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

```
BOOL SetValue(ParamID id, TimeValue t, TCHAR* v, int  
tabIndex=0);
```

**Remarks:**

This method is used with static class parameter blocks only.

Sets the string value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to set the value.

**TCHAR\* v**

The value to set.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to set.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

```
BOOL SetValue(ParamID id, TimeValue t, Mtl* v, int  
tabIndex=0);
```

**Remarks:**

This method is used with static class parameter blocks only.  
Sets the Mtl\* value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to set the value.

**Mtl\*v**

The value to set.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to set.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

```
BOOL SetValue(ParamID id, TimeValue t, Texmap* v, int  
tabIndex=0);
```

**Remarks:**

This method is used with static class parameter blocks only.  
Sets the Texmap\* value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to set the value.

**Texmap\* v**

The value to set.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to set.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

```
BOOL SetValue(ParamID id, TimeValue t, PBBitmap* v, int  
tabIndex=0);
```

**Remarks:**

This method is used with static class parameter blocks only.

Sets the PBBitmap\* value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to set the value.

**PBBitmap\* v**

The value to set.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to set.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

```
BOOL SetValue(ParamID id, TimeValue t, INode* v, int  
tabIndex=0);
```

**Remarks:**

This method is used with static class parameter blocks only.

Sets the INode\* value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to set the value.

**INode\* v**

The value to set.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to set.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

**BOOL SetValue(ParamID id, TimeValue t, ReferenceTarget\* v, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Sets the ReferenceTarget\* value of the specified parameter at the specified time.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to set the value.

**ReferenceTarget\*v**

The value to set.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to set.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

**BOOL SetValue(ParamID id, TimeValue t, Matrix3& v, int tabIndex=0);**

**Remarks:**

This method is available in release 4.0 and later only.

This method is used with static class parameter blocks only.

Sets the Matrix3 value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to set the value.

**Matrix3& v**

The value to set.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to set.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

```
BOOL GetValue(ParamID id, TimeValue t, float& v, Interval  
&ivalid, int tabIndex=0);
```

**Remarks:**

This method is used with static class parameter blocks only.

Retrieves the floating point value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to get the value.

**float& v**

The value to retrieve is returned here.

**Interval &ivalid**

This is the validity interval which is updated by the validity of the retrieved

parameter.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

**BOOL GetValue(ParamID id, TimeValue t, int& v, Interval &ivalid, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Retrieves the integer value of the specified parameter at the specified time.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to get the value.

**int& v**

The value to retrieve is returned here.

**Interval &ivalid**

This is the validity interval which is updated by the validity of the retrieved parameter.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

**BOOL GetValue(ParamID id, TimeValue t, Point3& v, Interval &ivalid, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Retrieves the Point3 value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to get the value.

**Point3& v**

The value to retrieve is returned here.

**Interval &ivalid**

This is the validity interval which is updated by the validity of the retrieved parameter.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

```
BOOL GetValue(ParamID id, TimeValue t, Color& v, Interval  
&ivalid, int tabIndex=0);
```

**Remarks:**

This method is used with static class parameter blocks only.

Retrieves the Color value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to get the value.

**Color& v**

The value to retrieve is returned here.

### **Interval &ivalid**

This is the validity interval which is updated by the validity of the retrieved parameter.

### **int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

### **Return Value:**

TRUE on success; otherwise FALSE.

### **Prototype:**

**BOOL GetValue(ParamID id, TimeValue t, TCHAR\*& v, Interval &ivalid, int tabIndex=0);**

### **Remarks:**

This method is used with static class parameter blocks only.

Retrieves the string value of the specified parameter at the specified time.

### **Parameters:**

#### **ParamID id**

The permanent ID of the parameter.

#### **TimeValue t**

The time at which to get the value.

#### **TCHAR\*& v**

The value to retrieve is returned here.

#### **Interval &ivalid**

This is the validity interval which is updated by the validity of the retrieved parameter.

#### **int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

### **Return Value:**

TRUE on success; otherwise FALSE.

### **Prototype:**

**BOOL GetValue(ParamID id, TimeValue t, Mtl\*& v, Interval**

**&ivalid, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Retrieves the Mtl\* value of the specified parameter at the specified time.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to get the value.

**Mtl\*& v**

The value to retrieve is returned here.

**Interval &ivalid**

This is the validity interval which is updated by the validity of the retrieved parameter.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

**BOOL GetValue(ParamID id, TimeValue t, Texmap\*& v, Interval &ivalid, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Retrieves the Texmap\* value of the specified parameter at the specified time.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to get the value.

**Texmap\*& v**

The value to retrieve is returned here.

**Interval &ivalid**

This is the validity interval which is updated by the validity of the retrieved parameter.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

**BOOL GetValue(ParamID id, TimeValue t, PBBitmap\*& v, Interval &ivalid, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Retrieves the PBBitmap\* value of the specified parameter at the specified time.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to get the value.

**PBBitmap\*& v**

The value to retrieve is returned here.

**Interval &ivalid**

This is the validity interval which is updated by the validity of the retrieved parameter.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

**BOOL GetValue(ParamID id, TimeValue t, INode\*& v, Interval &ivalid, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Retrieves the INode\* value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to get the value.

**INode\*& v**

The value to retrieve is returned here.

**Interval &ivalid**

This is the validity interval which is updated by the validity of the retrieved parameter.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

**BOOL GetValue(ParamID id, TimeValue t, ReferenceTarget\*& v, Interval &ivalid, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Retrieves the ReferenceTarget\* value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to get the value.

**ReferenceTarget\*& v**

The value to retrieve is returned here.

**Interval &ivalid**

This is the validity interval which is updated by the validity of the retrieved parameter.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

```
BOOL GetValue(ParamID id, TimeValue t, Matrix3& v, Interval  
&ivalid, int tabIndex=0);
```

**Remarks:**

This method is available in release 4.0 and later only.

This method is used with static class parameter blocks only.

Retrieves the Matrix3 value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t**

The time at which to get the value.

**Matrix3& v**

The value to retrieve is returned here.

**Interval &ivalid**

This is the validity interval which is updated by the validity of the retrieved parameter.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

TRUE on success; otherwise FALSE.

**Prototype:**

**Color GetColor(ParamID id, TimeValue t=0, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Returns the Color value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t=0**

The time at which to get the value.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

The Color value of the parameter.

**Prototype:**

**Point3 GetPoint3(ParamID id, TimeValue t=0, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Retrieves the value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t=0**

The time at which to get the value.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

The Point3 value of the parameter

**Prototype:**

```
int GetInt(ParamID id, TimeValue t=0, int tabIndex=0);
```

**Remarks:**

This method is used with static class parameter blocks only.

Returns the value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t=0**

The time at which to get the value.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

The integer value of the parameter.

**Prototype:**

```
float GetFloat(ParamID id, TimeValue t=0, int tabIndex=0);
```

**Remarks:**

This method is used with static class parameter blocks only.

Returns the value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t=0**

The time at which to get the value.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

The floating point value of the parameter.

**Prototype:**

```
TimeValue GetTimeValue(ParamID id, TimeValue t=0, int  
tabIndex=0);
```

**Remarks:**

This method is used with static class parameter blocks only.

Returns the value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t=0**

The time at which to get the value.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

The TimeValue value of the parameter.

**Prototype:**

```
TCHAR* GetStr(ParamID id, TimeValue t=0, int tabIndex=0);
```

**Remarks:**

This method is used with static class parameter blocks only.

Returns the value of the specified parameter at the specified time.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**TimeValue t=0**

The time at which to get the value.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the

value to get.

**Return Value:**

The TimeValue value of the parameter.

**Prototype:**

**Mtl\* GetMtl(ParamID id, TimeValue t=0, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Returns the value of the specified parameter at the specified time.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**TimeValue t=0**

The time at which to get the value.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

A pointer to the Mtl object.

**Prototype:**

**Texmap\* GetTexmap(ParamID id, TimeValue t=0, int  
tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Returns the value of the specified parameter at the specified time.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**TimeValue t=0**

The time at which to get the value.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

A pointer to the Texmap.

**Prototype:**

**PBBitmap\* GetBitmap(ParamID id, TimeValue t=0, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Returns the value of the specified parameter at the specified time.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**TimeValue t=0**

The time at which to get the value.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

A pointer to the PBBitmap object.

**Prototype:**

**INode\* GetINode(ParamID id, TimeValue t=0, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Returns the value of the specified parameter at the specified time.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**TimeValue t=0**

The time at which to get the value.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

A pointer to the INode.

**Prototype:**

**ReferenceTarget\* GetReferenceTarget(ParamID id, TimeValue t=0, int tabIndex=0);**

**Remarks:**

This method is used with static class parameter blocks only.

Returns the value of the specified parameter at the specified time.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**TimeValue t=0**

The time at which to get the value.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

A pointer to the ReferenceTarget.

**Prototype:**

**Matrix3 GetMatrix3(ParamID id, TimeValue t=0, int tabIndex=0);**

**Remarks:**

This method is available in release 4.0 and later only.

This method is used with static class parameter blocks only.

Retrieves the value of the specified parameter at the specified time.

**Parameters:**

**ParamID id**

The permanent ID of the parameter.

**TimeValue t=0**

The time at which to get the value.

**int tabIndex=0**

If the parameter is a Tab<> this is the zero based index into the table of the value to get.

**Return Value:**

The Matrix3 value of the parameter

**Prototype:**

```
TCHAR* GetString(int id);
```

**Remarks:**

Returns a string resource from plug-in module's resource.

**Parameters:****int id**

The permanent ID of the parameter.

**Prototype:**

```
void InvalidateUI();
```

**Remarks:**

This method invalidates any current parameter map2 user interface currently open for this descriptor.

**Prototype:**

```
void InvalidateUI(ParamID id, int tabIndex=-1);
```

**Remarks:**

This method invalidates the control whose parameter ID is specified.

**Parameters:****ParamID id**

The permanent ID of the parameter.

**int tabIndex=-1**

If the parameter is a Tab<> this is the zero based index of parameter whose associated control is to be redrawn.

**Prototype:**

```
void SetUserDlgProc(ParamMap2UserDlgProc* proc=NULL);
```

**Remarks:**

This method allows for special handling for a set of controls. The developer provides a dialog proc object to process the message from the controls. This method is used to tell the parameter map that the developer defined method should be called. The given proc will be called after default processing is done. Note that if the proc is non-NULL when the ParamMap is deleted its DeleteThis() method will be called.

Note, in version 4.0 and later, this actually maps to a call on the explicit map ID overload of **SetUserDlgProc()** with default map ID of 0.

**Parameters:**

```
ParamMap2UserDlgProc* proc=NULL
```

A pointer to the user dialog proc object to process the control.

**Prototype:**

```
void SetUserDlgProc(MapID map_id, ParamMap2UserDlgProc*  
proc=NULL);
```

**Remarks:**

This method is available in release 4.0 and later only.

This overload of **SetUserDlgProc()** has a new parameter, **map\_id**, that specifies the ID of the parameter map/rollup to set the user dialog proc for. See original function for the rest of the description.

**Prototype:**

```
ParamMap2UserDlgProc* GetUserDlgProc(MapID map_id = 0);
```

**Remarks:**

Returns the user dialog proc for the parameter map associated with this descriptor.

**Parameters:**

```
MapID map_id
```

This parameter is available in release 4.0 and later only.

Specifies the ID of the map/rollout to get the user dialog proc for.

**Prototype:**

**void SetOwnerRefNo(ParamID id, int refno);**

**Remarks:**

This method allows dynamic setting of the **P\_OWNERS\_REF** reference number for given Reference Target parameter.

**Parameters:**

**ParamID id**

The permanent ID for the parameter.

**int refno**

The reference number to set.

**Prototype:**

**int GetOwnerRefNo(ParamID id);**

**Remarks:**

This method returns the **P\_OWNERS\_REF** reference number for given Reference Target parameter.

**Parameters:**

**ParamID id**

The permanent ID for the parameter.

**Prototype:**

**void SetSubTexNo(ParamID id, int texno);**

**Remarks:**

Sets the sub-texture number for the specified texmap parameter. You can use this to dynamically change a parameter's sub object number.

**Parameters:**

**ParamID id**

The parameter ID for the texmap.

**int texno**

The sub-texture number to set.

**Prototype:**

**void SetSubMtlNo(ParamID id, int mtlno);**

**Remarks:**

Sets the sub-material number for the specified texmap parameter. You can use this to dynamically change a parameter's sub object number.

**Parameters:**

**ParamID id**

The parameter ID for the material.

**int mtlno**

The sub-material number to set.

**Prototype:**

**int GetSubTexNo(ParamID id);**

**Remarks:**

Returns the sub-texture number for the specified parameter.

**Parameters:**

**ParamID id**

The ID of the parameter.

**Prototype:**

**int GetSubMtlNo(ParamID id);**

**Remarks:**

Returns the sub-material number for the specified parameter.

**Parameters:**

**ParamID id**

The ID of the parameter.

**Prototype:**

**void SetInitFile(ParamID id, TCHAR\* s);**

**Remarks:**

This method allows dynamic setting of the **TYPE\_OPEN/SAVEFILEBUTTON p\_init\_file** field.

**Parameters:**

**ParamID id**

The permanent ID for the parameter.

**TCHAR\* s**

The string to set.

**Prototype:**

**TCHAR\* GetInitFile(ParamID id);**

**Remarks:**

This method returns the **TYPE\_OPEN/SAVEFILEBUTTON**  
**p\_init\_file** field.

**Parameters:**

**ParamID id**

The permanent ID for the parameter.

## List of ParamType2 Choices

See Also: [Class ParamBlockDesc2](#), [Template Class Tab](#), [Class ParamDimension](#), [Class Mtl](#), [Class Texmap](#), [Class INode](#), [Class PBBitmap](#), [Class ReferenceTarget](#).

The following are the valid types for parameters in parameter blocks.

The type is passed to the **ParamBlockDesc2** constructor as the **ParamType type** argument of the <required\_param\_spec>.

The first group are single parameters while the second are tables of the first set of parameters.

### **TYPE\_FLOAT**

A single floating point value.

### **TYPE\_INT**

A single integer value.

### **TYPE\_RGBA**

A Point3 value with an implied **stdColor255Dim** dimension.

### **TYPE\_POINT3**

A Point3 data type value.

### **TYPE\_BOOL**

An integer used as a boolean value.

### **TYPE\_ANGLE**

A floating point value with an implied **stdAngleDim** dimension.

### **TYPE\_PCNT\_FRAC**

A floating point with an implied **stdPercentDim** dimension.

### **TYPE\_WORLD**

Specify that a parameter represents world distance units. This implies a parameter dimension of **stdWorldDim**.

### **TYPE\_STRING**

A character string (**TCHAR\***). The string has a local copy made and managed by the paramblock.

### **TYPE\_FILENAME**

This is the same as **TYPE\_STRING**, but is used with

**TYPE\_FILEOPENBUTTON** and **TYPE\_FILESAVEBUTTON**  
parameter map controls.

### **TYPE\_HSV**

This option is obsolete.

### **TYPE\_COLOR\_CHANNEL**

A single floating point value with an implied **stdColor255Dim** dimension.

### **TYPE\_TIMEVALUE**

A single integer value used as a TimeValue -- implies a **stdTimeDim** dimension.

### **TYPE\_RADIOBTN\_INDEX**

This is currently unused but intended to allow specification of state names to make scripter access symbolic.

### **TYPE\_MTL**

A pointer to a material object (**Mtl\***). This can be one of three types: a reference owned by the parameter block, a reference owned by the block owner, or no reference management (just a copy of the pointer).

### **TYPE\_TEXMAP**

A pointer to a texmap object (**Texmap\***). This can be one of three types: a reference owned by the parameter block, a reference owned by the block owner, or no reference management (just a copy of the pointer).

### **TYPE\_BITMAP**

A pointer to a Bitmap/BitmapInfo object (**PBBitmap\***). This can be one of three types: a reference owned by the parameter block, a reference owned by the block owner, or no reference management (just a copy of the pointer).

### **TYPE\_INODE**

A pointer to a node (**Inode\***). This can be one of three types: a reference owned by the parameter block, a reference owned by the block owner, or no reference management (just a copy of the pointer).

### **TYPE\_REFTARG**

A pointer to a Reference arget (**ReferenceTarget\***), all the RefTarg types in this group can be one of three types: Reference owned by parameter block, Reference owned by block owner, No reference management (just a copy of the pointer).

## **TYPE\_INDEX**

This is used for parameters that are 0-based, but exposed to MAXScript as 1-based. For example a vertex index.

## **TYPE\_MATRIX3**

A standard max Matrix3

## **TYPE\_PBLOCK2**

A pointer to an IParamBlock2 object.

The following are tables of the above data types:

## **TYPE\_FLOAT\_TAB**

A table of floating point values.

## **TYPE\_INT\_TAB**

A table of integer values.

## **TYPE\_RGBA\_TAB**

A table of Point3 values with an implied **stdColor255Dim** dimension.

## **TYPE\_POINT3\_TAB**

A table of Point3 data type values.

## **TYPE\_BOOL\_TAB**

A table of integers used as a set of boolean values.

## **TYPE\_ANGLE\_TAB**

A table of floating point value with an implied **stdAngleDim** dimension.

## **TYPE\_PCNT\_FRAC\_TAB**

A table of same as **TYPE\_STRING**, but is used with **TYPE\_FILEOPENBUTTON** and **TYPE\_FILESAVEBUTTON** parameter map controls.

## **TYPE\_WORLD\_TAB**

A table of parameters that represents world distance units. This implies a parameter dimension of **stdWorldDim**.

## **TYPE\_STRING\_TAB**

A table of character strings (**TCHAR\***).

## **TYPE\_FILENAME\_TAB**

A table of filenames (**TYPE\_FILENAME** -- see notes above).

### **TYPE\_HSV\_TAB**

This option is obsolete.

### **TYPE\_COLOR\_CHANNEL\_TAB**

A table of floating point values with an implied **stdColor255Dim** dimension.

### **TYPE\_TIMEVALUE\_TAB**

A table of integer value used as a TimeValue -- implies **stdTimeDim** dimension.

### **TYPE\_RADIOBTN\_INDEX\_TAB**

This is currently unused.

### **TYPE\_MTL\_TAB**

A table of material object pointers (see **TYPE\_MTL** above).

### **TYPE\_TEXMAP\_TAB**

A table of texmap object pointers (see **TYPE\_TEXMAP** above).

### **TYPE\_BITMAP\_TAB**

A table of **TYPE\_BITMAP** values (see above).

### **TYPE\_INODE\_TAB**

A table of **TYPE\_INODE** values (see above).

### **TYPE\_REFTARG\_TAB**

A table of **TYPE\_REFTARG** values (see above).

### **TYPE\_MSFLOAT = 255**

This option is obsolete.

### **TYPE\_UNSPECIFIED = -255**

This option is obsolete.

## Structure ParamDef

See Also: [Class ParamBlockDesc2](#), [Structure PB2Value](#), [Class PBValidator](#), [Class PBBitmap](#), [List of ParamType2 Choices](#), [Class ParamDimension](#), [Template Class Tab](#).

```
struct ParamDef
```

### Description:

This structure is available in release 3.0 and later only.

The data members of this class provide a definition of a parameter. An array of these parameter definitions is a data member of class **ParamBlockDesc2**.

### struct ParamDef

```
{
```

#### **ParamID ID;**

This is the permanent, position independent ID of the parameter.

#### **TCHAR\* int\_name;**

This is a fixed internal name of the parameter. This name is not localized. Internal names are meant to be parsable as identifiers. As such they should begin with an alpha character, have only alphanumeric, and have no spaces, punctuations, etc. The convention for multi-word names is to use study-caps, eg, paintRadius.

#### **ParamType2 type;**

This is the type of the parameter. See [List of ParamType2 Choices](#).

#### **int flags;**

They are the per-parameter constructor flags (**P\_ANIMATABLE**, **P\_TRANSIENT**, etc.) Normally, the flags are set up as a result of things you specify in the **ParamBlockDesc2** constructor and should generally be read-only at runtime.

#### **int local\_name;**

This is the string table resource ID for the localized (sub-anim) name.

#### **ParamDimension\* dim;**

This is the parameter dimension. See [Class ParamDimension](#).

#### **PB2Value def;**

The default value for the parameter.

**PB2Value ms\_def;**

This is the default value for MAXScript and the MacroRecorder.

**PB2Value cur\_def;**

This is the current 'sticky' default value, used to maintain creation defaults within a session.

**int description;**

This is a one sentence description. Use a string resource ID.

**PB2Value range\_low;**

This indicates the low allowable range used in MAXScript validation and spinner setup.

**PB2Value range\_high;**

This indicates the high allowable range used in MAXScript validation and spinner setup.

**PBValidator\* validator;**

Points to an instance of the validator object. This object has a **Validate()** method used to check if the parameter is valid.

**PBAccessor\* accessor;**

Points to an instance of an accessor object. Any parameter in a block can have an accessor callback object that has its **Get()** or **Set()** method called whenever the parameter is accessed. This may be used to provide access to dynamically-computed virtual parameters and sometimes to allow parameter-specific processing by the class as the parameter in the block is modified.

**short tab\_size;**

If the parameter is a table (Tab<>) this is the initial table size.

**short ref\_no;**

This is a block-owner's reference number for non-hosted ReferenceTargets parameters.

**short subtex\_no;**

This is a block-owner's SubTex index for Texmap parameters in Mtl owners.

**Class\_ID class\_ID;**

This is the Class\_ID validator for reference targets.

**SClass\_ID sclass\_ID;**

This is the SClass\_ID validator for reference targets (similar to above).

**ControlType2 ctrl\_type;**

This is the type of user interface control.

**EditSpinnerType spin\_type;**

This is the spinner type if the associated UI control is a spinner. One of the following values may be used:

**EDITTYPE\_INT**

Any integer value.

**EDITTYPE\_FLOAT**

Any floating point value.

**EDITTYPE\_UNIVERSE**

This is a value in world space units. It respects the system's unit settings (for example feet and inches).

**EDITTYPE\_POS\_INT**

Any integer  $\geq 0$

**EDITTYPE\_POS\_FLOAT**

Any floating point value  $\geq 0.0$

**EDITTYPE\_POS\_UNIVERSE**

This is a positive value in world space units. It respects the system's unit settings (for example feet and inches) .

**EDITTYPE\_TIME**

This is a time value. It respects the system time settings (SMPTE for example).

**int\* ctrl\_IDs;**

This is the array of control IDs for this parameter.

**short ctrl\_count;**

This is the number of controls in the **ctrl\_IDs** array above.

**int\* val\_bits;**

These are radio button vals or bit numbers for int bits controlled by multiple checkboxes. The numbers in the int array are used to indicate which bit to flip in the TYPE\_INT parameter depending on the state of the associated (by order) checkbox. This is not yet implemented.

**float scale;**

This is the scale given to the ISpinnerControl, as is used in SetupFloatSpinner(), for example.

**int numSegs;**

This is the slider segments count.

**ParamID\* enable\_ctrls;**

The array of which other parameters have their UI controls automatically enabled by this parameter.

**short enable\_count;**

This is the number of parameter IDs in the **enable\_ctrls** array above.

**int prompt;**

The status line prompt string resource ID for various picker buttons.

**int caption;**

The caption string resource ID for open/save file dialogs.

**TCHAR\* init\_file;**

The initial filename for open/save file dialogs.

**int file\_types;**

The file types string resource ID for open/save file dialogs (in MAXScript type: form)

**void DeleteThis();**

This function deletes this instance of the structure.

## Class PBValidator

See Also: [Structure ParamDef](#), [List of Type 2 Params](#), [Class ParamBlockDesc2](#).

```
class PBValidator : public InterfaceServer
```

### Description:

This class is available in release 3.0 and later only.

A pointer to an instance of this class is a data member of struct **ParamDef** and is also used by the **p\_validator** tag in a **ParamBlockDesc2** constructor. Any parameter can have a custom validator. This is used by the scripter and node pick button filter for example. If you want to validate a parameter block 2 value create an instance of this class and implement the **Validate()** method.

### Methods:

public:

### Prototype:

```
virtual BOOL Validate(PB2Value& v)=0;
```

### Remarks:

Returns TRUE if the given PB2Value is valid; otherwise FALSE.

### Parameters:

**PB2Value& v**

The value to check.

### Prototype:

```
virtual BOOL Validate(PB2Value& v, ReferenceMaker* owner,  
ParamID id, int tabIndex);
```

### Remarks:

This method is available in release 4.0 and later only.

A variant of **Validate()** method to **PBValidate** which supplies more context than the original **Validate()**, effectively giving the same context information as the **Set()** & **Get()** methods in a **PBAccessor**.

### Parameters:

**PB2Value& v**

The value to check.

**ReferenceMaker\* owner**

Points to the owner of the parameter.

**ParamID id**

The permanent ID of the parameter.

**int tabIndex**

If the parameter is a Tab<> this is the zero based index of the parameter in the table.

**Prototype:**

**virtual void DeleteThis();**

**Remarks:**

This method that can be used to destroy dynamically allocated instances of this class.

**Default Implementation:**

```
{ }
```

## Class PBAccessor

See Also: [Structure ParamDef](#), [List of ParamType2 Choices](#), [Class ReferenceMaker](#), [Structure PB2Value](#).

```
class PBAccessor : public InterfaceServer
```

### Description:

This class is available in release 3.0 and later only.

Any parameter in a block can have an accessor callback object that has its **Get()** or **Set()** method called whenever the parameter is accessed. This may be used to provide access to dynamically-computed virtual parameters and sometimes to allow parameter-specific processing by the class as the parameter in the block is modified (such as keeping object data members up-to-date).

The **Get()** and **Set()** methods are called at all times when a parameter is accessed, including parameters that are animated. The **Get()** method is called after the controller is accessed, so the current controller value is seen and can be optionally overridden in the **Get()** method. Note that the controller is accessed whenever the 3ds max time is changed (such as a frame slider move) and so the **Get()** method will be called each frame as this happens.

A pointer to an instance of this class is a data member of the **ParamDef** structure.

### Methods:

public:

### Prototype:

```
virtual void Get(PB2Value& v, ReferenceMaker* owner, ParamID id, int tabIndex, TimeValue t, Interval &valid);
```

### Remarks:

This method is called when the specified owner object accesses (gets) the value v. This is called after the controller is accessed, so the current controller value is seen and can be optionally overridden in the this method. Note that the controller is accessed whenever the 3ds max time is changed (such as a slider move) and so this method will be called each frame as this happens.

### Parameters:

**PB2Value& v**

The value being accessed.

**ReferenceMaker\* owner**

Points to the owner of the parameter.

**ParamID id**

The permanent ID of the parameter.

**int tabIndex**

If the parameter is a Tab<> this is the zero based index of the parameter in the table.

**TimeValue t**

The current time the get is taking place.

**Interval &valid**

The validity interval for the value.

**Default Implementation:**

```
{}
```

**Prototype:**

```
virtual void Set(PB2Value& v, ReferenceMaker* owner, ParamID id, int tabIndex TimeValue t);
```

**Remarks:**

This method is called when the specified owner objects sets the value v. This is called just before calling **SetValue()** on the parameters controller, so it can take note of the value going in and change it if desired.

**Parameters:**

**PB2Value& v**

The value being set.

**ReferenceMaker\* owner**

Points to the owner of the parameter.

**ParamID id**

The permanent ID of the parameter.

**int tabIndex**

If the parameter is a Tab<> this is the zero based index of the parameter in the table.

**TimeValue t**

The current time the set is taking place.

**Default Implementation:**

```
{
```

**Function:**

```
virtual void TabChanged(tab_changes changeCode,  
Tab<PB2Value>* tab, ReferenceMaker* owner, ParamID id, int  
tabIndex, int count);
```

**Remarks:**

This method is available in release 4.0 and later only.

This method is called when a **Tab**<> parameter has a change made to its table structure.

**Parameters:**

**tab\_changes changeCode**

Describes the change that has just occurred to the **Tab**<> parameter. One of the following enumerations:

```
enum tab_changes { tab_insert, tab_append, tab_delete,  
tab_ref_deleted, tab_setcount, tab_sort };
```

**Tab<PB2Value>\* tab**

Points to the actual **Tab**<> in the pblock parameter.

**ReferenceMaker\* owner**

Points to the owner of the parameter.

**ParamID id**

The permanent ID of the parameter.

**int tabIndex**

The start index of the change (for **tab\_insert**, **tab\_append**, **tab\_delete**, **tab\_ref\_deleted**)

**int count**

The number of elements changed (for **tab\_insert**, **tab\_append**, **tab\_delete**).

**Prototype:**

**virtual BOOL KeyFrameAtTime(ReferenceMaker\* owner,  
ParamID id, int tabIndex, TimeValue t);**

**Remarks:**

Checks to see if a keyframe exists for the given parameter at the given time. Returns TRUE if a keyframe exists at the specified time; otherwise FALSE. For parameters not directly hosted in the parameter block that are internally animatable, this provides a keyframe query callback so that any ParamMap2 spinners associated with these 'virtual' parameters can show keyframe status for the underlying parameter. In these cases, developers should implement this method for the parameter usually asking the underlying parameter for its keyframe state.

**Parameters:**

**ReferenceMaker\* owner**

Points to the owner of the parameter.

**ParamID id**

The permanent ID of the parameter.

**int tabIndex**

**TimeValue t**

The current time.

**Default Implementation:**

```
{ return FALSE; }
```

**Prototype:**

**virtual TSTR GetLocalName(ReferenceMaker\* owner, ParamID  
id, int tabIndex);**

**Remarks:**

This allows a plug-in to provide a dynamically-created local name for a parameter or Tab<> parameter entry. If you specify the **P\_COMPUTED\_NAME** parameter flag, you also need to supply a **p\_accessor PBAccessor** instance pointer that has this method implemented.

**Parameters:**

**ReferenceMaker\* owner**

Points to the owner of the parameter.

**ParamID id**

The permanent ID of the parameter.

**int tabIndex**

If the parameter is a Tab<> this is the zero based index of the parameter in the table.

**Default Implementation:**

```
{ return _T(""); }
```

**Prototype:**

```
virtual void DeleteThis();
```

**Remarks:**

This method that can be used to destroy dynamically allocated instances of this class.

**Default Implementation:**

```
{ }
```

## Class PBitmap

See Also: [Class IParamBlock2](#), [Class Bitmap](#), [Class BitmapInfo](#), [Class BitmapManager](#).

```
class PBitmap
```

### Description:

This class is available in release 3.0 and later only.

This is a Bitmap/BitmapInfo wrapper class. It is used by ParamBlock2s to store bitmap information. The class has two public data members that hold the BitmapInfo and the Bitmap itself.

### Data Members:

public:

**BitmapInfo bi;**

Stores the BitmapInfo for the bitmap.

**Bitmap \*bm;**

Points to the Bitmap itself.

### Methods:

public:

### Prototype:

**PBitmap(BitmapInfo &bi);**

### Remarks:

Implemented by the System

Constructor. The BitmapInfo data member is initialized to the BitmapInfo passed. The Bitmap pointer is set to NULL.

### Prototype:

**PBitmap();**

### Remarks:

Implemented by the System

Constructor. The Bitmap pointer is set to NULL.

**Prototype:**

**~PBBitmap();**

**Remarks:**

Implemented by the System

Destructor. The Bitmap, if allocated, is deallocated.

**Prototype:**

**void Load();**

**Remarks:**

Implemented by the System

The BitmapManager is used to Load the bitmap as specified by the BitmapInfo.

**Prototype:**

**PBBitmap\* Clone();**

**Remarks:**

Implemented by the System

Makes a copy of the bitmap and returns a pointer to it.

## Class ParamBlock2PLCB

See Also: [Class PostLoadCallback](#), [Class ILoad](#).

```
class ParamBlock2PLCB : public PostLoadCallback
```

### Description:

This class is available in release 3.0 and later only.

This is a post load call back for fixing up parameter block2s. This callback handles conversion of pre-ParamBlock2 versions of an object to a ParamBlock2 version. NOTE: this thing deletes itself when it's done.

### Data Members:

All data members are public.

#### **ParamVersionDesc\* versions;**

This is an array of ParamVersionDesc2s.

#### **int count;**

This is the number in the array specified above.

#### **ParamBlockDesc2\* curdesc;**

This is a pointer to the current version of the description.

#### **ReferenceTarget\* targ;**

This is a pointer to a reference target. This is usually the this pointer of the object.

#### **int pbRefNum;**

This is the reference index of the parameter block.

### Methods:

public:

### Prototype:

```
ParamBlock2PLCB(ParamVersionDesc *v, int cnt,  
ParamBlockDesc2* pd, ReferenceTarget *t, int refNum);
```

### Remarks:

Constructor. The data members are initialized to the values passed.

### Prototype:

**void proc(ILoad \*iload);**

**Remarks:**

This methods handles the conversion of edition 1 ParamBlocks to the new ParamBlock2s.

**Parameters:**

**ILoad \*iload**

An interface for loading files.

## Structure ParamAlias

See Also: [Class IParamBlock2](#), [Class ParamBlockDesc2](#).

### Description:

This structure is available in release 3.0 and later only.

This structure provides information about a parameter alias. Aliases allow individual parameters or Tab<> parameter elements to be named. See the methods **IParamBlock2::DefineParamAlias**, **FindParamAlias**, etc.

### typedef struct

{

**TCHAR\* alias;**

The name of the alias.

**ParamID ID;**

The permanent ID of the parameter.

**int tabIndex;**

If the parameter is a Tab<> this is the zero based index into the table of the parameter. If the parameter is not a table this is -1.

**} ParamAlias;**

## Class IAutoEParamDlg

See Also: [Class ParamDlg](#), [Class IParamMap2](#), [Class IRendParams](#), [Class ParamMap2UserDlgProc](#).

```
class IAutoEParamDlg : public EffectParamDlg
```

### Description:

This class is available in release 3.0 and later only.

Auto ParamDlg class for Effects auto-UI, instanced by

**ClassDesc2::CreateParamDialog()**. It maintains a table of secondary EffectParamDlg for master EffectParamDlg (e.g., the one returned from CreateParamDialog()) and will broadcast appropriate method calls to them as the master receives them.

### Methods:

public:

### Prototype:

```
virtual void InvalidateUI()=0;
```

### Remarks:

This method causes the user interface controls to be re-drawn.

### Prototype:

```
virtual int NumDlgs()=0;
```

### Remarks:

Returns the number of secondary dialogs.

### Prototype:

```
virtual void AddDlg(SFXParamDlg* dlg)=0;
```

### Remarks:

Adds the specified dialog as another secondary dialog.

### Parameters:

**SFXParamDlg\* dlg**

Points to the parameter dialog to add.

**Prototype:**

**virtual SFXParamDlg\* GetDlg(int i)=0;**

**Remarks:**

Returns a pointer to the 'i-th' secondary dialog.

**Parameters:**

**int i**

The zero based index of the dialog to return.

**Prototype:**

**virtual void SetDlg(int i, SFXParamDlg\* dlg)=0;**

**Remarks:**

Sets the 'i-th' dialog to the one passed.

**Parameters:**

**int i**

The zero based index of the dialog to set.

**SFXParamDlg\* dlg**

Points to the parameter dialog to set.

**Prototype:**

**virtual void DeleteDlg(SFXParamDlg\* dlg)=0;**

**Remarks:**

This method is used for deleting secondary dialogs from a master **IAutoEParamDlg**. Use this along with **AddDlg()** if you are dynamically changing the set of rollups for the plugin, so that the **P\_AUTO\_UI** system can correctly manage all current secondary rollups.

**Parameters:**

**SFXParamDlg\* dlg**

Points to the ParamDlg to delete.

**Prototype:**

**virtual IParamMap2\* GetMap()=0;**

**Remarks:**

Returns a pointer to the parameter map2 of this primary (master) dialog.

**The following function is not a method of this class but is available for use:**

**Function:**

**IAutoEParamDlg\* CreateAutoEParamDlg(IRendParams \*i, Effect\* e, IParamBlock2\* pb, ClassDesc2\* cd, HINSTANCE inst, TCHAR\* dlgTemplate, TCHAR\* title, int rollFlags, ParamMap2UserDlgProc\* dlgProc=NULL);**

**Remarks:**

This function creates an AutoEParamDlg for render effects.

**Parameters:**

**IRendParams \*i**

An interface pointer for rendering effects.

**Effect\* e**

Points to the rendering effect calling this function.

**IParamBlock2\* pb**

Points to the parameter block instance associated with the parameter map.

**ClassDesc2\* cd**

The class descriptor2 for the plug-in creating the parameter map.

**HINSTANCE inst**

The plug-ins DLL instance handle.

**TCHAR\* dlgTemplate**

Dialog template for the rollup page (created using the resource editor)

**TCHAR\* title**

The title displayed in the rollup page title bar.

**int rollFlags**

A set of flags to control settings of the rollup page.

**APPENDROLL\_CLOSED**

Starts the page in the rolled up state.

**ParamMap2UserDlgProc\* dlgProc=NULL**

If there is some custom handling required by a particular control, the client

can derive a class from ParamMap2UserDlgProc and set it as the parameter map's user callback.

**Return Value:**

A pointer to an interface for managing the parameter map2.

## Class ParamMap2UserDlgProc

See Also: [Class ParamBlockDesc2](#), [Class ClassDesc2](#).

class ParamMap2UserDlgProc

### Description:

This class is available in release 3.0 and later only.

This class is used with the release 3 parameter map system. If there are controls which require custom handling you can create an object from this class and set it as the parameter map's user callback (usually using **SetUserDialogProc()**).

### Methods:

public:

### Prototype:

**virtual BOOL DlgProc(TimeValue t, IParamMap2 \*map, HWND hWnd, UINT msg, WPARAM wParam, LPARAM lParam)=0;**

### Remarks:

Implemented by the Plug-In.

This is the dialog proc that will be called to process the control messages. This proc will be called after the default processing is complete.

### Parameters:

#### **TimeValue t**

This is the current time.

#### **IParamMap2 \*map**

This is a pointer to the parameter map.

#### **HWND hWnd**

This is the handle to the dialog.

#### **UINT msg**

This is the message that should be processed by the dialog proc.

#### **WPARAM wParam**

This is a parameter that holds message specific information.

#### **LPARAM lParam**

This is a parameter that holds message specific information.

### Return Value:

This is essentially the equivalent of a normal Windows dialog proc, so it should return whatever value a normal dialog proc returns for the message. An exception is that the value **REDRAW\_VIEWS** may be returned to cause the viewports to be redrawn.

**Prototype:**

**virtual void DeleteThis()=0;**

**Remarks:**

Implemented by the Plug-In.

This method is called to delete this object. If the DlgProc is non-NULL when the ParamMap is deleted this method will be called.

**Prototype:**

**virtual void SetThing(ReferenceTarget \*m);**

**Remarks:**

Implemented by the Plug-In.

This gets called if the **DlgProc** is registered with a parameter map associated with one of the **IAutoXXXParamDlg** instances and that dialog has **SetThing()** called on it. This provides a simple way for the user dialog proc to track changes to the underlying object in the parameter map.

**Parameters:**

**ReferenceTarget \*m**

The item that was set.

**Default Implementation:**

**{}**

**Prototype:**

**virtual void Update(TimeValue t, Interval& valid, IParamMap2\* pmap);**

**Remarks:**

This method is available in release 4.0 and later only.

This is a variant of **Update()** method in **ParamMap2UserDlgProc** used to

supply more context, including the pmap itself and its validity interval.  
Changes you make to the validity interval passed in affect the validity interval of the whole parammap.

**Parameters:**

**TimeValue t**

The time at which the update is taking place.

**Interval& valid**

The validity interval of the parameter map.

**IParamMap2 \*pmap**

The parameter map the user dialog proc is associated with.

## Bitmap Flags

See Also: [Class BitmapStorage](#).

The following flag bits describe properties of the bitmap:

### **MAP\_READY**

This bitmap has had memory allocated to it, or is accessible directly.

### **MAP\_HAS\_ALPHA**

The bitmap has an alpha channel. This flag can be checked from a **BitmapInfo** instance (**bi.Flags() & MAP\_HAS\_ALPHA**), but not from a **Bitmap** instance (**bmap->Flags() & MAP\_HAS\_ALPHA**). Therefore if you have a **Bitmap**, use the **Bitmap's HasAlpha()** method to see if the map has an alpha channel.

### **MAP\_ALPHA\_PREMULTIPLIED**

The bitmap has pre-multiplied alpha.

### **MAP\_PALETTED**

The bitmap uses a palette (not true color).

### **MAP\_DITHERED**

The bitmap is dithered.

### **MAP\_FLIPPED**

The bitmap is flipped horizontally.

### **MAP\_INVERTED**

The bitmap is inverted vertically.

### **MAP\_USE\_SCALE\_COLORS**

This option is available in release 4.0 and later only.

The bitmap should scale colors when high dynamic range values are out of gamut.

### **MAP\_LEGAL\_DELETE**

This flag is for internal use only.

### **MAP\_VIEW\_FILTERED**

This flag is used for testing internally.

### **MAP\_FRAME\_SYSTEM\_LOCKED**

This flag is no longer used.

### **MAP\_NOFLAGS**

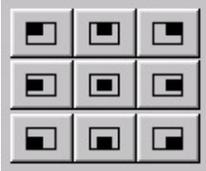

The bitmap has none of the characteristics below.

**MAP\_ALL\_FLAGS**

Indicates ALL the flags are set.

## List of Bitmap Alignment Positions

One of the following nine values define the position of the bitmap:

1 | 2 | 3

----+----+----

4 | 5 | 6

----+----+----

7 | 8 | 9

**BMM\_CUSTOM\_POSNW**

Top Left Position (1)

**BMM\_CUSTOM\_POSN**

Top Center Position (2)

**BMM\_CUSTOM\_POSNE**

Top Right Position (3)

**BMM\_CUSTOM\_POSW**

Middle Left Position (4)

**BMM\_CUSTOM\_POSCN**

Middle Center Position (5)

**BMM\_CUSTOM\_POSE**

Middle Right Position (6)

**BMM\_CUSTOM\_POSSW**

Bottom Left Position (7)

**BMM\_CUSTOM\_POSS**

Bottom Center Position (8)

**BMM\_CUSTOM\_POSSE**

Bottom Right Position (9)

## List of Custom Bitmap Flags

The Custom Bitmap Flags. These may be ORed together as in:

**BMM\_CUSTOM\_GAMMA | BMM\_CUSTOM\_SIZE**

One or more of the following flags may be used.

**BMM\_CUSTOM\_GAMMA**

Custom gamma setting.

**BMM\_CUSTOM\_SIZE**

Custom size setting.

**BMM\_CUSTOM\_RESFIT**

Bitmap is to be resized.

**BMM\_CUSTOM\_POS**

Bitmap has a custom positioning.

**BMM\_CUSTOM\_FILEGAMMA**

Bitmap has a custom file gamma setting.

# Class CropCallback

See Also: [Class Bitmap](#).

class CropCallback

## Description:

This class is available in release 2.0 and later only.

This class is a callback for interactive adjustment of bitmap "Cropping rectangle", passed in as an argument to the **Bitmap::Display()** method. See `\MAXSDK\SAMPLES\MATERIALS\BMTEX.CPP` for sample code.

All methods of this class are implemented by the plug-in.

## Methods:

### Prototype:

**virtual float GetInitU()=0;**

### Remarks:

Returns the initial U value.

### Prototype:

**virtual float GetInitV()=0;**

### Remarks:

Returns the initial V value.

### Prototype:

**virtual float GetInitW()=0;**

### Remarks:

Returns the initial W value.

### Prototype:

**virtual float GetInitH()=0;**

### Remarks:

Returns the initial H value.

**Prototype:**

**virtual BOOL GetInitMode()=0;**

**Remarks:**

Returns TRUE for place mode; FALSE for crop mode. In crop mode the image is clipped at the edges. In place mode, the image is resized or moved.

**Prototype:**

**virtual void SetValues(float u, float v, float w, float h, BOOL md)=0;**

**Remarks:**

This method is called to set the values as the user is making adjustments. If the parameters may be animated, use **Interface::GetTime()** to retrieve the time they are being set for.

**Parameters:**

**float u**

The U parameter to set.

**float v**

The V parameter to set.

**float w**

The W parameter to set.

**float h**

The H parameter to set.

**BOOL md**

The mode being set. TRUE is place mode; FALSE is crop.

**Prototype:**

**virtual void OnClose()=0;**

**Remarks:**

This method is called when the cropping adjustment window is closed.

# Class BitmapNotify

See Also: [Class Bitmap](#), [Class BitmapStorage](#).

```
class BitmapNotify
```

## Description:

This class is available in release 2.0 and later only.

This class is a callback for notifying bitmaps that their storage has changed, and if any on screen displays need to be refreshed. This is installed as a callback via the method **Bitmap::SetNotify()**.

All methods of this class are implemented by the system.

## Methods:

### Prototype:

```
virtual int Changed(ULONG flags)=0;
```

### Remarks:

This method is called when the storage for the Bitmap has changed.

### Parameters:

**ULONG flags**

One of the following:

**BMNOTIFY\_FLAG\_STORAGE\_CHANGE**, notifies that the storage (the contents of the bitmap) has changed.

**BMNOTIFY\_FLAG\_FILE\_CHANGE**, notifies that that bitmap file has changed, probably by an external program. The bitmap should be reloaded. Note that by the time this call is made, the API has already checked to see if the user has set the global preferences asking for these changes to be automatically reloaded.

### Prototype:

```
virtual void VFBClosed();
```

### Remarks:

This method is called when Virtual Frame Buffer is closed.

### Default Implementation:

```
{}
```

## Class GWinSetup

See Also: [Class GraphicsWindow](#).

class GWinSetup

### **Description:**

This class is the graphics window setup structure. An instance of this class is passed to the function **createGW()** to create a new graphics window.

Note: This is no longer available for use by plug-ins in 3ds max 2.0 and later.

## List of Rendering Limits

See [Class GraphicsWindow](#).

These are the flags for specifying rendering limits. One or more of the following values:

### **GW\_NO\_ATTS**

Not attributes are specified.

### **GW\_WIREFRAME**

Wireframe rendering mode.

### **GW\_ILLUM**

This indicates that you have colors per vertex in your polygons and that they should be used. If you had colors per vertex but this flag was not set, the colors would be ignored.

### **GW\_PERSPECTIVE\_CORRECT**

In this mode textures are corrected for perspective display.

### **GW\_POLY\_EDGES**

This option is available in release 2.0 and later only.

This mode causes polygon edges (Edged Faces) to be on.

### **GW\_FLAT**

Flat (facet) shading mode.

### **GW\_SPECULAR**

This enables specular highlight display.

### **GW\_TEXTURE**

This enables texture display.

### **GW\_Z\_BUFFER**

When coordinates are specified for drawing primitives they have x, y, and z values. Sometimes when drawing entities in the viewports it is desirable to ignore the z values. For example in the 3ds max viewports the text that display the type of viewport (Front, Left, ...) are drawn without z values. So are the arc-rotate circle control and the axis tripods. These items are drawn without this flag being set so they always show up in front.

### **GW\_BACKCULL**

Backface culling is used. Entities whose surface normal face away from the view direction are not drawn.

## **GW\_TWO\_SIDED**

Faces are displayed regardless of their surface normal orientation.

## **GW\_COLOR\_VERTS**

This option is available in release 2.0 and later only.

This turns on color-per-vertex display.

## **GW\_SHADE\_CVERTS**

This option is available in release 2.0 and later only.

This modifies **GW\_COLOR\_VERTS**. If set, then lighting is enabled and the vertex colors are used to modulate the colors that result from lighting. If off, then the colors on each vertex are used directly to shade the triangle. (Note that when 3ds max uses **GW\_SHADE\_CVERTS** mode, it puts a white diffuse-only material on the object so that it appears that the colors are shaded without distortion.)

Described further, when shading is OFF, then the vertex colors are used directly. This is equivalent to saying that they are modulated by a pure white self-illuminated material (i.e. the color values are "modulated (multiplied) by 1" -- so they don't change).

When shading is ON, the diffuse white material is illuminated by the scene lighting, resulting in shades ranging from black to white (0 to 1), with most vertices being some shade of pure gray. When the vertex colors are modulated by the material color, they get multiplied (in general) by a number less than 1, which makes them appear darker.

The RGB components of the colors are modulated uniformly, so that there is no shift from, say, red to green. That would happen if the underlying material was not evenly weighted (i.e. a pure gray lying between black and white). Said another way, only the intensity of the vertex colors is changed when shading is on, not luminance, chrominance, etc.

## **GW\_PICK**

This indicates hit testing will be performed (not rendering).

## **GW\_BOX\_MODE**

Objects are shown using their bounding box.

## **GW\_ALL\_EDGES**

All edges of the item are shown (including hidden ones).

## **GW\_VERT\_TICKS**

This option is available in release 2.0 and later only.

This mode is really a pseudo-mode, in that it doesn't actually cause GFX do anything differently, but rather is tested by the Mesh class, which sends down vertex markers (+) if the mode is on.

### **GW\_LIGHTING**

This is the same as (**GW\_ILLUM** | **GW\_SPECULAR**)

### **GW\_TRANSPARENCY**

Specifies to use Transparency

### **GW\_TRANSPARENT\_PASS**

Specifies a Second pass to perform Blended Transparency

## Clip Flags

View volume clip flags. Flags are provided for each of the six planes bounding the viewing frustum. One or more of the following values:

**GW\_LEFT\_PLANE**

**GW\_RIGHT\_PLANE**

**GW\_BOTTOM\_PLANE**

**GW\_TOP\_PLANE**

**GW\_FRONT\_PLANE**

**GW\_BACK\_PLANE**

## List of Mouse Callback Messages

This message describes the type of event that occurred.

### **MOUSE\_ABORT**

When the user aborts a mouse procedure, for example when they are dragging the mouse and they right click, this message is sent.

### **MOUSE\_IDLE**

This message is used internally.

### **MOUSE\_POINT**

This message is sent when the user has clicked a point.

### **MOUSE\_MOVE**

This message is sent when the mouse input is captured and the user moved the mouse. When mouse input is captured all mouse events continue to go to the current window even when the mouse is move outside the limits of the window. This is when the user is 'dragging'.

### **MOUSE\_DBLCLICK**

This is sent when the user has double clicked the mouse.

### **MOUSE\_INIT**

This is sent when the mouse proc is plugged in as the current mouse proc. If a plug-in needed to perform some kind of initialization when it was first became current this message could be processed.

### **MOUSE\_UNINIT**

This is sent when the mouse proc is un-plugged as the current mouse proc.

### **MOUSE\_FREEMOVE**

This message is similar to a **MOUSE\_MOVE** message except it is not called when the mouse is in a 'drag' session. This means that mouse input is not captured. If mouse input is not captured and the mouse is moved outside the current window, the current window will no longer receive the mouse messages.

### **MOUSE\_KEYBOARD**

This is not used. Keyboard input is processed by registering an accelerator table. See [Class Interface](#) for the methods to register a keyboard accelerator. Also see the section [Keyboard Accelerators and Dialog Messages](#).

### **MOUSE\_PROPCLICK**

This message is sent on a right click, when nothing is selected, and the user is not over any selectable object. For example, this is how the unfreeze-by-hit pick mode knows to abort if the user presses the right mouse button. Note that this is different than if you right click while dragging - in that case you get a **MOUSE\_ABORT** message.

## Class ICustStatusEdit

See Also: [Class ICustomControl](#).

```
class ICustStatusEdit : public ICustomControl
```

### Description:

This class is available in release 3.0 and later only.

This control mimics the edit control as well as a status control. It may be set to 'read-only' so the user can read but cannot edit the displayed string.

The value to use in the Class field of the Custom Control Properties dialog is:

**CustStatusEdit**

### Function:

```
ICustStatusEdit *GetICustStatusEdit(HWND hCtrl);
```

### Remarks:

This global function is available in release 3.0 and later only.

Used to initialize and return a pointer to the control.

### Parameters:

**HWND hCtrl**

The window handle of the control.

### Function:

```
void ReleaseICustStatusEdit(ICustStatusEdit *ice);
```

### Remarks:

This global function is available in release 3.0 and later only.

Used to release the control when finished.

### Parameters:

**ICustStatusEdit \*ice**

Points to the control to release.

### Methods:

public:

### Prototype:

```
virtual void GetText(TCHAR *text, int ct)=0;
```

**Remarks:**

Retrieves the text entered into the control.

**Parameters:**

**TCHAR \*text**

Storage for the text to retrieve.

**int ct**

Specifies the maximum length of the string returned.

**Prototype:**

**virtual void SetText(TCHAR \*text)=0;**

**Remarks:**

This method places the text into the control for editing.

**Parameters:**

**TCHAR \*text**

The text to place in the control.

**Prototype:**

**virtual void SetText(int i)=0;**

**Remarks:**

This method allows you to pass in an integer value to the control. The integer is converted to a string and displayed in the control.

**Parameters:**

**int i**

This value is converted to a string and displayed in the control.

**Prototype:**

**virtual void SetText(float f, int precision=3)=0;**

**Remarks:**

This method allows you to pass in a floating point value to the control. The float is converted to a string and displayed in the control.

**Parameters:**

**float f**

This value is converted to a string and displayed in the control.

### **int precision=3**

The precision argument is simply the number of decimal places that get represented in the string that appears in the edit field. So if the arguments were (1.0f/3.0f, 3) then the string "0.333" would appear in the edit field.

#### **Prototype:**

**virtual int GetInt(BOOL \*valid=NULL)=0;**

#### **Remarks:**

This method parses and returns an integer value from the control.

#### **Parameters:**

**BOOL \*valid=NULL**

This pointer, if passed, is set to TRUE if the input is 'valid'; otherwise FALSE. FALSE indicates that something caused the parsing of the input to terminate improperly. An example is a non-numeric character. So for example, if the user entered "123jkfk sdf" into the field the valid pointer would be set to FALSE.

#### **Prototype:**

**virtual float GetFloat(BOOL \*valid=NULL)=0;**

#### **Remarks:**

This method parses and returns a floating point value from the control.

#### **Parameters:**

**BOOL \*valid=NULL**

This pointer, if passed, is set to TRUE if the input is 'valid'; otherwise FALSE. FALSE indicates that something caused the parsing of the input to terminate improperly. An example is a non-numeric character. So for example, if the user entered "123jkfk sdf" into the field this pointer would be set to FALSE.

#### **Prototype:**

**virtual void SetLeading(int lead)=0;**

#### **Remarks:**

A developer doesn't normally need to call this method. This offsets the text

vertically in the edit control.

**Parameters:**

**int lead**

This parameter specifies the number of pixels to offset.

**Prototype:**

**virtual void WantReturn(BOOL yesNo)=0;**

**Remarks:**

This method allows custom handling of the RETURN key. If you pass TRUE to this method an EN\_CHANGE message will be sent to the control when the RETURN key is pressed. The EN\_CHANGE message is sent when the user has taken any action that may have altered text in an edit control so developer need to also call GotReturn() (documented below) to see if it was indeed a RETURN keypress.

**Parameters:**

**BOOL yesNo**

If TRUE, then when the user presses the RETURN key in that control, the edit field will send an EN\_CHANGE message to the owner, and calling GotReturn() will return TRUE.

**Prototype:**

**virtual BOOL GotReturn()=0;**

**Remarks:**

This method should be called on receipt of an EN\_CHANGE message. It return TRUE if pressing the RETURN key generated the message; otherwise FALSE.

**Prototype:**

**virtual void GiveFocus()=0;**

**Remarks:**

Calling this method gives the control the focus to receive input.

**Prototype:**

**virtual BOOL HasFocus()=0;**

**Remarks:**

Returns TRUE if the control has the focus to receive input; otherwise FALSE.

**Prototype:**

**virtual void WantDlgNextCtl(BOOL yesNo)=0;**

**Remarks:**

Determines whether the TAB key may be used to jump to the next control in the tab sequence.

**Parameters:**

**BOOL yesNo**

TRUE to enable the TAB key to move to the next control; FALSE to disable the TAB key from moving the focus.

**Prototype:**

**virtual void SetNotifyOnKillFocus(BOOL onOff)=0;**

**Remarks:**

Normally when a user exits an edit field the notification WM\_CUSTEDIT\_ENTER is sent. Many plug-ins key off this message to finalize the input of values. For instance, if the user is entering a value into an edit field and they hit the TAB key to leave the field the value should be entered. Normally this is the desired behavior. However, as a special case condition, if a developer does not want to update the value, this method may be called so the WM\_CUSTEDIT\_ENTER notification won't be sent when the edit control loses focus.

**Parameters:**

**BOOL onOff**

TRUE to turn on; FALSE to turn off.

**Prototype:**

**virtual void SetBold(BOOL onOff)=0;**

**Remarks:**

Sets the text font in the edit control to display in a bold format or normal.

**Parameters:**

**BOOL onOff**

TRUE to turn bolding on; FALSE to turn off.

**Prototype:**

**virtual void SetReadOnly(BOOL onOff)=0;**

**Remarks:**

Sets if the control is 'read-only'. That is, the string is displayed but cannot be edited.

**Parameters:**

**BOOL onOff**

TRUE for read-only; FALSE to allow editing.

# Class ToolItem

See Also: [Custom Controls](#), [Class ToolImageItem](#).

class ToolItem

## Description:

This class describes the properties of an item in a 3ds max custom toolbar.

## Data Members:

public:

**ToolItemType type;**

See [List of Tool Item Types](#).

**int id**

The ID for the control.

**DWORD helpID**

For plug-in developers this id should be set to 0. Basically, the main 3ds max help file contains help tags that are tied to various parts of the 3ds max UI, allowing the right help page to come up when UI help is requested. In particular, if you press the ? button on the toolbar, then press another toolbar button, you'll get help on that button's functionality. This is because internally pressing the button yields a help ID that indexes into the help file. But since the same help ID must be compiled into the help file and into MAX, and since the main 3ds max helpfile can not be rebuilt by developers, they cannot use this functionality.

**int w**

The width of the button image.

**int h**

The height of the button image.

**int orient;**

This data member is available in release 3.0 and later only.

The orientation of the item. One of the following values:

**CTB\_HORIZ**

**CTB\_VERT**

**CTB\_FLOAT**

**Methods:**

**Prototype:**

**virtual ~ToolItem()**

**Remarks:**

Destructor.

## Class ToolButtonItem

See Also: [Class ToolItem](#), [Class MAXBmpFileIcon](#), [Custom Controls](#).

```
class ToolButtonItem : public ToolItem
```

### Description:

This class describes the properties of a 3ds max custom toolbar button.

Note, you can use MaxBmpFileIcons on a toolbar button using the new constructor in custcont.h:

```
ToolButtonItem(ToolItemType t,  
               MaxBmpFileIcon* pIcon,  
               int iW, int iH, int wd,int ht,  
               int ID, DWORD hID=0, TCHAR *lbl = NULL,  
               int or = CTB_HORIZ|CTB_VERT|CTB_FLOAT)
```

### Data Members:

public:

The following four data members (**iOutEn**, **iInEn**, **iOutDis**, **iInDis**) are indices into the image list. They indicate which images to use for each of the four possible button states. You may specify a unique image for each one of these states by passing a different index for each state. Or you may supply a single image to be used for all the states by specifying the same index four times.

**int iOutEn**

Out&Enabled.

**int iInEn**

In&Enabled.

**int iOutDis**

Out&Disabled.

**int iInDis**

In&Disabled.

**int iw**

The width of the button image.

**int ih**

The height of the button image.

**TCHAR \*label;**

This data member is available in release 4.0 and later only.

The label describing the tool button item.

**MaxBmpFileIcon \*mpIcon;**

This data member is available in release 4.0 and later only.

A pointer to the icon image associated with the button.

**MaxBmpFileIcon \*mpInIcon;**

This data member is available in release 4.0 and later only.

A pointer to the in icon image associated with the button.

**Methods:**

**Prototype:**

**ToolButtonItem(ToolItemType t, int iOE, int iIE, int iOD, int iID, int iW, int iH, int wd, int ht, int ID, DWORD hID=0, TCHAR \*lbl = NULL, int or = CTB\_HORIZ|CTB\_VERT|CTB\_FLOAT)**

**Remarks:**

Constructor.

**Parameters:**

**ToolItemType t**

See [List of Tool Item Types](#).

**int iOE**

The Out&Enabled index.

**int iIE**

The In&Enabled index.

**int iOD**

The Out&Disabled index.

**int iID**

The In&Disabled index.

**int iW**

The image width (size of the bitmap in the ImageList).

**int iH**

The image height (size of the bitmap in the ImageList).

**int wd**

The width of the button.

**int ht**

The height of the button.

**int ID**

The ID of the control.

**DWORD hID=0**

The help ID. For plug-in developers this id should be set to 0.

**TCHAR \*lbl = NULL**

The label of the button.

**int or = CTB\_HORIZ|CTB\_VERT|CTB\_FLOAT**

The allowable orientation of the item. This may be one or more of the following:

**CTB\_HORIZ** - Horizontal

**CTB\_VERT** - Vertical

**CTB\_FLOAT** - Floating (not docked)

**Prototype:**

**ToolButtonItem(ToolItemType t, MaxBmpFileIcon\* pIcon, int iW, int iH, int wd, int ht, int ID, DWORD hID=0, TCHAR \*lbl = NULL, int or = CTB\_HORIZ|CTB\_VERT|CTB\_FLOAT);**

**Remarks:**

This method is available in release 4.0 and later only.

Constructor.

**Parameters:**

**ToolItemType t**

See [List of Tool Item Types](#).

**MaxBmpFileIcon\* pIcon**

A pointer to the icon associated with the button.

**int iW**

The image width (size of the bitmap in the ImageList).

**int iH**

The image height (size of the bitmap in the ImageList).

**int wd**

The width of the button.

**int ht**

The height of the button.

**int ID**

The ID of the control.

**DWORD hID=0**

The help ID. For plug-in developers this id should be set to 0.

**TCHAR \*lbl = NULL**

The label of the button.

**int or = CTB\_HORIZ|CTB\_VERT|CTB\_FLOAT**

The orientation of the button item.

#### **Prototype:**

```
ToolButtonItem(ToolItemType t, MaxBmpFileIcon* pIcon,  
MaxBmpFileIcon* pInIcon, int iW, int iH, int wd,int ht, int ID,  
DWORD hID=0, TCHAR *lbl = NULL, int or =  
CTB_HORIZ|CTB_VERT|CTB_FLOAT);
```

#### **Remarks:**

This method is available in release 4.0 and later only.

Constructor.

#### **Parameters:**

**ToolItemType t**

See [List of Tool Item Types](#).

**MaxBmpFileIcon\* pIcon**

A pointer to the icon associated with the button.

**MaxBmpFileIcon\* pInIcon**

A pointer to the in icon associated with the button.

**int iW**

The image width (size of the bitmap in the ImageList).

**int iH**

The image height (size of the bitmap in the ImageList).

**int wd**

The width of the button.

**int ht**

The height of the button.

**int ID**

The ID of the control.

**DWORD hID=0**

The help ID. For plug-in developers this id should be set to 0.

**TCHAR \*lbl = NULL**

The label of the button.

**int or = CTB\_HORIZ|CTB\_VERT|CTB\_FLOAT**

The orientation of the button item.

## Class IRollupPanel

class IRollupPanel : public InterfaceServer

### Description:

This class is available in release 4.0 and later only.

This class represents the interface for a rollup panel and describes the properties of that panel (which is one rollup). You can obtain a pointer to the IRollupPanel class for any given specified window by calling

**IRollupWindow::IRollupPanel \*GetPanel(HWND hWnd);**

### Methods:

public:

### Prototype:

**virtual HINSTANCE GetHInst()=0;**

### Remarks:

This method returns a handle to the rollup panel instance.

### Prototype:

**virtual DWORD\_PTR GetResID()=0;**

### Remarks:

This method returns the resource ID of the rollup panel.

### Prototype:

**virtual BOOL operator==(const IRollupPanel& id)=0;**

### Remarks:

Equality test operator.

### Prototype:

**virtual int GetCategory()=0;**

### Remarks:

This method returns the rollup panel category identifier.

**Prototype:**

**virtual void SetCategory(int cat)=0;**

**Remarks:**

This method allows you to set the category identifier for the rollup panel.

**Parameters:**

**int cat**

The category identifier to set.

**Prototype:**

**virtual HWND GetHwnd()=0;**

**Remarks:**

This method returns a handle to the rollup window.

**Prototype:**

**virtual HWND GetRollupWindowHWND()=0;**

**Remarks:**

This method returns a handle to the actual panel in the rollup window.

**Prototype:**

**virtual HWND GetTitleWnd()=0;**

**Remarks:**

This method returns a handle to the window from which you can get the title through the **GWLP\_USERDATA**.

## Class BitArrayCallback

See Also: [Class BitArray](#).

class BitArrayCallback

### Description:

This class is available in release 3.0 and later only.

This is the callback object for the method **BitArray::EnumSet()**. The proc method is called for each "1" in the BitArray.

### Methods:

public:

### Prototype:

```
virtual void proc(int n)=0;
```

### Remarks:

This method is called for each "1" in the BitArray.

### Parameters:

**int n**

This is the zero based index into the BitArray of the element which is "1".

## Class GamConvert16

See Also: [Class GammaMgr](#), [Class GamConv8](#).

class GamConvert16

### Description:

A temporary table for converting 16->16. A developer may define an instance of this class and it will build a gamma correction table. The constructor will build the table with the specified gamma setting and the destructor will free the table. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

**GamConvert16(float gam=1.0f);**

#### Remarks:

Constructor. The gamma table is built using the specified gamma setting.

#### Prototype:

**~GamConvert16();**

#### Remarks:

Destructor. The gamma table is deleted.

#### Prototype:

**void SetGamma(float gam);**

#### Remarks:

Sets the gamma setting to the value specified and builds the gamma table.

#### Parameters:

**float gam**

The gamma value to set.

#### Prototype:

**UWORD Convert(UWORD v);**

#### Remarks:

Gamma corrects the specified color.

**Parameters:**

**UWORD v**

The color to gamma correct.

**Return Value:**

The gamma corrected value.

## Class GamConvert8

See Also: [Class GammaMgr](#), [Class GamConvert16](#).

class GamConvert8

### Description:

A temporary table for converting 8->16. A developer may define an instance of this class and it will build a gamma correction table. The constructor will build the table with the specified gamma setting and the destructor will free the table. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

**GamConvert8(float gam=1.0f);**

#### Remarks:

Constructor. The gamma table is built using the specified gamma setting.

#### Prototype:

**void SetGamma(float gam);**

#### Remarks:

Sets the gamma setting to the value specified and builds the gamma table.

#### Parameters:

**float gam**

The gamma value to set.

#### Prototype:

**UWORD Convert(UBYTE v);**

#### Remarks:

Gamma corrects the specified color.

#### Parameters:

**UBYTE v**

The color to gamma correct.

#### Return Value:

The gamma corrected value.

# Class FlagUser

See Also: [Class MNMesh](#).

Class FlagUser

## Description:

This class is available in release 2.0 and later only.

This is a handy class to subclass off of when you're designing a class with flags. It contains one private data member, a DWORD, with the flag info. It then implements a bunch of handy flag-related functions. All methods of this class are implemented by the system.

## Data Members:

private:

**DWORD FlagUserFlags;**

Stores the flags.

## Methods:

### Prototype:

**FlagUser();**

### Remarks:

Constructor. Sets FlagUserFlags to 0, clearing all flag bits.

### Prototype:

**void SetFlag(DWORD fl, bool val=TRUE);**

### Remarks:

Sets flags. Each bit that is set in **fl** is assigned the value **val**.

### Prototype:

**void ClearFlag(DWORD fl);**

### Remarks:

Clears flags. Each bit that is set in **fl** is cleared.

**Prototype:**

**bool GetFlag(DWORD fl) const;**

**Remarks:**

Checks if flags are set.

**Return Value:**

TRUE if any of the bits set in fl are set in this FlagUser. FALSE if none of them are.

**Prototype:**

**void ClearAllFlags();**

**Remarks:**

Sets FlagUserFlags to 0, clearing all flag bits.

**Prototype:**

**void CopyFlags(DWORD fl);**

**Remarks:**

This method is available in release 2.0 and later only.  
Copies all flag bits over from **fl**.

**Prototype:**

**void CopyFlags(const FlagUser & fu);**

**Remarks:**

Copies all flag bits over from **fu**.

**Prototype:**

**void CopyFlags(const FlagUser \* fu);**

**Remarks:**

Copies all flag bits over from **\*fu**.

**Prototype:**

**void CopyFlags(DWORD fl, DWORD mask);**

**Remarks:**

Copies from **fl** only those bits set in **mask**.

**Prototype:**

**void CopyFlags(const FlagUser &fu, DWORD mask);**

**Remarks:**

Copies from **fu** only those bits set in **mask**.

**Prototype:**

**void CopyFlags(const FlagUser \*fu, DWORD mask);**

**Remarks:**

Copies from **\*fu** only those bits set in **mask**.

**Prototype:**

**void OrFlags(const FlagUser & fu);**

**Remarks:**

Sets all flags that are set in **fu**.

**Prototype:**

**void OrFlags(const FlagUser \* fu);**

**Remarks:**

Sets all flags that are set in **\*fu**.

**Prototype:**

**void AndFlags(const FlagUser & fu);**

**Remarks:**

Clears all flags that are clear in **fu**.

**Prototype:**

**void AndFlags(const FlagUser \* fu);**

**Remarks:**

Clears all flags that are clear in **\*fu**.

**Prototype:**

**bool FlagMatch(DWORD fmask, DWORD fl) const;**

**Remarks:**

Checks whether all the bits that are set in fmask are the same in this FlagUser and in fl.

**Prototype:**

**bool FlagMatch(DWORD fmask, const FlagUser & fu) const;**

**Remarks:**

Checks whether all the bits that are set in fmask are the same in this FlagUser and in fu.

**Prototype:**

**bool FlagMatch(DWORD fmask, const FlagUser \* fu) const;**

**Remarks:**

Checks whether all the bits that are set in fmask are the same in this FlagUser and in \*fu.

**Prototype:**

**DWORD ExportFlags() const;**

**Remarks:**

Returns a DWORD equal to FlagUserFlags.

**Prototype:**

**void ImportFlags(DWORD fl);**

**Remarks:**

Sets FlagUserFlags equal to fl. Same as CopyFlags (fl), but it's included for "linguistic completeness".

## Class MNVert

See Also: [Class FlagUser](#), [Class MNMesh](#), [Template Class Tab](#).

```
class MNVert : public FlagUser
```

### Description:

This class is available in release 2.0 and later only.

MNVert is the vertex class used with the MNMesh mesh. MNVerts have not only a Point3 location, but also some flags.

All methods of this class are implemented by the system.

### Data Members:

public:

#### **Point3 p**

The location of this MNVert.

#### **int orig**

This data member is obsolete and should not be used.

### Flags:

For more information on flags, see [Class FlagUser](#).

#### **MN\_SEL**

Indicates that the vertex is selected.

#### **MN\_TARG**

Indicates that the vertex is targeted. (See the MNMesh methods starting with the words TargetBy.)

#### **MN\_DEAD**

Indicates that the vertex is not used and should be ignored. Vertices with the MN\_DEAD flag are deleted in the next MNMesh call to CollapseDeadVerts ().

#### **MN\_BACKFACING**

Indicates that the vertex faces "backwards" in the current viewport. (Changes often.)

#### **MN\_WHATEVER**

Developers should not use this flag and should restrict themselves to

**MN\_USER** and higher bits.

#### **MN\_VERT\_DONE**

Set in algorithms that may accidentally revisit the same vertex twice, to keep them from processing it the second time.

### **MN\_VERT\_HIDDEN**

Different from MN\_HIDDEN - means a vert is on a face's hvtx list, rather than existing independently of faces.

### **MN\_USER(1<<16)**

Flag bits at or above MN\_USER are reserved in all MNMesh components for the plug-in developer, if needed. Since FlagUser-derived classes have 32 flag bits, this allows for up to 16 user-defined flags.

### **Methods:**

#### **Prototype:**

**MNVert();**

#### **Remarks:**

Constructor.

This method initializes the MNVert.

#### **Prototype:**

**MNVert & operator=(MNVert & from);**

#### **Remarks:**

Assignment operator. Copies over all data from "from".

## Class MNEdge

See Also: [Class FlagUser](#), [Class MNMesh](#).

```
class MNEdge : public FlagUser
```

### Description:

This class is available in release 2.0 and later only.

MNEdge is the edge class used with the MNMesh mesh. MNEdges are "winged-edge" structures, which means they keep track of a start vertex, an end vertex, and the (unique) face that uses the start and end vertices in that order. If there is a face that uses the end and start vertices in that order, i.e. that travels this edge in the other direction, it is also recorded.

All methods of this class are implemented by the system.

### Data Members:

public:

**int v1, v2**

The start and end vertices. These values are indices into the parent MNMesh's list of MNVerts.

**int f1**

The (unique) face that references this edge in the forward direction. This value is an index into the parent MNMesh's list of MNFaces.

**int f2**

The face (if any) that references this edge in the backward direction. Faces with f2=-1 are considered "one-sided", and lie on the boundary of a hole in the mesh. This value is an index into the parent MNMesh's list of MNFaces.

**int track**

This data member is obsolete and should not be used.

### Flags:

For more information on flags, see [Class FlagUser](#).

**MN\_SEL**

Indicates that the edge is selected.

**MN\_TARG**

Indicates that the edge is targeted. (See the MNMesh methods starting with the words TargetBy.)

## **MN\_DEAD**

Indicates that the edge is not used and should be ignored. Edges with the MN\_DEAD flag are deleted in the next MNMesh call to CollapseDeadEdges ().

## **MN\_EDGE\_INVIS**

Both faces using this edge consider it invisible.

## **MN\_EDGE\_HALFINVIS**

One face using this edge considers it invisible.

## **MN\_EDGE\_NOCROSS**

This edge should not be crossed in algorithms like MNMesh::SabinDoo that can "mix" faces across edges.

## **MN\_EDGE\_TV\_SEAM**

This edge lies on a mapping coordinate "seam". You must use MNMesh::SetTVSeamFlags on a mesh with mapping coordinates in order to set these flags correctly.

## **MN\_EDGE\_WHATEVER**

Developers should not use this flag and should restrict themselves to MN\_USER and higher bits.

## **MN\_USER(1<<16)**

Flag bits at or above MN\_USER are reserved in all MNMesh components for the plug-in developer, if needed. Since FlagUser-derived classes have 32 flag bits, this allows for up to 16 user-defined flags.

### **Methods:**

#### **Prototype:**

**MNEdge();**

#### **Remarks:**

Constructor. Initializes both faces to -1 and both vertices to 0.

#### **Prototype:**

**MNEdge(int vv1, int vv2, int fc);**

#### **Remarks:**

Constructor. Initializes edge to run from vv1 to vv2 with f1 set to fc.

**Prototype:**

**void Init();**

**Remarks:**

This method is available in release 3.0 and later only.  
Initializes v1, v2 and f1 to 0, f2 to -1 and track to -1.

**Prototype:**

**int OtherFace(int ff);**

**Remarks:**

Assuming that ff is one of the faces using this edge, OtherFace will return the other. If the edge is one-sided, -1 will be returned. If ff is not one of the faces, f2 (which may be -1) will be returned.

**Prototype:**

**int OtherVert(int vv);**

**Remarks:**

Assuming that vv is one of the vertices on this edge, OtherVert will return the other. If vv is not one of the faces, v2 will be returned.

**Prototype:**

**void Invert();**

**Remarks:**

Flips the edge around, so that it now goes from what was v2 to what was v1. f1 and f2 are also switched. This should not be called on one-sided edges.

**Prototype:**

**void ReplaceFace(int of, int nf, int vv1=-1);**

**Remarks:**

This method is available in release 2.5 or later only.

Replaces face **of** with face **nf** in the edge records. NOTE that this method causes an assertion failure if face of is not currently used by the edge. If **of** is on both sides of the edge, which is possible on some valid NONTRI meshes, a nonnegative **vv1** is used to specify which side is replaced. **Vv1** should be the

"starting vertex" for the edge on face of. Assertion failures will also result if **vv1** is nonnegative and is not either of the edge's verts, or if **vv1** indicates that of should be the edge's f1, but it is not, etc.

**Prototype:**

**void ReplaceVert(int ov, int nv);**

**Remarks:**

This method is available in release 2.5 or later only.

Replaces vertex ov in the edge records with vertex nv. NOTE that this method causes an assertion failure if vertex ov is not used by this edge

**Prototype:**

**bool Uncrossable();**

**Remarks:**

If this edge has the **MN\_EDGE\_NOCROSS** flag set, or if it has no second face, this method returns TRUE. Otherwise, it returns FALSE. It's a shorthand equivalent for **(GetFlag(MN\_EDGE\_NOCROSS) || (f2<0))**.

**Prototype:**

**void MNDebugPrint();**

**Remarks:**

This method is available in release 2.5 and later only.

Uses DebugPrint to print out edge information to the Debug Results window in DevStudio. The information consists of the vertices and faces using this edge. It is generally a good idea to put in a DebugPrint immediately before this with the index of the edge, so you know which one is being printed out:

**DebugPrint("Edge %d: ", eid);**

**E(eid)->MNDebugPrint();**

**Prototype:**

**MNEdge & operator=(const MNEdge & from);**

**Remarks:**

Assignment operator. Copies over all data.

**Prototype:**

```
int& operator[](int i);
```

**Remarks:**

This method is available in release 4.0 and later only.

Vertex access operator.

**Default Implementation:**

```
{ return i ? v2 : v1; }
```

**Prototype:**

```
const int& operator[](int i) const;
```

**Remarks:**

This method is available in release 4.0 and later only.

Vertex access operator.

**Default Implementation:**

```
{ return i ? v2 : v1; }
```

## Class MNMeshBorder

See Also: [Class MNMesh](#), [Template Class Tab](#), [Class BitArray](#).

class MNMeshBorder

### Description:

This class is available in release 2.0 and later only.

MNMeshBorder is a small class used to hold boundary information for an MNMesh mesh. The principal data contained is a table of tables of int's, which represent edge lists in the MNMesh. These edge lists form closed loops of one-sided edges: boundaries, or borders, of the mesh. These edges are stored in order such that  $E(\text{loop}(i)[j]) \rightarrow v1$  is the same as  $E(\text{loop}(i)[j+1]) \rightarrow v2$ ,  $E(\text{loop}(i)[j+1]) \rightarrow v1 == E(\text{loop}(i)[j+2]) \rightarrow v2$ , and so on. (This is the right-hand, counterclockwise order when looking down on the hole from outside the mesh.)

Most 3ds max primitives have no borders, but the Patch Grid, when converted to a mesh, is an example of one with a single border.

All methods of this class are implemented by the system.

### Data Members:

private:

**Tab<IntTab \*> bdr**

IntTab is itself a Tab<int>. We use a table of Tab<int> pointers (rather than a table of Tab<int>'s) for clean memory allocation & freeing. However, this is an unwieldy structure, so it's kept private.

**BitArray btarg**

This is simply an array of targeting bits for each of the boundary loops in bdr.

### Methods:

#### Prototype:

**~MNMeshBorder();**

#### Remarks:

Destructor; frees all reserved memory. There is no Constructor for this class, since both data members have their own, adequate constructors.

#### Prototype:

**void Clear();**

**Remarks:**

Frees all reserved memory and reinitializes the data, producing an empty border.

**Prototype:**

**int Num();**

**Remarks:**

Returns the number of border loops for the MNMesh analyzed.

**Prototype:**

**IntTab \*Loop(int i);**

**Remarks:**

Returns a pointer to the i'th border loop.

**Prototype:**

**bool LoopTarg(int i);**

**Remarks:**

Indicates whether border loop **i** is targeted or not.

**Prototype:**

**MNDebugPrint(MNMesh \*m);**

**Remarks:**

This method is available in release 2.5 and later only.

Uses DebugPrint to print out the MNMesh borders to the Debug Results window in DevStudio. This can be useful for tracking down bugs. Be careful not to leave MNDebugPrint calls in your final build; they will slow down your effect to no purpose.

**Parameters:**

**MNMesh \*m**

The MNMesh to which this MNMeshBorder refers is required to give more details about the border.

## MNMesh Note on Edge Characteristics.

See Also: [Class MNMesh](#), [Class Mesh](#).

Regular 3ds max Meshes consist of faces and vertices; they have no real edges as such. Edge characteristics such as visibility and selection are referenced by face. For example, the edgeSel data member of a Class Mesh has  $3 * \text{numFaces}$  members. Each set of three values `edgeSel[i*3]`, `edgeSel[i*3+1]`, and `edgeSel[i*3+2]` represent the selection of the three edges (going from vertex 0 to vertex 1, vertex 1 to vertex 2, and vertex 2 to vertex 0, respectively) of face `i`.

There are similar issues in MNMesh for a number of reasons. Edge selection and visibility data must initially be stored in the MNFace members, since until we call `FillInMesh` there are no MNEdges to store them in. There are a number of methods in the library (and many more the developer could design) which would invalidate the topological data, rendering the MNEdge list invalid. Also, eventually, we're going to want to convert each MNMesh back into a regular Mesh using `OutToTri`, so it's convenient to store edge selection and visibility information in the faces for this purpose.

Thus, although the MNEdges contain `MN_SEL` and `MN_EDGE_INVIS` flags, the more fundamental location for this data is in the MNFaces using that edge. When altering an MNMesh to make edges visible or invisible, or to change their selection status, be sure to make the changes in the MNFaces using the edge, otherwise the information can be easily overwritten, and generally won't get passed to the output Mesh.

With 3.0, there are simple new methods to do this:

```
void MNMesh::SetEdgeVis (int ee, BOOL vis=TRUE);
```

```
void MNMesh::SetEdgeSel (int ee, BOOL sel=TRUE);
```

Otherwise, here's an example of how to set all the information yourself. I want to make edge `ee` visible and selected in the following code:

```
void MakeEdgeVisAndSel(MNMesh & mm, int ee) {  
    assert(mm.GetFlag(MN_MESH_FILLED_IN));  
    MNEdge *me = mm.E(ee);  
    MNFace *mf1 = mm.F(me->f1);  
    MNFace *mf2 =(me->f2>-1) ? mm.F(me->f2) : NULL;  
  
    // Change the edge as desired
```

```
me->ClearFlag(MN_EDGE_INVIS |
MN_EDGE_HALF_INVIS);
me->SetFlag(MN_SEL);

// Make the corresponding changes in face 1
int i;
  i = mf1->EdgeIndex(ee);
  mf1->visedg.Set(i);
  mf1->edgsel.Set(i);

// Make the corresponding changes in face 2
if(mf2) {
  i = mf2->EdgeIndex(ee);
  mf2->visedg.Set(i);
  mf2->edgsel.Set(i);
}
}
```

## MNMesh Notes on Debugging

See Also: [Class MNMesh](#).

MNDebugPrint:

Please familiarize yourself with the new **MNDebugPrint** methods in **MNVert**, **MNEdge**, **MNFace**, **MNMesh**, and **MNMeshBorder**. These functions print out detailed ASCII summaries of the component or mesh, which can be an invaluable aid in tracking bugs. Also, during your debugging phase, frequent calls to **MNMesh::CheckAllData** can be very useful. But, since the **MNDebugPrint** and **CheckAllData** functions are highly time intensive and serve no useful purpose for a released plug-in, you should check to remove them all before release.

As an example, here is the **MNMesh::MNDebugPrint** output from a standard 3ds max box, after applying **MakePolyMesh**. Mapping coordinates, vertex colors, and face triangulation may also be included.

**MNMesh Debug Output: 8 verts, 12 edges, 6 faces**

**Vertex 0:( -17.185, -26.798, 0.000) Edges:(0 3 9 ) Faces:(0 2 5 )**

**Vertex 1:( 17.185, -26.798, 0.000) Edges:(2 3 8 ) Faces:(0 2 3 )**

**Vertex 2:( -17.185, 26.798, 0.000) Edges:(0 1 11 ) Faces:(0 4 5 )**

**Vertex 3:( 17.185, 26.798, 0.000) Edges:(1 2 10 ) Faces:(0 3 4 )**

**Vertex 4:( -17.185, -26.798, 24.984) Edges:(4 7 9 ) Faces:(1 2 5 )**

**Vertex 5:( 17.185, -26.798, 24.984) Edges:(4 5 8 ) Faces:(1 2 3 )**

**Vertex 6:( -17.185, 26.798, 24.984) Edges:(6 7 11 ) Faces:(1 4 5 )**

**Vertex 7:( 17.185, 26.798, 24.984) Edges:(5 6 10 ) Faces:(1 3 4 )**

**Edge 0: verts(0 2), face 0, rev-face 5**

**Edge 1: verts(2 3), face 0, rev-face 4**

**Edge 2: verts(3 1), face 0, rev-face 3**

**Edge 3: verts(1 0), face 0, rev-face 2**

**Edge 4: verts(4 5), face 1, rev-face 2**

**Edge 5: verts(5 7), face 1, rev-face 3**

**Edge 6: verts(7 6), face 1, rev-face 4**

**Edge 7: verts(6 4), face 1, rev-face 5**

**Edge 8: verts(1 5), face 2, rev-face 3**

**Edge 9: verts(4 0), face 2, rev-face 5**

**Edge 10: verts(3 7), face 3, rev-face 4**  
**Edge 11: verts(2 6), face 4, rev-face 5**  
**Face 0: verts(0 2 3 1 ) edges(0v 1v 2v 3v )**  
**Face 1: verts(4 5 7 6 ) edges(4v 5v 6v 7v )**  
**Face 2: verts(0 1 5 4 ) edges(3v 8v 4v 9v )**  
**Face 3: verts(1 3 7 5 ) edges(2v 10v 5v 8v )**  
**Face 4: verts(3 2 6 7 ) edges(1v 11v 6v 10v )**  
**Face 5: verts(2 0 4 6 ) edges(0v 9v 7v 11v )**

Assertion failures:

MNMeshes have a complex, interlinked topology. Without frequent assertions, a mistake in one part of the code can result in a failure much further down the line. Since an assertion failure in itself provides little diagnostic information, each AF in MNMath.dll is accompanied by a DebugPrint message giving more information about the problem. If this information does not immediately lead to a solution, try using assert (**CheckAllData()**) between each of your MNMesh operations.

If you call an **MNMesh** function that produces an inexplicable error after your MNMesh has successfully had all its data checked with **MNMesh::CheckAllData**, please contact SDK support.

To give a simple example, suppose you had an application which created an MNMesh from a Mesh, made it into a polygonal mesh, split a single face, and returned.

```
SplitUp(Mesh & mesh) {  
  MNMesh mm(mesh);  
  mm.MakePolyMesh();  
  mm.SplitTriEdge(0, .5f);  
  mm.OutToTri(mesh);  
}
```

You try it out on a geosphere, and it works fine. But then you try it out on a box, and for some reason you get an assertion failure somewhere in the MNMath.dll source. By running 3ds max under the debugger, you can reproduce the error. If you check the Debug output in Visual Studio, you'll find the message:

**MNMesh::SplitTriEdge error: edge's face 1(0) not a triangle.**

So you check with the documentation and realize that `SplitTriEdge` is an edge-splitting function that only works on triangulated meshes. To do the same thing to a `PolyMesh`, you need to use one of the variants of `SplitEdge`. So you can fix your code by either removing `mm.MakePolyMesh()`, triangulating with a call to `mm.Triangulate()`, or just calling `mm.SplitEdge (0, .5f)` instead of `SplitTriEdge`.

Imagine a more complicated case: in the middle of a series of complex `MNMesh` modifications made by your program, you need to recompute the triangulation of one of the higher-degree faces with a call to `MNMesh::RetriangulateFace`. For some reason, this generates an assertion failure. Checking the Debug output, you find the cryptic message:

**`MNMesh::RetriangulateFace` internal error.**

This could mean one of two things. First of all, the `MNMesh` could have had some of its data scrambled before the call to `RetriangulateFace`. You can check this by adding an assert (`mm.CheckAllData ()`), where `mm` is your `MNMesh`, immediately before the call to `RetriangulateFace`. `CheckAllData` performs a time-intensive series of checks on the mesh structure, checking each mesh component against the components it's supposed to be linked to, checking that nothing references a dead component, and so on. If any errors are found, the check will fail, and `CheckAllData` will print diagnostic information to the Debug output.

If `CheckAllData` gives your mesh a clean bill of health, but you're still getting an "internal error", or just an "error" with no further info, you may have found a bug. Please contact SDK support.

## List of Edge Data Index Options

See Also: [Class MNMesh](#), [Class PerData](#).

The following are the edge data channel index values for use with the edge data methods of class **MNMesh** and class **EPoly**.

**EDATA\_KNOT**: The edge knot data. This is index 0.

**EDATA\_CREASE**: The crease data. This is index 1.

**1** through **MAX\_EDGEDATA-1**: Developer defined data. Note: **#define MAX\_EDGEDATA 10**

## Class MNTempData

See Also: [Class BaseInterfaceServer](#), [Class MNMesh](#), [Class MNFaceClusters](#), [Class MNEdgeClusters](#), [Class MNFaceElement](#), [Class MNChamferData](#)

```
class MNTempData : public BaseInterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

This is a class for caching face and edge clusters, vertex normals, and other derived data about an **MNMesh**. There is a **SetMesh()** method to set the current mesh that the TempData is based on, then there's a series of methods to update the cache and return some sort of derived data. All of these methods follow the form:

**DerivedData \*MNTempData::DData(parameters);**

DerivedData is the container for the derived data requested (often a simple table, though there are some specialized classes returned from some methods). If the data has already been computed, the parameters are ignored and the cached data is returned. Otherwise, the data is computed from the parameters and the current mesh.

There are no procedures in place to detect changes in parameters or the mesh since the last time a method was called, so it's the calling routine's responsibility to free invalid structures. If you know that only certain pipeline channels, such as **GEOM\_CHANNEL**, have changed, you can use the **Invalidate(DWORD partsChanged)** method. (**GEOM\_CHANNEL** would free the distances-to-selected-vertices, for example, but not the Edge Clusters.)

In particular, there is no way for the **MNTempData** to know when its mesh pointer is no longer valid, so it's vital that the calling routine clear the mesh (with **SetMesh(NULL)**) or stop using the MNTempData when this happens.

All data members are private. They basically consist of a series of pointers which are initialized to NULL and then filled with allocated derived data as requested. There is also a NULL-initialized, private mesh pointer which is set with **SetMesh()**. Editable Poly uses this class to hold all the varieties of

temporary, cached data it creates -- examples are vertex normals and face clusters.

To use MNTempData, just set it to your mesh and start asking for stuff:

```
MyAlgorithm (MNMesh *m) {  
    MNTempData mtd(m);  
    // Get Edge Clusters.  
    MNEdgeClusters *eclust = mtd.EdgeClusters ();  
}
```

**Methods:**

public:

**Prototype:**

```
MNTempData ();
```

**Remarks:**

Constructor. Sets all data members to NULL.

**Prototype:**

```
MNTempData (MNMesh *m);
```

**Remarks:**

Constructor. Sets the internal mesh pointer to the mesh passed. (Sets all other data members to NULL.)

**Parameters:**

```
MNMesh *m
```

The internal mesh pointer to set.

**Prototype:**

```
~MNTempData ();
```

**Remarks:**

Destructor.

**Prototype:**

```
void SetMesh (MNMesh *m);
```

**Remarks:**

Sets the internal mesh pointer to **m**.

**Parameters:**

```
MNMesh *m
```

The internal mesh pointer to set.

**Default Implementation:**

```
{ mesh = m; }
```

**Prototype:**

```
MNFaceClusters *FaceClusters (DWORD  
clusterFlags=MN_SEL);
```

**Remarks:**

This method returns a face cluster list, which groups selected faces into "clusters" for transformation. See [Class MNFaceClusters](#) for more information. If cached, the cache is returned. Otherwise a cache is allocated and computed from the current mesh.

**Parameters:**

```
DWORD clusterFlags=MN_SEL
```

The face flags to cluster the faces by. For instance, with the default value, faces are clustered by their selection.

**Prototype:**

```
MNEdgeClusters *EdgeClusters (DWORD  
clusterFlags=MN_SEL);
```

**Remarks:**

Returns an edge cluster list, which groups selected edges into "clusters" for applying transforms. See [Class MNEdgeClusters](#) for more information. If cached, the cache is returned. Otherwise a cache is allocated and computed from the current mesh.

**Parameters:**

### **DWORD clusterFlags=MN\_SEL**

The edge flags to cluster the edges by. For instance, with the default value, edges are clustered by their selection.

#### **Prototype:**

```
Tab<int> *VertexClusters (int sl, DWORD  
clusterFlags=MN_SEL);
```

#### **Remarks:**

This method returns an index of which cluster, if any, each vertex is in. If cached, the cache is returned. Otherwise a cache is allocated and computed from the current mesh and the parameter.

#### **Parameters:**

##### **int sl**

The selection level. This should be either **MNM\_SL\_EDGE** or **MNM\_SL\_FACE**, to indicate whether the vertex cluster information should be based on edge or face clusters. Note that this parameter is ignored if there's already a vertex cluster cache.

##### **DWORD clusterFlags=MN\_SEL**

The edge or face flags to cluster the edges or faces by. For instance, with the default value, edges or faces are clustered by their selection. Note that this parameter is ignored if there's already a vertex cluster cache.

#### **Return Value:**

A table of DWORD's is returned, one for each vertex. If **(VertexClusters(sl))[i]** is **UNDEFINED**, vertex *i* is not in any cluster. Otherwise, the value for vertex *i* is the cluster index.

#### **Prototype:**

```
Tab<Point3> *ClusterNormals (int sl, DWORD  
clusterFlags=MN_SEL);
```

#### **Remarks:**

This method returns average normals for each cluster. If cached, the cache is returned. Otherwise a cache is allocated and computed from the current mesh and the parameter. Note that cluster centers and normals are computed and cached at the same time, when you call either method.

**Parameters:****int sl**

The selection level. This should be either **MNM\_SL\_EDGE** or **MNM\_SL\_FACE**, to indicate whether the vertex cluster information should be based on edge or face clusters. Note that this parameter is ignored if there's already a cluster normal cache.

**DWORD clusterFlags=MN\_SEL**

The edge or face flags to cluster the edges or faces by. For instance, with the default value, edges or faces are clustered by their selection. Note that this parameter is ignored if there's already a cluster normal cache.

**Return Value:**

A table of Point3's is returned, one for each cluster. The values are already normalized to length 1.

**Prototype:**

```
Tab<Point3> *ClusterCenters (int sl, DWORD  
clusterFlags=MN_SEL);
```

**Remarks:**

This method returns mean centers for each cluster. If cached, the cache is returned. Otherwise a cache is allocated and computed from the current mesh and the parameter. Note that cluster centers and normals are computed and cached at the same time, when you call either method.

**Parameters:****int sl**

Selection level. This should be either **MNM\_SL\_EDGE** or **MNM\_SL\_FACE**, to indicate whether the clusters we're talking about are the edge or face clusters. Note that this parameter is ignored if there's already a cluster center cache.

**DWORD clusterFlags=MN\_SEL**

The edge or face flags to cluster the edges or faces by. For instance, with the default value, edges or faces are clustered by their selection. Note that this parameter is ignored if there's already a cluster center cache.

**Return Value:**

A table of Point3's is returned, one for each cluster.

**Prototype:**

**Matrix3 ClusterTM (int clust);**

**Remarks:**

This method uses the current cluster center and normal caches to return the "objectspace to clusterspace" transform. This is the transform of the "local" axis in moving edge or face clusters in Editable Poly. If the cluster centers and normals have not been cached, the identity matrix is returned; thus the control over whether this is an edge or face cluster is handled by the last call to ClusterCenters or ClusterNormals.

**Parameters:**

**int clust**

The cluster you want the transform for.

**Prototype:**

**Tab<Point3> \*VertexNormals ();**

**Remarks:**

This method returns a table of local average normals for vertices. These normals are computed using the **MNMesh::GetVertexNormal()** method, wherein each face's contribution to the vertex normal is weighted by the face angle at the vertex.

**Prototype:**

**Tab<float> \*VSWeight (BOOL useEdgeDist, int edgeIts, BOOL ignoreBack, float falloff, float pinch, float bubble, DWORD selFlags=MN\_SEL);**

**Remarks:**

This method returns Vertex Selection weights (for soft selection). If cached, the cache is returned. Otherwise a cache is allocated and computed from the current mesh and the parameters. Weights are based on the standard soft selection falloff from the currently selected vertices.

Note: If **useEdgeDist** is FALSE, this is an n-log-n algorithm: it compares

every vertex not in the cluster with every vertex in it. If **useEdgeDist** is TRUE, the time it takes is proportional to the number of **verts** in the cluster times **edgeIts**.

**Parameters:**

**BOOL useEdgeDist**

If set to TRUE, the distance between vertices is computed along edges. If set to FALSE, it's computed directly through space.

**int edgeIts**

This indicates the maximum number of edges the algorithm may travel along in finding the distance between vertices. (Maximum path length.)

**BOOL ignoreBack**

If set to TRUE, vertices with a normal (as computed in VertexNormals) that points more than 90 degrees away from the average normal of the selection are not given any partial selections. They're either 1 if selected or 0 otherwise.

**float falloff**

The limit distance of the effect. If distance > falloff, the function will always return 0.

**float pinch**

Use this to affect the tangency of the curve near distance=0. Positive values produce a pointed tip, with a negative slope at 0, while negative values produce a dimple, with positive slope.

**float bubble**

Use this to change the curvature of the function. A value of 1.0 produces a half-dome. As you reduce this value, the sides of the dome slope more steeply. Negative values lower the base of the curve below 0.

**DWORD selFlags=MN\_SEL**

Indicates what flag defines the hard selection we're basing this soft selection on.

**Return Value:**

A table of float values, one per vertex, that are 1.0 if the vertex is in the current selection, 0.0 if it's more than falloff distance (or more than edgeIts edges, if (useEdgeDist)), and AffectRegionFunction((\*SelectionDist(useEdgeDist, edgeIts)), falloff, pinch, bubble) otherwise.

**Prototype:**

```
Tab<float> *SelectionDist (BOOL useEdgeDist, int edgeIts,  
    DWORD selFlags=MN_SEL);
```

**Remarks:**

This method computes the current distance of each vertex from the current selection. If cached, the cache is returned. Otherwise a cache is allocated and computed from the current mesh and the parameters. The term "Selected verts" below refers to the vertices that are selected in the mesh's current selection level. See the **Mesh** method **GetTempSel()** for details.

NOTE: If **useEdgeDist** is FALSE, this is an n-log-n algorithm: it compares every nonselected vertex with every selected one. If **useEdgeDist** is TRUE, the time it takes is proportional to the number of selected vertices times **edgeIts**.

**Parameters:****BOOL useEdgeDist**

If set to TRUE, the distance between vertices is computed along edges. If set to FALSE, it's computed directly through space.

**int edgeIts**

This indicates the maximum number of edges the algorithm may travel along in finding the distance between vertices. (Maximum path length.)

**DWORD selFlags=MN\_SEL**

Indicates what flag defines the hard selection we're basing this soft selection on.

**Return Value:**

A table consisting of one float value per vertex. If this value is 0, the vertex is either selected or on top of a selected vertex. Otherwise it represents the distance to the closest selected vertex. If **useEdgeDist** is TRUE, values of -1.0 are returned for vertices with no **edgeIts**-length path to a selected vertex.

**Prototype:**

```
Tab<float> *ClusterDist (int sl, DWORD clusterFlags, int clustId,  
    BOOL useEdgeDist, int edgeIts);
```

**Remarks:**

This method computes the current distance of each vertex from the specified cluster. If cached, the cache is returned. Otherwise a cache is allocated and computed from the current mesh and the parameters.

NOTE: If **useEdgeDist** is FALSE, this is an n-log-n algorithm: it compares every vertex not in the cluster with every vertex in it. If **useEdgeDist** is TRUE, the time it takes is proportional to the number of verts in the cluster times **edgeIts**.

**Parameters:**

**int sl**

Indicates whether we should use edges (**MNM\_SL\_EDGE**) or faces (**MNM\_SL\_FACE**) to construct the clusters, if needed.

**DWORD clusterFlags**

The edge or face flags to cluster the edges or faces by. For instance, if **clusterFlags==MN\_SEL**, edges or faces are clustered by selection.

**int clustId**

The ID of the cluster we're measuring distance from.

**BOOL useEdgeDist**

If set to TRUE, the distance between vertices is computed along edges. If set to FALSE, it's computed directly through space.

**int edgeIts**

This indicates the maximum number of edges the algorithm may travel along in finding the distance between vertices. (Maximum path length.)

**Return Value:**

A table consisting of one float value per vertex. If this value is 0, the vertex is either selected or on top of a vertex in the cluster. Otherwise it represents the distance to the closest selected vertex. If **useEdgeDist** is TRUE, values of -1.0 are returned for vertices with no **edgeIts**-length path to a vertex in the cluster.

**Prototype:**

```
Tab<Point3> *OutlineDir (int extrusionType, DWORD  
clusterFlags=MN_SEL);
```

**Remarks:**

This method produces the "Outline" direction of all vertices, based on the current face selection. "Outlining" is the direction vertices move to move edges of the current face selection outward at a constant rate. They are not set to length 1, but rather to whatever "rate" best makes the outline edges move most consistently, without changing their angles.

**Parameters:**

**int extrusionType**

This is one of **MESH\_EXTRUDE\_CLUSTER** or **MESH\_EXTRUDE\_LOCAL**, to indicate whether vertices should move according to cluster or local face normals.

**DWORD clusterFlags=MN\_SEL**

The face flags to cluster the faces by. For instance, if left at the default value, faces are clustered by selection. Note that this parameter is ignored if the **extrusionType** is **LOCAL**.

**Prototype:**

**MNChamferData \*ChamferData();**

**Remarks:**

This method returns the cache of a **ChamferData** for use in the **MNMesh** Chamfer methods. Unlike other **MeshTempData** methods, this method makes no calculations based on the current mesh, but merely supplies a memory cache. (Computing this information is left to the **MNMesh** methods **GetExtrudeDirection**, **ChamferVertices**, and **ChamferEdges**.)

**Prototype:**

**void Invalidate (DWORD part);**

**Remarks:**

This method invalidates all data based on the specified part of the mesh. In the following chart, the columns represent the channels **GEOM\_CHANNEL** (G), **TOPO\_CHANNEL** (T), **SELECT\_CHANNEL** (S), and **SUBSEL\_TYPE\_CHANNEL** (U). X's indicate dependency of the specified data cache on the given channel.

Method to get cache	G	T	S	U
---------------------	---	---	---	---

FaceClusters		X	X	
EdgeClusters		X	X	
VertexClusters		X	X	X
ClusterCenters	X	X	X	X
ClusterNormals	X	X	X	X
VertexNormals	X	X		
SelectionDist	X	X	X	X
ClusterDist	X	X	X	X
VSWeight	X	X	X	X

NOTE: **ChamferData** and the Outline direction info are handled separately in **freeChamferData** and **freeBevellInfo**.

**Parameters:**

**DWORD part**

One or more of the following channels: **GEOM\_CHANNEL**, **TOPO\_CHANNEL**, **SELECT\_CHANNEL**, **SUBSEL\_TYPE\_CHANNEL**.

**Prototype:**

**void InvalidateDistances ();**

**Remarks:**

This method Uncaches (frees) the distance dependent data returned by **VSWeight**, **SelectionDist**, and **ClusterDist**.

**Prototype:**

**void InvalidateSoftSelection ();**

**Remarks:**

This method frees the **VSWeight** data (but not the underlying distance-from-selection info). This is useful, e.g., if the mesh has not changed, but you wish to change the falloff, pinch, or bubble parameters to get new vertex selection weights.

**Prototype:**

**void freeClusterDist ();**

**Remarks:**

This method is mainly for internal use, this frees just the cluster distance data.

**Prototype:**

**void freeBevelInfo ();**

**Remarks:**

This method frees only the outlining data.

**Prototype:**

**void freeChamferData();**

**Remarks:**

This method frees only the chamfer data structure.

**Prototype:**

**void freeAll ();**

**Remarks:**

This method frees all cached data of any kind.

## **Global Functions**

The following global methods are also available for use, though the related methods in the **MNTempData** class are more highly recommended.

**Prototype:**

**void SelectionDistance (MNMesh & mesh, float \*selDist, DWORD selFlags);**

**Remarks:**

This function computes the current distance of each vertex from the current selection. NOTE: This is an n-log-n algorithm: it compares every non-selected vertex with every selected one.

**Parameters:**

## **MNMesh & mesh**

The mesh we're computing distances in.

### **float \*selDist**

A pointer to an array of floats of size **mesh.VNum()**. This array is filled in with one float value per vertex. If this value is 0, the vertex is either selected or "on top of" a selected vertex. Otherwise it represents the distance to the closest selected vertex.

### **DWORD selFlags**

Indicates what flag defines the hard selection we're basing this soft selection on. (**MN\_SEL** is generally best.)

## **Prototype:**

```
void SelectionDistance (MNMesh & mesh, float *selDist, int iters,  
DWORD selFlags);
```

## **Remarks:**

This function computes the current distance of each vertex from the current selection, along paths of edges. NOTE: This is an n-log-n algorithm: it compares every non-selected vertex with every selected one.

## **Parameters:**

### **MNMesh & mesh**

The mesh we're computing distances in.

### **float \*selDist**

A pointer to an array of floats of size **mesh.VNum()**. This array is filled in with one float value per vertex. If this value is 0, the vertex is either selected or "on top of" a selected vertex. Otherwise it represents the distance to the closest selected vertex. Values of -1 are used to indicate vertices that are more than **iters** edges away from any selected vertex.

### **int iters**

This indicates the maximum number of edges the algorithm may travel along in finding the distance between vertices. (Maximum path length.)

### **DWORD selFlags**

Indicates what flag defines the hard selection we're basing this soft selection on. (**MN\_SEL** is generally best.)

**Prototype:**

```
void ClustDistances (MNMesh & mesh, int numClusts, int *vclust,  
Tab<float> **clustDist);
```

**Remarks:**

Computes the current distance of each vertex from the specified cluster. If cached, the cache is returned. Otherwise a cache is allocated and computed from the current mesh and the parameters.

NOTE: This is an n-log-n algorithm for each cluster: it compares every vertex not in the cluster with every vertex in it.

**Parameters:****MNMesh & mesh**

The MNMesh these cluster distances are based on.

**int numClusts**

The number of clusters available.

**int \*vclust**

A pointer into the vertex cluster table.

**Tab<float> \*\*clustDist**

An array of pointers to tables which will be filled with one float value per vertex. The table pointed to by **clustDist[i]** contains the cluster distances for cluster i. Note that **clustDist** must be allocated, for instance by **clustDist = new (Tab<float>\*)[numClusts]**, and must have its members allocated, for instance by **clustDist[i] = new Tab<float>**, by the calling routine. If a value in a table is 0, the vertex is either selected or on top of a vertex in the cluster. Otherwise it represents the distance to the closest selected vertex. If **useEdgeDist** is TRUE, values of -1.0 are returned for vertices with no **edgeIts**-length path to a vertex in the cluster.

**Prototype:**

```
void ClustDistances (MNMesh & mesh, int numClusts, int *vclust,  
Tab<float> **clustDist, int iters);
```

**Remarks:**

Computes the current distance of each vertex from the specified cluster. If cached, the cache is returned. Otherwise a cache is allocated and computed

from the current mesh and the parameters.

NOTE: This algorithm takes time proportional to the number of **verts** in each cluster times **iters** times the number of clusters.

**Parameters:**

**MNMesh & mesh**

The MNMesh these cluster distances are based on.

**int numClusts**

The number of clusters available.

**int \*vclust**

A pointer into the vertex cluster table.

**Tab<float> \*\*clustDist**

An array of pointers to tables which will be filled with one float value per vertex. The table pointed to by **clustDist[i]** contains the cluster distances for cluster i. Note that **clustDist** must be allocated, for instance by **clustDist = new (Tab<float> \*)[numClusts]**, and must have its members allocated, for instance by **clustDist[i] = new Tab<float>**, by the calling routine. If a value in a table is 0, the vertex is either selected or on top of a vertex in the cluster. Otherwise it represents the distance to the closest selected vertex. Values of -1.0 are returned for vertices with no **iters**-length path to a vertex in the cluster.

**int iters**

The maximum edge path length to compute distance along (in number of edges).

## Class MNChamferData

See Also: [Class MNTempData](#), [Class MNMesh](#)

class MNChamferData

### Description:

This class is available in release 4.0 and later only.

This class contains all the data needed to move points (and map vertices) as the user drags a chamfer or extrude. It's created by the topological change that happens at the start of the chamfer or extrude. The strategy is this: The chamfer/extrude operation is divided into two parts, the topological change and a later geometric change. (This works well for Editable Poly, where the topology change is completed first, then apply a series of geometry changes as the user spins a spinner or drags a mouse. Each geometry change is undone before the next is applied, but the topology change only happens once.)

This class is first initialized to a mesh. Then its data is filled in by the topological change. This data is used to find "directions" for all the geometric and mapping vert changes over the course of the geometric modification.

For convenient caching, it is recommended that you use this class through the **MNTempData** class.

### Data Members:

private:

**Tab<UVVert> hmdir[NUM\_HIDDENMAPS];**

The direction vectors for mapping vertices in any active "hidden" mapping channels.

public:

**Tab<Point3> vdir;**

The related direction vectors for mapping vertices in all active mapping channels.

**Tab<Point3> vmax;**

The maximum amount each vector may be applied (before vertices start crossing over each other).

**Tab<UVVert> \*mdir;**

The related direction vectors for mapping vertices in all active mapping channels.

**Methods:**

public:

**Prototype:**

```
MNChamferData ();
```

**Remarks:**

Constructor.

**Default Implementation:**

```
{ mdir=NULL; }
```

**Prototype:**

```
MNChamferData (const MNMesh & m);
```

**Remarks:**

Constructor.

This constructor initializes to the mesh passed (allocates mapping channels, etc.)

**Parameters:**

```
const MNMesh & m
```

The specified mesh.

**Default Implementation:**

```
{ mdir=NULL; InitToMesh(m); }
```

**Prototype:**

```
~MNChamferData ();
```

**Remarks:**

Destructor.

**Default Implementation:**

```
{ if (mdir) delete [] mdir; }
```

**Prototype:**

```
void InitToMesh (const MNMesh & m);
```

**Remarks:**

This method sets up the **MNChamferData** based on a given mesh, allocating the vertex and mapping vertex tables as appropriate.

**Parameters:**

**const MNMesh & m**

The Mesh to initialize from.

**Prototype:**

**void setNumVerts (int nv, bool keep=TRUE, int resizer=0);**

**Remarks:**

This method simply allocates the **vdir** and **vmax** tables, and initializes the new members of **vmax** to 0. (Note: this method can be applied to an existing **MNChamferData** to reflect an increase in vertices in the **MNMesh** as topological changes occur.)

**Parameters:**

**int nv**

The number of vertices.

**bool keep=TRUE**

TRUE to keep old data if resized; FALSE to discard old data.

**int resizer=0**

The number of extra elements the **vdir** and **vmax** tables are resized beyond their current size. (Extra allocation space to prevent excessive reallocation.)

**Prototype:**

**void ClearLimits ();**

**Remarks:**

Clears all the **vmax** limits to -1 (no limit).

**Prototype:**

**void GetDelta (float amount, Tab<Point3> & delta);**

**Remarks:**

Uses vectors and limits to obtain the offsets corresponding to a certain extrude

or chamfer amount.

**Parameters:**

**float amount**

The amount of the extrude or chamfer.

**Tab<Point3> & delta**

A table (with size set equal to the number of vertices, aka **vdir.Count()**) containing the geometric offset for each vertex in the mesh.

**Prototype:**

**bool GetMapDelta (MNMesh & mm, int mapChannel, float amount, Tab<UVVert> & delta);**

**Remarks:**

Uses map vectors and limits to obtain the mapping offsets corresponding to a certain extrude or chamfer amount.

**Parameters:**

**MNMesh & mm**

The mesh this **MNChamferData** is based on.

**int mapChannel**

The index of the map channel (from **-NUM\_HIDDENMAPS** to **mm.MNum()**).

**float amount**

The amount of the extrude or chamfer.

**Tab<UVVert> & delta**

The offsets for each mapping vertex in this map in the mesh.

**Prototype:**

**Tab<UVVert> & MDir (int mp);**

**Remarks:**

Data accessor. This method returns the appropriate map info. If **mp**  $\geq 0$ , it returns the member of the **mdir** array. If **mp**  $< 0$ , it returns the member of the **hmdir** array (in keeping with "hidden map channel" indexing conventions).

**Default Implementation:**

```
{ return (mp<0) ? hmdir[-1-mp] : mdir[mp]; }
```

**The following are not part of the class but are useful for debugging**

**Prototype:**

```
DllExport void MNChamferDataDebugPrint (MNChamferData &  
mcd, int mapNum);
```

**Description**

This function uses calls to DebugPrint() to output all the data in the specified MNChamferData to the DebugPrint buffer during debug runs. It is available for programmers' use, providing easy access to MNChamferData during development. It ought to be removed for release builds.

**Parameters:**

**MNChamferData & mcd**

The MNChamferData we want to investigate.

**int mapNum**

The number of map channels in the MNMesh associated with this MNChamferData . (For historical reasons, this information is not kept in the MNChamferData class.) Generally this is retrieved with a call to MNMesh::MNum().

## Class FrameRange

See Also: [Class ImageFilterInfo](#).

class FrameRange

### Description:

This class describes a range of frames and provides methods to access the first, last, current and number of frames in the range. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

**virtual int First()**

#### Remarks:

Returns the first frame number of this range.

#### Prototype:

**virtual int Last()**

#### Remarks:

Returns the last frame number of this range.

#### Prototype:

**virtual int Count()**

#### Remarks:

Returns the number of frames in this range.

#### Prototype:

**virtual int Current()**

#### Remarks:

Returns the current frame of this range.

#### Prototype:

**virtual int Elapsed()**

**Remarks:**

Returns the elapsed time of this range.

**Prototype:**

**virtual void SetFirst(int u)**

**Remarks:**

Sets the first frame number for this range to the specified value.

**Parameters:**

**int u**

Specifies the new first frame number.

**Prototype:**

**virtual void SetLast(int u)**

**Remarks:**

Sets the last frame number for this range to the specified value.

**Parameters:**

**int u**

Specifies the new last frame number.

**Prototype:**

**virtual void SetCurrent(int u)**

**Remarks:**

Sets the current frame number for this range to the specified value.

**Parameters:**

**int u**

Specifies the new current frame number.

## Class TVNodeNotify

See Also: [Class ITrackViewNode](#), [Class UndoNotify](#).

```
class TVNodeNotify
```

### Description:

This class is available in release 2.0 and later only.

This class is the callback object for

**ITrackViewNode::RegisterTVNodeNotify()**. Developers should derive their class from this class and implement the **NotifyRefChanged()** method. This allows the Track View Node to intercept reference notifications when they use a Track View Node.

For an example of this class in use by **ImageFilter** plug-ins see class **UndoNotify** in `\MAXSDK\INCLUDE\FILTERS.H`. It is sub-classed from this class and provides an implementation of **NotifyRefChanged()**.

All methods of this class are implemented by the plug-in.

### Methods:

#### Prototype:

```
virtual RefResult NotifyRefChanged(Interval changeInt,  
RefTargetHandle hTarget, PartID& partID, RefMessage  
message)=0;
```

### Remarks:

A plug-in which makes references must implement this method to receive and respond to messages broadcast by its dependents.

### Parameters:

#### Interval changeInt

This is the interval of time over which the message is active. Currently, all plug-ins will receive **FOREVER** for this interval.

#### RefTargetHandle hTarget

This is the handle of the reference target the message was sent by. The reference maker uses this handle to know specifically which reference target sent the message.

#### PartID& partID

This contains information specific to the message passed in. Some messages don't use the **partID** at all. See the section [List of Reference Messages](#) for more information about the meaning of the **partID** for some common messages.

### **RefMessage message**

The **message** parameters passed into this method is the specific message which needs to be handled. See [List of Reference Messages](#).

### **Return Value:**

The return value from this method is of type **RefResult**. This is usually **REF\_SUCCEED** indicating the message was processed. Sometimes, the return value may be **REF\_STOP**. This return value is used to stop the message from being propagated to the dependents of the item.

## DLL Setup (SDK)

MAXScript plug-in extensions are packaged as Win32 DLL's in almost exactly the same way as standard MAX plug-ins. They are named with a specific suffix to fit in with the MAX plug-in naming scheme (.DLX) and should be installed in one of the MAX plug-in directories. MAXScript looks for and loads all the **\*.DLX** files it finds in the MAX plug-in directories.

You should be familiar with the section on MAX plug-in construction in the MAX SDK documentation because the following notes primarily describe what is different about setting up MAXScript plug-ins.

The plug-in's external interface is defined with a **.DEF** file, as are MAX plug-ins, but in this case there are only three entry points:

```
LIBRARY <plugin_name>
EXPORTS
LibDescription @1
LibInit @2
LibVersion @3
SECTIONS
.data READ WRITE
```

The **LibDescription** and **LibVersion** entry points are the same as for MAX plug-ins. The **LibInit** entry is called by MAX after MAXScript has loaded itself and all its .DLX plug-ins so that each can perform any runtime initialization. MAXScript is fully functional at the time these init functions are called.

The following code shows a typical DLX entry point implementation (this is from **sample.cpp** in the SDK). All of the required headers are included by the master header file, **MAXscript.h**, including **Max.h** for MAX SDK-related code.

```

#include "MAXScript.h"

HMODULE hInstance;

BOOL APIENTRY
DllMain(HMODULE hModule, DWORD ul_reason_for_call,
LPVOID lpReserved)
{
static BOOL controlsInit = FALSE;
switch (ul_reason_for_call)
{
case DLL_PROCESS_ATTACH:
// Hang on to this DLL's instance handle.
hInstance = hModule;
if (!controlsInit)
{
controlsInit = TRUE;
// Initialize Win95 controls
InitCommonControls();
}
break;
}
return(TRUE);
}

__declspec( dllexport ) void
LibInit()
{
// do any setup here. MAXScript is fully up at this point.
}

__declspec( dllexport ) const TCHAR *
LibDescription()

```

```
{  
return _T("Sample MAXscript DLX");  
}
```

```
__declspec( dllexport ) ULONG  
LibVersion()  
{  
return VERSION_3DSMAX;  
}
```

If any Win32 common controls or MAX custom controls are to be used in the DLL, you should initialize them during process attach, in the same way you would in a MAX DLL. For the **LibVersion** entry point, you should return the current 3DSMAX version as shown.

## **Libraries (SDK)**

The MAXScript SDK API is defined in the various headers and the import library, **Maxscript.lib**, supplied with the SDK. You should add this library to your project along with any MAX SDK import libraries needed to support MAX SDK use. The header files are described in the [MAXScript Header Files](#) topic.

### **Build Configurations (SDK)**

For the moment, there is no Debug version of the SDK. You should configure VC++ builds as you would **Hybrid** MAX SDK plug-in builds (that is, exactly as **Debug** with code generation set for Multi-threaded DLL rather than Debug Multi-threaded DLL).

## MAXScript Value Constructors (SDK)

In the course of implementing new extensions to MAXScript, you will encounter the need to create MAXScript values, perhaps to pass back results or to work with other parts of the MAXScript API. This topic describes the MAXScript value classes, their constructors and how to cooperate with the automatic garbage collector.

All computable values in MAXScript are instances of classes derived from Value. MAXScript is polymorphic across all Value subclasses. These values are allocated in a separate, garbage collected heap, and carry their own runtime typing info.

All non-static instances of the Value class family should be heap-allocated with the 'new' operator or one of the following intern() functions so that garbage collection will work.

Certain classes with immutable instances provide interning functions in place of C++ constructors that may implement caches or other interning mechanisms. In particular, Name instances are always be created with Name::intern() to ensure pointer equality on names.

```
static Value* Float::intern(float init_val);
static Value* Integer::intern(int init_val);
static Value* Name::intern(char* str);
static Value* Name::find_intern(char* str);
static Value* MStime::intern(TimeValue t);
```

```
AngAxisValue (const AngAxis& iaa);
AngAxisValue (const Matrix3& m);
AngAxisValue (const Quat& q);
AngAxisValue (float angle, Point3 axis);
AngAxisValue (float* angles);
```

AngAxisValue (Value\* angle, Value\* axis);  
AngAxisValue (Value\*);  
Array (int init\_size);  
ColorValue (AColor col);  
ColorValue (BMM\_Color\_64& col);  
ColorValue (Color col);  
ColorValue (COLORREF col);  
ColorValue (float r, float g, float b, float a = 1.0f);  
ColorValue (Point3 col);  
ColorValue (Point3Value\* col);  
EulerAnglesValue (const AngAxis&);  
EulerAnglesValue (const Matrix3&);  
EulerAnglesValue (const Quat&);  
EulerAnglesValue (float ax, float ay, float az);  
Matrix3Value (const AngAxis& aa);  
Matrix3Value (const Matrix3& im);  
Matrix3Value (const Point3& row0, const Point3& row1,  
const Point3& row2, Point3& row3);  
Matrix3Value (const Quat& q);  
Matrix3Value (float\* angles);  
Matrix3Value (int i);  
MSInterval (Interval i);  
MSInterval (TimeValue s, TimeValue e);  
Point2Value (float x, float y);  
Point2Value (POINT ipoint);  
Point2Value (Point2 ipoint);  
Point2Value (Value\* x, Value\* y);  
Point3Value (float x, float y, float z);  
Point3Value (Point3 init\_point);  
Point3Value (Value\* x, Value\* y, Value\* z);  
QuatValue (AngAxis& aa);  
QuatValue (const Quat& init\_quat);  
QuatValue (float w, float x, float y, float z);

```
QuatValue (float* angles);  
QuatValue (Matrix3& m);  
QuatValue (Value* val);  
QuatValue (Value* w, Value* x, Value* y, Value* z);  
RayValue (Point3 init_origin, Point3 init_dir);  
RayValue (Ray init_ray);
```

## Distinguished Values (SDK)

There are several distinguished values in MAXScript that are implemented as static instances of their classes, as follows:

```
Undefined undefined;  
Ok ok;  
Unsupplied unsupplied;  
Boolean true_value;  
Boolean false_value;
```

Because these are static instances, you need to remember to work with their addresses:

```
return &ok; // return the ok value  
  
if (val == &>true_value) // value true?  
...
```

## Coercion to C++ Types (SDK)

The Value class defines the following virtual functions for converting selected Value instances to appropriate C++ types. Value subclasses implement the converters that make sense for them. Attempting an unsupported conversion will generate a descriptive MAXScript runtime error.

In most cases, MAXScript Value classes act as wrappers for C++ types and classes. Converters that yield pointer types all return pointers to the value being wrapped, so take care when modifying the data and be aware that the collector may invalidate the pointer underneath you (the topic [Protecting Newly Created Values from the Collector](#) shows you ways to prevent this). At the moment, the collector is synchronous and will only run if needed during an allocate.

```
class Value
virtual float to_float();
virtual char* to_string();
virtual int to_int();
virtual BOOL to_bool();
virtual Point3 to_point3();
virtual Point2 to_point2();
virtual AColor to_acolor();
virtual INode* to_node();
virtual Ray to_ray();
virtual Interval to_interval();
virtual Quat to_quat();
virtual AngAxis to_angaxis();
virtual Matrix3& to_matrix3();
virtual float* to_eulerangles();
virtual Mtl* to_mtl();
```

```
virtual Texmap* to_texmap();  
virtual Modifier* to_modifier();  
virtual TimeValue to_timevalue();  
virtual Control* to_controller();
```

### **Protecting Newly Created Values from the Collector (SDK)**

Value family instances created in running C++ code are immediately visible to the collector. The collector cannot see references in plain C++ local or global variables, so to prevent them from being collected while just in C++ variables, you can use the following macros to ensure the collector leaves them alone. You also need to do this if you take a value out of some structure such that nothing else is referencing it and still want to keep hold of it in a C++ variable.

An important convention is that values you get in arguments passed to you are guaranteed to be protected by someone up the call chain. You must ensure this convention holds yourself for any function you call.

**See Also:**

[Collector-Safe Value Local Macros](#)

## Collector-Safe Value Local Macros (SDK)

The general approach is to declare special C++ local variables that are known by the collector to contain protected values. You declare them with one of the following macros:

```
one_value_local(name);
two_value_locals(name1, name2);
three_value_locals(name1, name2, name3);
... etc., up to eight locals.
```

They are declared as type `Value*` to be able to hold any MAXScript value. There are also explicitly typed variants:

```
one_typed_value_local(type name);
two_typed_value_local(type1 name1, type2 name2);
...
```

For example,

```
two_typed_value_locals(Array* result, String* item);
```

These locals are implemented as members in a local struct named 'vl', so you work with them as members of that struct:

```
two_typed_value_locals(Array* result, String* item);
...
vl.result = new Array (5);
...
vl.item = new String ("foo");
...
vl.result->append(vl.item);
...
```

There can be only one `value_local` declaration macro per C++ block.

Value locals variables **must** be explicitly dismissed before the block is exited. One way to do this is with the macro:

```
pop_value_locals();
```

At this point, the collector protection is lost. In some cases, however, you want to return one of the new values as the result and this value must continue to be protected from the collector. The macro:

```
return_value(r);
```

will do this. It both dismisses the value locals and places the return value in a protected area. This return value protection will last as the value passes out through any number of levels of return until the next `return_value()` use.

In another case, you may have taken a value out of some rooted structure (say an array in a MAXScript global) and want to hand that back as a function result. To protect it against being collected if, for example, that rooted structure gets dropped, you can use the macro:

```
return_protected(r);
```

which protects the return value as does `return_value()`, but doesn't dismiss any value locals.

All functions in the MAXScript core that return potentially new values, including all the **new** operators, use one of these return value protection schemes. Since this means that a new value returned to you is safe until another function call or operation that might create another new value, you can forego the `value_local` protection in those cases in which you are immediately returning the new value.

One thing to note about these protected variables is that they are considered to be part of the root set and **are** scanned by the collector for internal references, so you only need to protect the top-level object if you are constructing some tree of values.

There are some examples of these macros in use in the [Scripter-](#)

[Callable Functions](#) topic.

## Value Local Arrays (SDK)

Sometimes, the number of new locals to be protected is unknown at compile time. To handle this, you can use the following macros that create protected arrays of values. One form creates the array on the stack using `_alloca()` and so is useful inside one function call, the other puts the array in the heap and so can be used across functions. In both cases, you also need to declare a `Value**` variable to hold the pointer to the array.

### Stack-resident

```
value_local_array(pointer_var, count); // allocate
pop_value_local_array(pointer_var); // dismiss
```

### Heap-resident

```
value_temp_array(pointer_var, count); // allocate
realloc_value_temp_array(pointer_var, count, old_count); // grow
pop_value_temp_array(pointer_var); //dismiss
```

For example,

```
Value** items;
...
value_local_array(items, n);
...
for (int i = 0; i < n; i++)
items[i] = Float::intern(data[i]);
...
pop_value_local_array(items);
...
```

## Marking Values as Permanent or Collectable (SDK)

You can also mark a value as permanent by calling the `make_permanent()` member function on it:

```
vl.foo->make_permanent();
```

From then on the value is in the root set and will be scanned for internal references but is not eligible for collection. This operation is fairly heavy-weight and so should not be used in place of `value_local` variables.

You can also make a permanent value collectable again by calling the member function `make_collectable()`:

```
foo->make_collectable();
```

## Scripter-Callable Functions (SDK)

Scripter-callable functions are represented by instances of the Function family of classes. These descend from Value and so are all first-class values in MAXScript. For the moment, this document only describes non-polymorphic primitive functions, of which there are three kinds.

Primitive functions are defined using one of the three declaration macros:

```
def_visible_primitive(fn, name);  
def_mapped_primitive(fn, name);  
def_lazy_primitive(fn, name);
```

corresponding to the 3 primitive function types. Mapped primitives are automatically mapped over collection first arguments and lazy primitives have their arguments delivered as unevaluated code fragments (see the [Access to the Compiler and Interpreter](#) topic for more details).

The first argument to these macros is the implementing C++ function, the second is a string literal giving the scripter-visible name for the function. This string winds up naming a MAXScript global variable that contains the Primitive instance representing the function.

All the def\_x macros have several replaceable definitions in different header files. One is used to statically instantiate the Primitive object that represents the function, another to create externs in a header file. The convention throughout the MAXScript codebase is to gather sets of related scripter function definitions in 'protocol' files (eg, mathpro.h) and include in various places with different def\_x macro definitions in force.

The def\_x macro definition headers relevant to Primitive function

defs are as follows:

"defextfn.h" - generate externs from def\_x macros

"definsfn.h" - generate static instances from def\_x macros

A side-effect of using the instantiating form of the def\_ macros is that a scripter global variable named by the second argument is automatically created and loaded with the representing instance; you don't have to do anything else to make them visible in the scripter.

**Example:**

```
#include "definsfn.h"
def_visible_primitive( open_file,"openFile");
def_visible_primitive( query_box,"queryBox");
def_lazy_primitive ( quote,"quote");
def_mapped_primitive ( dump,"dump");
```

The implementing C++ functions you provide to these macros must have the following signature to conform to scripter calling conventions:

```
Value* func_cf(Value** arg_list, int count);
```

Further, the C++ function name is a derivative of the name given in the def\_x macro (to avoid some naming conflicts). It is constructed by appending '\_cf' to the name give, so:

```
def_visible_primitive( open_file, "openFile");
```

would refer to:

```
Value* open_file_cf(Value** arg_list, int count) { ... }
```

The arguments from the script call are delivered in call order in the arg\_list array which is count Value\*'s long. The function must return a Value\*, which for otherwise void functions, should be the distinguished value **ok**.

Note that the caller-protects-new-values convention means that values in the arg\_list array are already protected from the collector.

There is no implicit type or argument checking in this calling mechanism - you have to do it yourself in the called function. There are several macros to help with this:

```
check_arg_count(fn_name, wanted_count, got_count);
type_check(val, class, fn_name_or_description);
```

**Example:**

```
Value* open_file_cf(Value** arg_list, int count)
{
// check we have 1 arg and that it's a string
check_arg_count(openFile, 1, count);
type_check(arg_list[0], String, "openFile filename");
...
char* fn = arg_list[0]->to_string();
...
}
```

In this example, you could have left out the `type_check()` and let the `to_string()` converter complain if it didn't have a string, but the error message might be less descriptive.

MAXScript functions also support keyword argument passing. The keyword arguments are placed in the `arg_list` after all the positional args, preceded by a marker value (accessible in the `Value*` global, `keyarg_marker`). The arguments are passed in pairs, a keyword Name and the argument's value, one after the other in the `arg_list` array.

There are several macros to help extract keyword arguments. All assume that the C++ function parameter names are 'arg\_list' and 'count' as shown in the above examples.

```
key_arg(key);
    get the named arg value or &unsupplied if not present
```

```
key_arg_or_default(key, def);
```

get the named argument or the default value 'def' if not supplied

```
int_key_arg(key, var, def);
```

get named key arg into Value\* 'var' variable and return it as a C++ int, return 'def' if not supplied.

```
float_key_arg(key, var, def);
```

get named key arg into Value\* 'var' variable and return it as a C++ float, return 'def' if not supplied.

```
bool_key_arg(key, var, def);
```

get named key arg into Value\* 'var' variable and return it as a C++ BOOL, return 'def' if not supplied.

There is also a macro for checking positional argument counts in the presence of keyword args:

```
check_arg_count_with_keys(fn, wanted, got);
```

### Examples:

The following 'delete\_file' example shows an arg count check, conversion of first argument (arg\_list[0]) to a string and the return of MAXScript 'true' or 'false' values.

```
def_visible_primitive(delete_file, "deleteFile");
```

```
...
```

```
Value*
```

```
delete_file_cf(Value** arg_list, int count)
```

```
{
```

```
// deleteFile "file_name"
```

```
check_arg_count("deleteFile", 1, count);
```

```
BOOL result = DeleteFile(arg_list[0]->to_string());
```

```
return result ? &true_value : &>false_value;
```

```
}
```

The 'file\_in' example shows working with an optional keyword argument 'quiet'. The required arg count is checked with `check_arg_count_with_keys()` in this case.

Two typed value locals are declared, one to hold the temporary `FileStream` instance and the other to hold the `fileIn` result.

```
def_visible_primitive(file_in, "fileIn");

...

Value*
file_in_cf(Value** arg_list, int count)
{
// fileIn "filename" [quiet:true]

check_arg_count_with_keys("fileIn", 1, count);
two_typed_value_locals(FileStream* file, Value* result);
Value* quiet = key_arg_or_default(quiet, &true_value);
type_check(quiet, Boolean, "fileIn quiet:");
Value* result;

// open a temp fileStream
vl.file = (new FileStream)->open(arg_list[0]->to_string(), "rt");
if (vl.file == (FileStream*)&undefined)
throw RuntimeError
(GetString(IDS_FILEIN_CANT_OPEN_FILE),
arg_list[0]);

// pass it to the stream-based file_in
try
{
vl.result = file_in(vl.file, (quiet == &true_value));
}
}
```

```

catch (...)
{
// catch any errors and close the temp filestream
vl.file->close();
throw;
}

// pop value locals & return fileIn result
return_value(vl.result);
}

```

The implementation of the **file\_in()** function is given as another example later in these notes.

### Useful Globals

Interface\* MAXScript\_interface; -- MAX interface object

### Exported Value\* Virtual Functions

```

void print(); -- print representation to listener
void sprin1(CharStream* s); -- print representation on stream with
no
-- terminating \n

```

### Listener Window I/O

```

mputs(char*); -- print string to listener
mprintf(char* fmt, ...); -- printf to listener

```

### MAXScript Exception Classes

Compile and runtime errors are reported in MAXScript using the C++ exception-handling mechanism. A MAXScript exception class hierarchy is defined for these errors, as follows:

```

class MAXScriptException
class UnknownSystemException
class SignalException
class CompileError

```

```
class SyntaxError
class TypeError
class NoMethodError
class AccessorError
class AssignToConstError
class ArgCountError
class RuntimeError
class IncompatibleTypes
class ConversionError
```

**Common exception constructors:**

```
AccessorError (Value* target, Value* prop)
ArgCountError (char* fn_name, int wanted, int got);
ConversionError (Value* val, char* typename);
IncompatibleTypes (Value* v1, Value* v2);
RuntimeError (char* description);
RuntimeError (char* desc_part1, char* desc_part1);
RuntimeError (char* description, Value* implicated_value);
RuntimeError (char* desc_part1, char* desc_part1,
Value* implicated_value);
RuntimeError (Value* implicated_value);
TypeError (char* descr, Value* wrong_val,
ValueMetaClass* should_be = NULL);
```

An error is signalled by throwing one of these exceptions, for example:

```
if (arg_list[0]->to_int() > max_index)
throw RuntimeError ("Index out of range: ", arg_list[0]);
```

## Working with MAX Objects in the SDK (SDK)

All of the MAX-side objects accessible in MAXScript are represented by instances of the MAXWrapper family of classes. As the name suggests, these are wrappers for MAX object references that live in the garbage-collected MAXScript world. The wrapped reference is a standard MAX reference created with `ReferenceMaker::MakeRefByID()`; the MAXWrapper class inherits from both `Value` and `ReferenceMaker`. This reference allows MAXScript to be notified of MAX-side changes to the object, particularly deletion.

The wrapper class family is as follows:

- Value, ReferenceMaker
- MAXWrapper
- MAXNode
- MAXModifier
- MAXControl
- MAXKey
- MAXMaterial
- MAXMultiMaterial
- MAXTexture
- MAXMaterialLibrary
- MAXObject
- MAXSubAnim

There is also a **Value** subclass, **MAXBitMap**, which can be used to wrap MAX Bitmaps, but it is not a **ReferenceMaker** because Bitmaps in MAX are not referenceable in this way.

It should be clear which wrapper classes wrap which MAX-side entities, except perhaps for **MAXSubAnim** which is used to wrap objects you only know as Animatables that are accessible inside other

Max objects via the **Animatable::SubAnim()** function. This is used in MAXScript to wrap things like modifier gizmo sub-objects, for example.

## Constructing Wrappers (SDK)

There are three ways to make wrapper values for a MAX object you have in hand, depending on how much you know about what kind of object it is.

1. If you know its an **Object\***, a **Control\***, or **Modifier\***, etc., you can use a wrapper class constructor directly. The available constructors are:

```
MAXNode (INode* node);
MAXModifier (Modifier* mod);
MAXControl (Control* cont, ParamDimension* dim);
MAXControl (Control* cont);
MAXObject (Object* obj);
MAXKey (Control* icont, int ikey, ParamDimension* dim);
MAXKey (Control* icont, int ikey);
MAXMaterial (Mtl* imat);
MAXMultiMaterial (MultiMtl* imat);
MAXMaterialLibrary (MtlBaseLib& ilib);
MAXMaterialLibrary (MtlBaseLib* ilib);
MAXMaterialLibrary ();
MAXTexture (Texmap* imap);
MAXBitMap ();
MAXBitMap (BitmapInfo bi, Bitmap* bm);
```

1. If you know you have a **ReferenceTarget\***, you can use the static member function:

```
static MAXClass::make_wrapper_for(ReferenceTarget* ref);
```

This looks at ClassIDs and SClassIDs inside the object and chooses the appropriate wrapper class.

2. If you want to wrap a subanim inside a known ReferenceTarget\*, you can use the MAXSubAnim constructor:

```
MAXSubAnim (ReferenceTarget* ref, int subanim_num);
```

Remember, these all construct new MAXScript values in the MAXScript heap, subject immediately to potential collection. You have to use one of the protection schemes mentioned in the [Protecting Newly Created Values from the Collector](#) topic to ensure the value is not collected while you are still working with it.

## Retrieving Wrapped Objects (SDK)

You can get MAX objects out of MAXScript wrapper values in several ways:

1. Using one of the coercion virtual functions that are implemented on the appropriate wrapper classes:

```
virtual INode* to_node();  
virtual Mtl* to_mtl();  
virtual Texmap* to_texmap();  
virtual Modifier* to_modifier();  
virtual Control* to_controller();
```

For example,

```
INode* node = arg_list[0]->to_node();
```

2. Using the general purpose MAXWrapper virtual function, `get_max_object()`:

```
virtual ReferenceTarget* get_max_object();
```

Note that this function will retrieve the **base object** in a node inside a MAXNode wrapper value, rather than the INode itself.

The reason for this is explained in the [MAX ClassIDs and SuperclassIDs](#) topic.

3. Using the ReferenceMaker member function, `GetReference()`. All MAXWrapper objects store their MAX-side object reference as reference 0, so:

```
ref = arg_list[1]->GetReference(0);
```

## Handling Deleted Objects (SDK)

There is a potential in MAXScript for a wrapper value to reference a deleted MAX object. This might happen, for example, if a MAX global variable contains a MAXNode value and the user interactively deletes the object that the MAXNode references. It is critical for any code that works with wrapper values to first check to make sure the wrapped MAX objects are not deleted using the macro:

```
deletion_check(val);
```

which takes a MAXWrapper derived class instance. This macro will throw an appropriate runtime error if the MAX object referenced by 'val' is deleted. If you want to handle the error reporting yourself or perform some conditional code, you can test the MAXWrapper public data member, **ref\_deleted**, which holds a C++ BOOL.

You typically only need to do this checking once on entry to your code because scripts always run synchronously - MAXScript locks out the MAX UI so users cannot do things to the scene that would potentially crash a running script.

## MAX Class IDs and Superclass IDs (SDK)

You'll notice that the MAXScript wrapper classes correspond roughly to MAX object superclasses, there are no C++ classes in MAXScript for individual MAX object classes (Box, Sphere, Bend, StdMaterial, etc.). This is primarily because the MAX object classes present in any running copy of MAX is dynamic depending on the plug-ins that are loaded. MAXScript deals with this in much the same way the MAX SDK does by having descriptor classes whose instances define individual MAX plug-in classes. There are two MAXScript classes for this MAXScript-specific metadata, both Value subclasses so their instances can be manipulated as values in the scripter:

- Value
- MAXSuperClass
- MAXClass

The MAXSuperClass instances correspond to object superclasses in MAX and there is one instance per MAX superclass ID. The MAXClass instances correspond roughly to ClassDesc instances in MAX and there is one MAXClass instance per MAX Class ID.

All of the superclass instances and most of the MAXClass instances corresponding to the core objects in MAX are statically instantiated in MAXScript. There are also many MAXClass instances created dynamically by the MAXScript plug-in scanner which attempts to construct metadata for 3rd-party and new MAX plug-ins that it finds as MAX starts up.

MAXScript extension DLLs can statically define new MAXClass instances to provide complete metadata for new or 3rd-party MAX

plug-ins. The advantage of doing this is that you can typically provide a much more complete description for new MAX object classes than the plug-in scanner can construct.

These are declared as static instances using the MAXClass constructor described below. As an example, here is the definition for the Box primitive object from the MAXScript core:

```
MAXClass box
("Box", Class_ID(BOXOBJ_CLASS_ID, 0),
GEOMOBJECT_CLASS_ID, &geom_class, 0,
accessors,
paramblock,
"length", BOXOBJ_LENGTH, TYPE_FLOAT, 25.0,
"width", BOXOBJ_WIDTH, TYPE_FLOAT, 25.0,
"height", BOXOBJ_HEIGHT, TYPE_FLOAT, 25.0,
"widthsegs", BOXOBJ_WSEGS, TYPE_INT, 1,
"lengthsegs", BOXOBJ_LSEGS, TYPE_INT, 1,
"heightsegs", BOXOBJ_HSEGS, TYPE_INT, 1,
"mapcoords", BOXOBJ_GENUVS, TYPE_BOOL, FALSE,
end,
end,
end
);
```

This declares a static instance named 'box' that defines a scripter-visible name, the MAX class ID and superclass ID, and specifies the MAXSuperClass instance for this class and a set of MAX SDK ParamBlock-based properties. The property definitions define a scripter-visible name, parameter ID, type info and a useful default value, used when creating instances of the class in the scripter. The property definitions can also include properties not carried in ParamBlocks, for which you supply getter and setter C++ functions, so you can define any number of real or virtual properties.

As a side-effect of this declaration, a scripter global variable of the given name is created and loaded with the MAXClass value. Scripts can use this value both as a class value in methods such as [classOf\(\)](#) and to construct new MAX objects. MAXClass values, like several other class values in MAXScript can be 'applied' like a constructor in C++ to a set of arguments to create instances of themselves. In the case of MAXClass instances, all the properties you describe in its constructor can be used as creation arguments in MAXScript.

## The MAXClass Constructor (SDK)

The MAXClass constructor you should use for static instances is as follows:

```
MAXClass ( char* cname, // scripter-visible class name
Class_ID cid, // MAX class ID
SClass_ID sid, // MAX superclass ID
MAXSuperClass* superclass, // MAXScript MAXSuperClass
short cflags, // option flags (see below)
... // accessor definitions
);
```

The **cflags** value can be one or more of:

`md_no_create`

This class is not instantiable. Scripts cannot use this class as a constructor. Typically specified on object classes that cannot exist alone (such as spacewarp bindings) but are still accessible in the scripter.

`md_use_getref0`

`md_use_getref1`

`md_direct_index`

These three flags relate to ParamBlock-hosted properties. It turns out that core MAX objects use ParamBlocks in a variety of non-standard ways and these flags basically cover the possibilities. According to the docs, object classes that use a ParamBlock can implement

**Object::GetParamBlock()** to return a pointer to the block. Some MAX classes do and some don't. All of them stick the block in `reference(0)` or `reference(1)`, so if the class does not implement **GetParamBlock()** you can specify **md\_use\_getref0** or **md\_use\_getref1** accordingly. If neither of these flags are specified and there are paramblock accessors defined, MAXScript will use **GetParamBlock()**.

Further, the docs suggest that all classes should implement

**Object::GetParamBlockIndex()** to map logical parameter ID's into ParamBlock indexes. Again, only some of the MAX core classes do this

and some of them do it inconsistently. The **md\_direct\_index** flag indicates that the parameter IDs in the accessor definitions are direct indexes into the ParamBlock. If not this flag is not specified, MAXScript uses **GetParamBlockIndex()** to map the given IDs to paramblock indexes.

### md\_auto\_parms

This flag indicates that the properties defined are **in addition to** any properties that can be discovered by the MAXScript plug-in scanner. This gives you a way to incrementally add definitions for just those properties that are not housed in ParamBlocks or are not properly exposed there.

The property accessor definitions are supplied in the ... **varargs** to the MAXClass constructor. These take the form of tagged lists of specifiers each terminated with an 'end' tag. The tags are enumerated constants defined in MAXObj.h.

The syntax for these is as follows:

```
property_defs ::= [ <accessors>, ] end
accessors ::= accessors, [ <pb_props>, ] [ <fn_props> ]
pb_props ::= paramblock, { <pb_prop>, } end
pb_prop ::= <name_str> <param_id> <type> [ <default_val> ]
fn_props ::= fns, { <fn_prop>, } end
fn_prop ::= <name_str> <getter_fn> <setter_fn> <type>
[<default_val>]
```

Where:

<**param\_id**> is a ParamBlock parameter ID or ParamBlock index depending on whether the **md\_direct\_index** flag was specified.

<**type**> is one of:

TYPE\_MSFLOAT // float

TYPE\_INT // integer

TYPE\_RGBA // point3 of 0-255 externally, 0-1 internally

TYPE\_POINT3

TYPE\_BOOL

TYPE\_ANGLE // degrees externally, radians internally  
TYPE\_PCNT\_FRAC // percent externall, 0-1 float internally  
TYPE\_STRING  
TYPE\_HSV // point3 of 0-255 externally, 0-1 internally  
TYPE\_COLOR\_CHANNEL // 0-255 float externally, 0-1  
internally  
TYPE\_TIMEVALUE // frames externally, tick TimeValue  
internally  
TYPE\_UNSPECIFIED

Some of the types imply automatic scaling between scripter visible values and internal parameter values. For example, TYPE\_ANGLE causes radians-to-degree conversion on the away out to the scripter for property gets and degrees-to-radians conversion on the way in from the scripter for property sets.

TYPE\_UNSPECIFIED can only be used in **fn**s property definitions and means that the accessor functions take care of the type conversions and that there is no default value.

The <default\_val> default values **must be** of the correct C++ type or definition parsing may fail.

Default value C++ type  
TYPE\_MSFLOAT float  
TYPE\_INT int  
TYPE\_RGBA three comma-separated floats  
TYPE\_POINT3 three comma-separated floats  
TYPE\_BOOL BOOL  
TYPE\_ANGLE float  
TYPE\_PCNT\_FRAC float  
TYPE\_STRING string  
TYPE\_HSV three comma-separated floats  
TYPE\_COLOR\_CHANNEL float  
TYPE\_TIMEVALUE float

TYPE\_UNSPECIFIED -- no default value --

If you do not wish to specify a default value, perhaps because the property is a synonym for another which already has a default value specified, make the type -ve (put a minus in front of the type code) and leave out the default.

The signature for the getter and setter functions supplied in the **fns** section is:

```
Value* getter_fn(ReferenceTarget* obj, Value* prop, TimeValue t, Interval& valid);
```

```
void setter_fn(ReferenceTarget* obj, Value* prop, TimeValue t, Value* val);
```

When these functions are invoked by the MAXScript property accessor system, you can be sure the ReferenceTarget parameter points to a MAX object of the Class ID specified in the MAXClass constructor referencing these functions. The TimeValue and Interval parameters are used in the same way as they are on the Control and IParamBlock GetValue() and SetValue() member functions in the MAX SDK.

Here are some more examples:

```
MAXClass quadpatch  
("Quadpatch", Class_ID(PATCHGRID_CLASS_ID, 0),  
GEOMOBJECT_CLASS_ID,  
&geom_class, md_use_getref0 + md_direct_index,  
accessors,  
paramblock,  
"length", PATCHGRID_LENGTH, TYPE_MSFLOAT, 25.0,  
"width", PATCHGRID_WIDTH, TYPE_MSFLOAT, 25.0,  
"widthsegs", PATCHGRID_WSEGS, TYPE_INT, 1,
```

```

"lengthsegs", PATCHGRID_LSEGS, TYPE_INT, 1,
end,
end,
end
);
MAXClass text
("Text", Class_ID(TEXT_CLASS_ID, 0), SHAPE_CLASS_ID,
&shape, 0,
accessors,
paramblock,
"size", TEXT_SIZE, TYPE_FLOAT, 100.0,
end,
fns,
"text", get_txt_strng, set_txt_strng, TYPE_UNSPECIFIED,
"font", get_txt_font, set_text_font, TYPE_UNSPECIFIED,
"italic", get_txt_italic, set_txt_italic, TYPE_BOOL, FALSE,
"underline", get_txt_under, set_txt_under, TYPE_BOOL, FALSE,
end,
end,
end
);

```

The Text class defines both ParamBlock and function-based properties. It is typical only to specify type information for function-based properties when you want to give default values.

These are the MAXSuperClass static instances you can reference in MAXClass constructors. They are externed in the header file "**Maxcls.h**".

```

geom_object
modifier
shape

```

helper\_object  
spacewarp\_object  
light\_object  
camera\_object  
material\_class  
texture\_map  
system\_object  
utility\_plugin  
spacewarp\_modifier  
float\_controller  
point3\_controller  
position\_controller  
quat\_controller  
rotation\_controller  
scale\_controller  
matrix3\_controller  
morph\_controller

## **classOf() and superClassOf() Methods for MAX Objects (SDK)**

Even though the individual MAX object classes are not represented by C++ classes in MAXScript, they are considered classes at the scripter level, represented by the MAXClass values. Accordingly, the MAXScript class inquiry methods, **classOf()**, **superClassOf()** and **isAKindOf()**, are implemented in the C++ MAXWrapper classes to use the appropriate MAXClass instance as the class of the wrapped object when called on MAX object wrapper values, such as scene nodes, modifiers, or controllers. On scene nodes, the **classOf()** function always returns the class of the world-state of the object, its state at the top of the modifier stack.

### **Examples:**

```
classOf $foo.bend => Bend
superClassOf $foo.bend => Modifier
classOf $baz.position.controller => Bezier_position
superClassOf $baz.position.controller => Position_controller
```

In order to determine the class of the base object, you can use the **.baseObject** property of the scene node, for example on a line with an extrude modifier:

```
classOf $line01 => Editable_mesh
classOf $line01.baseObject => Shape
```

## Collection Mapping (SDK)

For Object Sets, Pathnames, Modifier/Key/NodeChildren Arrays and Arrays.

The following virtual functions are defined on Value and implemented by those classes that support them to provide a collection mapping mechanism. Those that support mapping return true from the virtual function predicate `is_collection()`. The MAXScript 'for x in y ...' loop statement relies on these mapping functions, for example. Attempting to map a non-collection results in a descriptive MAXScript runtime error.

Some of the functions are driven by a mapping structure, 'node\_map', defined below.

Only PathNames, ObjectSets and Nodes implement the '\_path' variants. Mapping over a scene node Value (MAXNode instance), effectively maps over its descendants.

### class Value

```
Value* map(node_map& m);
```

```
    map node structure over collection
```

```
Value* map_path(PathName* path, node_map& m);
```

```
    map node collection over values matching pathname
```

```
Value* find_first(BOOL (*test_fn)(INode* node, int level, void*
```

```
arg),
```

```
void* test_arg);
```

```
    find first node matching test
```

```
Value* get_path(PathName* path);
```

```
    get the non-wild-card pathname-specified node
```

```
struct node_map
```

```
{
```

```
value_vfvpn_ptr; // virtual fn to map
```

```
value_cfcfn_ptr; // or, c fn to map (one or the other must be null)
Value**arg_list; // args to pass on...
intcount;
BOOL(*selector)(INode*, int, void*); // set selector fn
void*sel_arg; // arg for the selector
intget_index; // index if we are doing an indexed get
intget_count; // local running traverse count during get
Value**get_result_p; // ptr to result holder for indexed get
Array*collection; // append map results here if non-null (used
// in for ... collect)
shortflags; // control flags
};
```

```
#define NM_INVERT0x0001 // invert map order, map parents last
on
// the way out of the recursion
#define NM_SELECT0x0002 // applying a select, adjust clear flag
#define NM_GET 0x0004 // doing a get, return get_index'th item
```

## Array Access and Construction (SDK)

Arrays are useful for passing multiple values back and forth; there is no multiple-value return mechanism in MAXScript.

Arrays in MAXScript are dynamic and will grow as necessary (by a factor of 1.5 when needed). You can set the initial extent size on creation. Uninitialized elements are set to **&undefined**.

As with all Value creation inside C++ code, a freshly created array must be protected from garbage collection, either by placing it immediately inside some other protected value, or by using the protection macros described in the [Protecting Newly Created Values from the Collector](#) topic.

```
Array(int init_size); // constructor allocates initial array size
```

```
Value* append(Value*);
```

```
Value* get(int index);
```

```
Value* map(node_map& m);
```

## Stream I/O (SDK)

MAXScript contains a number of character stream classes that are used primarily by the compiler and by the text I/O subsystem. These are all Value subclasses and so are first-class MAXScript values. If you want to call the compiler directly or pass or take stream values from scripts, you should use these classes.

The text file I/O classes and functions in MAXScript create and work on FileStream instances.

```
FileStream
FileStream::FileStream ();
FileStream* open(char* file_name, char* mode);
char get_char();
void unget_char(char c);
char peek_char();
int at_eos();
void rewind();
void flush_to_eol();
char putch(char c);
char* puts(char* str);
int printf(const char *format, ...);
void flush();
void close();
```

You can construct and pass StringStreams to the compiler if you want to compile pieces of source text.

```
StringStream
StringStream(char* init_string);
StringStream(Value* init_string_value);
StringStream(int ilen);
```

```
void init(char* init_string);  
char* puts(char* str);  
char putch(char c);  
int printf(const char *format, ...);
```

## Access to the Compiler and Interpreter (SDK)

The compiler in MAXScript can be invoked to compile source in files or strings into executable code. You gain access to it by creating an instance of the Parser class with the following constructor:

```
Parser(CharStream* errout);
```

Debugging and error output is sent to the given 'errout' charstream. Typically, you would specify the current standard output for this, which defaults to the Listener window, for example:

```
Parser* reader = new Parser (thread_local(current_stdout));
```

Any number of Parsers can be instantiated and active; they each encapsulate a separate compile environment including lexical scoping tables and source stream tracking.

The following Parser member functions are used to compile source code in a CharStream instance, either a FileStream or a StringStream (see the [Stream I/O](#) topic for details on constructing these streams).

```
Value* compile(CharStream* stream);
```

Compile the next complete expression in the given stream. The stream pointer is left at the end of the expression compiled, so you can repeatedly call compile() to step through source an expression at a time. Remember that MAXScript is expression-based, so 'expression' here means any MAXScript construct including all the control structures, function definitions, blocks, utility definitions, etc.

```
Value* compile_factor(CharStream* stream);
```

Compile the next MAXScript <operand> in the source stream. See the MAXScript Grammar topic for the exact definition of <operand>. The

MAXScript function **readValue()** uses **compile\_factor()** to get the next value in a text file, so it is capable of reading global variable references, array indexes, property references, pathnames, etc. as well as simple literals.

```
Value* compile_all(CharStream* stream);
```

Compile the whole stream into one piece of executable code.

The compile functions all return a MAXScript value containing the executable code, usually a CodeTree instance, but possibly a Number or String if the expression you give it to compile is a simple literal. The code is executed by invoking the Value virtual function **eval()** on it. For example,

```
Value* code = reader->compile(source); // compile an expr  
result = code->eval(); // execute it
```

In the case of simple values, this is a no-op and just returns the value. The code returned from the compiler is always a first-class MAXScript value that you can store for later execution or pass back to running scripts.

Here is the low-level **file\_in()** function in MAXScript, showing how the compiler and interpreter are used.

```
Value* file_in(CharStream* source, int quiet)  
{  
  three_typed_value_locals(Parser* parser, Value* code, Value*  
  result);  
  CharStream* out = thread_local(current_stdout);  
  vl.parser = new Parser (out);  
  if (!quiet)  
    source->log_to(out);  
  // loop through file compiling and evaluating all expressions
```

```
try
{
source->flush_whitespace();
while (!source->at_eos())
{
vl.code = vl.parser->compile(source);
vl.result = vl.code->eval();
if (!quiet)
vl.result->print();
source->flush_whitespace();
}
source->close();
}
catch (...)
{
// catch any errors and tell what file we are in if any
out->puts("Error occurred during fileIn: ");
source->sprin1(out);
out->puts("\n");
throw;
}

// return last expression in stream as result
if (vl.result == NULL)
vl.result = &ok;
return_value(vl.result);
}
```

## Calling Scripted Functions (SDK)

If you have a scripted function value in hand (an instance of the class `MAXScriptFunction`), you can invoke it directly using the `Value` virtual function **`apply()`**:

```
virtual Value* apply(Value** arglist, int count);
```

## MAXScript Header Files (SDK)

There are many header files supplied with the MAXScript SDK in the directory 'includes'. The following list shows the main ones you might use:

**Maxscript.h** The main MAXScript header. It includes most of the core headers required for the MAXScript API and 'Max.h', needed for any MAX SDK code.

**defextfn.h** Scripter-callable function definition macros. See the section **definsfn.h** in the [Scripter-callable functions](#) topic for details.

**MAXObj.h** The prime MAXWrapper header, used if you are constructing or accessing any of the main MAXScript values that represent MAX objects within MAXScript. See the [Working with MAX Objects in the SDK](#) topic for more details on this and the rest of the header files in this group.

**MAXKeys.h** MAXScript classes for wrapping MAX controller keys.

**MAXMats.h** MAXScript classes for wrapping MAX materials and texture maps.

**BitMaps.h** MAXScript class for wrapping MAX bitmaps.

**Maxclses.h** Defines all the static MAXClass and MAXSuperclass instances which provide MAXScript-specific metadata for the most of the core MAX classes.

The following headers define most of the foundation classes in MAXScript. Many of them are basically wrappers for primitive C++ types or MAX SDK classes, such as Point2, TimeValue, etc. You would include these headers if you need to create or access any instances of these classes.

3DMath.h All the MAXScript linear algebra classes

Arrays.h The Array class.

ColorVal.h MAXScript color class.

Funcs.h Scriptor functions.

HashTab.h MAXScript's internal hashtable class.

MSTime.h Time classes.

Name.h MAXScript's Name class.

Numbers.h Float and Integer classes.

Parser.h The MAXScript compiler.

Streams.h Character stream I/O, notable FileStream.

Strings.h Character string class.

## Defining New System Globals (SDK)

You can define new system global variables with the **define\_system\_global()** function. It has the following signature:

```
void define_system_global(TCHAR* name,  
Value* (*getter)(),  
Value* (*setter)(Value*));
```

Where **name** points to the string naming the new global and **getter** and **setter** are pointers to the getter and setter functions for the variable. For example:

```
{  
...  
define_system_global("frameRate", get_frame_rate,  
set_frame_rate);  
...  
}
```

...

```
Value*  
get_frame_rate()  
{  
return Integer::intern(GetFrameRate());  
}
```

```
Value*  
set_frame_rate(Value* val)  
{  
SetFrameRate(val->to_int());  
return val;  
}
```

## Core Names (SDK)

Instances of the class Name are used extensively throughout MAXScript as variable and parameter names, keyword argument tags, symbolic arguments, etc. Names are immutable, interned values - the same name string always (caselessly) interns to the same Name value. To save interning overhead, many common names are interned once during MAXScript startup and made available in C++ global variables.

The following list shows the pre-interned name globals with the convention that the name for the global is the interned name with an 'n\_' prefix.

## Class ShortcutTable

See Also: [Structure ShortcutDescription](#), [Class ClassDesc](#), [Class ShortcutOperation](#), [Class ShortcutCallback](#).

class ShortcutTable

### Description:

This class is available in release 3.0 and later only.

This class represents a table of accelerators used by plug-ins. A plug-in can have various keyboard shortcut tables it uses. These tables hold a name that appears in the Preference Settings dialog / Keyboard tab / Plug-Ins dropdown list, a unique ID for the table, the number of shortcuts in the table, and storage for each of the Shortcut operations.

The number and a pointer to the 'i-th' shortcut table are returned by the methods **ClassDesc::NumShortcutTables()** and **ClassDesc::GetShortcutTable(int i)**.

For an example of using this mechanism see the code in the directory **\MAXSDK\SAMPLES\MODIFIERS\FFD**.

All methods of this class are implemented by the system.

### Methods:

### Prototype:

```
ShortcutTable(ShortcutTableId id, TSTR& name, HACCEL  
hDefaults, int numIds, ShortcutDescription* pOps, HINSTANCE  
hInst);
```

### Remarks:

Constructor. The data members are initialized to the values passed. A typical call to this constructor looks like this:

```
const ShortcutTableId kNURBSShortcuts = 0x34f274e4;  
#define NumElements(array) (sizeof(array) / sizeof(array[0]))
```

```
ShortcutTable *GetShortcuts() {  
TSTR name = GetString(IDS_JUST_NURBS);  
HACCEL hAccel = LoadAccelerators(hInstance,
```

```

MAKEINTRESOURCE(IDR_NURBS_SHORTCUTS));
int numOps = NumElements(spShortcuts);
ShortcutTable* pTab;
pTab = new ShortcutTable(kNURBSShortcuts,
name, hAccel, numOps, spShortcuts, hInstance);
return pTab;
}

```

**Parameters:**

**ShortcutTableId id**

This is the **unique** ID for the table. Typically developers use 'half' a ClassID as output by the ClassID Generator program. See the example above. Note:

**typedef long ShortcutTableId;**

**TSTR& name**

This is the name for the table which appears in the 3ds max UI in the Files / Preference Settings / Keyboard tab / Plug-In drop down list.

**HACCEL hDefaults**

This is the handle to the default keyboard accelerators. When a plug-in registers a shortcut table it needs to give the system a table of default shortcut assignments. It doesn't need to give all the operations default assignments, but it does need to give it a table of defaults. This table could be empty. This table is also used to implement the "Reset Category" button on the keyboard preferences dialog.

**int numIds**

This is the size of the array of shortcut descriptors specified below.

**ShortcutDescription\* pOps**

Points to the array of shortcut descriptors.

**HINSTANCE hInst**

The Dll instance handle of the plug-in.

**Prototype:**

**~ShortcutTable();**

**Remarks:**

Destructor. Any memory allocated by the constructor is freed here.

**Prototype:**

**HACCEL GetHAccel();**

**Remarks:**

Returns the handle of the currently active keyboard accelerator table.

**Prototype:**

**void SetHAccel(HACCEL hAccel);**

**Remarks:**

Sets the currently active keyboard accelerator table.

**Parameters:**

**HACCEL hAccel**

The handle to use.

**Prototype:**

**HACCEL GetDefaultHAccel();**

**Remarks:**

Returns the handle of the table of default shortcut assignments that are registered in the constructor for **ShortcutTable**.

**Prototype:**

**TSTR& GetName();**

**Remarks:**

Returns the name of the table to use in the Preference Settings / Keyboard tab / Plug-Ins drop down list.

**Prototype:**

**ShortcutTableId GetId();**

**Remarks:**

Returns the unique identifier of the table. Note: **typedef long ShortcutTableId;**

**Prototype:**

**int Count();**

**Remarks:**

Returns the number of shortcut operations in the table.

**Prototype:**

**void DeleteThis();**

**Remarks:**

Deletes this instance of the class.

**Prototype:**

**ShortcutOperation& operator[](int i);**

**Remarks:**

Provides access to the table of shortcut descriptions.

**Parameters:**

**int i**

The zero based index of the entry to get.

## Class ShortcutOperation

See Also: [Class ShortcutTable](#), [Class ShortcutCallback](#), [Class Interface](#), [Class ClassDesc](#).

### Description:

This class is available in release 3.0 and later only.

This class describes an operation that can be attached to a shortcut. Each shortcut stores an ID that is passed to the window proc when the shortcut is executed, a name for the shortcut operation that appears in the list of accelerators in a table, and an enabled/disabled state. Methods of this class provide access to each of these.

All methods of this class are implemented by the system.

### Methods:

#### Prototype:

**ShortcutOperation();**

#### Remarks:

Constructor. The command ID is set to zero, the name is set to NULL and the enabled state is set to FALSE.

#### Prototype:

**int GetId();**

#### Remarks:

Returns the command ID sent to the window proc when the shortcut is executed.

#### Prototype:

**void SetId(int id);**

#### Remarks:

Sets the command ID sent to the window proc.

#### Parameters:

**int id**

The ID to set.

**Prototype:**

**TCHAR\* GetName();**

**Remarks:**

Returns the name of the operation the user sees in the Preference Settings / Keyboard tab / command list for Plug-Ins.

**Prototype:**

**void SetName(TCHAR\* pName);**

**Remarks:**

Sets the name of the operation the user sees.

**Parameters:**

**TCHAR\* pName**

The name to set.

## Class ShortcutCallback

See Also: [Class ShortcutOperation](#), [Class ShortcutTable](#), [Class Interface](#).

class ShortcutCallback

### Description:

This class is available in release 3.0 and later only.

An instance of a class derived from this class is passed into the method

### Interface:: ActivateShortcutTable().

When the user presses a shortcut key that is assigned in an active table, the system calls the **KeyboardShortcut(int id)** method of this class with the id of the operation.

**KeyboardShortcut()** should normally return TRUE. If the **KeyboardShortcut()** call returns FALSE, the system will ignore that shortcut and process any system shortcut for the key. This lets the plug-in selectively override system defined shortcuts. For example, NURBS use "H" to bring up a sub-object hit by name dialog when in a sub-object level, but at the top-level, "H" is ignored and the system hit-by-name dialog comes up instead.

The **KeyboardShortcut()** method is always where the keyboard shortcut will be handled. Note:There is no need for a window proc to handle the message as the old **RegisterAccelTable()** call required. The old **RegisterAccelTable()** functionality has not been removed (for backward source compatibility) , but new plug-ins should use the new ShortcutTable mechanism.

### Methods:

public:

### Prototype:

**virtual BOOL KeyboardShortcut(int id) = 0;**

### Remarks:

Implemented by the Plug-In.

This method is called when the user press a shortcut key assigned to an active table.

### Parameters:

**int id**

The id of the operation associated with the key.

**Return Value:**

TRUE to process the shortcut; FALSE to ignore the shortcut and process any system shortcut for the key.

## Structure ShortcutDescription

See Also: [Class ShortcutTable](#).

### Description:

This structure is available in release 3.0 and later only.

It provides a description of a command for building shortcut tables from static data. A pointer to an array of these is passed to the **ShortcutTable** constructor.

Typically one is declared like this:

```
static ShortcutDescription spShortcuts[] = {  
    ID_CURVE_TOGGLE, IDS_DISPLAY_CURVES,  
    ID_DISP_DEP_TOGGLE, IDS_DISPLAY_DEPENDENTS,  
    ...  
};
```

```
struct ShortcutDescription {
```

```
    int mCmdID;
```

This is the command ID.

```
    int mResourceID;
```

This is the resource ID of the description string.

```
};
```

## List of CUI Frame Position Types

See Also: [Class ICUIFrame](#).

One or more of the following flag values (which may be ORed together, as in **CUI\_HORIZ\_DOCK | CUI\_VERT\_DOCK | CUI\_FLOATABLE | CUI\_SM\_HANDLES**):

### **CUI\_TOP\_DOCK**

May be docked at the top.

### **CUI\_BOTTOM\_DOCK**

May be docked at the bottom.

### **CUI\_LEFT\_DOCK**

May be docked on the left.

### **CUI\_RIGHT\_DOCK**

May be docked on the right.

The flags below are combinations of those above:

### **CUI\_ALL\_DOCK**

May be docked in any of the positions above (same as

**(CUI\_TOP\_DOCK|CUI\_BOTTOM\_DOCK|CUI\_LEFT\_DOCK|CUI\_RIGHT\_DOCK)**)

### **CUI\_HORIZ\_DOCK**

May be docked at the top or the bottom.

**(CUI\_TOP\_DOCK|CUI\_BOTTOM\_DOCK)**

### **CUI\_VERT\_DOCK**

May be docked at the left or the right.

**(CUI\_LEFT\_DOCK|CUI\_RIGHT\_DOCK)**

The flags below control if the frame may be floated, connected, or should display handles:

### **CUI\_FLOATABLE**

The frame may be floated.

### **CUI\_FLOATING**

This is a synonym for **CUI\_FLOATING** above.

### **CUI\_CONNECTABLE**

This is not currently implemented.

### **CUI\_SM\_HANDLES**

Set this flag if frame should display size/move handles and it is resized/moved.

## List of CUI Frame Size Types

See Also: [Class ICUIFrame](#).

The size type. One of the following values:

**CUI\_MIN\_SIZE** - The minimum size.

**CUI\_MAX\_SIZE** - The maximum size.

**CUI\_PREF\_SIZE** - The preferred size. 3ds max does not currently take advantage of this size, only MIN and 3ds max are used.

## List of CUI Frame Orientations

See Also: [Class ICUIFrame](#).

The orientation. One or more of the following values:

**CUI\_HORIZ** - Horizontal orientation.

**CUI\_VERT** - Vertical orientation.

**CUI\_FLOAT** - As a floating toolbar.

## List of CUI Docking Panel Locations

See Also: [Class CUIFrameMgr](#).

One or more of the following values:

**CUI\_TOP\_PANEL**

**CUI\_BOTTOM\_PANEL**

**CUI\_LEFT\_PANEL**

**CUI\_RIGHT\_PANEL**

**CUI\_FIXED\_PANELS** -- This is the same as:

**(CUI\_TOP\_PANEL|CUI\_BOTTOM\_PANEL|CUI\_LEFT\_PANE**

**CUI\_FLOATING\_PANELS**

**CUI\_ALL\_PANELS** --This is the same as:

**(CUI\_FIXED\_PANELS|CUI\_FLOATING\_PANELS)**

## Class ICurve

See Also: [Class ReferenceTarget](#), [Class ICurveCtl](#), [Class CurvePoint](#), [COLORREF](#), [Class BitArray](#).

```
class ICurve : public ReferenceTarget
```

### Description:

This class is available in release 3.0 and later only.

This class is an interface to a single curve used by a **ICurveCtl**. A pointer to one of these is returned from the method **ICurveCtl::GetControlCurve()**. All methods of this class are implemented by the system.

### Methods:

public:

### Prototype:

```
virtual void SetPenProperty(COLORREF color, int width = 0, int style = PS_SOLID)=0;
```

### Remarks:

Sets the pen properties of a curve

### Parameters:

**COLORREF color**

The color for the curve lines.

**int width = 0**

The width of the lines in pixels.

**int style = PS\_SOLID**

The pen style to use. One of the following types may be used. See the Win32 API Reference for more information on pen styles.

**PS\_SOLID**

**PS\_DASH**

**PS\_DOT**

**PS\_DASHDOT**

**PS\_DASHDOTDOT**

**PS\_NULL**

## **PS\_INSIDEFRAME**

### **Prototype:**

**virtual void GetPenProperty(COLORREF &color, int &width, int &style)=0;**

### **Remarks:**

Retrieves the color, width and style of a curve.

### **Parameters:**

**COLORREF &color**

The color in use.

**int &width**

The width in use.

**int &style**

The style in use. One of the following types:

**PS\_SOLID**

**PS\_DASH**

**PS\_DOT**

**PS\_DASHDOT**

**PS\_DASHDOTDOT**

**PS\_NULL**

**PS\_INSIDEFRAME**

### **Prototype:**

**virtual void SetDisabledPenProperty(COLORREF color, int width = 0, int style = PS\_SOLID)=0;**

### **Remarks:**

Sets the pen properties of a curve if it is disabled.

### **Parameters:**

**COLORREF color**

The color to set.

**int width = 0**

The width to set.

**int style = PS\_SOLID**

The style to set. One of the following types:

**PS\_SOLID**

**PS\_DASH**

**PS\_DOT**

**PS\_DASHDOT**

**PS\_DASHDOTDOT**

**PS\_NULL**

**PS\_INSIDEFRAME**

**Prototype:**

**virtual void GetDisabledPenProperty(COLORREF &color, int &width, int &style)=0;**

**Remarks:**

Retrieves the color of a curve if it is disabled.

**Parameters:**

**COLORREF &color**

The color in use.

**int &width**

The width in use.

**int &style**

The style in use. One of the following types:

**PS\_SOLID**

**PS\_DASH**

**PS\_DOT**

**PS\_DASHDOT**

**PS\_DASHDOTDOT**

**PS\_NULL**

**PS\_INSIDEFRAME**

**Prototype:**

**virtual float GetValue(TimeValue t, float fX, Interval &ivalid = FOREVER, BOOL UseLookupTable = FALSE)=0;**

**Remarks:**

Returns the Y-value for a given X-Value of the curve. Note that values outside the X-range are extrapolated from the curve using a straight line based on the tangents of the first or last point.

**Parameters:****TimeValue t**

The time to get the value.

**float fX**

The input X value.

**Interval &ivalid = FOREVER**

The validity interval which is updated by this method to reflect the validity of the curve.

**BOOL UseLookupTable = FALSE**

If TRUE a lookup table is used to get the value (for speed). If FALSE the value is computed.

This is used to speed up value access. The default value for the lookup table size is 1000. The lookup table will be calculated whenever this method is called with TRUE and the current lookup table is not initialized yet, or invalid (it will be invalidated, when a point or tangent is moved, or the time has changed in case it is animated).

**Prototype:**

**virtual void SetCanBeAnimated(BOOL Animated)=0;**

**Remarks:**

Sets if the curve can be animated or not.

**Parameters:****BOOL Animated**

TRUE if it can be animated; FALSE if it can't.

**Prototype:**

**virtual BOOL GetCanBeAnimated()=0;**

**Remarks:**

Returns TRUE if the curve can be animated; otherwise FALSE.

**Prototype:**

**virtual int IsAnimated(int index)=0;**

**Remarks:**

Returns nonzero if the specified point is animated; otherwise zero.

**Parameters:**

**int index**

The zero based index of the curve to check.

**Prototype:**

**virtual int GetNumPts()=0;**

**Remarks:**

Returns the number of points in the curve.

**Prototype:**

**virtual void SetNumPts(int count)=0;**

**Remarks:**

Sets the number of points in the curve.

**Parameters:**

**int count**

The number to set.

**Prototype:**

**virtual BitArray GetSelectedPts()=0;**

**Remarks:**

Returns a BitArray which contains the selected / de-selected state for each point. The BitArray is **GetNumPts()** in size where the 0-th bit corresponds to the 0-th point.

**Prototype:**

```
virtual void SetSelectedPts(BitArray &sel, int flags)=0;
```

**Remarks:**

Sets the selected state of the points in the curve using the BitArray passed. Bits which are affected as specified by the flags.

**Parameters:****BitArray &sel**

Specifies which points are affected. The 0-th bit corresponds to the 0-th point.

**int flags**

One or more of the following values:

**SELPTS\_SELECT**

Select the points.

**SELPTS\_DESELECT**

De-select the points.

**SELPTS\_CLEARPTS**

If this bit is set the method de-selects (clears) all the points before performing the operation as specified by the flags above.

**Prototype:**

```
virtual void SetPoint(TimeValue t, int index, CurvePoint *point,  
BOOL CheckConstraints = TRUE, BOOL notify = TRUE)=0;
```

**Remarks:**

Sets the specified point at the time passed.

**Parameters:****TimeValue t**

The time at which to set the point.

**int index**

The zero based index of the point in the curve.

**CurvePoint \*point**

Points to the curve point to set.

**BOOL CheckConstraints = TRUE**

When you're setting a point, it checks the in and outtan handles to prevent them from going beyond the previous or next point's location, since that would

create an invalid curve. Thus the Curve Control will adjust the tangents due to the constraints. However, if you set the first point, there is no next point, to check the tangent location against, thus you have to have a possibility to turn CheckConstraints off, so the constraints won't be checked (developers have to make sure that they are inserting valid points/tangents. )

**BOOL notify = TRUE**

This parameter is available in release 4.0 and later only.

This allows developers to control whether the command sends windows messages or not. When set to FALSE windows messages are not sent to the message handler. This lets developers constrain points when the user attempts to move them without getting into a message loop. When TRUE messages are sent.

**Prototype:**

**virtual CurvePoint GetPoint(TimeValue t, int index, Interval &valid = FOREVER)=0;**

**Remarks:**

Retrieves data about the specified point and updates the validity interval to reflect the validity of the point's controller.

**Parameters:**

**TimeValue t**

The time to get the data.

**int index**

The zero based index of the point.

**Interval &valid = FOREVER**

The validity interval which is updated.

**Prototype:**

**virtual void SetOutOfRangeType(int type)=0;**

**Remarks:**

This method is available in release 4.0 and later only.

This method allows you to set the out of range type.

**Parameters:**

## **int type**

Currently these types are supported;

**CURVE\_EXTRAPOLATE\_LINEAR**

**CURVE\_EXTRAPOLATE\_CONSTANT**

### **Prototype:**

**virtual int GetOutOfRangeType()=0;**

### **Remarks:**

This method is available in release 4.0 and later only.

This method returns the out of range type.

### **Return Value:**

One of the following; **CURVE\_EXTRAPOLATE\_LINEAR**,  
**CURVE\_EXTRAPOLATE\_CONSTANT**

### **Prototype:**

**virtual int Insert(int where, CurvePoint &p)=0;**

### **Remarks:**

Inserts the specified point at the location passed.

### **Parameters:**

**int where**

This value becomes the new index of the point.

**CurvePoint &p**

The point to insert.

### **Return Value:**

Nonzero if the point was inserted; otherwise zero.

### **Prototype:**

**virtual int Insert(int where, CurvePoint& p, BOOL  
do\_not\_hold)=0;**

### **Remarks:**

This method is available in release 4.0 and later only.

This is identical to the Insert above but allows you to turn off/on the hold that

occurs.this is useful when you are doing interactive inserts and moves from code, the original Insert hold would often get in the way

**Parameters:**

**int where**

This value becomes the new index of the point.

**CurvePoint &p**

The point to insert.

**BOOL do\_not\_hold**

TRUE in order not to hold; otherwise FALSE.

**Return Value:**

Nonzero if the point was inserted; otherwise zero.

**Prototype:**

**virtual void Delete(int index)=0;**

**Remarks:**

Deletes the point whose index is passed.

**Parameters:**

**int index**

The zero based index of the point to delete.

**Prototype:**

**virtual void SetLookupTableSize(int size)=0;**

**Remarks:**

This method sets the size of the Curve Control lookup table. The lookup table allows users of the Curve Control to easily speed up their value access. The default value for the lookup table size is 1000. The lookup table will be calculated whenever **GetValue()** is called with the parameter **UseLookupTable==TRUE** and the current LookupTable is not initialized yet, or invalid (it will be invalidated, when a point or tangent is moved, or the time has changed in case it is animated).

**Parameters:**

**int size**

The size to set.

**Prototype:**

**virtual int GetLookupTableSize()=0;**

**Remarks:**

Returns the current size of the lookup table. See **SetLookupTableSize()** above.

# Class CurvePoint

See Also: [Class ICurve](#).

class CurvePoint

## Description:

This class is available in release 3.0 and later only.

This class stores data about a single point on a curve used by the custom curve control.

## Data Members:

public:

**Point2 p;**

The curve point.

**Point2 in;**

The in tangent, relative to **p**.

**Point2 out;**

The out tangent, relative to **p**.

**int flags;**

One or more of the following values which describes the type of curve point:

**CURVEP\_BEZIER**

Indicates the point is a bezier smooth point.

**CURVEP\_CORNER**

Indicates the point is a corner point.

To get a Bezier Corner use:

**CURVEP\_CORNER & CURVEP\_BEZIER**

**CURVEP\_LOCKED\_Y**

Indicates the point is locked in Y.

**CURVEP\_LOCKED\_X**

Indicates the point is locked in X.

**CURVEP\_SELECTED**

Indicates the point is selected.

**CURVEP\_ENDPOINT**

Indicates a constrained endpoint on the curve.

## **CURVEP\_NO\_X\_CONSTRAINT**

Indicates a point should not be constrained to X.

# Class ResourceMakerCallback

See Also: [Class ICurveCtl](#).

class ResourceMakerCallback

public:

## Description:

This class is available in release 3.0 and later only.

This callback object may be used to handle custom bitmaps and tooltips for the display buttons of a curve control. There are also methods which get called to handle the situations when a curve is reset or a new curve is created.

All methods of this class are implemented by the plug-in.

## Methods:

public:

## Prototype:

```
virtual BOOL SetCustomImageList(HIMAGELIST  
&hCTools,ICurveCtl *pCCtl);
```

## Remarks:

This method is called to set the image list.

This callback is used to update the HIMAGELIST to handle custom bitmaps on the display buttons. The image list has to have 2\*NumCurves 16x15 bitmaps. The format for the first set of images is for Out&In Enabled. The second set is for Out&In Disabled (which are not yet used).

## Parameters:

### **HIMAGELIST &hCTools**

A reference to the image list to set. An HIMAGELIST is a Win32 data type that is a handle to an image list.

### **ICurveCtl \*pCCtl**

This pointer can be used to determine which ICurveCtl calls the callback, in case the plugin uses many CurveControls and want to set different bitmaps for different CurveControls.

## Return Value:

If the image list was assigned the callback should return TRUE. If it returns FALSE, the default bitmaps will be used.

**Default Implementation:**

```
{return FALSE;}
```

**Prototype:**

```
virtual BOOL GetToolTip(int iButton, TSTR &ToolTip,ICurveCtl  
*pCctl);
```

**Remarks:**

This callback allows the developer to assign custom ToolTips to the display buttons. One simply has to assign a string to the ToolTip parameter for the specified button number.

**Parameters:****int iButton**

The zero based index of the button whose tool tip text to retrieve.

**TSTR &ToolTip**

The string for the tool tip text.

**ICurveCtl \*pCctl**

This pointer can be used to determine which ICurveCtl calls the callback, in case the plugin uses many CurveControls and want to set different Tooltips for different CurveControls.

**Return Value:**

TRUE if the method is implemented to use custom tooltips; otherwise FALSE.

**Default Implementation:**

```
{return FALSE;}
```

**Prototype:**

```
virtual void ResetCallback(int curvenum, ICurveCtl *pCctl);
```

**Remarks:**

This methods gets called when the user preses the Reset button (cross symbol) in the user interface (if the control is using the upper toolbar).

**Parameters:****int curvenum**

The zero based index of the curve.

**ICurveCtl \*pCctl**

Points to the interface for the custom curve control.

**Default Implementation:**

**{}**

**Prototype:**

**virtual void NewCurveCreatedCallback(int curvenum, ICurveCtl \*pCctl);**

**Remarks:**

This method gets called after the curve control creates a new curve. The developer can set the default values here for the new curve. This call will be a result of a call to **SetNumCurves(i)** where the new size is bigger than the old size.

**Parameters:**

**int curvenum**

The zero based index of the curve.

**ICurveCtl \*pCctl**

Points to the interface for the custom curve control.

**Default Implementation:**

**{}**

## List of Custom Curve Control Flags

See Also: [Class ICurveCtl](#).

These flags control various display aspects of the custom curve control. See the methods **ICurveCtl::SetCCFlags()** and **GetCCFlags()**.

Developers can easily review these by running the curve control utility CCUtil in `\MAXSDK\SAMPLES\UTILITIES\CCUTIL`.

One or more of the following values:

### **CC\_DRAWBG**

Specifies to draw the white background in the graph window.

### **CC\_DRAWGRID**

Specifies to draw the grid lines and coordinates in the graph window.

### **CC\_DRAWUTOOLBAR**

Specifies to draw the upper toolbar above the control.

### **CC\_SHOWRESET**

Specifies to display the Reset button in the upper toolbar.

### **CC\_DRAWLTOOLBAR**

Specifies to draw the lower toolbar beneath the control.

### **CC\_DRAWSCROLLBARS**

Specifies to draw the horizontal and vertical scroll bars for the control.

### **CC\_AUTOSCROLL**

Specifies to do auto scrolling. Auto scroll happens when you drag a CurvePoint out of the currently visible range. In case you're zoomed in, the window will automatically scroll.

### **CC\_DRAWRULER**

Specifies to draw a small moveable ruler window (measures horizontal coordinates).

### **CC\_ASPOPUP**

Specifies to create the control as a pop-up with a title string. Have the Window as popup window. If this is not set, it's important to set the `SetCustomParentWnd(HWND hParent)=0;` to the parent of the CurveControl Window.

### **CC\_CONSTRAIN\_Y**

Specifies that no points (or handles) can be moved out of the value that is

set by **SetYRange()**.

### **CC\_HIDE\_DISABLED\_CURVES**

Specifies that disabled curves won't be displayed at all. If this is not set, the disabled curves will be drawn by the color set by

**SetDisabledPenProperty()**.

Note: The following flags may be specified to enable a right click menu with choices used to activate the corresponding command mode (for instance if the upper toolbar is not present where these choice are also available).

### **CC\_RCMENU\_MOVE\_XY**

### **CC\_RCMENU\_MOVE\_X**

### **CC\_RCMENU\_MOVE\_Y**

### **CC\_RCMENU\_SCALE**

### **CC\_RCMENU\_INSERT\_CORNER**

### **CC\_RCMENU\_INSERT\_BEZIER**

### **CC\_RCMENU\_DELETE**

**CC\_SHOW\_CURRENTXVAL** (a flag to allow a vertical bar to be drawn over the graph to show the current X value)

Also note: One loses the automatic switch from insert to move mode when right-clicking, if a RightClick menu is active. Also note the following 'user' features:

- Pressing Control key while inserting keys will insert the opposite type of key than what's currently selected (bezier or corner).
- Pressing the Shift key while moving a tangent convertes a bezier key into a bezier corner key.

### **CC\_SINGLESELECT**

This flag allows the user to single select a point normally if a bunch of points are stacked in area if you click on the area you get all of them with this flag you get the first one.

### **CC\_NOFILTERBUTTONS**

This flag turns off the curve visible/editable toggle in the top of the menu

bar useful for when you have lots of curves and want to do the display management yourself.

## Class RightClickMenu

See Also: [Class RightClickMenuManager](#), [Class Interface](#), [Class IPoint2](#).

class RightClickMenu

### Description:

This class provides methods to work with the right click menu that pops up when the user right clicks over an item in a viewport. Methods of this class are used to initialize the menu and process the users selections. A developer derives a class from this class. For sample code see

**\\MAXSDK\\SAMPLES\\MODIFIERS\\EDITPATCH\\EDITPAT.CPP.**

Also see the method **Interface::GetRightClickMenuManager()**.

### Methods:

### Prototype:

```
virtual void Init(RightClickMenuManager* manager, HWND  
hWnd, IPoint2 m)=0;
```

### Remarks:

Implemented by the Plug-In.

This method is called when the user right clicks on an object in the scene. At this point you can determine what you need in the menu, and add these items using **manager->AddMenu()**.

### Parameters:

**RightClickMenuManager\* manager**

The menu manager. You may use this pointer to call methods of this class (for example to add items to the menu).

**HWND hWnd**

The window handle the user right clicked in.

**IPoint2 m**

The screen point the user right clicked on.

### Prototype:

```
virtual void Selected(UINT id)=0;
```

### Remarks:

Implemented by the Plug-In.

This method is called when the user has selected an item from the menu.

**Parameters:**

**UINT id**

This is the **id** of the users selection. This **id** is established when the developer calls **RightClickMenuManager::AddMenu()**.

## List of IGraphObjectManager Filter Bits

See Also: [Class IGraphObjectManager](#).

The filter bits: One or more of the following values:

### **SV\_FILTER\_SEOBJECTS**

Show only Selected objects.

### **SV\_FILTER\_OBJECTMODS**

Show Modified Objects.

### **SV\_FILTER\_BASEPARAMS**

Show Base Objects.

### **SV\_FILTER\_MATPARAMS**

Show Materials.

### **SV\_FILTER\_GEOM**

Show geometry nodes.

### **SV\_FILTER\_SHAPES**

Show shape nodes.

### **SV\_FILTER\_LIGHTS**

Show light nodes.

### **SV\_FILTER\_CAMERAS**

Show camera nodes.

### **SV\_FILTER\_HELPERS**

Show helper nodes.

### **SV\_FILTER\_WARPS**

Show space warps.

### **SV\_FILTER\_VISIBLE\_OBJS**

Show only Visible objects.

### **SV\_FILTER\_CONTROLLERS**

Show controllers.

### **SV\_FILTER\_ANIMATEDONLY**

Show only animated nodes.

### **SV\_FILTER\_MAPS**

Show maps.

### **SV\_FILTER\_BONES**

Show bone base objects.

## Class SClassUIInfo

See Also: [Class SubClassList](#), [COLORREF](#).

class SClassUIInfo

### Description:

This class is available in release 3.0 and later only.

This class allows developers to provide some additional information on a superclass. Currently this includes a color, and a method which draws a representative image in a Windows DC.

DrawRepresentation(...) can return false to indicate that no image was drawn. DrawRepresentation(...) should cache its image (if applicable) as the method is called repeatedly while drawing certain UI components (like the schematic view).

### Methods:

public:

### Prototype:

**virtual COLORREF Color(SClass\_ID superClassID);**

### Remarks:

Returns a color associated with the specified super class. This is currently used to draw nodes in the schematic view at extreme zoom-outs where it is impossible to draw legible node names.

### Parameters:

**SClass\_ID superClassID**

The Super Class whose associated color to return.

### Default Implementation:

**{ return RGB(128, 128, 128); }**

### Prototype:

**virtual bool DrawRepresentation(SClass\_ID superClassID,  
COLORREF bkColor, HDC hDC, Rect &rect);**

### Remarks:

Draws an image which represents the superclass (usually an icon) in a

rectangle in a given Windows DC. The implementation should attempt to draw the image as fast as possible as this method is called repeatedly while drawing certain UI components.

**Parameters:**

**SClass\_ID superClassID**

The super class to draw.

**COLORREF bkColor**

This is the average background color of the surface on which the image is being drawn. It can be used, if desired, to antialias the image.

**HDC hDC**

The handle to the device context.

**Rect &rect**

The rectangle to draw in.

**Return Value:**

Return **false** if no image was drawn and a generic stand-in image will be used.

**Default Implementation:**

```
{ return false; }
```

## List of Macro Recorder Value Types

See Also: [Class MacroRecorder](#), [Class Point3](#), [Class Matrix3](#), [Class Color](#), [Class AngAxis](#), [Class Quat](#), [Class BitArray](#), [Class PBitmap](#), [Class Class\\_ID](#), [Class ParamDimension](#).

One of the following macro recorder type tags followed by the argument(s) indicated. Depending upon the case there may be one, two or three arguments as noted:

### Basic C Types:

#### **mr\_int**

An integer. Follow the tag with the **int**.

Example code: **91462**

#### **mr\_float**

A floating point value. Follow the tag with a **double**.

Example code: **123.45**

#### **mr\_string**

A string. Follow the tag with the string (**TCHAR\***).

Example code: **"Benson"**

#### **mr\_bool**

A boolean. Follow the tag with a **int**.

Example code: **true**

### MAX SDK Types:

#### **mr\_point3**

A Point3. Follow the tag with a **Point3\***.

Example code: **[10,0,0]**

#### **mr\_color**

A Color. Follow the tag with a **Color\***.

Example code: **color 12 128 0**

#### **mr\_angaxis**

An AngAxis. Follow the tag with an **AngAxis\***.

Example code: **angleAxis 45[1,0,0]**

#### **mr\_quat**

A Quaternion. Follow the tag with a **Quat\***.

Example code: **quat 1 0 0 0**

### **mr\_time**

A TimeValue, follow the tag with a **TimeValue**.

Example code: **22f**

### **mr\_reftarg**

A Reference Target pointer. Follow the tag with a **ReferenceTarget\***.

Example code: **\$foo** or **\$baz.modifiers[2]** or **\$foo.material**, etc.

### **mr\_bitarray**

A bit array. Follow the tag with a pointer to a **BitArray\***.

Example code: **#{1..20, 30,34..100}**

### **mr\_pbitmap**

A parameter block2 bitmap object. Follow the tag with a **PBBitmap\***.

Example code: **bitMap 640 480 fileName:"fuz.bmp"**

### **mr\_matrix3**

A Matrix3. Follow the tag with a **Matrix3\***.

Example code: **matrix3 [1,0,0] [0,1,0] [0,0,1] [10,0,0]**

### **mr\_dimfloat**

A floating point value with the specified **ParamDimension**. Follow the tag with: **ParamDimension\***, **double**.

Example code: **123.45** (scaled by the dimension)

### **mr\_dimpoint3**

A Point3 value with the specified **ParamDimension**. Follow the tag with: **ParamDimension\***, **Point3\***.

Example code: **[10,0,0]** (scaled by the dimension)

### **mr\_classid**

A Class ID, follow the tag with a **Class\_ID** and a **SClass\_ID**.

Example code: **box** (the class variable name)

### **mr\_create**

A constructor call for the class. Follow the tag with: **Class\_ID**, **SClass\_ID**, **int**, **<args>**

The **int** parameter is the number of keyword args following, these are specified in pairs as **TCHAR\***, **<arg>**

Example code: **sphere radius:20 pos:[10,0,0]**

### **mr\_angle**

A floating point value with a **ParamDimension** of a **stdAngleDim**. Follow the tag with a **double**.

Example code: **90**

### **mr\_percent**

A floating point value with a **ParamDimension** of **stdPercentDim**. Follow the tag with a **double**.

Example code: **10**

## **MAXScript Types:**

### **mr\_sel**

A selection set. This tag works alone with no additional data. This tag denotes the current scene node selection and will emit as either a '\$' or an array of explicit objects, depending on the state of the **EmitAbsoluteSceneNames()** flag.

Example code: **\$** or **\$sphere01**

### **mr\_funcall**

A function call. Follow the tag with an **int, int, <args>**

The first int parameter is the number of positional arguments, given first in the **<args>** items, as **<arg>**, the second int parameter is the number of keyword args following the positional args in **<args>**, given as **TCHAR\*, <arg>** pairs.

Example code: **foo x y z output:f**

### **mr\_varname**

A variable name. Follow the tag with a string (**TCHAR\***).

Example code: **baz**

### **mr\_index**

An index. Follow the tag with: **<op\_arg>**, **<index\_arg>**

**<op\_arg>** is an **<arg>** specifying the operand to be indexed and

**<index\_arg>** is an **<arg>** specifying the index value.

Example code: **meditMaterials[3]**

### **mr\_prop**

A property name. Follow the tag with **TCHAR\***, **<arg>**. The **TCHAR\*** is the property name, the **<arg>** specifies the item being accessed.

Example code: **\$foo.pos**

### **mr\_nurbssel**

A NURBS selection level. Follow the tag with: **int, ReferenceTarget\***

The **int** parameter is the selection level desired of the specified NURBS base object.

Example code: **#{1..20, 50..100}**

This is an example of a BitArray literal in MAXScript, so it says sub-objects 1 through 20 and 50 through 100 are currently selected at the given level (the **int**) in the NURBS ReferenceTarget\* base object.

### **mr\_name**

A name. Follow the tag with a string (**TCHAR \***).

Example code: **#relational**

Note: A name in MAXScript is a simple symbolic value, often used instead of numbers to denote options in some function call. For example, when setting the motion blur of a scene node, one can say:

**\$foo.motionBlur = #image (or #none, or #object)**

generated, perhaps by:

**macroRecorder->SetSelProperty(\_T("motionBlur"), mr\_name, blurname);**

or when choosing g-buffer channels in the render() function, one would say:

**bm = render camera:\$c1 channels:##(zdepth, coverage, objectID)**

## Class IKSlaveControl

See Also: [Class Control](#), [Class IKMasterControl](#), [Class Point3](#), [Class Quat](#).

```
class IKSlaveControl : public Control
```

### Description:

This class is available in release 2.0 and later only.

The IK Controller requires that you use the Bones system. When you create the bones, a slave IK controller is assigned to each bone. All of the slave IK controllers in a single hierarchy are, in turn, controlled by a master IK controller. This class provides access to the slave controller parameters.

If you have a pointer to a TM controller you may test the Class\_ID against **IKSLAVE\_CLASSID** to determine if it is an IK Slave Controller.

For an example the use of this class see

**\MAXSDK\SAMPLES\OBJECTS\BONES.CPP.**

### Methods:

public:

### Prototype:

```
virtual IKMasterControl *GetMaster()=0;
```

### Remarks:

Returns a pointer to the **IKMasterControl** that manages this IK slave controller.

### Prototype:

```
virtual void SetDOF(int which, BOOL onOff)=0;
```

### Remarks:

Sets the specified degree of freedom to on or off.

### Parameters:

**int which**

Specifies which degree of freedom to modify. Pass a value between 1 and 6. The first 3 DOFs are position and the next 3 are rotation.

**BOOL onOff**

TRUE for on; FALSE for off.

**Prototype:**

**virtual void SetInitPos(Point3 pos)=0;**

**Remarks:**

Sets the initial position to the value passed.

**Parameters:**

**Point3 pos**

The initial position to set.

**Prototype:**

**virtual void SetInitRot(Point3 rot)=0;**

**Remarks:**

Sets the initial rotation to the value passed.

**Parameters:**

**Point3 rot**

The initial rotation to set.

**Prototype:**

**virtual void MakeEE(BOOL onOff,DWORD which,Point3 pos,Quat rot)=0;**

**Remarks:**

For any IK solution you explicitly move one object. 3ds max uses IK calculations to move and rotate all other objects in the kinematic chain to react to the object you moved. The object that you move is the end effector. There are two types of end effectors; Position and Rotation. This method create or deletes an end effector for position or rotation or both.

**Parameters:**

**BOOL onOff**

Controls if the end effector is on or off (creates or deletes the end effector controller). TRUE to create; FALSE to delete.

**DWORD which**

Specifies which end effector(s) to modify. Set the low order bit for position, the second bit for rotation, or set both for position and rotation.

**Point3 pos**

The initial position set at time 0 for the position controller

(CTRL\_ABSOLUTE).

### **Quat rot**

The initial rotation set at time 0 for the rotation controller  
(CTRL\_ABSOLUTE).

**The following function is not part of this class but is available for use:**

### **Function:**

```
IKSlaveControl *CreateIKSlaveControl(IKMasterControl  
*master,INode *slaveNode);
```

### **Remarks:**

This global function creates and returns a pointer to a new IK slave controller by specifying the master controller and a node to which the slave controller is assigned.

### **Parameters:**

**IKMasterControl \*master**

Points to the master controller to use.

**INode \*slaveNode**

Points to the slave node to use.

## Structure ISect

See Also: [Class RenderGlobalContext](#), [Class RenderInstance](#), [Class ISectList](#).

### Description:

This structure is available in release 2.0 and later only.

This structure is updated by the **RenderGlobalContext::IntersectWorld()** and **RenderGlobalContext::IntersectRay()** methods. It stores information about the intersection of a ray and a single triangle in a mesh.

**struct ISect {**

**float t;**

The ray that was intersected has a unit vector specifying a direction. The ray defines an infinite line in the specified direction. If you take this value **t** and multiply it by the direction itself it gives a point on the ray. This specifies a distance along the vector. For instance if this way 5.0, the point would 5.0 units along the ray vector. This is the point of intersection along the ray.

**BOOL exit;**

TRUE if the ray is exiting the object; otherwise FALSE.

**BOOL backFace;**

TRUE if the ray hits a back face of the triangle; otherwise FALSE.

**RenderInstance \*inst;**

Points to the render instance associated with this triangle hit.

**int fnum;**

The face number of the triangle.

**Point3 bc;**

The barycentric coordinates of the intersection.

**Point3 p;**

The intersection point in object coordinates.

**Point3 pc;**

The intersection point in camera coordinates.

**ULONG matreq;**

The material requirements of the intersected face. See [List of Material Requirement Flags](#).

**int mtlNum;**

The material number for a multi-material.

**ISect \*next;**

Points to the next **ISect** structure in the list.

**};**

# Class ISectList

See Also: [Structure ISect](#).

class ISectList

## Description:

This class is available in release 2.0 and later only.

It provides a list of ray / triangle intersection structures (**struct ISect**). Methods are available for initializing the list, adding to the list, and selectively removing items from the list.

All methods of this class are implemented by the system.

Note the following global functions may be used to create and free instances of this class.

## Function:

**ISect \*GetNewISect();**

## Remarks:

This global function is available in release 2.0 and later only.

Returns a pointer to a new **ISect** structure.

## Function:

**void DiscardISect(ISect \*is);**

## Remarks:

This global function is available in release 2.0 and later only.

Deletes the **ISect** structure whose pointer is passed.

## Parameters:

**ISect \*is**

Points to the **ISect** structure to free.

## Data Members:

public:

**ISect \*first;**

A pointer to the first intersection.

## Methods:

**Prototype:**

**ISectList();**

**Remarks:**

Constructor. The list is set to empty.

**Prototype:**

**~ISectList();**

**Remarks:**

Destructor. The list is freed. **first** is set to NULL.

**Prototype:**

**BOOL IsEmpty();**

**Remarks:**

Returns TRUE if the list is empty; otherwise FALSE.

**Prototype:**

**void Add(ISect \*is);**

**Remarks:**

Adds the specified **ISect** to the list with the most distant layers first.

**Parameters:**

**ISect \*is**

Points to the **ISect** structure to add to the list.

**Prototype:**

**void Prune(float a);**

**Remarks:**

Removes the **ISect** structures from the list whose **t** values are less than or equal to the specified value **a**.

**Parameters:**

**float a**

The ray parameter used for comparison.

**Prototype:**

**void Init();**

**Remarks:**

Deletes any items from the list and sets **first** to NULL.

## List of NURBSTess Types

See Also: [Class NURBSSurface](#), [Class TessApprox](#), [Class NURBSSet](#).

One of the following enum values determines the tessellation type.

### **kNTessSurface**

Surface tessellation.

### **kNTessDisplacement**

Displacement tessellation.

### **kNTessCurve**

Curve tessellation.

## List of Render Instance Flags

See Also: [Class RenderInstance](#).

One or more of the following values:

### **INST\_HIDE**

Indicates the instance is hidden.

### **INST\_CLIP**

Indicates this is a clip instance: ray tracers should skip it .

### **INST\_BLUR**

Indicates this is a secondary motion blur instance: ray tracers can skip it.

### **INST\_RCV\_SHADOWS**

Indicates the instance receives shadows.

### **INST\_TM\_NEGPARITY**

Indicates the mesh is inside-out: need to reverse normals on-the-fly.

### **INST\_MTL\_BYFACE**

Indicates the instance's object supports the material-by-face interface. See [Class IChkMtlAPI](#).

## List of Patch Display Flags

One or more of the following values:

**DISP\_VERTTICKS**

Display vertices as tick marks

**DISP\_SELVERTS**

Display selected vertices.

**DISP\_SELPATCHES**

Display selected patches.

**DISP\_SELEDGES**

Display selected edges.

**DISP\_SELPOLYS**

Display selected polygons.

**DISP\_LATTICE**

Display the patch lattice.

**DISP\_VERTS**

This is used by the Edit Patch modifier to indicate if the vertices are displayed or not. This may be toggled on or off.

## Class SubPatchHitList

See Also: [Class PatchMesh](#), [Class PatchSubHitRec](#).

class SubPatchHitList

### Description:

This class describes a list of sub-patch hit records. Methods are available to return the first PatchSubHitRec in the list, and to add hits to the list. All methods of this class are implemented by the system.

### Methods:

#### Prototype:

**SubPatchHitList();**

#### Remarks:

Constructor. The first sub hit is set to NULL.

#### Prototype:

**~SubPatchHitList();**

#### Remarks:

Destructor. The list of patch hits are deleted.

#### Prototype:

**PatchSubHitRec \*First();**

#### Remarks:

Returns the first sub hit record.

#### Prototype:

**void AddHit(DWORD dist, PatchMesh \*patch, int index, int type)**

#### Remarks:

Creates a new sub hit record and adds it to the list.

#### Parameters:

**DWORD dist**

The distance of the hit. If the user is in wireframe mode, this is the distance in

pixels to the item that was hit. If the user is in shaded mode, this is the Z depth distance. Smaller numbers indicate a closer hit.

**PatchMesh \*patch**

The PatchMesh associated with this sub-patch hit.

**int index**

The index of the sub-object component. For example, if vertices were being hit tested, this would be the index into the vertex table.

**int type**

The type of the hit. One of the following values:

- PATCH\_HIT\_PATCH**
- PATCH\_HIT\_EDGE**
- PATCH\_HIT\_VERTEX**
- PATCH\_HIT\_VECTOR**
- PATCH\_HIT\_INTERIOR**

## Class IManipulatorMgr

See Also: [Class FPStaticInterface](#)

class IManipulatorMgr : public FPStaticInterface

### Description:

This class is available in release 4.0 and later only.

This is the abstract interface class for Manipulator Manager Objects

The Interface ID of this class is **MANIP\_MGR\_INTERFACE**.

### Methods:

public:

### Prototype:

```
virtual Mesh* MakeSphere(Point3& pos, float radius, int  
segments)=0;
```

### Remarks:

This method allows you to create a spherical mesh gizmo.

### Parameters:

**Point3& pos**

The position of the sphere.

**float radius**

The radius of the sphere

**int segments**

The number of segments in the sphere.

### Return Value:

A pointer to the resulting mesh.

### Prototype:

```
virtual Mesh* MakeTorus(Point3& pos, float radius, float radius2,  
int segs, int sides)=0;
```

### Remarks:

This method allows you to create a torus mesh gizmo.

**Parameters:****Point3& pos**

The position of the torus.

**float radius**

The radius of the torus.

**float radius2**

The second radius of the torus.

**int segs**

The number of segments in the torus.

**int sides**

The number of sides of the torus.

**Return Value:**

A pointer to the resulting mesh.

**Prototype:**

```
virtual Mesh* MakeBox(Point3& pos, float l, float w, float h, int  
lsegs, int wsegs, int hsegs)=0;
```

**Remarks:**

This method allows you to create a box mesh gizmo.

**Parameters:****Point3& pos**

The position of the box.

**float l**

The length of the box.

**float w**

The width of the box.

**float h**

The height of the box.

**int lsegs**

The length segments of the box.

**int wsegs**

The width segments of the box.

**int hsegs**

The height segments of the box.

**Return Value:**

A pointer to the resulting mesh.

**Prototype:**

**virtual Plane\* MakePlane()**=0;****

**Remarks:**

This method creates a default plane gizmo.

**Prototype:**

**virtual Plane\* MakePlane(Point3& p1, Point3& p2, Point3& p3)**=0;****

**Remarks:**

This method creates a plane gizmo.

**Parameters:**

**Point3& p1**

The first point of the plane.

**Point3& p2**

The second point of the plane.

**Point3& p3**

The third point of the plane.

**Prototype:**

**virtual Plane\* MakePlane(Point3& normal, Point3& point)**=0;****

**Remarks:**

This method creates a plane gizmo.

**Parameters:**

**Point3& normal**

The normal of the plane

**Point3& point**

The center point in space of the plane.

**Prototype:**

**virtual Plane\* GetmsXYPlane()=0;**

**Remarks:**

This method returns the XY plane.

**Prototype:**

**virtual Plane\* GetmsXZPlane()=0;**

**Remarks:**

This method returns the XZ plane.

**Prototype:**

**virtual Plane\* GetmsYZPlane()=0;**

**Remarks:**

This method returns the YZ plane.

**Prototype:**

**virtual GizmoShape\* MakeGizmoShape()=0;**

**Remarks:**

This method will create a default gizmo shape.

**Prototype:**

**virtual GizmoShape\* MakeCircle(Point3& center, float radius, int segments)=0;**

**Remarks:**

This method will make a circular gizmo shape.

**Parameters:**

**Point3& center**

The center of the circle.

**float radius**

The radius of the circle.

**int segments**

The number of segments of the circle.

**Return Value:**

A pointer to the resulting gizmo shape.

## Class ISimpleManipulator

See Also: [Class FPMixinInterface](#), [Class SimpleManipulator Class Interface](#), [Class PolyShape](#), [Class Mesh](#), [Class Point3](#), [Class Point2](#), [Class ViewExp](#), [Class IColorManager](#), [Class Ray](#), [Class ManipHitData](#), [List of Marker Types](#)

```
class ISimpleManipulator : public FPMixinInterface
```

### Description:

This class is available in release 4.0 and later only.

The ISimpleManipulator class is an interface to SimpleManipulators with built-in ParamBlock2 support and a variety of additionally useful methods.

### Methods:

public:

### Prototype:

```
virtual void ClearPolyShapes()=0;
```

### Remarks:

Implemented by the system.

Removes all of the current gizmos in the manipulator. This is normally called at the top of **UpdateShapes()** to clear out any previous gizmos before creating new ones.

### Prototype:

```
virtual void AppendPolyShape(PolyShape* pPolyShape, DWORD  
flags = 0, Point3& unselColor =  
GetUIColor(COLOR_SEL_GIZMOS), Point3& selColor =  
GetSubSelColor())=0;
```

### Remarks:

Implemented by the system.

This method adds a new PolyShape gizmo to the manipulator. The shape is defined in the local coordinates of the node that owns the manipulator.

### Parameters:

**PolyShape\* pPolyShape**

A pointer to the poly shape to add.

## **DWORD flags = 0**

The flags can have one or more of the following values:

### **kGizmoDontDisplay**

Instruct the gizmo not to display. It will still hit-test.

### **kGizmoDontHitTest**

Instruct the gizmo not to do any hit testing. It will still display.

### **kGizmoScaleToViewport**

Instruct the gizmo to scale itself to have a constant size in the viewport. In this case the system will use the **ManipulatorGizmo::mGizmoSize** to determine how big the manipulator should be. It interprets **mGizmoSize** as pixels in this case.

## **Point3& unselColor = GetUIColor(COLOR\_SEL\_GIZMOS)**

The color of the gizmo when unselected.

## **Point3& selColor = GetSubSelColor()**

The color of the gizmo when selected.

## **Prototype:**

```
virtual void AppendGizmo(GizmoShape* pGizmoShape, DWORD  
flags = 0, Point3& unselColor =  
GetUIColor(COLOR_SEL_GIZMOS), Point3& selColor =  
GetSubSelColor())=0;
```

## **Remarks:**

Implemented by the system.

This method adds a new GizmoShape to the manipulator. The shape is defined in the local coordinates of the node that owns the manipulator.

## **Parameters:**

### **GizmoShape\* pGizmoShape**

A pointer to the gizmo shape to add.

### **DWORD flags = 0**

The flags can have one or more of the following values:

### **kGizmoDontDisplay**

Instruct the gizmo not to display. It will still hit-test.

### **kGizmoDontHitTest**

Instruct the gizmo not to do any hit testing. It will still display.

### **kGizmoScaleToViewport**

Instruct the gizmo to scale itself to have a constant size in the viewport. In this case the system will use the **ManipulatorGizmo::mGizmoSize** to determine how big the manipulator should be. It interprets **mGizmoSize** as pixels in this case.

### **Point3& unselColor = GetUIColor(COLOR\_SEL\_GIZMOS)**

The color of the gizmo when unselected.

### **Point3& selColor = GetSubSelColor()**

The color of the gizmo when selected.

### **Prototype:**

```
virtual void AppendMesh(Mesh* pMesh, DWORD flags = 0,  
Point3& unselColor = GetUIColor(COLOR_SEL_GIZMOS),  
Point3& selColor = GetSubSelColor())=0;
```

### **Remarks:**

Implemented by the system.

This method adds a new mesh to the manipulator. The mesh is defined in the local coordinates of the node that owns the manipulator.

### **Parameters:**

#### **Mesh\* pMesh**

A pointer to the mesh to add.

#### **DWORD flags = 0**

The flags can have one or more of the following values:

#### **kGizmoDontDisplay**

Instruct the gizmo not to display. It will still hit-test.

#### **kGizmoDontHitTest**

Instruct the gizmo not to do any hit testing. It will still display.

#### **kGizmoScaleToViewport**

Instruct the gizmo to scale itself to have a constant size in the viewport. In this case the system will use the **ManipulatorGizmo::mGizmoSize** to determine how big the manipulator should be. It interprets **mGizmoSize** as pixels in this case.

**Point3& unselColor = GetUIColor(COLOR\_SEL\_GIZMOS)**

The color of the gizmo when unselected.

**Point3& selColor = GetSubSelColor()**

The color of the gizmo when selected.

**Prototype:**

**virtual void AppendMarker(MarkerType markerType, Point3& position, DWORD flags = 0, Point3& unselColor = GetUIColor(COLOR\_SEL\_GIZMOS), Point3& selColor = GetSubSelColor())=0;**

**Remarks:**

Implemented by the system.

This method adds a new marker to the manipulator.

**Parameters:**

**MarkerType markerType**

The marker type to add.

**Point3& position**

The position of the marker.

**DWORD flags = 0**

The flags can have one or more of the following values:

**kGizmoDontDisplay**

Instruct the gizmo not to display. It will still hit-test.

**kGizmoDontHitTest**

Instruct the gizmo not to do any hit testing. It will still display.

**kGizmoScaleToViewport**

Instruct the gizmo to scale itself to have a constant size in the viewport. In this case the system will use the **ManipulatorGizmo::mGizmoSize** to determine how big the manipulator should be. It interprets **mGizmoSize** as pixels in this case.

**Point3& unselColor = GetUIColor(COLOR\_SEL\_GIZMOS)**

The color of the gizmo when unselected.

**Point3& selColor = GetSubSelColor()**

The color of the gizmo when selected.

**Prototype:**

```
virtual void AppendText(TCHAR* pText, Point3& position,  
DWORD flags = 0, Point3& unselColor =  
GetUIColor(COLOR_SEL_GIZMOS), Point3& selColor =  
GetSubSelColor())=0;
```

**Remarks:**

Implemented by the system.

This method adds a new text entry to the manipulator.

**Parameters:**

**TCHAR\* pText**

The string containing the text to add.

**Point3& position**

The position of the text.

**DWORD flags = 0**

The flags can have one or more of the following values:

**kGizmoDontDisplay**

Instruct the gizmo not to display. It will still hit-test.

**kGizmoDontHitTest**

Instruct the gizmo not to do any hit testing. It will still display.

**kGizmoScaleToViewport**

Instruct the gizmo to scale itself to have a constant size in the viewport. In this case the system will use the **ManipulatorGizmo::mGizmoSize** to determine how big the manipulator should be. It interprets **mGizmoSize** as pixels in this case.

**Point3& unselColor = GetUIColor(COLOR\_SEL\_GIZMOS)**

The color of the gizmo when unselected.

**Point3& selColor = GetSubSelColor()**

The color of the gizmo when selected.

**Prototype:**

```
virtual MouseState GetMouseState()=0;
```

**Remarks:**

This method returns the current status of the mouse.

**Return Value:**

One of the following values:

**kMouseIdle**

The mouse is idle, manipulator not active and the mouse is not over it.

**kMouseDragging**

The mouse is currently dragging the manipulator.

**kMouseOverManip**

The mouse is over the manipulator, but it is not being dragged.

**Prototype:**

```
virtual void GetLocalViewRay(ViewExp* pVpt, IPoint2& m,  
Ray& viewRay)=0;
```

**Remarks:**

This method gets the view ray going through the given screen coordinate. The result is in local coordinates of the owning INode.

**Parameters:****ViewExp\* pVpt**

An interface that may be used to call methods associated with the viewports.

**IPoint2& m**

The screen coordinate.

**Ray& viewRay**

The returned local view ray.

**Prototype:**

```
virtual void UpdateShapes(TimeValue t, TSTR& toolTip)=0;
```

**Remarks:**

Implemented by the Plug-In.

This method gets called whenever the manipulator needs to update its gizmos.

This is implemented by the manipulator to create the gizmos based on the current state of the node being manipulated.

**Parameters:****TimeValue t**

The time value at which the shapes should be updated.

## **TSTR& toolTip**

The tooltip string.

### **Prototype:**

```
virtual void OnMouseMove(TimeValue t, ViewExp* pVpt,  
IPoint2& m, DWORD flags, ManipHitData* pHitData)=0;
```

### **Remarks:**

This method gets called when the mouse moves within the manipulator context.

### **Parameters:**

#### **TimeValue t**

The time to display the object.

#### **ViewExp\* pVpt**

An interface that may be used to call methods associated with the viewports.

#### **IPoint2& m**

The screen coordinates of the mouse.

#### **DWORD flags**

Not used, should be set to 0.

#### **ManipHitData\* pHitData**

A pointer to the hitdata containing information on which manipulator was hit.

## Class GizmoShape

See Also: [Class SimpleManipulator](#), [Class ISimpleManipulator](#), [Class FPMixinInterface](#), [Class PolyLine](#), [Class PolyShape](#)

```
class GizmoShape : public FPMixinInterface
```

### Description:

This class is available in release 4.0 and later only.

This class represents the main gizmo shape.

The Function Publishing interface to SimpleManipulators is defined as:

```
#define MANIP_GIZMO_INTERFACE Interface_ID(0x124e3169,  
0xf067ad4)
```

### Data Members:

private:

```
PolyShape mPolyShape;
```

The gizmo polyshape.

```
PolyLine mLine;
```

A poly line.

### Methods:

public:

### Prototype:

```
GizmoShape();
```

### Remarks:

Constructor.

### Default Implementation:

```
{ mLine.Init(); }
```

### Prototype:

```
void StartNewLine();
```

### Remarks:

This method instructs the gizmo shape to start (append) a new line segment.

**Prototype:**

**AppendPoint(Point3& p);**

**Remarks:**

This method instructs the gizmo shape to append a new point to the line segment.

**Parameters:**

**Point3& p**

The vertex point to add.

**Prototype:**

**PolyShape\* GetPolyShape();**

**Remarks:**

This method returns a pointer to the gizmo's poly shape.

**Prototype:**

**Transform(Matrix3& tm);**

**Remarks:**

This method allows you to transform the gizmo shape.

**Parameters:**

**Matrix3& tm**

The transformation matrix.

## Class ManipHitData

See Also: [Class HitData](#), [Class Manipulator](#)

```
class ManipHitData : public HitData
```

### Description:

This class is available in release 4.0 and later only.

This is a special storage class for hit records that keep track of which manipulator was hit.

### Data Members:

public:

**Manipulator\* mpManip;**

A pointer to the manipulator associated with the hit data.

**int mShapeIndex;**

The index of the selected manipulator.

### Methods:

public:

### Prototype:

**ManipHitData(Manipulator\* pManip);**

### Remarks:

Constructor.

### Parameters:

**Manipulator\* pManip**

A pointer to the manipulator to use.

### Prototype:

**ManipHitData();**

### Remarks:

Constructor.

### Prototype:

**~ManipHitData();**

**Remarks:**

Destructor.

**Prototype:**

**virtual ManipHitData\* Copy();**

**Remarks:**

This method allows you to copy the hit data.

**Default Implementation:**

**{ return new ManipHitData(mpManip); }**

## Class ToneOperatorInterface

See Also: [Class FPStaticInterface](#), [Class ToneOperator](#).

```
class ToneOperatorInterface : public FPStaticInterface
```

### Description:

This class is available in release 4.0 and later only.

This class allows plug-ins and the scripter to get access to the tone operator assigned to a scene. You can get a pointer to the interface using the global interface pointer in this manner:

```
ToneOperatorInterface* toneOpInt =  
static_cast<ToneOperatorInterface*>  
( GetCOREInterface(TONE_OPERATOR_INTERFACE));
```

If the return value is NULL, the running version of 3ds max doesn't support tone operators. If the return value is not NULL, you can use these methods to perform some scene management.

### Methods:

public:

### Prototype:

```
virtual void OpenToneOperatorPanel()=0;
```

### Remarks:

This method opens the tone operator panel UI. If the panel has been minimized, it is restored.

### Prototype:

```
virtual void CloseToneOperatorPanel()=0;
```

### Remarks:

This method closes the tone operator panel UI.

### Prototype:

```
virtual void MinimizeToneOperatorPanel()=0;
```

### Remarks:

This method minimizes the tone operator panel UI.

**Prototype:**

```
virtual ToneOperator* GetToneOperator() const = 0;
```

**Remarks:**

This method returns the current tone operator assigned to a scene. If no tone operator is assigned NULL is returned.

**Prototype:**

```
virtual void SetToneOperator(ToneOperator* op) = 0;
```

**Remarks:**

This method assigns a tone operator to the scene. To remove a tone operator, assign NULL. When a new tone operator is assigned the current operator is removed automatically.

**Prototype:**

```
virtual void  
RegisterToneOperatorChangeNotification(ToneChangeCallback  
callback, void* param) = 0;
```

**Remarks:**

This method registers a callback that is called when the tone operator is changed. Note the definition of ToneChangeCallback:

```
typedef void (*ToneChangeCallback)(ToneOperator* newOp,  
ToneOperator* oldOp, void* param);
```

**Parameters:**

**ToneChangeCallback callback**

The callback to register.

**void\* param**

This parameter is passed to the callback function as the parameter argument when it is called.

**Prototype:**

```
virtual void  
UnRegisterToneOperatorChangeNotification(ToneChangeCallback  
callback, void* param) = 0;
```

**Remarks:**

This method un-registers a callback that was registered by RegisterToneOperatorChangeNotification. Note the definition of ToneChangeCallback:

```
typedef void (*ToneChangeCallback)(ToneOperator* newOp,  
ToneOperator* oldOp, void* param);
```

**Parameters:**

**ToneChangeCallback callback**

The callback to un-register.

**void\* param**

This parameter is passed to the callback function as the parameter argument when it is called.

## Class IReshadeFragment

See Also: [Class InterfaceServer](#), [Class IReshading](#), [Class Point2](#), [Class Point3](#)

```
class IReshadeFragment : public InterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

The Reshade Fragment interface is the materials/shaders/textures interface to reshading fragments. This interface is only concerned with saving and retrieving values in the fragments variable sized cache. Values are always saved in multiples of 32 bit words, and they can be a variety of types, colors, float's, int's, etc. Unit vectors are compressed to a single 32 bit word. Point2 and Point3 data types save multiple floats.

Color channels will be compressed to a 32 bit rgba color and saved in the cache. Color32 channels are only used internally. This is the 'raw' form of what's stored, other forms may be accessed from this class.

Float and integer channels are stored uncompressed, they are stored directly in the 32 bits.

The Point2 & Point3 channels are shells that store multiple float channels so these values will be uncompressed. These should be used with great caution, as this memory is stored per fragment, in a scene with 100,000 fragments of a given material, a point3 channel will add 1.2 megabytes to the storage for the reshading buffer.

### Methods:

public:

### Prototype:

```
virtual int NChannels()=0;
```

### Remarks:

This method returns the number of textures for the fragment.

### Prototype:

```
virtual int NFirstChannel()=0;
```

### Remarks:

This method returns the index of the first channel.

**Prototype:**

**virtual int NTextures()=0;**

**Remarks:**

This method returns the number of textures.

**Prototype:**

**virtual Color32 Channel(int nChan)=0;**

**Remarks:**

This method returns the specified channel.

**Parameters:**

**int nChan**

The channel you wish to return.

**Prototype:**

**virtual void SetChannel(int nChan, Color32 c)=0;**

**Remarks:**

This method allows you to set a channel in raw mode to a new value.

**Parameters:**

**int nChan**

The channel you wish to set.

**Color32 c**

The new value to set.

**Prototype:**

**virtual void AddChannel(Color32 c)=0;**

**Remarks:**

This method allows you to add a new color channel in raw mode to the end of the cache.

**Parameters:**

### **Color32 c**

The channel value you wish to set.

#### **Prototype:**

**virtual void AddColorChannel(RGBA tex)=0;**

#### **Remarks:**

This method allows you to add a new color channel to the end of the cache.  
The color will be compressed to 32bits.

#### **Parameters:**

**RGBA tex**

The color channel value you wish to add.

#### **Prototype:**

**virtual void AddFloatChannel(float f)=0;**

#### **Remarks:**

This method allows you to add a float channel in the fragment cache.

#### **Parameters:**

**float f**

The channel value to add.

#### **Prototype:**

**virtual void AddIntChannel(int i)=0;**

#### **Remarks:**

This method allows you to add an integer channel in the fragment cache.

#### **Parameters:**

**int i**

The integer value to add.

#### **Prototype:**

**virtual void AddUnitVecChannel(Point3 v)=0;**

**Remarks:**

This method allows you to add a unit vector channel in the fragment cache, compressed to 32-bits.

**Parameters:****Point3 v**

The unit vector to add.

**Prototype:****virtual void AddPoint2Channel(Point2 p)=0;****Remarks:**

This method allows you to add a Point2 channel in the fragment cache, uncompressed.

**Parameters:****Point2 p**

The Point2 to add.

**Prototype:****virtual void AddPoint3Channel(Point3 p)=0;****Remarks:**

This method allows you to add a Point3 channel in the fragment cache, uncompressed.

**Parameters:****Point3 p**

The Point3 to add.

**Prototype:****virtual void SetColorChannel(int nChan, RGBA tex)=0;****Remarks:**

This method sets the existing color channel number **nChan** to the new value.

**Parameters:****int nChan**

The color channel number.

## **RGBA text**

The new color value.

### **Prototype:**

**virtual void SetFloatChannel(int nChan, float f)=0;**

### **Remarks:**

This method allows you to set a float channel in the fragment cache to a new value.

### **Parameters:**

**int nChan**

The float channel number.

**float f**

The new value to set.

### **Prototype:**

**virtual void SetIntChannel(int nChan, int i)=0;**

### **Remarks:**

This method allows you to set an int channel in the fragment cache to a new value.

### **Parameters:**

**int nChan**

The int channel number.

**int i**

The new value to set.

### **Prototype:**

**virtual void SetUnitVecChannel(int nChan, Point3 v)=0;**

### **Remarks:**

This method allows you to set a unit vector channel in the fragment cache to a new value.

### **Parameters:**

**int nChan**

The unit vector channel number.

**Point3 v**

The new value to set.

**Prototype:**

**virtual void SetPoint2Channel(int nChan, Point2 p)=0;**

**Remarks:**

This method allows you to set a Point2 channel in the fragment cache to a new value.

**Parameters:**

**int nChan**

The Point2 channel number.

**Point2 p**

The new value to set.

**Prototype:**

**virtual void SetPoint3Channel(int nChan, Point3 p)=0;**

**Remarks:**

This method allows you to set a Point3 channel in the fragment cache to a new value.

**Parameters:**

**int nChan**

The Point3 channel number.

**Point3 p**

The new value to set.

**Prototype:**

**virtual RGBA GetColorChannel(int nChan)=0;**

**Remarks:**

This method will return an existing color channel, expanded to float RGBA.

**Parameters:**

**int nChan**

The color channel you wish to return.

**Prototype:**

**virtual float GetFloatChannel(int nChan)=0;**

**Remarks:**

This method will return an existing float channel.

**Parameters:**

**int nChan**

The float channel you wish to return.

**Prototype:**

**virtual int GetIntChannel(int nChan)=0;**

**Remarks:**

This method will return an existing int channel.

**Parameters:**

**int nChan**

The int channel you wish to return.

**Prototype:**

**virtual Point3 GetUnitVecChannel(int nChan)=0;**

**Remarks:**

This method will return an existing unit vector channel.

**Parameters:**

**int nChan**

The unit vector channel you wish to return.

**Prototype:**

**virtual Point2 GetPoint2Channel(int nChan)=0;**

**Remarks:**

This method will return an existing Point2 channel.

**Parameters:**

**int nChan**

The Point2 channel you wish to return.

**Prototype:**

**virtual Point3 GetPoint3Channel(int nChan)=0;**

**Remarks:**

This method will return an existing Point3 channel.

**Parameters:**

**int nChan**

The Point3 channel you wish to return.

# Class IllumParams

See Also: [Class Shader](#), [Class Point3](#), [Class Color](#).

```
class IllumParams : public BaseInterfaceServer
```

## Description:

This class is available in release 3.0 and later only.

This class allows the Standard material to get the parameters from a Shader plug-in. It also allows the Shader to supply its computed color data back to the Standard material. The Standard material will handle the texturing but it needs to know the color before the texturing is done.

The shader object holds some raw parameters. But these parameters may be textured. So for each pixel that will be shaded, the 3ds max shade routine asks the shader to fill in the raw values. Then it applies the texture over the top of any of the values which are textured.

## Data Members:

public:

### **Shader\* pShader;**

This parameter is available in release 4.0 and later only.

A pointer to the shader.

### **Mtl\* pMtl;**

This parameter is available in release 4.0 and later only.

A pointer to the material being shaded or NULL if it's a background.

### **Color channels[32];**

A color channel for each of the possible parameters that may be textured. Note that these channels don't have specific meanings. They are defined by each Shader. The Shader tells the Standard material what data is in these channels using its **ChannelType()** and **StdIDToChannel()** methods.

### **float falloffOpac;**

Shaders using standard opacity can ignore this data member. This is available for certain Shaders which don't use the standard 3ds max transparency equation. This allows these Shaders to simulate the 3ds max version. This is the pre-computed textured opacity with standard falloff applied. The value here is pre-computed to consider all the standard opacity settings of falloff direction, etc. The standard transparency computation then uses this after

shading. So a shader could modify this value if it wanted to affect the transparency.

Note: The regular opacity can be obtained from the channel data.

### **float kR;**

This value is used when there is a reflection and an atmosphere present. Normally if there is no atmosphere (for instance no Fog in the scene) then the transparency of the reflection is 100% (it is unaffected). However, if there is an atmosphere present it will impart some level of opacity. This opacity (alpha value) is not available via the reflection color. Thus this data member is here to provide this opacity information to the Shader.

This value is the alpha which is returned by the reflection query that has the transparency of the atmosphere contained within it, which is then multiplied by the Amount spinner. This can then be used either by the Shader or by the standard handling for reflection maps.

### **ULONG hasComponents;**

These are the bits for the active components of bump, reflection, refraction and opacity mapping. If the bit is set that component is active. This provides a quick way for a Shader to check if they're used (as opposed to looking through the **channels** array searching for these channel types).

**HAS\_BUMPS** -- If bump mapping is present this is set.

**HAS\_REFLECT** -- If there is any kind of reflection (raytraced, etc) then this is set.

**HAS\_REFRACT** -- If there is any kind of refraction then this is set..

**HAS\_OPACITY** -- If opacity mapping is used this is set.

**HAS\_REFLECT\_MAP** -- If there is a reflection map only this is set. This is used by the Straus shader for example. If it sees a reflection map present it dims the diffuse channel.

**HAS\_REFRACT\_MAP** -- If there is a refraction map only then this is set.

### **ULONG stdParams;**

The standard parameter bits. See [List of Shader Standard Parameter Flags](#). This is filled in by the Standard material.

### **Color ambIllumOut;**

This is the ambient output from the **Illum()** method.

**Color diffIllumOut;**

This is the diffuse output from the **Illum()** method.

**Color transIllumOut;**

This is the transparency output from the **Illum()** method.

**Color selfIllumOut;**

This is the self illumination output from the **Illum()** method.

**Color specIllumOut;**

This is the specular illumination output from the **Illum()** method.

**Color reflIllumOut;**

This is the reflection output from the **Illum()** method. Certain shaders may wish to store the reflection output here (as opposed to providing it in the **channels** array). This is the "raw " color from the direction of reflection (unattenuated). Some combiner implementations (**Shader::CombineComponents()**) can get the reflection data here, others may get it from the channels.

**float diffIllumIntens;**

Used only by reflection dimming, intensity of diffIllum prior to color multiply.

**float finalAttenuation;**

The final attenuation for combining components.

**float finalOpac;**

This is the final opacity value used for combining components together in **Shader::CombineComponents()**.

**Color finalC;**

This is the final output color that the **Shader::CombineComponents()** composites together.

**Color finalT;**

This is the final Shader transparency color output.

**Methods:**

public:

**Prototype:**

```
void ClearOutputs();
```

**Remarks:**

This method is called by the Standard material prior to calling the **Illum()** method of the Shader. It sets to black all the output colors:

```
ambIllumOut=diffIllumOut=transIllumOut=selfIllumOut=  
specIllumOut=reflIllumOut=Color(0.0f, 0.0f, 0.0f);
```

## Class InterfaceServer

See Also: [Class BaseInterface](#), [Class IObject](#), [Function Publishing System](#).

class InterfaceServer

### Description:

This class is available in release 4.0 and later only.

Class InterfaceServer is the base class for interface servers in 3ds max and should be inherited by any class that wishes to implement the GetInterface() protocol. The InterfaceServer also adds a data member for storing interfaces, typically extension interfaces added to maintain API binary compatibility.

### Methods:

public:

### Prototype:

```
virtual BaseInterface* GetInterface(Interface_ID id) = 0;
```

### Remarks:

Returns a pointer to the interface whose ID is specified.

### Parameters:

**Interface\_ID id**

The ID of the interface to return.

### Default Implementation:

```
{ return NULL; }
```

## Class IIRenderMgr

See Also: [Class InterfaceServer](#), [Class IInteractiveRender](#) ,  
[IIRenderMgrSelector](#) , [Class ViewExp](#)

```
class IIRenderMgr : public InterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

This class represents the abstract (interface) for an interactive rendering manager.

### Methods:

public:

### Prototype:

```
virtual bool CanExecute() = 0;
```

### Remarks:

This method will indicate the viewport has valid data and can execute.

### Prototype:

```
virtual void SetActive(bool active) = 0;
```

### Remarks:

This method allows you to activate and deactivate the current interactive rendering manager.

### Parameters:

**bool active**

TRUE to enable; FALSE to disable.

### Prototype:

```
virtual TCHAR* GetName() = 0;
```

### Remarks:

This method will return the name of the render manager.

### Prototype:

**virtual bool IsActive() = 0;**

**Remarks:**

This method returns TRUE if the current interactive rendering manager is active, otherwise FALSE.

**Prototype:**

**virtual BOOL AreAnyNodesSelected() const = 0;**

**Remarks:**

This method returns TRUE if the rendering manager has any selected notes or FALSE if there are none.

**Prototype:**

**virtual IIRenderMgrSelector\* GetNodeSelector() = 0;**

**Remarks:**

This method allows you to get the interface that determines whether nodes are selected.

**Prototype:**

**virtual HWND GetHwnd() const = 0;**

**Remarks:**

This method returns a handle to the current window which is being rendered to.

**Prototype:**

**virtual ViewExp \*GetViewExp() = 0;**

**Remarks:**

This method returns a pointer to the ViewExp associated with the current interactive rendering manager.

**Prototype:**

**virtual void SetPos(int X, int Y, int W, int H) = 0;**

**Remarks:**

This method allows you to set the position and size of the window being rendered to.

**Parameters:**

**int X, int Y**

The x and y screen coordinates of the window.

**int W, int H**

The width and height of the window.

**Prototype:**

**virtual void Show() = 0;**

**Remarks:**

This method will show the window currently being rendered to.

**Prototype:**

**virtual void Hide() = 0;**

**Remarks:**

This method will hide the window currently being rendered to.

**Prototype:**

**virtual void UpdateDisplay() = 0;**

**Remarks:**

This method will issue an update of the current display.

**Prototype:**

**virtual void Render() = 0;**

**Remarks:**

This method starts the actual rendering process.

**Prototype:**

**virtual void SetDelayTime(int msecDelay) = 0;**

**Remarks:**

This method allows you to set the delay time in milliseconds.

**Prototype:**

**virtual int GetDelayTime() = 0;**

**Remarks:**

This method returns the delay time in milliseconds.

**Prototype:**

**virtual void Close() = 0;**

**Remarks:**

This method will close the window currently being rendered to.

**Prototype:**

**virtual void Delete() = 0;**

**Remarks:**

This method will delete this render manager.

**Prototype:**

**virtual void SetCommandMode(CommandMode commandMode)  
= 0;**

**Remarks:**

This method allows you to set the command mode.

**Parameters:**

**CommandMode commandMode**

One of the following; **CMD\_MODE\_DRAW\_REGION**, or  
**CMD\_MODE\_SELECT\_OBJECT**.

**Prototype:**

**virtual CommandMode GetCommandMode() const = 0;**

**Remarks:**

This method returns the command mode, which is one of the following;

**CMD\_MODE\_DRAW\_REGION**, or  
**CMD\_MODE\_SELECT\_OBJECT**.

**Prototype:**

**virtual void SetActOnlyOnMouseUp(bool actOnlyOnMouseUp) = 0;**

**Remarks:**

This method allows you to define whether an interactive rendering action and update should be issued when the mouse button is released upward.

**Parameters:**

**bool actOnlyOnMouseUp**

TRUE to act only on mouse-up, otherwise FALSE.

**Prototype:**

**virtual bool GetActOnlyOnMouseUp() const = 0;**

**Remarks:**

This method returns TRUE if the interactive rendering action and update should be issued when the mouse button is released upward, otherwise FALSE.

**Prototype:**

**virtual void ToggleToolbar() const = 0;**

**Remarks:**

This method toggles the toolbar display mode (for docked windows).

**Prototype:**

**virtual IImageViewer::DisplayStyle GetDisplayStyle() const = 0;**

**Remarks:**

This method returns the display style of the window being rendered in, which is one of the following; **IV\_FLOATING** or **IV\_DOCKED**.

**Prototype:**

**virtual BOOL IsRendering() = 0;**

**Remarks:**

This method returns TRUE if the renderer is currently rendering, otherwise FALSE.

**Prototype:**

**static IIRenderMgr\* GetActiveIIRenderMgr();**

**Remarks:**

This method returns a pointer to the active interactive rendering manager, or NULL if none exist.

**Prototype:**

**static unsigned int GetNumIIRenderMgrs();**

**Remarks:**

This method returns the number of interactive rendering managers.

**Prototype:**

**static IIRenderMgr\* GetIIRenderMgr(unsigned int i);**

**Remarks:**

This method returns a pointer to the I-th interactive rendering manager.

**Parameters:**

**unsigned int i**

The index of the IIRenderMgr to return.

## Class IRenderProgressCallback

See Also: [Class IInteractiveRender](#), [Class RendProgressCallback](#) , [Class Color](#)

class IRenderProgressCallback : public RendProgressCallback

### Description:

This class is available in release 4.0 and later only.

This class represent a callback object which can be used with an interactive renderer.

Information set via **RendProgressCallback::SetCurField()** or **RendProgressCallback::SetSceneStats()** will be ignored. if a title is set via the inherited method **SetTitle()**, it will appear in the main status bar, but will be replaced by the 'IRenderTitle' when necessary.

### Methods:

public:

### Prototype:

```
virtual void SetProgressLineOrientation(LineOrientation orientation) = 0;
```

### Remarks:

This method allows you to set the orientation of the progress line shown during rendering.

### Parameters:

**LineOrientation orientation**

The line orientation which is one of the following; **LO\_Horizontal** or **LO\_Vertical**.

### Prototype:

```
virtual LineOrientation GetProgressLineOrientation() const = 0;
```

### Remarks:

This method allows you to retrieve the orientation of the progress line shown during rendering.

### Return Value:

The line orientation which is one of the following; **LO\_Horizontal** or **LO\_Vertical**.

**Prototype:**

**virtual void SetProgressLineColor(const Color& color) = 0;**

**Remarks:**

This method allows you to set the color of the progress line shown during rendering.

**Parameters:**

**const Color& color**

The color to set the progress line to.

**Prototype:**

**virtual const Color& GetProgressLineColor() const = 0;**

**Remarks:**

This method returns the color of the progress line shown during rendering.

**Prototype:**

**virtual void SetIRenderTitle(const TCHAR \*pProgressTitle) = 0;**

**Remarks:**

This method allows you to set the current title. This will appear in the main status bar as "'Title': xx% complete". If no title is provided, 'ActiveShade' will be used instead.

**Parameters:**

**const TCHAR \*pProgressTitle**

The progress title string.

**Prototype:**

**virtual const TCHAR \*GetIRenderTitle() const = 0;**

**Remarks:**

This method returns the current title.

## Class FPStaticInterface

See Also: [Class FPInterfaceDesc](#).

```
class FPStaticInterface: public FPInterfaceDesc
```

### Description

This class is currently the same as **FPInterfaceDesc** as per the following typedef:

```
typedef FPInterfaceDesc FPStaticInterface
```

See [Class FPInterfaceDesc](#) for details.

## Class BaseInterface

See Also: [Class InterfaceServer](#), [Class InterfaceNotifyCallback](#), [Class FPInterface](#), [Function Publishing System](#).

```
class BaseInterface : public InterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

This class represents the base class for interfaces in 3ds max. The BaseInterface class should be used as the base class for any new interface class in 3ds max and provides basic identity, memory management, and cloning methods. **Class FPInterface**, which is part of the Function Publishing system, has the BaseInterface class as its base class.

### Methods:

public:

### Prototype:

```
virtual Interface_ID GetID() = 0;
```

### Remarks:

This method returns the unique interface ID.

### Prototype:

```
virtual LifetimeType LifetimeControl()
```

### Remarks:

This method allows enquiries into the actual lifetime policy of a client and provide a server-controlled delete notify callback.

### Return Value:

One of the following LifetimeTypes:

#### **noRelease**

Do not call release, use interface as long as you like.

#### **immediateRelease**

The interface is only good for one calls. The release is implied so a call to release is not required.

### **wantsRelease**

The clients are controlling the lifetime, so the interface needs a Release() when the client has finished. This is the default.

### **serverControlled**

The server controls the lifetime and will use the InterfaceNotifyCallback to inform the code when it is gone.

#### **Default Implementation:**

```
{ return noRelease; }
```

#### **Prototype:**

```
virtual void
```

```
RegisterNotifyCallback(InterfaceNotifyCallback<BaseInterface>*  
incb);
```

#### **Remarks:**

This method allows you to register an interface notify callback.

#### **Parameters:**

```
InterfaceNotifyCallback<BaseInterface>* incb
```

A pointer to the interface notify callback.

#### **Default Implementation:**

```
{ }
```

#### **Prototype:**

```
virtual void
```

```
UnRegisterNotifyCallback(InterfaceNotifyCallback<BaseInterface>  
incb);
```

#### **Remarks:**

This method allows you to un-register an interface notify callback.

#### **Parameters:**

```
InterfaceNotifyCallback<BaseInterface>* incb
```

A pointer to the interface notify callback.

#### **Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual bool Acquire(InterfaceNotifyCallback* incb=NULL);
```

**Remarks:**

This method is part of the interface reference management and can be implemented by dynamically allocated interfaces for ref-count based lifetime control). This method should return TRUE if it needs **Release()** to be called.

**Parameters:**

**InterfaceNotifyCallback\* incb**

A pointer to an InterfaceNotifyCallback class which will be used to signal deletion (usually a mixin).

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

```
virtual void Release(InterfaceNotifyCallback* incb=NULL);
```

**Remarks:**

This method is called when a reference to this object is deleted.

**Parameters:**

**InterfaceNotifyCallback\* incb**

A pointer to an InterfaceNotifyCallback class which will be used to signal deletion (usually a mixin).

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void DeleteInterface();
```

**Remarks:**

This method can be used as a direct interface delete request.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual BaseInterface* CloneInterface(void* remapDir = NULL);
```

**Remarks:**

This method allows you to clone the base interface.

**Parameters:**

**void\* remapDir**

The RemapDir passed to the clone method.

**Default Implementation:**

```
{ return NULL; }
```

## Class IMaxBitmapViewer

See Also: [Class IImageViewer](#), [Class Bitmap](#), [Class CropCallback](#)

```
class IMaxBitmapViewer : public IImageViewer
```

### Description:

This class is available in release 4.0 and later only.

This class represents an abstract interface class for a default bitmap viewer.

The following functions are available for use but are not part of the class IMaxBitmapViewer.

Note that the minimum size of the floating window is 390 x 325.

### Function:

```
IMaxBitmapViewer* CreateIMaxBitmapViewer(Bitmap*  
pBitmap, IImageViewer::DisplayStyle displayStyle);
```

### Remarks:

This function allows you to create a new bitmap viewer as either a floating window or docked in a viewport.

### Parameters:

**Bitmap\* pBitmap**

The bitmap to use with the viewer. This should not be NULL.

**IImageViewer::DisplayStyle displayStyle**

The display style for the viewer, which is either **IV\_FLOATING** or **IV\_DOCKED**.

### Return Value:

A pointer to a new IMaxBitmapViewer or NULL if the viewer could not be created.

### Function:

```
void ReleaseIMaxBitmapViewer(IMaxBitmapViewer *);
```

### Remarks:

This method will delete and release the specified bitmap viewer. This method should not be used while the viewer is being displayed. Use **UnDisplay()** or

**Hide()** before calling this method.

**Parameters:**

**IMaxBitmapViewer \***

A pointer to the viewer.

**Methods:**

public:

**Prototype:**

**virtual void SetBitmap(Bitmap\* pBitmap) = 0;**

**Remarks:**

This method allows you to set the bitmap which should be displayed in the bitmap viewer.

Note: This is for internal use only.

**Parameters:**

**Bitmap\* pBitmap**

A pointer to the bitmap to display.

**Prototype:**

**virtual Bitmap\* GetBitmap() const = 0;**

**Remarks:**

This method returns a pointer to the bitmap that is being displayed by the bitmap viewer.

**Prototype:**

**virtual void SetCropCB(CropCallback\* pCropCallback) = 0;**

**Remarks:**

This method allows you to set the crop callback function which will assist in interactive adjustments of the bitmap cropping rectangle. This method should not be called after the window has been displayed. Preferably the callback should be set before the window is displayed or after the window has been destroyed.

**Parameters:**

## **CropCallback\* pCropCallback**

A pointer to the callback function to set.

### **Prototype:**

```
virtual CropCallback* GetCropCB() const = 0;
```

### **Remarks:**

This method returns a pointer to the crop callback function used by the bitmap viewer.

### **Prototype:**

```
virtual void SetAutonomous(bool isAutonomous) = 0;
```

### **Remarks:**

This method allows you to set whether the bitmap viewer is autonomous or not. When the bitmap viewer is set in autonomous mode, the viewer will not have a clone button, although the viewer will not display a clone button unless the save button is also displayed. Changes will not take effect until the next time the viewer is displayed using **Display()**.

### **Parameters:**

**bool isAutonomous**

TRUE to set the viewer to autonomous, otherwise FALSE.

### **Prototype:**

```
virtual bool GetAutonomous() const = 0;
```

### **Remarks:**

This method returns TRUE if the viewer is autonomous, otherwise FALSE. When the bitmap viewer is set in autonomous mode, the viewer will not have a clone button, although the viewer will not display a clone button unless the save button is also displayed.

### **Prototype:**

```
virtual void SetCurrentPosition(WindowPosition currentPosition)  
= 0;
```

### **Remarks:**

A call to this method will never impact the current opened window. This function should be used prior to calling **Display()** in order to specify the position of the next created window.

**Prototype:**

**virtual WindowPosition GetCurrentPosition() const = 0;**

**Remarks:**

This method returns the current position of the bitmap viewer.

**Prototype:**

**virtual void SetShowSaveButton(bool showSaveButton) = 0;**

**Remarks:**

This method allows you to set whether or not the save button should be shown as part of the bitmap viewer window. A change will not take effect until the next time the viewer is opened via **Display()**.

**Parameters:**

**bool showSaveButton**

TRUE to show; FALSE to hide.

**Prototype:**

**virtual bool GetShowSaveButton() const = 0;**

**Remarks:**

This method returns TRUE if the save button is shown as part of the bitmap viewer window, otherwise FALSE.

**Prototype:**

**virtual bool Display(TCHAR \*title, WindowPosition position = WPos\_Center) = 0;**

**Remarks:**

This method will display the bitmap image viewer. Note that the **Show()** and **Hide()** methods have no effect until the window is initialized by a call to **Display()**. This method should not be called when the window is already

open and this method can't be used to create a docked viewer.

You should also not call this twice on this interface. The second time the function is called, the viewer will lose all references to the previously opened window. To switch images using the same bitmap viewer, a call to "UnDisplay" should be made to close the previous window before calling this method again.

**Parameters:**

**TCHAR \*title**

The title of the window to set.

**WindowPosition position = WPos\_Center**

The window position you wish to set, which is one of the following enum values; **WPos\_NULL**, **WPos\_UpperLeft**, **WPos\_LowerLeft**, **WPos\_UpperRight**, **WPos\_LowerRight**, **WPos\_Center**.

**Return Value:**

TRUE if successful, otherwise FALSE.

**Prototype:**

```
virtual bool Display(TCHAR *title, HWND hParent, int x, int y,  
int w, int h) = 0;
```

**Remarks:**

This method will display the bitmap image viewer. Note that the **Show()** and **Hide()** methods have no effect until the window is initialized by a call to **Display()**. For docked viewers, the **hParent** parameter is the window into which the viewer will be docked. For floating viewers, the parameter has no effect.

You should also not call this twice on this interface. The second time the function is called, the viewer will lose all references to the previously opened window. To switch images using the same bitmap viewer, a call to "UnDisplay" should be made to close the previous window before calling this method again.

**Parameters:**

**TCHAR \*title**

The title of the window to set.

**HWND hParent**

A handle to the parent window.

**int x, y, h, w**

The position and dimensions of the window.

Note that these parameters will be ignored unless 'Current Position' is

**WPos\_NULL**.

**Return Value:**

TRUE if successful, otherwise FALSE.

**Prototype:**

**virtual bool UnDisplay() = 0;**

**Remarks:**

This method will undisplay the current bitmap image. The **Show()** and **Hide()** methods will no longer function after the window is destroyed.

**Prototype:**

**virtual void ClearScreen() = 0;**

**Remarks:**

This method will clear the bitmap image viewer window contents. This will not delete the window as it would using the Delete button on the viewer toolbar which actually deletes the contents of the bitmap.

**Prototype:**

**virtual POINT XFormScreenToBitmap(const POINT &pt) const = 0;**

**Remarks:**

This method will transform a specified point between the window's client coordinates and the bitmap coordinates and return the result.

**Parameters:**

**const POINT &pt**

The point on screen.

**Prototype:**

**virtual POINT XFormBitmapToScreen(const POINT &pt) const = 0;**

**Remarks:**

This method will transform a specified point between the window's client coordinates and the bitmap coordinates and return the result.

**Parameters:**

**const POINT &pt**

The point on the bitmap.

**Prototype:**

**virtual Rect XFormScreenToBitmap(const Rect &rect) const = 0;**

**Remarks:**

This method will transform a specified rectangle between the window's client coordinates and the bitmap coordinates and return the result.

**Parameters:**

**const Rect &rect**

The screen rectangle.

**Prototype:**

**virtual Rect XFormBitmapToScreen(const Rect &rect) const = 0;**

**Remarks:**

This method will transform a specified rectangle between the window's client coordinates and the bitmap coordinates and return the result.

**Parameters:**

**const Rect &rect**

The bitmap rectangle.

**Prototype:**

**virtual void ShowToolbar(bool show) = 0;**

**Remarks:**

This method allows you to set whether the toolbar should be shown as part of

the bitmap image viewer window.

**Parameters:**

**bool show**

TRUE to show; FALSE to hide.

**Prototype:**

**virtual void ToggleToolbar() = 0;**

**Remarks:**

This method allows you to toggle the toolbar of the bitmap image viewer window on and off.

**Prototype:**

**virtual void GetDrawableRect(Rect& drawableRect) = 0;**

**Remarks:**

This method will retrieve the portion of the window's client area that is safe to draw in (in client coordinates and below the toolbar). This method can return a value larger than the displayed bitmap if the window size is large enough.

**Parameters:**

**Rect& drawableRect**

The client area.

**Prototype:**

**virtual void RefreshWindow(Rect\* pRefreshRegion = NULL) = 0;**

**Remarks:**

This method will refresh the region of the window, or the entire window if region is NULL

**Parameters:**

**Rect\* pRefreshRegion = NULL**

The region of the window you wish to refresh.

## Class IMenu

See Also: [Class IMenuElement](#), [Class IMenuItem](#), [Class IMenuGlobalContext](#), [Class IMenuLocalContext](#), [Structure MenuEvent](#), [Class IPoint2](#), [Class Interface](#).

```
class IMenu : public IMenuElement
```

### Description:

This class is available in release 4.0 and later only.

This abstract class represents an interface for a menu item. Methods that are marked as internal should not be used.

### Methods:

public:

### Prototype:

```
virtual void SetIMenuGlobalContext(IMenuGlobalContext*  
pIMenuGlobalContext) = 0;
```

### Remarks:

This method is used internally.

This method sets a new context for the menu, invalidating the menu's cache.

### Parameters:

**IMenuGlobalContext\* pIMenuGlobalContext**

Points to the context to set.

### Prototype:

```
virtual IMenuLocalContext* GetIMenuLocalContext() = 0;
```

### Remarks:

This method is used internally.

Returns a pointer to the menu's local context.

### Prototype:

```
virtual int NumItems() const = 0;
```

### Remarks:

Returns the number of items in the menu.

**Prototype:**

**virtual IMenuItem\* GetItem(int position) = 0;**

**Remarks:**

Returns a pointer to the specified menu item.

**Parameters:**

**int position**

The position/index in the menu.

**Prototype:**

**virtual void AddItem(IMenuItem\* item, int position = -1) = 0;**

**Remarks:**

This method adds the specified item into the menu at the position passed. The default position is at the end.

**Parameters:**

**IMenuItem\* item**

Points to the menu item to add.

**int position = -1**

Position 0 indicates the beginning of the list. A negative or otherwise invalid position defaults to end of list.

**Prototype:**

**virtual void RemoveItem(int position) = 0;**

**Remarks:**

Removes the item from the menu whose position is passed.

**Parameters:**

**int position**

The zero based index in the list of the item to remove. Position 0 is the first item.

**Prototype:**

**virtual void RemoveItem(IMenuItem\* item) = 0;**

**Remarks:**

Removes the specified item from the menu (if it indeed appears in the menu).

**Parameters:**

**IMenuItem\* item**

Points to the menu item to remove.

**Prototype:**

**virtual IPoint2 GetMaxItemSize() = 0;**

**Remarks:**

This method is used internally.

Returns the maximum size of all items in the menu in pixels.

**Prototype:**

**virtual void Initialize() = 0;**

**Remarks:**

This method is used internally.

This method is called before menu is first displayed during a user / menu interaction.

**Prototype:**

**virtual void PostMenuInteraction() = 0;**

**Remarks:**

This method is used internally.

This method is called after a user / menu interaction.

**Prototype:**

**virtual bool HandleEvent(MenuEvent event) = 0;**

**Remarks:**

This method is used internally.

This method is called to handle an event occurring within the menu.

**Parameters:**

**MenuEvent event**

A menu event structure containing the event data.

**Return Value:**

TRUE if the event was handled successfully, otherwise FALSE.

**Prototype:**

```
virtual void Show(DisplayMethod displayMethod =  
DM_NORMAL, Box2 *rect = NULL) = 0;
```

**Remarks:**

This method is used internally.

This method will display the menu using the provided display method.

**Prototype:**

```
virtual void Hide(DisplayMethod displayMethod =  
DM_NORMAL) = 0;
```

**Remarks:**

This method is used internally.

This method will hide the menu using the provided display method.

**Prototype:**

```
virtual IMenuItem* FindAccelItem(TCHAR accelerator) = 0;
```

**Remarks:**

This method is used internally.

Finds and returns a pointer to the menu item whose accelerator is passed.

**Parameters:**

**TCHAR accelerator**

The single character of the accelerator.

**Return Value:**

A pointer to the menu item or NULL if not found.

**Prototype:**

```
virtual IMenuItem* FindNewSelectedItem() = 0;
```

**Remarks:**

This method is used internally.

Returns a pointer to the currently selected menu item.

**Prototype:**

**virtual void Display(IMenu\* pParentMenu = NULL) = 0;**

**Remarks:**

This method is used internally.

This method displays the menu.

**Parameters:**

**IMenu\* pParentMenu = NULL**

Points to the parent menu.

**Prototype:**

**virtual void DisplayItems(IPoint2& origin, bool descending) = 0;**

**Remarks:**

This method is used internally.

**Prototype:**

**virtual void Undisplay() = 0;**

**Remarks:**

This method is used internally.

This method removes the menu from the display.

**Prototype:**

**virtual bool IsDisplayingSubMenu() = 0;**

**Remarks:**

This method is used internally.

Returns TRUE if the menu is displaying a sub-menu; otherwise FALSE.

**Prototype:**

**virtual void TimerElapsed(EventParam timingType) = 0;**

**Remarks:**

This method is used internally.

This method notifies the menu that the timer has elapsed.

**Prototype:**

```
virtual void SetShowTitle(bool showTitle) = 0;
```

**Remarks:**

This method is used internally.

Sets whether to show the title or not.

**Parameters:**

**bool showTitle**

Pass true to show the title; false to not show it.

**Prototype:**

```
virtual bool GetShowTitle() const = 0;
```

**Remarks:**

This method is used internally.

Returns true if a title is shown; otherwise false.

**Prototype:**

```
virtual void SetCustomTitle(const TCHAR *customTitle) = 0;
```

**Remarks:**

Sets the custom title to the string passed.

**Parameters:**

**const TCHAR \*customTitle**

Points to the string to use.

**Prototype:**

```
virtual const TSTR& GetCustomTitle() const = 0;
```

**Remarks:**

Returns the custom title string.

**Prototype:**

**virtual void SetUseCustomTitle(bool useCustomTitle) = 0;**

**Remarks:**

Sets if the item should use a custom title.

**Parameters:**

**bool useCustomTitle**

Pass true to use a custom title; false to not use one.

**Prototype:**

**virtual bool GetUseCustomTitle() const = 0;**

**Remarks:**

This method returns TRUE if the menu uses a custom title, otherwise FALSE.

**Prototype:**

**virtual void SetUseGlobalWidths(bool useGlobalWidths) = 0;**

**Remarks:**

This method is used internally.

This method allows you to instruct the menu to use global widths in order to show the title.

**Parameters:**

**bool useGlobalWidths**

TRUE to use global widths, otherwise FALSE.

**Prototype:**

**virtual bool GetUseGlobalWidths() const = 0;**

**Remarks:**

This method is used internally.

This method returns TRUE if the menu uses global widths in order to show the title, otherwise FALSE.

**Prototype:**

**virtual bool NoVisibleItems() = 0;**

**Remarks:**

This method is used internally.

Returns true if the menu has no visible items in it; otherwise false.

**The following functions are not part of the class but are available for use.**

**Function:**

**IMenu \* GetIMenu();**

**Remarks:**

This method will return a pointer to the IMenu.

**Prototype:**

**void ReleaseIMenu(IMenu \*);**

**Remarks:**

This method will release the specified IMenu.

**Parameters:**

**IMenuItem \***

A pointer to the IMenu you wish to release.

## Class IMenuBarContext

See Also: [Class IMenuContext](#), [Class Interface](#).

class IMenuBarContext: public IMenuContext

### Description:

This class is available in release 4.0 and later only.

### Description:

This class is available in release 4.0 and later only.

This abstract class represents an interface for a menu bar context. Methods that are marked as internal should not be used.

### Methods:

public:

### Prototype:

**virtual void SetMenu(IMenu\* pMenu) = 0;**

### Remarks:

This method allows you to set the menu associated with this context.

### Parameters:

**IMenu\* pMenu**

A pointer to the menu.

### Prototype:

**virtual IMenu\* GetMenu() = 0;**

### Remarks:

This method returns a pointer to the menu associated with this context.

### Prototype:

**virtual HMENU CreateWindowsMenu() = 0;**

### Remarks:

Used Internally.

This method will create a new windows menu and return it's handle.

**Prototype:**

**virtual void UpdateWindowsMenu() = 0;**

**Remarks:**

Used Internally.

This method will update the current windows menu.

**Prototype:**

**virtual HMENU GetCurWindowsMenu() = 0;**

**Remarks:**

Used Internally.

This method returns the handle to the current windows menu.

**Prototype:**

**virtual void ExecuteAction(int cmdId) = 0;**

**Remarks:**

This method executes an action based on the provided command ID.

**Parameters:**

**int cmdId**

The command ID of the action to execute.

**Prototype:**

**virtual bool CommandIDInRange(int cmdId) = 0;**

**Remarks:**

Used internally.

**Parameters:**

**int cmdId**

The command ID.

## Class IQuadMenuContext

See Also: [Class IMenuContext](#), [Class Interface](#), [List of Right-Click Contexts](#).

```
class IQuadMenuContext: public IMenuContext
```

### Description:

This class is available in release 4.0 and later only.

This abstract class represents the interface for a quad menu bar context and provides the functionality to manage the quad menu context by adding and removing menu sections.

Note that methods marked for internal use only should not be used.

### Methods:

public:

### Prototype:

```
virtual bool AddQuadMenu(IQuadMenu* pMenu, TCHAR* pName) = 0;
```

### Remarks:

This method allows you to add a new quad menu to the context.

### Parameters:

**IQuadMenu\* pMenu**

A pointer to the quad menu you wish to add.

**TCHAR\* pName**

The name of the quad menu.

### Return Value:

TRUE if the quad menu is successfully added, otherwise FALSE.

### Prototype:

```
virtual void SetMenu(int index, IQuadMenu* pMenu, TCHAR* pName) = 0;
```

### Remarks:

This method allows you to set a quad menu for a slot in the context.

**Parameters:**

**int index**

The index of the slot in the context.

**IQuadMenu\* pMenu**

A pointer to the quad menu you wish to set.

**TCHAR\* pName**

The name of the quad menu.

**Prototype:**

**virtual void RemoveMenu(int index) = 0;**

**Remarks:**

This method allows you to remove a quad menu from the context.

**Parameters:**

**int index**

The index of the quad menu to remove.

**Prototype:**

**virtual int MenuCount() = 0;**

**Remarks:**

This method returns the number of quad menu's in this context.

**Prototype:**

**virtual IQuadMenu\* GetMenu(int index) = 0;**

**Remarks:**

This method returns a pointer to a quad menu based on its index in the context.

**Parameters:**

**int index**

The index of the quad menu you wish to retrieve.

**Prototype:**

**virtual int GetCurrentMenuIndex() = 0;**

**Remarks:**

This method returns the index of the currently set default right-click menu.

**Prototype:**

```
virtual void SetCurrentMenuIndex(int index) = 0;
```

**Remarks:**

This method allows you to set the current default right-click menu.

**Parameters:**

**int index**

The index of the menu you wish to set as the default menu.

**Prototype:**

```
virtual bool GetShowAllQuads(int index) = 0;
```

**Remarks:**

This method returns the state of the "Show All Menus" flag in each quad registered in the menu manager. TRUE if the flag is set or FALSE if the flag is not set.

**Parameters:**

**int index**

The index of the quad menu.

**Prototype:**

```
virtual void SetShowAllQuads(int index, bool showAll) = 0;
```

**Remarks:**

This method allows you to set the "Show All Menus" flag in each quad registered in the menu manager.

**Parameters:**

**int index**

The index of the quad menu.

**bool showAll**

Set this parameter to TRUE if you wish to enable the "Show All Menus" flag. Otherwise FALSE.

**Prototype:**

**virtual RightClickContext GetRightClickContext() = 0;**

**Remarks:**

This method queries the state of the modifier keys and returns the appropriate context.

**Return Value:**

See the [List of Right-Click Contexts..](#)

**Prototype:**

**virtual IQuadMenu\* GetRightClickMenu(RightClickContext context) = 0;**

**Remarks:**

This method returns a pointer to the quad menu which has been assigned to the specified right-click context, or NULL if no menu is assigned.

**Parameters:**

**RightClickContext context**

See the [List of Right-Click Contexts..](#)

**Prototype:**

**virtual void SetRightClickMenu(RightClickContext context, IQuadMenu \*pMenu) = 0;**

**Remarks:**

This method allows you to set the quad menu associated with a specific right-click context.

**Parameters:**

**RightClickContext context**

See the [List of Right-Click Contexts..](#)

**IQuadMenu \*pMenu**

A pointer to the quad menu you wish to set.

**Prototype:**

**virtual int FindMenu(IQuadMenu\* pMenu) = 0;**

**Remarks:**

This method returns the index for a specified quad menu, or -1 if the menu is not in the context.

**Parameters:****IQuadMenu\* pMenu**

A pointer to the quad menu you wish to obtain the index of.

**Prototype:****virtual IQuadMenu\* FindMenuByTitle(TCHAR\* pTitle) = 0;****Remarks:**

This method returns a pointer to a quad menu by specifying the title of the menu you wish to find. NULL will be returned if the menu was not found.

**Parameters:****TCHAR\* pTitle**

The title string of the menu.

## List of Right-Click Contexts

See Also: [Class IQuadMenuContext](#), [Class IMenuManager](#)

This is the list of the right-click contexts:

### **kNonePressed**

No key is pressed.

### **kShiftPressed**

The shift key is pressed.

### **kAltPressed**

The alt key is pressed.

### **kControlPressed**

The control key is pressed.

### **kShiftAndAltPressed**

The shift and alt keys are pressed.

### **kShiftAndControlPressed**

The shift and control keys are pressed.

### **kControlAndAltPressed**

The control and alt keys are pressed.

### **kShiftAndAltAndControlPressed**

The shift, alt, and control keys are pressed.

## List of Standard Color IDs

See Also: [Class IColorManager](#).

This is the list of the standard color IDs that 3ds max registers:

**kBackground** -- Used for all windows backgrounds.  
**kText** --Used for static and button text  
**kActiveCommand** --Used for active command mode buttons  
**kHilight** -- COLOR\_BTNHILIGHT  
**kShadow** -- COLOR\_BTNSHADOW  
**kWindow** -- COLOR\_WINDOW  
**kActiveCaption** -- COLOR\_ACTIVECAPTION  
**kToolTipBackground** -- COLOR\_INFOBK  
**kToolTipText** -- COLOR\_INFOTEXT  
**kHilightText** -- COLOR\_HILIGHTTEXT  
**kWindowText** -- COLOR\_WINDOWTEXT  
**kItemHilight** -- COLOR\_HILIGHT  
**kSubObjectColor** -- This is the blue sub-object color  
**k3dDarkShadow** -- COLOR\_3DDKSHADOW  
**k3dLight** -- COLOR\_3DLIGHT  
**kAppWorkspace** -- COLOR\_APPWORKSPACE  
**kTrackbarBg**  
**kTrackbarBgSel**  
**kTrackbarText**  
**kTrackbarTicks**  
**kTrackbarKeys**  
**kTrackbarSelKeys**  
**kTrackbarCursor**  
**kPressedButton**  
**kTimeSliderBg**  
**kViewportBorder**

**kActiveViewportBorder**

**kRollupTitleFace**

**kRollupTitleText**

**kRollupTitleHiligh**

**kRollupTitleShadow**

**kSelectionRubberBand**

**kStackViewSelection** -- This is the yellow sub-object color.

## Class DragAndDropHandler

See Also: [Class IDragAndDropMgr](#), [Class DropType](#)

```
class DragAndDropHandler : public InterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

The **DragAndDropHandler** class is the base class from which specialized drag-and-drop handlers should be derived. Instances of these classes can be registered with the **DragAndDropMgr** when enabling a window for DnD activity and virtual methods on them are called to handle the various DnD events. Use **IDragAndDropMgr::EnableDnD(hwnd, flag, handler)** to enable DnD in a window and specify the **DragAndDropHandler** instance that will handle DnD events for that window. Note that the event method calls all deliver the current target window as an explicit argument, so one instance can potentially be shared among many windows. Further, a parent window can be enabled for DnD and this effectively causes all child windows to be enabled and handled by the given handler (unless overridden by an explicit **EnableDnD** with a different handler on a child).

```
// enable DnD on my window
```

```
GetDragAndDropMgr()->EnabledDnD(hWnd, TRUE,  
&myHandler);
```

There are actually two sets of DnD event handler virtual methods in the base class, a low-level set that equates to the methods on the OLE **IDropTarget** interface that take raw **IDataObject** drop data and a high-level set that take fully-parsed **DropType** drop data. The low-level methods have default implementations provided that do this parsing and call the corresponding high-level method, so in most cases you only need to provide implementations for the high-level methods. You would provide implementations of the low-level methods if custom parsing of the **IDataObject** was required.

### Data Members:

```
protected:
```

```
DropType* current_droptype;
```

Cache for the currently parsed DropType. This is usually filled in during **DragEnter()** processing in the **DragAndDropHandler** for the current window.

**static IDragAndDropMgr\* dndMgr;**

Cached pointer to the DnD manager. For use by subclasses.

#### Methods:

public:

#### Prototype:

```
virtual HRESULT DragEnter(HWND window, IDataObject*  
pDataObject, DWORD grfKeyState, POINTL pt, DWORD*  
pdwEffect);
```

#### Remarks:

Override this method in your **DragAndDropHandler** subclass to get low-level control over DnD operations. This is just a redirect of the identical method called on the OLE **IDropTarget** interface, see MSDN docs for details.

The default implementation for this methods use the **DropClipFormat** and **DropType** classes to recognize and parse the incoming **IDataObject** into a **DropType** instance and hand this to the associated high-level DnD handler methods described next. As an example, here is the default **DragEnter()** implementation which does the initial parsing on entry to a window:

```
// DragAndDropHandler default methods, parse IDataObject into  
// DropTypes & hand-off main DnD methods to specific handlers  
HRESULT DragAndDropHandler::DragEnter(HWND hWnd,  
IDataObject* pDataObject, DWORD grfKeyState, POINTL pt,  
DWORD* pdwEffect)  
{  
    current_droptype = NULL;  
    // look for one of our accepted clip formats  
    DropClipFormat* cf =
```

```

DropClipFormat::FindClipFormat(pDataObject);
if (cf != NULL)
{
    // have one, get it to parse it into a DropType subclass
    current_droptype = cf->ParseDataObject(pDataObject);
    if (current_droptype != NULL)
    {
        // got recognizable drop data,
            // pass on to high-level method
        if(pdwEffect)
            *pdwEffect = DROPEFFECT_LINK|DROPEFFECT_COPY;
        POINT p = { pt.x, pt.y };
        DragEnter(hWnd, current_droptype,
                grfKeyState, p, pdwEffect);
        return S_OK;
    }
}
// nothing for us
if(pdwEffect)
    *pdwEffect = DROPEFFECT_NONE;
return S_OK;
}

```

**Parameters:**

**HWND window**

The specified handle to the window in which the DnD event is occurring. This is one of the windows that was enabled via a

**IDragAndDropMgr::EnabledDnD()** call, so it may be the parent of the lowest-level window that the mouse is actually over.

**IDataObject\* pDataObject**

The incoming IDataObject.

**DWORD grfKeyState**

The specified current state of the keyboard modifier keys on the keyboard. Valid values can be a combination of any of the flags **MK\_CONTROL**, **MK\_SHIFT**, **MK\_ALT**, **MK\_BUTTON**, **MK\_LBUTTON**, **MK\_MBUTTON**, and **MK\_RBUTTON**.

**POINTL pt**

The specified current cursor coordinates in the coordinate space of the drop-target window.

**DWORD\* pdwEffect**

On entry, pointer to the value of the **pdwEffect** parameter of the **DoDragDrop** function. On return, must contain one of the effect flags from the Win32 **DROPEFFECT** enumeration, which indicates what the result of the drop operation would be.

**Return Value:**

Standard return values of **E\_OUTOFMEMORY**, **E\_INVALIDARG**, **F\_UNEXPECTED**, and **E\_FAIL**, **S\_OK**.

**Prototype:**

```
virtual HRESULT Drop(HWND window, IDataObject*  
pDataObject, DWORD grfKeyState, POINTL pt, DWORD*  
pdwEffect);
```

**Remarks:**

This method will parse the dropped dataObject.

**Parameters:**

**HWND window**

The specified handle to the window in which the DnD event is occurring. This is one of the windows that was enabled via a **IDragAndDropMgr::EnabledDnD()** call, so it may be the parent of the lowest-level window that the mouse is actually over.

**IDataObject\* pDataObject**

The incoming IDataObject.

**DWORD grfKeyState**

The specified current state of the keyboard modifier keys on the keyboard. Valid values can be a combination of any of the flags **MK\_CONTROL**,

**MK\_SHIFT, MK\_ALT, MK\_BUTTON, MK\_LBUTTON, MK\_MBUTTON, and MK\_RBUTTON.**

**POINTL pt**

The specified current cursor coordinates in the coordinate space of the drop-target window.

**DWORD\* pdwEffect**

On entry, pointer to the value of the **pdwEffect** parameter of the **DoDragDrop** function. On return, must contain one of the effect flags from the Win32 **DROPEFFECT** enumeration, which indicates what the result of the drop operation would be.

**Return Value:**

Standard return values of **E\_OUTOFMEMORY, E\_INVALIDARG, F\_UNEXPECTED, and E\_FAIL, S\_OK.**

**Prototype:**

**virtual HRESULT DragOver(HWND window, DWORD grfKeyState, POINTL pt, DWORD \* pdwEffect);**

**Remarks:**

This method handles the process of dragging over a drop target.

**Parameters:**

**HWND window**

The specified handle to the window in which the DnD event is occurring. This is one of the windows that was enabled via a

**IDragAndDropMgr::EnabledDnD()** call, so it may be the parent of the lowest-level window that the mouse is actually over.

**DWORD grfKeyState**

The specified current state of the keyboard modifier keys on the keyboard.

Valid values can be a combination of any of the flags **MK\_CONTROL, MK\_SHIFT, MK\_ALT, MK\_BUTTON, MK\_LBUTTON, MK\_MBUTTON, and MK\_RBUTTON.**

**POINTL pt**

The specified current cursor coordinates in the coordinate space of the drop-target window.

## **DWORD\* pdwEffect**

On entry, pointer to the value of the **pdwEffect** parameter of the **DoDragDrop** function. On return, must contain one of the effect flags from the Win32 **DROPEFFECT** enumeration, which indicates what the result of the drop operation would be.

### **Return Value:**

Standard return values of **E\_OUTOFMEMORY**, **E\_INVALIDARG**, **F\_UNEXPECTED**, and **E\_FAIL**, **S\_OK**.

### **Prototype:**

```
virtual HRESULT DragEnter(HWND window, DropType* type,  
DWORD grfKeyState, POINT& pt, DWORD* pdwEffect);
```

### **Remarks:**

This is the high-level method called to handle DnD events with already recognized and parsed data object. Override the above methods as needed in your **DragAndDropHandler** subclass to handle DnD events.

### **Parameters:**

#### **HWND window**

The specified handle to the window in which the DnD event is occurring. This is one of the windows that was enabled via a **IDragAndDropMgr::EnabledDnD()** call, so it may be the parent of the lowest-level window that the mouse is actually over.

#### **DropType\* type**

The specified Pointer to the **DropType** instance that corresponds to the data in the dropped **IDataObject**. You can use **the DropType::TypeCode()** method to determine the droptype (see the built-in codes in the **DropType** section). Each **DropType** subclass instance has utility methods and public data members containing the parsed drop data. See each subclass definition for details.

#### **DWORD grfKeyState**

The specified current state of the keyboard modifier keys on the keyboard. Valid values can be a combination of any of the flags **MK\_CONTROL**, **MK\_SHIFT**, **MK\_ALT**, **MK\_BUTTON**, **MK\_LBUTTON**,

**MK\_MBUTTON**, and **MK\_RBUTTON**.

**POINT& pt**

The specified current cursor coordinates in the coordinate space of the drop-target window.

**DWORD\* pdwEffect**

On entry, pointer to the value of the **pdwEffect** parameter of the **DoDragDrop** function. On return, must contain one of the effect flags from the Win32 **DROPEFFECT** enumeration, which indicates what the result of the drop operation would be.

**Return Value:**

Standard return values of **E\_OUTOFMEMORY**, **E\_INVALIDARG**, **F\_UNEXPECTED**, and **E\_FAIL**, **S\_OK**.

**Default Implementation:**

```
{ return E_FAIL; }
```

**Prototype:**

```
virtual HRESULT Drop(HWND window, DropType* type,  
    DWORD grfKeyState, POINT& pt, DWORD* pdwEffect);
```

**Remarks:**

This method will parse the dropped dataObject.

Here's an example implementation of Drop() in the default handler:

```
HRESULT DefaultDragAndDropHandler::Drop(HWND hwnd,  
    DropType* type,  
    DWORD grfKeyState, POINT& pt, DWORD* pdwEffect)  
{  
    // This could take a while, set wait cursor  
    HCURSOR hOldCursor = SetCursor(LoadCursor(NULL,  
        IDC_WAIT));  
    HRESULT result = S_OK;  
  
    // load the dropped data if needed
```

```
if (type->Load())
{
    // see if dropped on a viewport, if so adjust point
    // to be vp-relative
    HWND vpwin = FindDropViewport(hwnd, pt);

    // Handle the drop depending on drop type
    BOOL bRet;
    switch (type->TypeCode())
    {
        case SCENEFILE_DROPTYPE:
            bRet = HandleDroppedGeom(
                hwnd, vpwin, pt,
                sceneFileDropType.current_package[0]);

            break;
        case IMAGEFILE_DROPTYPE:
            bRet = HandleDroppedBitmap(
                hwnd, vpwin, pt,
                imageFileDropType.current_package[0]);

            break;
        case DROPSCRIPTFILE_DROPTYPE:
            bRet = HandleDroppedDropScript(
                hwnd, vpwin, pt,
                dropScriptFileDropType.current_package[0]);

            break;
    }
    result = bRet ? S_OK : E_FAIL;
}
// restore cursor
SetCursor(hOldCursor);
```

```
    return result;
}
```

#### Parameters:

##### **HWND window**

The specified handle to the window in which the DnD event is occurring. This is one of the windows that was enabled via a **IDragAndDropMgr::EnabledDnD()** call, so it may be the parent of the lowest-level window that the mouse is actually over.

##### **DropType\* type**

The specified Pointer to the **DropType** instance that corresponds to the data in the dropped **IDataObject**. You can use **the DropType::TypeCode()** method to determine the droptype (see the built-in codes in the **DropType** section). Each **DropType** subclass instance has utility methods and public data members containing the parsed drop data. See each subclass definition for details.

##### **DWORD grfKeyState**

The specified current state of the keyboard modifier keys on the keyboard. Valid values can be a combination of any of the flags **MK\_CONTROL**, **MK\_SHIFT**, **MK\_ALT**, **MK\_BUTTON**, **MK\_LBUTTON**, **MK\_MBUTTON**, and **MK\_RBUTTON**.

##### **POINT& pt**

The specified current cursor coordinates in the coordinate space of the drop-target window.

##### **DWORD\* pdwEffect**

On entry, pointer to the value of the **pdwEffect** parameter of the **DoDragDrop** function. On return, must contain one of the effect flags from the Win32 **DROPEFFECT** enumeration, which indicates what the result of the drop operation would be.

#### Return Value:

Standard return values of **E\_OUTOFMEMORY**, **E\_INVALIDARG**, **F\_UNEXPECTED**, and **E\_FAIL**, **S\_OK**.

#### Default Implementation:

```
{ return E_FAIL; }
```

**Prototype:**

```
virtual HRESULT DragOver(HWND window, DWORD  
grfKeyState, POINT& pt, DWORD * pdwEffect);
```

**Remarks:**

This method handles the process of dragging over a drop target.

**Parameters:****HWND window**

The specified handle to the window in which the DnD event is occurring. This is one of the windows that was enabled via a

**IDragAndDropMgr::EnabledDnD()** call, so it may be the parent of the lowest-level window that the mouse is actually over.

**DWORD grfKeyState**

The specified current state of the keyboard modifier keys on the keyboard.

Valid values can be a combination of any of the flags **MK\_CONTROL**, **MK\_SHIFT**, **MK\_ALT**, **MK\_BUTTON**, **MK\_LBUTTON**, **MK\_MBUTTON**, and **MK\_RBUTTON**.

**POINT& pt**

The specified current cursor coordinates in the coordinate space of the drop-target window.

**DWORD\* pdwEffect**

On entry, pointer to the value of the **pdwEffect** parameter of the

**DoDragDrop** function. On return, must contain one of the effect flags from the Win32 **DROPEFFECT** enumeration, which indicates what the result of the drop operation would be.

**Return Value:**

Standard return values of **E\_OUTOFMEMORY**, **E\_INVALIDARG**, **F\_UNEXPECTED**, and **E\_FAIL**, **S\_OK**.

**Default Implementation:**

```
{ return E_FAIL; }
```

**Prototype:**

```
virtual HRESULT DragLeave(HWND window);
```

**Remarks:**

This method handles the process of the drag operation leaving the drop target window.

**Parameters:****HWND window**

The specified handle to the window in which the DnD event is occurring. This is one of the windows that was enabled via a

**IDragAndDropMgr::EnabledDnD()** call, so it may be the parent of the lowest-level window that the mouse is actually over.

**Return Value:**

Standard return values of **E\_OUTOFMEMORY**, **E\_INVALIDARG**, **F\_UNEXPECTED**, and **E\_FAIL**, **S\_OK**.

**Default Implementation:**

```
{ return E_FAIL; }
```

**Prototype:**

```
virtual void Acquire();
```

**Remarks:**

This method is called called when the DnD manager starts managing DnD events for a particular window for this handler. You can provide an implementation if you need to keep track of extant uses of the handler (say, by ref-counting) or to do handler-specific cleanup.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void Release();
```

**Remarks:**

This method is called called when the DnD manager stops managing DnD events for a particular window for this handler. You can provide an implementation if you need to keep track of extant uses of the handler (say, by ref-counting) or to do handler-specific cleanup.

**Default Implementation:**

**{ }**

## Class URLTab

See Also: [Class DragAndDropHandler](#)

```
class URLTab : public Tab<TCHAR*>
```

### Description:

This class is available in release 4.0 and later only.

The URLTab class is a **Tab<TCHAR\*>** utility class that is used by certain components in the Drag and Drop manager to hold and pass around packages of file URLs. The class manages its own local copies of URL strings. This class represents the additional API support by URLTab, over-and-above that provided by any **Tab<>** template instantiation.

### Data Members:

protected:

#### **BOOL downloaded;**

This flag is set to indicate the URL package has been downloaded and names will reflect local copies.

### Methods:

public:

### Prototype:

```
URLTab();
```

### Remarks:

Constructor.

### Default Implementation:

```
{ downloaded = FALSE; }
```

### Prototype:

```
~URLTab();
```

### Remarks:

Destructor.

URLTabs manage their own local string element copies, the destructor frees all these strings.

**Default Implementation:**

```
{ Clear(); }
```

**Prototype:**

```
URLTab& operator=(const Tab<TCHAR*>& tb);
```

**Remarks:**

Assignment operator.

**Prototype:**

```
URLTab& operator=(const URLTab& tb);
```

**Remarks:**

Assignment operator.

**Prototype:**

```
void Add(TCHAR* url);
```

**Remarks:**

This method adds a URL string to the package. A local copy of the string will be made.

**Parameters:**

**TCHAR\* url**

The URL string to add.

**Prototype:**

```
void Change(int i, TCHAR* url);
```

**Remarks:**

This method replaces the i'th element by deletes the old string, taking a local copy of the new one. This is used by the various loaders to replace a URL with its local copy path name upon download.

**Parameters:**

**int i**

The index of the URL to replace.

**TCHAR\* url**

The new URL string.

**Prototype:**

**void Clear();**

**Remarks:**

This method clears the package (deletes all the strings), zeros the Tab<> and resets 'downloaded' to FALSE.

## Class INodeDisplayControl

See Also: [Class InterfaceServer](#), [Class NodeDisplayCallback](#), [Class INode](#).

```
class INodeDisplayControl : public InterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

This class is an interface that is used to register the node display callback. To get a pointer to this interface the developer should use the following macro:

```
#define GetNodeDisplayControl(i) ((INodeDisplayControl*)i->GetInterface(I_NODEDISPLAYCONTROL))
```

### Methods:

public:

### Prototype:

```
virtual void RegisterNodeDisplayCallback(NodeDisplayCallback *cb)=0;
```

### Remarks:

Register a node display callback which can be used to control the display of nodes in the scene.

### Parameters:

**NodeDisplayCallback \*cb**

Points to the callback object.

### Prototype:

```
virtual void
```

```
UnRegisterNodeDisplayCallback(NodeDisplayCallback *cb)=0;
```

### Remarks:

Un-registers the node display callback.

### Parameters:

**NodeDisplayCallback \*cb**

Points to the callback object.

**Prototype:**

**virtual bool SetNodeCallback(NodeDisplayCallback\* hook)=0;**

**Remarks:**

Sets the current current callback. The callback must be previously registered.

**Parameters:**

**NodeDisplayCallback\* hook**

Points to the node display callback to set.

**Return Value:**

Returns true if the callback was set; otherwise false.

**Prototype:**

**virtual NodeDisplayCallback\* GetNodeCallback()=0;**

**Remarks:**

Returns a pointer to the current current callback. The callback must be previously registered.

**Prototype:**

**virtual void InvalidateNodeDisplay()=0;**

**Remarks:**

Viewport refresh routine. Tthis function only invalidates the display, it's up to the callback to select the correct redraw technique.

# Class XTCContainer

See Also: [Class XTCTObject](#)

class XTCContainer

## Description:

This class is available in release 4.0 and later only.

This class represents a container class for XTCTObjects.

## Data Members:

public:

**XTCTObject \*obj;**

A pointer to the XTCTObject.

**int prio;**

The priority.

**int branchID;**

The branch identifier.

## Methods:

public:

## Prototype:

**XTCContainer();**

## Remarks:

Constructor.

## Default Implementation:

**{obj = NULL; prio = 0; branchID = -1;}**

## Class IXTCAccess

See Also: [Class Object](#), [Class XTCTObject](#)

class IXTCAccess

### Description:

This class is available in release 4.0 and later only.

This class provides an interface to access Extension Channels.

### Methods:

public:

### Prototype:

```
virtual Interface_ID GetID();
```

### Remarks:

This method returns the IXTCAccess interface ID.

### Default Implementation:

```
{ return IXTCACCESS_INTERFACE_ID; }
```

### Prototype:

```
virtual LifetimeType LifetimeControl();
```

### Remarks:

This method allows enquiries into the actual lifetime policy of a client and provide a server-controlled delete notify callback.

### Return Value:

One of the following LifetimeTypes:

#### **noRelease**

Do not call release, use interface as long as you like.

#### **immediateRelease**

The interface is only good for one calls. The release is implied so a call to release is not required.

#### **wantsRelease**

The clients are controlling the lifetime, so the interface needs a Release() when the client has finished. This is the default.

## **serverControlled**

The server controls the lifetime and will use the InterfaceNotifyCallback to inform the code when it is gone.

### **Default Implementation:**

```
{ return noRelease; }
```

### **Prototype:**

```
virtual void AddXTCObject(XTCObject *pObj, int priority = 0,  
int branchID = -1)=0;
```

### **Remarks:**

This method adds an extension object into the pipeline.

### **Parameters:**

**XTCObject \*pObj**

The extension object you wish to add.

**int priority = 0**

The priority to set.

**int branchID = -1**

The branch identifier to set.

### **Prototype:**

```
virtual int NumXTCObjects()=0;
```

### **Remarks:**

This method returns the number of extension objects.

### **Prototype:**

```
virtual XTCObject *GetXTCObject(int index)=0;
```

### **Remarks:**

This method returns the I-th extension object.

### **Parameters:**

**int index**

The index of the extension object to return.

**Prototype:**

**virtual void RemoveXTCObject(int index)=0;**

**Remarks:**

This method allows you to remove the I-th extension object.

**Parameters:**

**int index**

The index of the extension object you wish to remove.

**Prototype:**

**virtual void SetXTCObjectPriority(int index,int priority)=0;**

**Remarks:**

This method allows you to set the priority for the I-th extension object.

**Parameters:**

**int index**

The index of the extension object for which to set the priority.

**int priority**

The priority to set.

**Prototype:**

**virtual int GetXTCObjectPriority(int index)=0;**

**Remarks:**

This method returns the priority for the I-th extension object.

**Parameters:**

**int index**

The index of the extension object.

**Prototype:**

**virtual void SetXTCObjectBranchID(int index,int branchID)=0;**

**Remarks:**

This method allows you to set the branch identifier for the I-th extension object.

**Parameters:**

**int index**

The index of the extension object.

**int branchID**

The branch identifier to set.

**Prototype:**

**virtual int GetXTCObjectBranchID(int index)=0;**

**Remarks:**

This method returns the branch identifier for the I-th extension object.

**Parameters:**

**int index**

The index of the extension object.

**Prototype:**

**virtual void MergeAdditionalChannels(Object \*from, int branchID)=0;**

**Remarks:**

This method has to be called whenever the CompoundObject updates a branch (calling Eval on it). Object \*from is the object returned **from Eval (os.obj)**; branchID is an int, that specifies that branch. The extension channel will get a callback to **RemoveXTCObjectOnMergeBranches()** and **MergeXTCObject()**. By default it returns true to **RemoveXTCObjectOnMergeBranches()**, which means, that the existing XTCObjects with that branchID will be deleted. The method **MergeXTCObject()** simply copies the XTCObjects from the incoming branch into the compound object.

**Parameters:**

**Object \*from**

The object from which to merge additional channels

**int branchID**

The branch identifier.

**Prototype:**

```
virtual void BranchDeleted(int branchID, bool  
reorderChannels)=0;
```

**Remarks:**

This method has to be called on the CompoundObject, so it can delete the XTCTObjects for the specific branch. The XTCTObject will have again the final decision if the XTCTObject gets really deleted or not in a callback to **RemoveXTCTObjectOnBranchDeleted()**, which will return true, if the XTCTObject should be removed.

**Parameters:**

**int branchID**

The branch identifier.

**bool reorderChannels**

TRUE to reorder the channels, otherwise FALSE.

**Prototype:**

```
virtual void CopyAdditionalChannels(Object *from, bool  
deleteOld = true, bool bShallowCopy = false)=0;
```

**Remarks:**

This method copies all extension objects from the "from" objects into the current object. In case deleteOld is false, the objects will be appended. In case it is true, the old XTCTObjects will be deleted.

**Parameters:**

**Object \*from**

The object to copy from.

**bool deleteOld = true**

TRUE to delete the old channel, FALSE to append the channels.

**bool bShallowCopy = false**

TRUE to create a shallow copy, FALSE to create a deep copy.

**Prototype:**

```
virtual void DeleteAllAdditionalChannels()=0;
```

**Remarks:**

This method allows you to delete all additional channels.

## Class IDataChannel

See Also: [Class InterfaceServer](#), [Class Class\\_ID](#), [Class IFaceDataChannel](#), [Class IFaceDataChannelsEnumCallBack](#)

```
class IDataChannel : public InterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

A data channel is a homogeneous collection of objects of a user defined type (data objects). Data channels are uniquely identified by a Class\_ID. Data channels can be associated with any element type of a 3ds max object: faces or vertexes of Meshes, etc. You can use the macro

**GetDataChannelInterface(obj)** to obtain a pointer to this interface.

### Methods:

public:

### Prototype:

```
virtual Class_ID DataChannelID() const =0;
```

### Remarks:

This method returns the unique class ID of the channel.

### Prototype:

```
virtual ULONG Count() const;
```

### Remarks:

This method returns the number of data objects in this channel.

### Default Implementation:

```
{ return 0; }
```

### Prototype:

```
virtual void DeleteThis() = 0;
```

### Remarks:

Destructor. Deletes self.

## Class IFaceDataChannelsEnumCallBack

See Also: [Class IDataChannel](#), [Class IFaceDataChannel](#) , [Class IFaceDataMgr](#)

class IFaceDataChannelsEnumCallBack

### Description:

This class is available in release 4.0 and later only.

This is an interface class that will allow a callback procedure to execute for all face data channels of an object. You should derive your own classes from this interface and overwrite the **Proc()** method to call the desired **IFaceDataChannel** method. It is up to the derived class to interpret the context parameter passed to **Proc()**.

Classes that hold face data channels can implement the method:

**EnumFaceDataChannels(IFaceDataEnumCallBack& cb, void\* pContext)**

This method would be called with a reference to an instance of a class derived from **IFaceDataEnumCallBack** in which **Proc()** is overwritten. The implementation of **EnumFaceDataChannels** would call **cb.Proc** for each of the face-data channels of the object

Note: Do not delete data channels from within the Proc(). This could lead to unexpected behaviour.

### Methods:

public:

### Prototype:

```
virtual BOOL Proc(IFaceDataChannel* pChan, void* pContext) = 0;
```

### Remarks:

The callback method that should be overridden.

### Parameters:

**IFaceDataChannel\* pChan**

A pointer to the face-data channel interface.

**void\* pContext**

A pointer to the context data.

**Return Value:**

TRUE if successful, otherwise FALSE.

## Class CollisionOps

See Also: [Class ICollision](#), [Class CollisionPlane](#), [Class CollisionSphere](#), [Class CollisionVNormal](#), [Class CollisionMesh](#), [Class Box3](#), [Class Point3](#), [Class FPInterface](#)

```
class CollisionOps : public FPInterface
```

### Description:

This class is available in release 4.0 and later only.

This class represents the operation interface to the collision detection system.

The interface ID is defined as **COLLISION\_FO\_INTERFACE**. To obtain a pointer to this interface you can use the macro

**GetCollisionOpsInterface(cd)**, which will return **(CollisionOps \*)(cd)->GetFPInterface(COLLISION\_FO\_INTERFACE)**.

### Methods:

public:

### Prototype:

```
virtual int SupportedCollisions(ReferenceTarget *r) = 0;
```

### Remarks:

This method returns the collision type supported by the engine.

### Parameters:

**ReferenceTarget \*r**

A pointer to the reference target to check the collision type for.

### Return Value:

One of the following;

**POINT\_COLLISION** for point collision, currently supported.

**SPHERE\_COLLISION** for spherical collision, currently not supported.

**BOX\_COLLISION** for box collision, currently not supported.

**EDGE\_COLLISION** for edge collision, currently not supported.

### Prototype:

**virtual void PreFrame(ReferenceTarget \*r, TimeValue &t,  
TimeValue &dt) = 0;**

**Remarks:**

This method will be called once before the checkcollision is called for each frame which allows you to do any required initialization.

**Parameters:**

**ReferenceTarget \*r**

A pointer to the reference target.

**TimeValue t**

The time at which to initialize.

**TimeValue dt**

The delta of time the particle wil travel.

**Prototype:**

**virtual void PostFrame(ReferenceTarget \*r, TimeValue &t,  
TimeValue &dt) = 0;**

**Remarks:**

This method will be called at the end of each frame solve to allow you to destroy and deallocate any data you no longer need.

**Parameters:**

**ReferenceTarget \*r**

A pointer to the reference target.

**TimeValue t**

The time at which to initialize.

**TimeValue dt**

The delta of time the particle wil travel.

**Prototype:**

**virtual BOOL CheckCollision (ReferenceTarget \*r,TimeValue t,  
Point3 pos, Point3 vel, float dt, float &at, Point3 &hitPoint, Point3  
&norm, Point3 &friction, Point3 &inheritedVel) = 0;**

**Remarks:**

This method will be called to execute a point to surface collision and compute the time at which the particle hit the surface.

**Parameters:**

**ReferenceTarget \*r**

A pointer to the reference target.

**TimeValue t**

The end time of the particle.

**Point3 pos**

The position of the particle in world space.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

**Prototype:**

```
virtual BOOL CheckCollision (ReferenceTarget *r,TimeValue t,Point3 pos, float radius, Point3 vel, float dt, float &at, Point3 &hitPoint, Point3 &norm, Point3 &friction, Point3 &inheritedVel) = 0;;
```

**Remarks:**

This method will be called to execute a sphere to surface collision and compute the time at which the particle hit the surface.

**Parameters:****ReferenceTarget \*r**

A pointer to the reference target.

**TimeValue t**

The end time of the particle.

**Point3 pos**

The position of the particle in world space.

**float radius**

The radius of the sphere.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

**Prototype:**

**virtual BOOL CheckCollision (ReferenceTarget \*r,TimeValue t,**

**Box3 box, Point3 vel, float dt, float &at, Point3 &hitPoint, Point3 &norm, Point3 &friction, Point3 &inheritedVel) = 0;**

**Remarks:**

This method will be called to execute a box to surface collision and compute the time at which the particle hit the surface.

**Parameters:**

**ReferenceTarget \*r**

A pointer to the reference target.

**TimeValue t**

The end time of the particle.

**Box3 box**

The box itself.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

**Prototype:**

```
virtual BOOL CheckCollision (ReferenceTarget *r,TimeValue  
t,Point3 edgeA,Point3 edgeB ,Point3 vel, float dt, float &at, Point3  
&hitPoint, Point3 &norm, Point3 &friction, Point3 &inheritedVel)  
= 0;
```

**Remarks:**

This method will be called to execute an edge to surface collision and compute the time at which the particle hit the surface.

**Parameters:**

**ReferenceTarget \*r**

A pointer to the reference target.

**TimeValue t**

The end time of the particle.

**Point3 edgeA**

The first edge.

**Point3 edgeB**

The second edge.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

## Class CollisionPlane

See Also: [Class ICollision](#), [Class CollisionOps](#), [Class CollisionSphere](#), [Class CollisionVNormal](#), [Class CollisionMesh](#), [Class Box3](#), [Class Point3](#), [Class IParamBlock2](#), [Class INode](#), [Class Control](#)

```
class CollisionPlane : public ICollision
```

### Description:

This class is available in release 4.0 and later only.

This class represents the planar collision object with the ClassID defined as **PLANAR\_COLLISION\_ID**. This class allows you to define a plane in space and determine if a particle hit it.

### Data Members:

private:

**INode \*node;**

The associated node.

public:

**IParamBlock2 \*pblock;**

The parameter block data. You can use the following enum parameter ID's:

**collisionplane\_width**

**collisionplane\_height**

**collisionplane\_quality**

**collisionplane\_node**

**Interval validity;**

The validity interval.

**Matrix3 tm;**

The plane's TM.

**Matrix3 invtm;**

The inverse TM.

**Matrix3 prevInvTm;**

The cached previous inverse TM.

**int initialTime;**

The initial time.

**Tab<Matrix3> invTmList;**

The table of inverse TM's.

**float width, height;**

The width and height of the plane.

**int quality;**

The collision quality value.

**Methods:**

public:

**Prototype:**

**CollisionPlane();**

**Remarks:**

Constructor.

**Prototype:**

**~CollisionPlane();**

**Remarks:**

Destructor.

**Prototype:**

**int SupportedCollisions();**

**Remarks:**

This method determines the type of collisions that are supported.

**Return Value:**

One of the following;

**POINT\_COLLISION** for point collision, currently supported.

**SPHERE\_COLLISION** for spherical collision, currently not supported.

**BOX\_COLLISION** for box collision, currently not supported.

**EDGE\_COLLISION** for edge collision, currently not supported.

**Default Implementation:**

```
{ return POINT_COLLISION; }
```

**Prototype:**

```
void PreFrame(TimeValue t, TimeValue dt);
```

**Remarks:**

This method will be called once before the checkcollision is called for each frame which allows you to do any required initialization.

**Parameters:**

**TimeValue t**

The time at which to initialize.

**TimeValue dt**

The delta of time the particle will travel.

**Prototype:**

```
void PostFrame(TimeValue t, TimeValue dt);
```

**Remarks:**

This method will be called at the end of each frame solve to allow you to destroy and deallocate any data you no longer need.

**Parameters:**

**TimeValue t**

The time at which to initialize.

**TimeValue dt**

The delta of time the particle will travel.

**Default Implementation:**

```
{}
```

**Prototype:**

```
virtual BOOL CheckCollision (TimeValue t, Point3 pos, Point3 vel,  
float dt, float &at, Point3 &hitPoint, Point3 &norm, Point3  
&friction, Point3 &inheritedVel) = 0;
```

**Remarks:**

This method will be called to execute a point to surface collision and compute the time at which the particle hit the surface.

**Parameters:**

**TimeValue t**

The end time of the particle.

**Point3 pos**

The position of the particle in world space.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

**Prototype:**

```
virtual BOOL CheckCollision (TimeValue t,Point3 pos, float  
radius, Point3 vel, float dt, float &at, Point3 &hitPoint, Point3  
&norm, Point3 &friction, Point3 &inheritedVel) = 0;;
```

**Remarks:**

This method will be called to execute a sphere to surface collision and compute the time at which the particle hit the surface.

**Parameters:****TimeValue t**

The end time of the particle.

**Point3 pos**

The position of the particle in world space.

**float radius**

The radius of the sphere.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

**Prototype:**

```
virtual BOOL CheckCollision (TimeValue t, Box3 box, Point3 vel,  
float dt, float &at, Point3 &hitPoint, Point3 &norm, Point3  
&friction, Point3 &inheritedVel) = 0;
```

**Remarks:**

This method will be called to execute a box to surface collision and compute the time at which the particle hit the surface.

**Parameters:****TimeValue t**

The end time of the particle.

**Box3 box**

The box itself.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

**Prototype:**

```
virtual BOOL CheckCollision (TimeValue t,Point3 edgeA,Point3 edgeB ,Point3 vel, float dt, float &at, Point3 &hitPoint, Point3 &norm, Point3 &friction, Point3 &inheritedVel) = 0;
```

**Remarks:**

This method will be called to execute an edge to surface collision and compute the time at which the particle hit the surface.

**Parameters:****TimeValue t**

The end time of the particle.

**Point3 edgeA**

The first edge.

**Point3 edgeB**

The second edge.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

**Prototype:**

```
void SetWidth(TimeValue t, float w);
```

**Remarks:**

Sets the width of the plane.

**Parameters:****TimeValue t**

The time at which to set the width.

**float w**

The width.

**Default Implementation:**

```
{ pblock->SetValue(collisionplane_width,t,w); }
```

**Prototype:**

```
void SetHeight(TimeValue t, float h);
```

**Remarks:**

Sets the height of the plane.

**Parameters:**

**TimeValue t**

The time at which to set the height.

**float h**

The height.

**Default Implementation:**

```
{ pblock->SetValue(collisionplane_height,t,h); }
```

**Prototype:**

```
void SetQuality(TimeValue t, int q);
```

**Remarks:**

Sets the quality of the solve. This is the maximum number of iterations the solver will take to find the hit point. The lower quality the more likely a particle will leak through the surface but the faster the solver will be.

**Parameters:**

**TimeValue t**

The time at which to set the quality.

**int q**

The quality value.

**Default Implementation:**

```
{ pblock->SetValue(collisionplane_quality,t,q); }
```

**Prototype:**

```
void SetNode(TimeValue t, INode *n);
```

**Remarks:**

Sets the node which drives the TM to put the plane in world space.

**Parameters:**

**TimeValue t**

The time at which to set the node.

**Inode \*n**

The node to set.

**Default Implementation:**

```
{ pblock->SetValue(collisionplane_node,t,n); node = n; }
```

**Prototype:**

```
void SetWidth(Control *c);
```

**Remarks:**

Sets the controller for the plane width.

**Parameters:****Control \*c**

A pointer to the controller to set.

**Default Implementation:**

```
{ pblock->SetController(collisionplane_width,0,c); }
```

**Prototype:**

```
void SetHeight(Control *c);
```

**Remarks:**

Sets the controller for the plane height.

**Parameters:****Control \*c**

A pointer to the controller to set.

**Default Implementation:**

```
{ pblock->SetController(collisionplane_height,0,c); }
```

**Prototype:**

```
void SetQuality(Control *c);
```

**Remarks:**

Sets the quality of the solve. This is the maximum number of iterations the

solver will take to find the hit point. The lower quality the mire likely a particle will leak through the surface but the faster the solver will be.

**Parameters:**

**Control \*c**

A pointer to the controller to set.

**Default Implementation:**

```
{ pblock->SetController(collisionplane_quality,0,c); }
```

**Prototype:**

```
void DeleteThis();
```

**Remarks:**

Self deletion.

**Default Implementation:**

```
{ delete this; }
```

**Prototype:**

```
Class_ID ClassID();
```

**Remarks:**

This method returns the class ID.

**Default Implementation:**

```
{return PLANAR_COLLISION_ID;}
```

**Prototype:**

```
SClass_ID SuperClassID();
```

**Remarks:**

This method returns the super class ID.

**Default Implementation:**

```
{return REF_MAKER_CLASS_ID;}
```

**Prototype:**

```
int NumRefs();
```

**Remarks:**

This method returns the number of references.

**Default Implementation:**

```
{ return 1; }
```

**Prototype:**

```
RefTargetHandle GetReference(int i);
```

**Remarks:**

This method returns the I-th parameter block.

**Default Implementation:**

```
{ return pblock; }
```

**Prototype:**

```
void SetReference(int i, RefTargetHandle rtarg);
```

**Remarks:**

This method allows you to set the I-th parameter block.

**Parameters:**

**int i**

The I-th parameter block to set.

**RefTargetHandle rtarg**

The reference target handle to the parameter block.

**Default Implementation:**

```
{pblock = (IParamBlock2*)rtarg;}
```

**Prototype:**

```
RefTargetHandle Clone(RemapDir &remap = NoRemap());
```

**Remarks:**

This method is called to have the plug-in clone itself. This method should copy both the data structure and all the data residing in the data structure of this reference target. The plug-in should clone all its references as well.

**Parameters:**

## **RemapDir &remap = NoRemap()**

This class is used for remapping references during a Clone. See [Class RemapDir](#).

### **Return Value:**

A pointer to the cloned item.

### **Prototype:**

**RefResult NotifyRefChanged(Interval changeInt,  
RefTargetHandle hTarget, PartID& partID,RefMessage message);**

### **Remarks:**

A plug-in which makes references must implement this method to receive and respond to messages broadcast by its dependents.

### **Parameters:**

#### **Interval changeInt**

This is the interval of time over which the message is active.

#### **RefTargetHandle hTarget**

This is the handle of the reference target the message was sent by. The reference maker uses this handle to know specifically which reference target sent the message.

#### **PartID& partID**

This contains information specific to the message passed in. Some messages don't use the partID at all. See the section [List of Reference Messages](#) for more information about the meaning of the partID for some common messages.

#### **RefMessage message**

The msg parameters passed into this method is the specific message which needs to be handled. See [List of Reference Messages](#).

### **Return Value:**

The return value from this method is of type RefResult. This is usually **REF\_SUCCEED** indicating the message was processed. Sometimes, the return value may be **REF\_STOP**. This return value is used to stop the message from being propagated to the dependents of the item.

## Class CollisionVNormal

See Also: [Class ICollision](#), [Class CollisionOps](#), [Class CollisionPlane](#), [Class CollisionSphere](#), [Class CollisionMesh](#), [Class Box3](#), [Class Point3](#)

class CollisionVNormal

### Description:

This class is available in release 4.0 and later only.

This class represents a general list of collision vertex normals.

### Data Members:

public:

**Point3 norm;**

The normal vector

**DWORD smooth;**

The smoothing flag.

**CollisionVNormal \*next;**

A pointer to the next normal in the linked list.

**BOOL init;**

The initialization flag.

### Methods:

public:

### Prototype:

**CollisionVNormal();**

### Remarks:

Constructor.

### Default Implementation:

```
{smooth=0;next=NULL;init=FALSE;norm=Point3(0,0,0);}
```

### Prototype:

**CollisionVNormal(Point3 &n,DWORD s);**

### Remarks:

Constructor.

**Parameters:**

**Point3 &n**

The vector to initialize with.

**DWORD s**

The smoothing flag to initialize with.

**Default Implementation:**

```
{next=NULL;init=TRUE;norm=n;smooth=s;}
```

**Prototype:**

```
~CollisionVNormal();
```

**Remarks:**

Destructor.

**Default Implementation:**

```
{delete next;}
```

**Prototype:**

```
void AddNormal(Point3 &n,DWORD s);
```

**Remarks:**

Add a vector to the list.

**Parameters:**

**Point3 &n**

The vector to add.

**DWORD s**

The smoothing flag to add.

**Prototype:**

```
Point3 &GetNormal(DWORD s);;
```

**Remarks:**

Returns the specified normal from the list.

**Parameters:**

**DWORD s**

The index of the normal in the list.

**Prototype:**

```
void Normalize();
```

**Remarks:**

This method normalizes the vector.

## Class CollisionMesh

See Also: [Class ICollision](#), [Class CollisionOps](#), [Class CollisionPlane](#), [Class CollisionSphere](#), [Class CollisionVNormal](#), [Class Box3](#), [Class Point3](#), [Class IParamBlock2](#), [Class INode](#), [Class Control](#)

```
class CollisionMesh : public ICollision
```

### Description:

This class is available in release 4.0 and later only.

This class represents the planar collision object with the ClassID defined as **MESH\_COLLISION\_ID**. This class allows you to define a plane in space and determine if a particle hit it.

### Data Members:

private:

**INode \*node;**

The associated node.

public:

**IParamBlock2 \*pblock;**

The parameter block data. You can use the following enum parameter ID's:

**collisionmesh\_hit\_face\_index**

**collisionmesh\_hit\_bary**

**collisionmesh\_node**

**Interval validity;**

The validity interval.

**Matrix3 tm;**

The plane's TM.

**Matrix3 invtm;**

The inverse TM.

**Matrix3 tmPrev;**

The previous TM.

**Matrix3 prevInvTm;**

The cached previous inverse TM.

**float radius;**

The radius of the sphere.

**Mesh \*dmesh;**

The mesh pointer.

**int nv, nf;**

The mesh number of vertices and number of faces.

**CollisionVNormal \*vnorms;**

The collision vertex normals.

**Point3 \*fnorms;**

The face normals.

**Methods:**

public:

**Prototype:**

**CollisionMesh();**

**Remarks:**

Constructor.

**Prototype:**

**~CollisionMesh();**

**Remarks:**

Destructor.

**Prototype:**

**int SupportedCollisions();**

**Remarks:**

This method determines the type of collisions that are supported.

**Return Value:**

One of the following;

**POINT\_COLLISION** for point collision, currently supported.

**SPHERE\_COLLISION** for spherical collision, currently not supported.

**BOX\_COLLISION** for box collision, currently not supported.

**EDGE\_COLLISION** for edge collision, currently not supported.

**Default Implementation:**

```
{ return POINT_COLLISION; }
```

**Prototype:**

```
void PreFrame(TimeValue t, TimeValue dt);
```

**Remarks:**

This method will be called once before the checkcollision is called for each frame which allows you to do any required initialization.

**Parameters:**

**TimeValue t**

The time at which to initialize.

**TimeValue dt**

The delta of time the particle wil travel.

**Prototype:**

```
void PostFrame(TimeValue t, TimeValue dt);
```

**Remarks:**

This method will be called at the end of each frame solve to allow you to destroy and deallocate any data you no longer need.

**Parameters:**

**TimeValue t**

The time at which to initialize.

**TimeValue dt**

The delta of time the particle wil travel.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual BOOL CheckCollision (TimeValue t, Point3 pos, Point3 vel,  
float dt, float &at, Point3 &hitPoint, Point3 &norm, Point3  
&friction, Point3 &inheritedVel) = 0;
```

**Remarks:**

This method will be called to execute a point to surface collision and compute the time at which the particle hit the surface.

**Parameters:****TimeValue t**

The end time of the particle.

**Point3 pos**

The position of the particle in world space.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

**Prototype:**

**virtual BOOL CheckCollision (TimeValue t,Point3 pos, float radius, Point3 vel, float dt, float &at, Point3 &hitPoint, Point3 &norm, Point3 &friction, Point3 &inheritedVel) = 0;;**

**Remarks:**

This method will be called to execute a sphere to surface collision and

compute the time at which the particle hit the surface.

**Parameters:**

**TimeValue t**

The end time of the particle.

**Point3 pos**

The position of the particle in world space.

**float radius**

The radius of the sphere.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

**Prototype:**

**virtual BOOL CheckCollision (TimeValue t, Box3 box, Point3 vel, float dt, float &at, Point3 &hitPoint, Point3 &norm, Point3 &friction, Point3 &inheritedVel) = 0;**

**Remarks:**

This method will be called to execute a box to surface collision and compute

the time at which the particle hit the surface.

**Parameters:**

**TimeValue t**

The end time of the particle.

**Box3 box**

The box itself.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

**Prototype:**

**virtual BOOL CheckCollision (TimeValue t,Point3 edgeA,Point3 edgeB ,Point3 vel, float dt, float &at, Point3 &hitPoint, Point3 &norm, Point3 &friction, Point3 &inheritedVel) = 0;**

**Remarks:**

This method will be called to execute an edge to surface collision and compute the time at which the particle hit the surface.

**Parameters:**

**TimeValue t**

The end time of the particle.

**Point3 edgeA**

The first edge.

**Point3 edgeB**

The second edge.

**Point3 vel**

The velocity of the particle in world space.

**float dt**

The delta of time that the particle travels (**t-dt** being the start of time of the particle)

**float &at**

The point in time that the collision occurs with respect to the **dt**.

**Point3 &hitPoint**

The point of collision.

**Point3 &norm**

The bounce vector component of the final velocity.

**Point3 &friction**

The friction vector component of the final velocity.

**Point3 inheritedVel**

The approximated amount of velocity inherited from the motion of the deflector.

**Return Value:**

TRUE if there's a collision, otherwise FALSE.

**Prototype:**

```
void SetNode(TimeValue t, INode *n);
```

**Remarks:**

Sets the node which drives the TM to put the plane in world space.

**Parameters:****TimeValue t**

The time at which to set the node.

**INode \*n**

The node to set.

**Default Implementation:**

```
{ pblock->SetValue(collisionmesh_node,t,n); node = n; }
```

**Prototype:**

```
void DeleteThis();
```

**Remarks:**

Self deletion.

**Default Implementation:**

```
{ delete this; }
```

**Prototype:**

```
Class_ID ClassID();
```

**Remarks:**

This method returns the class ID.

**Default Implementation:**

```
{return SPHERICAL_COLLISION_ID;}
```

**Prototype:**

```
SClass_ID SuperClassID();
```

**Remarks:**

This method returns the super class ID.

**Default Implementation:**

```
{return REF_MAKER_CLASS_ID;}
```

**Prototype:**

```
int NumRefs();
```

**Remarks:**

This method returns the number of references.

**Default Implementation:**

```
{ return 1; }
```

**Prototype:**

```
RefTargetHandle GetReference(int i);
```

**Remarks:**

This method returns the I-th parameter block.

**Default Implementation:**

```
{ return pblock; }
```

**Prototype:**

```
void SetReference(int i, RefTargetHandle rtarg);
```

**Remarks:**

This method allows you to set the I-th parameter block.

**Parameters:**

**int i**

The I-th parameter block to set.

**RefTargetHandle rtarg**

The reference target handle to the parameter block.

**Default Implementation:**

```
{pblock = (IParamBlock2*)rtarg;}
```

**Prototype:**

```
RefTargetHandle Clone(RemapDir &remap = NoRemap());
```

**Remarks:**

This method is called to have the plug-in clone itself. This method should copy both the data structure and all the data residing in the data structure of this reference target. The plug-in should clone all its references as well.

**Parameters:**

**RemapDir &remap = NoRemap()**

This class is used for remapping references during a Clone. See [Class RemapDir](#).

**Return Value:**

A pointer to the cloned item.

**Prototype:**

**RefResult NotifyRefChanged(Interval changeInt,  
RefTargetHandle hTarget, PartID& partID,RefMessage message);**

**Remarks:**

A plug-in which makes references must implement this method to receive and respond to messages broadcast by its dependents.

**Parameters:****Interval changeInt**

This is the interval of time over which the message is active.

**RefTargetHandle hTarget**

This is the handle of the reference target the message was sent by. The reference maker uses this handle to know specifically which reference target sent the message.

**PartID& partID**

This contains information specific to the message passed in. Some messages don't use the partID at all. See the section [List of Reference Messages](#) for more information about the meaning of the partID for some common messages.

**RefMessage message**

The msg parameters passed into this method is the specific message which needs to be handled. See [List of Reference Messages](#).

**Return Value:**

The return value from this method is of type RefResult. This is usually **REF\_SUCCEED** indicating the message was processed. Sometimes, the return value may be **REF\_STOP**. This return value is used to stop the message from being propagated to the dependents of the item.

## Class IVertexShader

See Also: [Class ID3DGraphicsWindow](#) , [Class Mesh](#), [Class INode](#), [Class MNMesh](#)

class IVertexShader

### Description:

This class is available in release 4.0 and later only.

The abstract interface for a vertex shader.

### Methods:

public:

### Prototype:

```
virtual HRESULT Initialize(Mesh *mesh, INode *node) = 0;
```

### Remarks:

This method loads VertexShader instructions, create any additional per vertex data on a per node basis. VertexShader instructions should be loaded once and shared among all the nodes using this VertexShader. Additional per vertex data should be (re)created only when the associated node data changes. In addition, if there is sufficient memory, VertexBuffers can be created and updated only when node data changes in order to improve rendering performance.

### Parameters:

**Mesh \*mesh**

A pointer to the mesh to initialize.

**INode \*node**

A pointer to the node to initialize.

### Prototype:

```
virtual HRESULT Initialize(MNMesh *mnmesh, INode *node) = 0;
```

### Remarks:

This method loads VertexShader instructions, create any additional per vertex data on a per node basis. VertexShader instructions should be loaded once and

shared among all the nodes using this VertexShader. Additional per vertex data should be (re)created only when the associated node data changes. In addition, if there is sufficient memory, VertexBuffers can be created and updated only when node data changes in order to improve rendering performance.

**Parameters:**

**MNMesh \*mnmesh**

A pointer to the MNMesh to initialize.

**INode \*node**

A pointer to the node to initialize.

## Class BaseInterfaceServer

See Also: [Class InterfaceServer](#), [Class BaseInterface](#)

```
class BaseInterfaceServer : public InterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

The BaseInterface server class specializes the InterfaceServer class with an implementation based on a Tab<> of interface pointers for storing interfaces, typically extension interfaces, and providing an interface iteration protocol.

**class IObject** in the Function Publishing System specializes class BaseInterfaceServer. The class contains a protected table of BaseInterface pointers. **Class IObject** is an example of a class which is based on the BaseInterfaceServer class.

### Methods:

public:

### Prototype:

```
virtual BaseInterface* GetInterface(Interface_ID id);
```

### Remarks:

This method returns a pointer to the BaseInterface of the specified interface.

### Parameters:

**Interface\_ID id**

The interface ID for which to return the BaseInterface.

### Prototype:

```
virtual int NumInterfaces() const;
```

### Remarks:

This method returns the number of interfaces.

### Default Implementation:

```
{ return interfaces.Count(); }
```

### Prototype:

**virtual BaseInterface\* GetInterfaceAt(int i) const;**

**Remarks:**

This method returns a pointer to the BaseInterface of the I-th interface.

**Parameters:**

**int i**

The index of the interface in the table.

**Default Implementation:**

```
{ return interfaces[i]; }
```

**Prototype:**

```
~BaseInterfaceServer();
```

**Remarks:**

Destructor.

## Structure GBufData

See Also: [List of Image Channels](#), [Class GBufReader](#), [Class GBufWriter](#), [Class GBuffer](#), [Structure RealPixel](#), [Structure Color24](#), [Class Point2](#), [List of G-Buffer Channel Types](#).

This structure is used by the **GBufReader** and **GBurWriter** code to hold the G-Buffer data.

**struct GBufData {**

**float z;**

The floating point depth value at the center of the fragment that is foremost in the sorted list of a-buffer fragments.

**UBYTE mtl\_id;**

The ID assigned to the material via the Material Editor.

**UWORD node\_id;**

This is the ID assigned to node via the Object Properties / G-buffer ID spinner.

**Point2 uv;**

UV coordinates, stored as a Point2.

**DWORD normal;**

Normal vector in view space, compressed.

**RealPixel realpix;**

Non clamped colors in "RealPixel" format.

**UBYTE coverage;**

Pixel coverage of the front surface.

**UWORD rend\_id;**

The renderer will set this ID for all rendered nodes, and will set all non-rendered nodes to 0xffff.

**Color24 color;**

This is color returned by the material shader for the fragment.

**Color24 transp;**

This is transparency returned by the material shader for the fragment.

**Color24 weight;**

This is the sub-pixel weight of a fragment.

**Point2 veloc;**

This gives the velocity vector of the fragment relative to the screen, in screen

coordinates.

};

# Class RadiosityInterface

See Also: : [Class RadiosityEffect](#)

class RadiosityInterface : public FPStaticInterface

## Description:

This class is only available in release 5 or later.

This class provides access to the Advanced Lighting dialog. It allows you to open and close the dialog, and get or set the currently active Advanced Lighting plug-in. This class is a function-published static interface; you can use GetCOREInterface() to obtain an instance of the class, as follows:

```
RadiosityInterface r = static_cast<IRadiosityInterface*>  
(GetCOREInterface(RADIOSITY_INTERFACE))
```

This interface is also accessible via MAXScript as “SceneRadiosity”.

All methods of this class are implemented by the system.

## Methods:

### Prototype:

**virtual void OpenRadiosityPanel() = 0**

### Remarks:

Displays the Advanced Lighting dialog, unless it is already displayed.

### Prototype:

**virtual void CloseRadiosityPanel() = 0**

### Remarks:

Hides the Advanced Lighting dialog, if it is currently displayed.

### Prototype:

**virtual void MinimizeRadiosityPanel() = 0**

**Remarks:**

Minimizes the Advanced Lighting dialog if it is open.

**Prototype:**

**virtual RadiosityEffect\* GetRadiosity () = 0**

**Return value:**

Returns a pointer to the currently active Advanced Lighting plug-in (RadiosityEffect) if any.

**Prototype:**

**virtual void SetRadiosity (RadiosityEffect\* op) = 0**

**Remarks:**

Sets the given Advanced Lighting plug-in (RadiosityEffect) as the active one in the UI. When switching Advanced Lighting types in the UI, a dialog sometimes appears, warning that the current lighting solution will be discarded; but this dialog is not displayed when using SetRadiosity(). It is also valid to pass NULL as a parameter, in which case no active lighting plug-in will be active.

**Parameters:**

**RadiosityEffect\* op**

The RadiosityEffect instance to be made active, or NULL if no lighting plug-in should be active.

# Class IRadiosityEffectExtension

See Also: : [Class RadiosityEffect](#)

```
class IRadiosityEffectExtension : public BaseInterface
```

## Description:

This class is only available in release 5 or later.

This class provides additional functionality for class RadiosityEffect. Given an instance of RadiosityEffect, you may retrieve the extension interface as follows:

```
IRadiosityEffectExtension* r = static_cast<IRadiosityEffectExtension*>  
(radiosityInstance->GetInterface(IRADIOSITYEFFECT_EXTENSION_INTERFACE));
```

If the result is NULL, the RadiosityEffect does not support this interface.

All methods of this class are implemented by the plug-in.

## Methods:

### Prototype:

```
virtual bool useDefaultLight(const DefaultLight& defLight) const =  
0
```

## Remarks:

Returns whether the specified default light should be used by the scanline renderer. The scanline renderer normally creates default lights when there are no lights in the scene. A radiosity plug-in could override this if it uses objects other than lights as light sources (e.g. self-emitting surfaces)

## Parameters:

**Const DefaultLight& defLight**

A default light created by the scanline renderer when it begins rendering.

## Return value:

Returns whether or not the scanline renderer should use the light for the current rendering.

**Prototype:**

**virtual bool IsInterestedInChannels(PartID part) const**

**Remarks:**

This is used to control reference messages sent to the RadiosityEffect plug-in. It allows the RadiosityEffect to tell the system which messages will not invalidate the lighting solution.

If the RadiosityEffect decides that all messages of a given PartID are irrelevant to the lighting solution, it can return false when that PartID flag is present in the input parameter (and no other, more relevant, PartID flags are present). Otherwise it should return true, indicating it needs those messages.

If the return value is false, the system will add the PartID flag `PART_EXCLUDE_RADIOSITY` to all appropriate reference messages; this flag generically indicates an event which should not invalidate a radiosity solution. The RadiosityEffect will still receive the message but can ignore it. Other modules which need to discriminate messages pertinent radiosity, can also check this flag.

As an example of when this is important, an edit mesh modifier may send change messages which are meant to flush internal caches but not relevant to radiosity. As the message propagates, some PartID flags are added in order to force modifiers to re-evaluate downstream in the stack. This may confuse the radiosity engine into invalidating its lighting solution. But the edit mesh ensures the original message bears the `PART_EXCLUDE_RADIOSITY` flag, and as subsequent messages inherit the flag, the RadiosityEffect can correctly ignore the message.

**Parameters:****PartID part**

One or more PartID flags defining the category of messages to be filtered.

**Return value:**

Whether or not to filter the given messages, by setting their

PART\_EXCLUDE\_RADIOSITY PartID flag.

**Prototype:**

**virtual Interface\_ID GetID()**

**Remarks:**

This returns the ID of the interface, IRADIOSITYEFFECT\_EXTENSION\_INTERFACE, and should not be overridden by an implementation class.

**Return value:**

The IRadiosityEffectExtension interface ID, IRADIOSITYEFFECT\_EXTENSION\_INTERFACE.

**Default Implementation:**

```
{ return IRADIOSITYEFFECT_EXTENSION_INTERFACE; }
```

# Class IRadiosityPreferences

See Also: : [Class RadiosityEffect](#)

class IRadiosityPreferences : public FPStaticInterface

## Description:

This class is only available in release 5 or later.

This class defines the interface for accessing the Advanced Lighting Preferences from the 'Advanced Lighting' tab in the preferences dialog. It also provides access to the use/compute advanced lighting controls found in the Rendering dialog. This is a function-published static interface; you can use GetCOREInterface() to obtain an instance of the class, as follows:

```
IRadiosityPreferences* r = static_cast<IRadiosityPreferences*>  
(GetCOREInterface(IRADIOSITYPREFERENCES_INTERFACE));
```

This interface is also accessible via MAXScript as “RadiosityPreferences”.

All methods of this class are implemented by the system.

## Methods:

### Prototype:

**virtual BOOL GetAutoProcessObjectRefine() const = 0**

### Remarks:

Returns the state of the checkbox “Automatically Process Refine Iterations Stored in Geometric Objects”, in the preferences dialog Advanced Lighting tab

### Prototype:

**virtual void SetAutoProcessObjectRefine(BOOL val) = 0**

### Remarks:

Sets the state of the checkbox “Automatically Process Refine Iterations Stored in Geometric Objects”, in the preferences dialog Advanced Lighting tab

**Parameters:**

**BOOL val**

TRUE for on; FALSE for off.

**Prototype:**

**virtual BOOL GetDisplayReflectanceInMEditor() const = 0**

**Remarks:**

Returns the state of the checkbox “Display Reflectance & Transmittance Information”, in the preferences dialog Advanced Lighting tab

**Prototype:**

**virtual void SetDisplayReflectanceInMEditor(BOOL val) = 0**

**Remarks:**

Sets the state of the checkbox “Display Reflectance & Transmittance Information”, in the preferences dialog Advanced Lighting tab

**Parameters:**

**BOOL val**

TRUE for on; FALSE for off.

**Prototype:**

**virtual BOOL GetDisplayInViewport() const = 0**

**Remarks:**

Returns the state of the checkbox “Display Radiosity in Viewports”, in the preferences dialog Advanced Lighting tab

**Prototype:**

**virtual void SetDisplayInViewport(BOOL val) = 0**

**Remarks:**

Sets the state of the checkbox “Display Radiosity in Viewports”, in the preferences dialog Advanced Lighting tab

**Parameters:**

**BOOL val**

TRUE for on; FALSE for off.

**Prototype:**

**virtual BOOL GetDisplayResetWarning() const = 0**

**Remarks:**

Returns the state of the checkbox “Display Reset Warning”, in the preferences dialog Advanced Lighting tab

**Prototype:**

**virtual void SetDisplayResetWarning(BOOL val) = 0**

**Remarks:**

Sets the state of the checkbox “Display Reset Warning”, in the preferences dialog Advanced Lighting tab

**Parameters:**

**BOOL val**

TRUE for on; FALSE for off.

**Prototype:**

**virtual BOOL GetDisplayWarningOnGIPropsChange() const = 0**

**Remarks:**

Returns the state of the checkbox “Display Undo Warning on Properties Change”, in the preferences dialog Advanced Lighting tab

**Prototype:**

**virtual void SetDisplayWarningOnGIPropsChange(BOOL val) = 0**

**Remarks:**

Sets the state of the checkbox “Display Undo Warning on Properties Change”, in the preferences dialog Advanced Lighting tab

**Parameters:**

**BOOL val**

TRUE for on; FALSE for off.

**Prototype:**

**virtual BOOL GetSaveScene() const = 0**

**Remarks:**

Returns the state of the checkbox “Save Scene Information in MAX File”, in the preferences dialog Advanced Lighting tab

**Prototype:**

**virtual void SetSaveScene(BOOL val) = 0**

**Remarks:**

Sets the state of the checkbox “Save Scene Information in MAX File”, in the

preferences dialog Advanced Lighting tab

**Parameters:**

**BOOL val**

TRUE for on; FALSE for off.

**Prototype:**

**virtual BOOL GetUseRadiosity() const = 0**

**Remarks:**

Returns the state of the “Use Advanced Lighting” checkbox in the render dialog

**Prototype:**

**virtual void SetUseRadiosity(BOOL val) = 0**

**Remarks:**

Sets the state of the “Use Advanced Lighting” checkbox in the render dialog

**Parameters:**

**BOOL val**

TRUE for on; FALSE for off.

**Prototype:**

**virtual BOOL GetComputeRadiosity() const = 0**

**Remarks:**

Returns the state of the “Compute Advanced Lighting when Required” checkbox in the render dialog

**Prototype:**

**virtual void SetComputeRadiosity(BOOL val) = 0**

**Remarks:**

Sets the state of the “Compute Advanced Lighting when Required” checkbox in the render dialog

**Parameters:**

**BOOL val**

TRUE for on; FALSE for off.

## Class IDXShaderManagerInterface

See Also: [Class IViewportShaderManager](#)

```
class IDXShaderManagerInterface : public FPStaticInterface
```

### Description:

**This class is only available in release 5 or later.**

The class provides access to the Viewport Manager feature in release 5. The viewport manager controls the loading of Viewport Shaders in 3ds max and is displayed on each material. The class provides methods to query the manager to find out whether it is visible or active, and also to retrieve the active shader.

The viewport manager ONLY works in DirectX mode. It can however be visible in Heidi and OpenGL, so as to provide the artist feedback when loading someone else's file.

There is a global method you can call to get access to the DX manager.

**IDXShaderManagerInterface\* GetDXShaderManager()**

### Methods:

#### Prototype:

**virtual CustAttrib\* FindViewportShaderManager (MtlBase\* mtl)=0**

### Remarks:

This method will check the Material passed into find out whether it contains the ViewportManager Custom Attribute. If it does it will return its pointer, otherwise it will be NULL. This pointer can safely be cast to

**IViewportShaderManager.**

### Parameters:

**MtlBase\* mtl**

The material to search for the Viewport Manager.

**Prototype:**

**virtual CustAttrib\* AddViewportShaderManager(MtlBase\* mtl)=0**

**Remarks:**

This method will add the ViewportManager custom attribute to the material supplied. If successful it will return the newly created custom attribute. This pointer can safely be cast to **IViewportShaderManager**.

**Parameters:**

**MtlBase\* mtl**

The material to add the Viewport Manager to

**Prototype:**

**virtual void SetVisible(BOOL show=TRUE)=0**

**Remarks:**

This method allows the system to either show or hide the ViewportManager. This will physically remove it from the Material Editor, whoever the manager will still exist on the material

**Parameters:**

**BOOL show**

The value to set the visible state of the manager.

**Prototype:**

**virtual BOOL IsVisible ()=0**

**Remarks:**

This method will return the actual visible state of the manager

## Class IHardwareRenderer

### Description:

**This class is only available in release 5 or later.**

This interface provides access to the DirectX interfaces on the drawing thread of max. This allows creation and loading of various DirectX objects such as Textures. This class has many interfaces not currently implemented, although they will compile and link correctly. This is due to support for DirectX 9, meaning that when a compatible driver is released these methods will be implemented. The documentation for this class only deals with methods that developers can and would normally use.

The basic idea of this class is to provide the developer with access to the DirectX device without actually giving the developer total control, and thus possibility to de-stable the 3ds max Viewports.

A pointer to this class can be obtained with the following code snippet: -

```
ViewExp *pview = GetCOREInterface()->GetActiveViewport();  
GraphicsWindow *gw = pview->getGW();  
IHardwareRenderer * phr = (IHardwareRenderer *)gw->  
>GetInterface(HARDWARE_RENDERER_INTERFACE_ID);
```

For an example usage of this class see

**MAXSDK\SAMPLES\HardwareShaders\LightMap\Lightmap.cpp**

### Methods:

### Prototype:

```
Virtual DWORD_PTR BuildTexture(BITMAPINFO *bmi, UINT  
miplevels, DWORD usage, DWORD format)
```

### Remarks:

This will create a DX texture stored in local storage. The pointer returned can be used in IHardwareMaterial::SetTexture method. An example of using this

method can be seen in the Lightmap sample.

**Parameters:**

**BITMAPINFO \*bmi**

A pointer to the bitmap from which the texture will be created

**UINT miplevels**

The number of miplevels to create

**DWORD usage**

The usage flag is the same as for D3DXCreateTexture – see the DirectX documentation for more information

**DWORD format**

The pixel format for the texture

**Prototype:**

**Virtual DWORD\_PTR LoadTexture(LPCSTR filename)**

**Remarks:**

This simple loads a texture from the supplied filename using the default options for D3DXCreateTextureFromFile. Please refer to the DirectX documentation for further information.

## Class MNNormalSpec

See Also: [Class MNMESH](#) , [Class MNNormalFace](#)

```
class MNNormalSpec : public IPipelineClient, public FlagUser
```

### Description:

This class is available in release 5.0 and later only.

This class is an interface used to store user-specified normals (as created in the Edit Normals modifier). These normals have very limited pipeline support. They are used for viewport display, but not for rendering.

The MNNormalSpec contains three types of normals:

- **Unspecified** - these are the usual normals that are computed from smoothing groups. All normals are unspecified by default.
- **Specified** - these are normals that are intended for use by particular corners of particular faces, without regard to smoothing groups. For instance, you can create a box, apply Edit Normals, select a group of normals at a particular vertex, and click "Unify". Now those three faces are told to specifically use that one unified normal, and they ignore their smoothing groups at that vertex (which would normally tell them they should each have their own normal).
- **Explicit** - these are normals that are set to particular values. For instance, if the user wants to use the Edit Normals Move or Rotate commands to set a normal to something other than its default value, it has to be made explicit, so it won't be recomputed based on the face normals. All explicit normals are also considered to be

specified..

**Flags:**

**MNNORMAL\_NORMALS\_BUILT**

Indicates that non-specified normals have been constructed using smoothing groups. If not set, non-specified normals may be invalid.

**MNNORMAL\_NORMALS\_COMPUTED**

Indicates that non-explicit normals have been computed using geometrically computed face normals. (If not set, only explicit normals may be assumed to be pointing the right direction.)

**Data Members**

All data members are private.

**int mNumNormalAlloc, mNumFaceAlloc;**

The current allocation length of the mpNormal and mpFace arrays.

**int mNumNormals, mNumFaces;**

The number of normals and faces in the mpNormal and mpFace arrays.

(May be less than the actual allocation above.)

**MNNormalFace \*mpFace;**

The array of normal faces.

**Point3 \*mpNormal;**

The array of normals, all of which should be either length 1 or (occasionally) 0.

**BitArray mNormalExplicit;**

Indicates whether mpNormal[i] is explicit or computed from face normals.

**BitArray mNormalSel;**

Current normal selection.

**float mDisplayLength;**

The length to use when displaying, hit testing, or moving normals.

**MNMesh \*mpParent;**

A pointer to the "parent" MNMesh that owns this MNNormalSpec. This parent information is required for some operations, such as display. (Such operations should indicate below where parent information is required.)

:

**Methods:****Prototype:****MNNormalSpec ();****Remarks:**

Constructor. Initializes all data members.

**Prototype:****~ MNNormalSpec ();****Remarks:**

Destructor. Calls ClearAndFree().

**Prototype:**  
**void Initialize();**

**Remarks:**  
Initializes all data members. Do not call if memory has already been allocated, or that memory will be leaked.

**Prototype:**  
**bool NAlloc (int num, bool keep=TRUE);**

**Remarks:**  
Sets the size of the normal array

**Return Value:**  
True if successful; false indicates a failed memory allocation.

**Prototype:**  
**void NShrink ();**

**Remarks:**  
Reduces the allocation size down to the actual number of normals.

**Prototype:**  
**bool FAlloc (int num, bool keep=TRUE);**

**Remarks:**

Sets the size of the face array.

**Return Value:**

True if successful; false indicates a failed memory allocation.

**Prototype:**

```
void FShrink ();
```

**Remarks:**

Reduces the allocation size down to the actual number of faces.

**Prototype:**

```
void Clear ();
```

**Remarks:**

Clears out all data, but doesn't necessarily free array memory.

**Prototype:**

```
void ClearAndFree ();
```

**Remarks:**

Clears out all data and frees all memory.

**Prototype:**

```
int GetNumFaces () const
```

**Remarks:**

Returns the current number of faces in the MNNormalSpec

**Prototype:**

**bool SetNumFaces (int numFaces);**

**Remarks:**

Sets the current number of faces in the MNNormalSpec, increasing the allocation size as needed.

**Return Value:**

True if successful; false indicates a failed memory allocation.

**Prototype:**

**int GetNumNormals () const**

**Remarks:**

Returns the current number of normals in the MNNormalSpec

**Prototype:**

**bool SetNumNormals (int numNormals);**

**Remarks:**

Sets the current number of normals in the MNNormalSpec, increasing the allocation size as needed.

**Return Value:**

True if successful; false indicates a failed memory allocation.

**Prototype:**  
**Point3 & Normal (int normID) const**

**Remarks:**  
Returns the normal indicated. Since it returns a reference, you can use it as a set method as well:  
Normal(i) = Normalize (Point3(1,1,0));  
(Note that all normals should be normalized to a length of 1.)

**Prototype:**  
**Point3 \* GetNormalArray () const**

**Remarks:**  
Returns a pointer to the whole normal array.

**Prototype:**  
**bool GetNormalExplicit (int normID) const**

**Remarks:**  
Indicates whether a given normal is explicit or not.

**Prototype:**  
**void SetNormalExplicit (int normID, bool value);**

**Remarks:**  
Sets a particular normal to be explicit or not. Note that if you make a normal non-explicit, it may need to be recomputed, so you may want to call ComputeNormals or at least clear the MNNORMAL\_NORMALS\_COMPUTED flag.

**Parameters:**

**int normID**

The index of the normal

**bool value**

True to make the normal explicit; false to make it non-explicit.

**Prototype:**

**MNNormalFace & Face(int faceID) const**

**Remarks:**

Returns the indicated face.

**Prototype:**

**MNNormalFace \* GetFaceArray () const**

**Remarks:**

Returns a pointer to the whole face array.

**Prototype:**

**void SetParent (MNMesh \*pMesh);**

**Remarks:**

Tells the MNNormalSpec what MNMesh "owns" it. This "Parent" MNMesh is used in methods such as Display, Hit-Testing, and certain operations like Unify to get information about the vertices that

normals are based on. (There's no vertex info in the MNNormalSpec itself.)

If you have an isolated MNNormalSpec which doesn't really have an associated "parent", you can temporarily set this to a mesh with the right sort of faces and vertices, but you should clear it afterwards by calling SetParent (NULL). See the Edit Normals modifier source in maxsdk\samples\mesh\EditablePoly\EditNormals.cpp for an example of this sort of usage.

**Prototype:**

**Point3 & GetNormal (int face, int corner);**

**Remarks:**

Returns the normal used by the indicated face, in the indicated corner.

**Prototype:**

**void SetNormal (int face, int corner, Point3 & normal);**

**Remarks:**

Creates a new (explicit) normal and uses it in the indicated corner of the indicated face. If "normal" is not already normalized, this method will take care of it.

**Prototype:**

**int GetNormalIndex (int face, int corner);**

**Remarks:**

Returns the index of the normal used in the indicated corner of the indicated face.

**Prototype:**

**void SetNormalIndex (int face, int corner, int normalIndex);**

**Remarks:**

Sets the index of the normal used in the indicated corner of the indicated face, and marks it as specified.

**Prototype:**

**int NewNormal (Point3 & normal, bool explic=true);**

**Remarks:**

Creates a new normal at the end of the normal array.

**Parameters:****Point3 & normal**

The desired normal direction. Will be normalized to a length of 1 by the method if needed.

**bool explic=true**

Indicates whether the new normal should be considered explicit or not.

**Prototype:**

**void SetSelection (BitArray & newSelection);**

**Remarks:**

Sets the current normal selection.

**Prototype:**

**BitArray & GetSelection();**

**Remarks:**

Returns the current normal selection.

**Prototype:**

**void SetDisplayLength (float displayLength);**

**Remarks:**

Sets the current length used for normal display, hit-testing, and Translations.

**Prototype:**

**float GetDisplayLength ();**

**Remarks:**

Returns the current length used for normal display, hit-testing, and Translations.

**Prototype:**

**void Display (GraphicsWindow \*gw, bool showSel);**

**Remarks:**

Requires an accurate "parent" pointer (see SetParent).

Displays the current normals in the graphics window indicated.  
If "showSel" is true, selected normals are displayed in the usual subobject selection color.

**Prototype:**

**bool HitTest (GraphicsWindow \*gw, HitRegion \*hr, DWORD flags, SubObjHitList& hitList);**

**Remarks:**

Requires an accurate "parent" pointer (see SetParent). Hit-tests on the current normals.

**Parameters:**

**GraphicsWindow \*gw**

The window to hit-test in.

**HitRegion \*hr**

A hit region, typically generated by a call like  
MakeHitRegion(hr,type, crossing,4,p);

**DWORD flags**

Hit testing flags. Please see BaseObject::HitTest for a description of these flags and of the "type" and "crossing" variables used to generate the HitRegion.

**SubObjHitList & hitList**

Where the hits get stored.

**Return Value:**

True if a hit was found; false if not.

**Prototype:**

**Box3 GetBoundingBox (Matrix3 \*tm=NULL, bool selectedOnly=false);**

**Remarks:**

Requires an accurate "parent" pointer (see SetParent). Computes the bounding box of the normals.

**Parameters:**

**Matrix3 tm=NULL**

An optional transform for computing the bounding box in a different space (such as world space).

**bool selectedOnly=false**

Indicates whether all normals should be included in the bounding box,  
or only selected ones.

**Prototype:**

**void ClearNormals ();**

**Remarks:**

This method dumps all unspecified normals. Best to use only from within BuildNormals, since it leaves all unspecified normals in faces initialized to -1.

**Prototype:****void CollapseDeadFaces ();****Remarks:**

Requires an accurate "parent" pointer (see SetParent).

This method is used in conjunction with the parent MNMesh's CollapseDeadFaces method to keep the normal faces in synch with the parent MNMesh faces. It removes any normal face whose equivalent face in the parent mesh is considered "Dead".

Called by MNMesh::CollapseDeadFaces, so you generally don't need or want to call it separately.

**Prototype:****void BuildNormals ();****Remarks:**

Requires an accurate "parent" pointer (see SetParent).

Fills in the mpSpecNormal data by building all the unspecified normals, and computing non-explicit ones. Does nothing if face array is not allocated yet!

**Prototype:****void ComputeNormals ();****Remarks:**

Requires an accurate "parent" pointer (see SetParent).

This method just recomputes the directions of non-explicit normals, without rebuilding the normal list.

**Prototype:**

**void CheckNormals ();**

**Remarks:**

Requires an accurate "parent" pointer (see SetParent).

This checks our flags and calls BuildNormals or ComputeNormals as needed.

**Prototype:**

**MNNormalSpec & operator= (const MNNormalSpec & from);**

**Remarks:**

Typical = operator. Allocates arrays in this, and makes copies of all the data in "from". Does NOT copy "Parent" pointer.

**Prototype:**

**void CopySpecified (const MNNormalSpec & from);**

**Remarks:**

This is similar to operator=, but copies only the specified and explicit information from "from". Result will need to have BuildNormals and ComputeNormals called.

**Prototype:**

**MNNormalSpec & operator+= (const MNNormalSpec & from);**

**Remarks:**

Adds the faces and normals from "from" to our normal spec, renumbering the normals so they don't conflict with existing ones. Called by the "AppendAllChannels" method below (which itself is called by MNMesh::operator+=).

**Prototype:**

**void MNDebugPrint (bool printAll=false);**

**Remarks:**

Uses "DebugPrint" to output information about this MNNormalSpece to the Debug buffer in DevStudio.

**Parameters:**

**bool printAll=false**

If false, only explicit normals and faces using specified normals will be printed out. If true, all normals and faces will be completely printed out.

Here is what the output looks like on a box with mostly default (non-specified) normals, but with one corner "Unified" into a single specified normal:

If printAll = true, you'll see:

MNNormalSpec Debug Output: 22 normals, 6 faces

Normal (Non ) 0: 0.577350, -0.577350, 0.577350

Normal (Non ) 1: 0.000000, 0.000000, -1.000000  
Normal (Non ) 2: 0.000000, 0.000000, -1.000000  
Normal (Non ) 3: 0.000000, 0.000000, -1.000000  
Normal (Non ) 4: 0.000000, 0.000000, -1.000000  
Normal (Non ) 5: 0.000000, 0.000000, 1.000000  
Normal (Non ) 6: 0.000000, 0.000000, 1.000000  
Normal (Non ) 7: 0.000000, 0.000000, 1.000000  
Normal (Non ) 8: 0.000000, -1.000000, 0.000000  
Normal (Non ) 9: 0.000000, -1.000000, 0.000000  
Normal (Non ) 10: 0.000000, -1.000000, 0.000000  
Normal (Non ) 11: 1.000000, 0.000000, 0.000000  
Normal (Non ) 12: 1.000000, 0.000000, 0.000000  
Normal (Non ) 13: 1.000000, 0.000000, 0.000000  
Normal (Non ) 14: 0.000000, 1.000000, 0.000000  
Normal (Non ) 15: 0.000000, 1.000000, 0.000000  
Normal (Non ) 16: 0.000000, 1.000000, 0.000000  
Normal (Non ) 17: 0.000000, 1.000000, 0.000000  
Normal (Non ) 18: -1.000000, 0.000000, 0.000000  
Normal (Non ) 19: -1.000000, 0.000000, 0.000000  
Normal (Non ) 20: -1.000000, 0.000000, 0.000000  
Normal (Non ) 21: -1.000000, 0.000000, 0.000000

Normal Selection:

0 6 13 17

Normal faces: \_ before normal index means non-specified.

Face 0: \_1 \_2 \_3 \_4

Face 1: \_5 0 \_6 \_7

Face 2: \_8 \_9 0 \_10

Face 3: \_11 \_12 \_13 0

Face 4: \_14 \_15 \_16 \_17

Face 5: \_18 \_19 \_20 \_21

If printAll is false, you'll just see:

MNNormalSpec Debug Output: 22 normals, 6 faces

Normal Selection:

0 6 13 17

Face 1: \_ 0 \_ \_

Face 2: \_ \_ 0 \_

Face 3: \_ \_ \_ 0

**Prototype:**

**bool CheckAllData (int numParentFaces);**

**Remarks:**

Performs a series of internal checks to verify that the normal data is consistent. If there are any problems, messages are sent out via DebugPrint.

**Parameters:**

**int numParentFaces**

The number of faces in the parent MNMesh. (This method does not require an accurate "parent" pointer, but it does require this number to be accurate.

**Return Value:**

True if everything checks out ok, false if not.

**Prototype:**

**IOResult Save (ISave \*isave);**

**Remarks:**

Called by the system. Saves the MNNormalSpec to the buffer.

**Prototype:**  
**IOResult Load (ILoad \*iload);**

**Remarks:**  
Called by the system. Loads the MNNormalSpec from the buffer.

**Prototype:**  
**bool Transform (Matrix3 & xfm, BOOL useSel=false, BitArray  
\*normalSelection=NULL);**

**Remarks:**  
Transforms the normals. Note that since normals are always considered to be unit length vectors, scales and translations are not effective. Translations drop out because we use the VectorTransform method to transform the normals, and scales drop out because we renormalize the normals to a length of 1 afterwards.

**Parameters:**  
**Matrix3 & xfm**  
The desired transform.

**BOOL useSel=false**  
Indicates whether all normals should be translated, or only selected ones.

**BitArray \*normalSelection=NULL**  
The desired transform.

**BOOL useSel=false**

If non-NULL, this represents a selection of normals that should be used instead of the usual selection, when deciding which normals to transform.

**Return Value:**

True if something was modified. False would indicate that no normals were changed, perhaps because there are no normals in the spec or because none were selected.

**Prototype:**

**bool Translate (Point3 & translate, BOOL useSel=true, BitArray \*normalSelection=NULL);**

**Remarks:**

This is used to give a translation-like effect to normals. It's used in the Edit

Normals "Move" mode. Essentially it drags the "top" of the normals by the amount

given, and then renormalizes the vectors to unit length. It uses the current

display length as well, so the formula is basically

$mpNormal[i] = \text{Normalize}(mpNormal[i]*mDisplayLength + \text{translate});$

This gives a fairly natural result in Edit Normals Move.

**Parameters:**

**Point3 & translate**

The desired translation.

**BOOL useSel=false**

Indicates whether all normals should be translated, or only selected ones.

**BitArray \*normalSelection=NULL**

If non-NULL, this represents a selection of normals that should be used instead of the usual selection, when deciding which normals to translate.

**Return Value:**

True if something was modified. False would indicate that no normals were changed, perhaps because there are no normals in the spec or because none were selected.

**Prototype:**

```
bool BreakNormals (BOOL useSel=true, BitArray  
*normalSelection=NULL);
```

**Remarks:**

"Breaks" normals so that none are shared between faces. Broken normals are set to Specified (but not explicit.)

**Parameters:****BOOL useSel=false**

Indicates whether all normals should be affected, or only selected ones.

**BitArray \*normalSelection=NULL**

If non-NULL, this represents a selection of normals that should be used instead of

the usual selection, when deciding which normals to affect.  
(Irrelevant if  
useSel=false.)

**Return Value:**

True if something was modified. False would indicate that no normals were changed,  
perhaps because there are no normals present or because none were selected,  
or because selected normals were already fully broken and specified.

If the return value is true, the MNNORMAL\_NORMALS\_BUILT and MNNORMAL\_NORMALS\_COMPUTED flags are cleared, because the newly broken normals need to be rebuilt and computed.

**Prototype:**

**bool UnifyNormals (BOOL useSel=true, BitArray  
\*normalSelection=NULL);**

**Remarks:**

Requires an accurate "parent" pointer (see SetParent).

This method unifies selected normals so that there's a maximum of one per vertex. For instance, a default box has 3 normals at every vertex. You can select 2 or 3 of them and click "Unify" in Edit Normals, and the normals will be shared across the faces that use them. See Edit Normals documentation for more information.

This method does not unify normals that are based at different vertices. If you want separate vertices to use the same normal, you must use more direct, low-level methods like SetNormalIndex.

Unified normals are set to specified (but not explicit).

**Parameters:**

**BOOL useSel=false**

Indicates whether all normals should be affected, or only selected ones.

**BitArray \*normalSelection=NULL**

If non-NULL, this represents a selection of normals that should be used instead of the usual selection, when deciding which normals to affect. (Irrelevant if useSel=false.)

**Return Value:**

True if something was modified. False would indicate that no normals were changed, perhaps because there are no normals present or because none were selected, or because selected normals were already fully unified and specified.

If the return value is true, the `MNNORMAL_NORMALS_BUILT` and `MNNORMAL_NORMALS_COMPUTED` flags are cleared, because the newly unified normals need to be rebuilt and computed.

**Prototype:**

**bool SpecifyNormals (BOOL useSel=true, BitArray \*normalSelection=NULL);**

**Remarks:**

Specifies the indicated normals. DOESN'T remove the explicitness of the normals.

(That should be done separately with `MakeNormalsExplicit`, `value=false`.)

**Parameters:**

**BOOL useSel=false**

Indicates whether all normals should be affected, or only selected ones.

**BitArray \*normalSelection=NULL**

If non-NULL, this represents a selection of normals that should be used instead of the usual selection, when deciding which normals to affect. (Irrelevant if `useSel=false`.)

**Return Value:**

True if something was modified. False would indicate that no normals were changed, perhaps because there are no normals present or because none were selected, or because they were all already specified.

**Prototype:**

**bool MakeNormalsExplicit (BOOL useSel=true, BitArray \*normalSelection=NULL, bool value=true);**

**Remarks:**

Makes the indicated normals both specified and explicit.

**Parameters:**

**BOOL useSel=false**

Indicates whether all normals should be affected, or only selected

ones.

**BitArray \*normalSelection=NULL**

If non-NULL, this represents a selection of normals that should be used instead of the usual selection, when deciding which normals to affect. (Irrelevant if useSel=false.)

**bool value=true**

I Indicates whether the normals should be set to explicit, or non-explicit.

**Return Value:**

True if something was modified. False would indicate that no normals were changed, perhaps because there are no normals present or because none were selected.

If value=false and the return value is true, the MNNORMAL\_NORMALS\_COMPUTED flag is cleared, because the newly nonexplicit normals need to be computed

.

**Prototype:**

**bool ResetNormals (BOOL useSel=true, BitArray \*normalSelection=NULL);**

**Remarks:**

Resets the indicated normals to be completely non-explicit and non-specified.

**Parameters:****BOOL useSel=false**

Indicates whether all normals should be affected, or only selected ones.

**BitArray \*normalSelection=NULL**

If non-NULL, this represents a selection of normals that should be used instead of

the usual selection, when deciding which normals to affect.

(Irrelevant if useSel=false.)

**Return Value:**

True if something was modified. False would indicate that no normals were changed,

perhaps because there are no normals present or because none were selected.

If the return value is true, the MNNORMAL\_NORMALS\_BUILT and MNNORMAL\_NORMALS\_COMPUTED flags are cleared, because the newly nonspecified normals need to be rebuilt and computed.

## List of Expression Types

One of the following values:

### **SCALAR\_EXPR**

Scalar expression. This is a single floating point value.

### **VECTOR\_EXPR**

Vector expression. The **eval()** method returns the result as an array of floating point values:

**ans[0] = x, ans[1] = y, ans[2] = z.**

The method **getExprType()** may be used to determine the type of the expression result.

## List of Expression Variable Types

See Also: [Class Point3](#).

One of the following values:

### **SCALAR\_VAR**

Scalar variable. This is a single floating point value.

### **VECTOR\_VAR**

Vector variable. This is a **Point3** value when passed to the **eval()** method. The **x**, **y**, **z** public data members of the **Point3** are the values representing the vector. Vectors are specified in an expression by enclosing the three values in square brackets, i.e. "**[]**". For example, this is a unit vector parallel to the world Z axis: **[0,0,1]**.

## List of Expression Return Codes

One of the following values:

### **EXPR\_NORMAL**

No problems, expression evaluated successfully.

### **EXPR\_INST\_OVERFLOW**

Expression caused an instruction stack overflow during parsing.

### **EXPR\_UNKNOWN\_TOKEN**

Unknown function, constant, or register found during parsing.

### **EXPR\_TOO\_MANY\_VARS**

Expression caused a value stack overflow.

### **EXPR\_TOO\_MANY\_REGS**

Register array overflow, or register number too big.

### **EXPR\_CANT\_EVAL**

Function can't be evaluated with given arguments.

### **EXPR\_CANT\_PARSE**

Expression can't be parsed syntactically.

## List of FPStatus Values

See Also: [Class FPInterface](#), [Function Publishing System](#).

One of the following values are returned from the various FPInterface methods:

### **FPS\_FAIL**

This status indicates a failure.

### **FPS\_NO\_SUCH\_FUNCTION**

The function called does not exist.

### **FPS\_ACTION\_DISABLED**

The action is disabled.

### **FPS\_OK**

Indicates a success.

## List of ControlType2 Choices

See Also: [Class IParamBlock2](#), [Structure ParamDef](#), [Class ParamBlockDesc2](#).

### Description:

This data is available in release 3.0 and later only.

This is the list of user interface control choices available for use with parameter block2s. There is one of these associated with each parameter definition in a **ParamBlockDesc2**.

### enum ControlType2

{

#### **TYPE\_SPINNER**

A custom spinner control.

#### **TYPE\_RADIO**

A radio button control.

#### **TYPE\_SINGLECHECKBOX**

A single checkbox control.

#### **TYPE\_MULTICHECKBOX**

A multiple checkbox control. This control type is not currently supported.

#### **TYPE\_COLORSWATCH**

A color swatch color control.

#### **TYPE\_EDITBOX**

An edit box control.

#### **TYPE\_CHECKBUTTON**

A check button control. This button's state is either pressed or not.

#### **TYPE\_PICKNODEBUTTON**

A node picker button.

#### **TYPE\_TEXMAPBUTTON**

A texture map selector button. This button supports drag and drop of texmaps.

#### **TYPE\_MTLBUTTON**

A material selector button. This button supports drag and drop of materials.

#### **TYPE\_FILEOPENBUTTON**

A file open button.

#### **TYPE\_FILESAVEBUTTON**

A file save button.

**TYPE\_INTLISTBOX**

A list box control for integers.

**TYPE\_FLOATLISTBOX**

A list box control for floats.

**TYPE\_STRINGLISTBOX**

A list box control for strings.

**TYPE\_NODELISTBOX**

A list box control for nodes.

**TYPE\_MAPLISTBOX**

A list box control for maps.

**TYPE\_SLIDER**

A custom slider control.

};

# Class MaxNetCallback

See Also: [Class MaxNetManager](#)

class MaxNetCallback

## Description:

This class is available in release 4.0 and later only.

If you want to use the call back mechanisms provided by the MaxNetManager class, you create your own class derived from MaxNetCallback and pass it as the argument for **MaxNetManager::SetCallback()**. All methods are optional. You need only to implement those you want.

## Methods:

### Prototype:

**bool Progress(int total, int current);**

### Remarks:

This method is called whenever a lengthy operation is under way. This includes large block transfers, file transfers, etc.

### Parameters:

**int total**

A total amount of information to process.

**int current**

From the total amount, this is the current position.

### Return Value:

TRUE if you want to cancel the operation, otherwise FALSE.

### Prototype:

**void ProgressMsg(const TCHAR \*message);**

### Remarks:

This method is called to provide a textual message regarding the current process which is under way (connecting to a Manager, waiting for a reply, etc.)

### Parameters:

**const TCHAR\* message**

The text message.

**Prototype:**

**void ManagerDown();**

**Remarks:**

This method is called for messages which are sent to indicate that the Manager was shut down and is no longer available to service any requests.

**Prototype:**

**void Update();**

**Remarks:**

This method is called to indicate something has changed. This message is sent whenever a new job is sent to the queue, a Server changed its state, an error occurred, etc. This allows you to be kept up to date without the need to poll the Manager from time to time. Note that these messages are queued up. That is, if 10 jobs are deleted at once or any number of changes occur within a short period, you will only receive one **Update()** call.

**Prototype:**

**void QueryControl(TCHAR\* station);**

**Remarks:**

This method is called if someone requests control over the queue. If you do not have control over the queue, you do not need to respond to this message. If you have control over the queue and do nothing when this call is received, the Manager will timeout and take control over the queue. If you have control over the queue, you should respond to this message using **MaxNetManager::GrantManagerControl()** passing either a true value, indicating you are granting control, or a false value, indicating you do not want to relinquish control.

**Parameters:**

**TCHAR\* station**

The name of the computer requesting control.

**Prototype:**

```
void QueueControl();
```

**Remarks:**

This method is called in order to notify that someone took control of the queue.

## Structure ManagerInfo

See Also: [Class MaxNetManager](#), [Structure NetworkStatus](#), [Structure ConfigurationBlock](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store information about a Manager.

### typedef struct {

**DWORD size;**

The size of the structure, being **sizeof(ManagerInfo)**.

**DWORD version;**

The version information, defined by **\_MANAGER\_INFO\_VERSION**.

**ConfigurationBlock cfg;**

The network system configuration data. Refer to this structure for more information.

**NetworkStatus net\_status;**

The network status information.

**int servers;**

The number of servers registered.

**int jobs;**

The number of jobs.

**char reserved[32];**

Reserved for future use.

**} ManagerInfo;**

## Structure ClientInfo

See Also: [Class MaxNetManager](#), [Structure ConfigurationBlock](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store information about a Client.

### typedef struct {

**DWORD size;**

The size of the structure, being **sizeof(ClientInfo)**.

**DWORD version;**

The version information, defined by **\_CLIENTINFO\_VERSION**.

**ConfigurationBlock cfg;**

The network system configuration data. Refer to this structure for more information.

**bool controller;**

TRUE if the Client is currently controlling the queue.

**short udp\_port;**

The UDP port being used for network communications.

**char reserved[32];**

Reserved for future use.

**} ClientInfo;**

## Structure JobList

See Also: [Class MaxNetManager](#), [Structure Job](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store information the state of a job.

### typedef struct {

#### **Job job;**

The structure containing the job details.

#### **HJOB hJob;**

The handle to the job.

#### **WORD state;**

The current state of the job, which is one of the following values:

#### **JOB\_STATE\_COMPLETE**

The job is complete.

#### **JOB\_STATE\_WAITING**

The job is waiting to be rendered.

#### **JOB\_STATE\_BUSY**

The job is busy rendering.

#### **JOB\_STATE\_ERROR**

The job experienced an error.

#### **JOB\_STATE\_SUSPENDED**

The job is suspended.

### **} JobList;**

## Structure Job

See Also: [Class MaxNetManager](#), [Structure AlertData](#), [Structure MaxJob](#), [Structure CombustionJob](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store information about a job.

### typedef struct {

#### **DWORD size;**

The size of the structure, being **sizeof(Job)**.

#### **DWORD version;**

The structure version information, defined by **\_JOB\_VERSION**.

#### **DWORD server\_pid;**

The server Process ID which is used by 3ds max to check server's health.

#### **DWORD flags;**

The job flags, defined as the following values:

#### **JOB\_VP**

Video Post (otherwise is Render Scene).

#### **JOB\_NONC**

Non concurrent driver (Accom DDR, AVI, etc.)

#### **JOB\_MAPS**

The Include Maps flag.

#### **JOB\_NONSTOP**

Uninterruptible driver (AVI, FLC, etc.)

#### **JOB\_SKIPEXST**

Skip Existing Frames.

#### **JOB\_ALLSERVERS**

Allow the use of all available servers.

#### **JOB\_INACTIVE**

This flag indicates the job is suspended

#### **JOB\_COMPLETE**

This read-only flag indicates that the job is complete.

**JOB\_IGNORESHARE**

Ignore the Manager's job share, always request archives.

**JOB\_SKIPOUTPUTTST**

This flag indicates that the server should not test the output path.

**JOB\_NONSEQFRAMES**

Non sequential frames such as 1,3,5-10, etc.

**JOB\_COMBUSTIONJOB**

This flag indicates the job is a Combustion specific job.

**JOB\_NOTARCHIVED**

This flag indicates an uncompressed file (i.e. not an archive).

**JOB\_ASSIGN\_VP**

This is a legacy support flag, defined as **JOB\_VP**.

**JOB\_ASSIGN\_RND**

This is a legacy support flag.

**HJOB hJob;**

Handle to the job, assigned by the Manager when a job is created/submitted.

This handle will be read-only after its creation.

**char name[MAX\_PATH];**

The name of the job.

**DWORD filesize;**

This variable is used internally when transferring an archive and specifies its size.

**DWORD filesizeextracted;**

This variable is used internally when transferring an archive and specifies its uncompressed size.

**SYSTEMTIME submission;**

The system time, set when a job is created/submitted.

**SYSTEMTIME startjob;**

The system time, set when a job starts.

**SYSTEMTIME endjob;**

The system time, set when a job is completed.

**int servercount;**

The number of servers defined for the job (can be 0 if

**JOB\_ALLSERVERS** is set).

**AlertData alerts;**

The alert notification data structure.

**int jobtextcount;**

The number of JobTextInfo records.

**int firstframe;**

The first frame in the range.

**int lastframe;**

The last frame in the range.

**int step;**

The frame step value (i.e. every n-th frame).

**int width;**

The frame output width.

**int height;**

The frame output height.

**int frames\_completed;**

The number of frames completed.

**char priority;**

The job priority level.

**char reserved[32];**

Reserved for future use.

**union {**

**MaxJob maxJob**

    Specific information about a job pertaining to 3ds max.

**CombustionJob combustionJob**

    Specific information about a job pertaining to Combustion.

**}**

**} Job;**

## Class CJobText

See Also: [Class MaxNetCallBack](#), [Structure JobText](#), [List of Job Text Types](#)

class CJobText

### Description:

This class is available in release 4.0 and later only.

The CJobText class stores job information which is of a dynamic nature or of variable length.

### Methods:

public:

### Prototype:

**~CJobText();**

### Remarks:

Destructor. The CJobText buffers will be deallocated.

### Prototype:

**int Count();**

### Remarks:

This method return the number of JobText buffers in the list.

Note: Developers should use Job.jobtextcount to find out how many elements there are.

### Prototype:

**int Add(JobText\* jt);**

### Remarks:

This method will add another JobText buffer.

### Parameters:

**JobText\* jt**

A pointer to the JobText buffer to add.

### Return Value:

The number of JobText buffers.

**Prototype:**

**void Delete(int idx, int count = 1);**

**Remarks:**

This method will delete one or a sequence of buffers.

**Parameters:**

**int idx**

The position of the first index to be deleted.

**int count**

The number of entries to delete.

**Prototype:**

**void Reset();**

**Remarks:**

This method will reset and deallocate the CJobText buffers.

**Prototype:**

**JobText\* Buffer();**

**Remarks:**

This method will return a pointer to the actual JobText buffer.

**Prototype:**

**int BufferSize();**

**Remarks:**

This method returns the total size of the JobText buffer.

**Prototype:**

**int FindJobText(JOB\_TEXT\_TYPE tp, int start = 0);**

**Remarks:**

This method allows you to search for a JobText entry by its type. Refer to the list of Job Text types for details.

**Parameters:****JOB\_TEXT\_TYPE tp**

The Job Text type you wish to find.

**int start**

The start position from which to initiate the search process.

**Return Value:**

The index of the entry which was found, or -1 if not found.

**Prototype:**

```
bool GetTextItem(TCHAR* text, JOB_TEXT_TYPE type, int  
start = 0, int* idx = 0);
```

**Remarks:**

This method retrieves an index based on its Text Type. Refer to the [List of Job Text Types](#) for details.

**Parameters:****TCHAR\* text**

A pointer to the text buffer which will be filled in by the method.

**JOB\_TEXT\_TYPE type**

The Job Text type you wish to find.

**int start**

The start position from which to retrieve the text item.

**int\* idx**

A pointer to the index found.

**Return Value:**

TRUE if the method was successful, otherwise FALSE.

**Prototype:**

```
bool GetUser(TCHAR* user);
```

**Remarks:**

This method will retrieve the user name associated with a job.

**Parameters:****TCHAR\* user**

The user name which was retrieved.

**Return Value:**

TRUE if the user name was retrieved, otherwise FALSE.

**Prototype:**

**bool GetComputer(TCHAR\* computer);**

**Remarks:**

This method will retrieve the computer name associated with a job.

**Parameters:**

**TCHAR\* computer**

The computer name which was retrieved.

**Return Value:**

TRUE if the computer name was retrieved, otherwise FALSE.

**Prototype:**

**bool GetFrames(TCHAR\* frames);**

**Remarks:**

This method will retrieve the frame sequence (such as the "1,2,4,5-40" types).

**Parameters:**

**TCHAR \*frames**

The frames retrieved.

**Return Value:**

TRUE if the frame sequence string was retrieved, otherwise FALSE.

**Prototype:**

**bool GetShare(TCHAR\* share);**

**Remarks:**

This method will retrieve the Manager's network share associated with a job.

**Parameters:**

**TCHAR\* share**

The network share which was retrieved.

**Return Value:**

TRUE if the network share was retrieved, otherwise FALSE.

**Operators:****Prototype:**

**JobText& operator[](const int i);**

**Remarks:**

This access operator returns a reference to a JobText entry.

**Parameters:**

**const int i**

The index of the JobText buffer to return.

## Structure HSERVER

See Also: [Class MaxNetManager](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API as a handle to a server.

**typedef struct {**

**BYTE addr[8];**

    The handle to a server by it's mac (Ethernet) address.

**} HSERVER;**

## Structure JOBFAMES

See Also: [Class MaxNetManager](#), [Structure HSERVER](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store a job's frame progress information.

### typedef struct {

#### **char state;**

The current state of this frame which is one of the following values:

#### **FRAME\_WAITING**

The frame is waiting to be assigned and rendered.

#### **FRAME\_ASSIGNED**

The frame is assigned to the server.

#### **FRAME\_COMPLETE**

The frame has completed rendering.

#### **NO\_FRAME**

There are no frames to be rendered.

#### **int frame;**

The frame number.

#### **HSERVER hServer;**

The handle to the server rendering this frame.

#### **DWORD elapsed;**

The time it took to render this frame, in milliseconds.

### } JOBFAMES;

## Structure JobServer

See Also: [Class MaxNetManager](#), [Structure HSERVER](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store information about the servers in the job queue.

### typedef struct {

**HSERVER hServer;**

The handle to the server.

**char status;**

The current state of the server, which is one of the following values:

**JOB\_SRV\_IDLE**

The server is idle.

**JOB\_SRV\_BUSY**

The server is busy.

**JOB\_SRV\_FAILED**

The server is has failed (rendering error).

**JOB\_SRV\_ABSENT**

The server is absent.

**JOB\_SRV\_SUSPENDED**

The server is suspended, out of work schedule.

**JOB\_SRV\_BUSYOTHER**

The server is busy with another job.

**JOB\_SRV\_ERROR**

The server experienced a connection error.

**JOB\_SRV\_COOL\_OFF**

The server is "cooling off" (i.e. in error recovery).

**bool failed;**

This variable is used internally.

**bool active;**

Indicates that the server is active in the job.

**int cur\_frame;**

The frame which is currently being rendered.

**float thours;**

The total hours the server has spent rendering.

**int frames;**

The total number of frames the server has rendered.

**} JobServer;**

## Structure ServerList

See Also: [Class MaxNetManager](#), [Structure HSERVER](#), [Structure ServerInfo](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store global server state information.

If **hJob** is a valid handle (i.e. non 0) and **frame** holds a **NO\_FRAME**, this means this server has just be assigned a job or it is in between frames (no frames assigned). Most likely it is loading 3ds max. The transition in between frames is in the nanosecond level, but seeing as it is possible, it cannot be discarded.

### typedef struct {

**HSERVER hServer;**

The handle to the server.

**HJOB hJob;**

The handle to the job that the server is currently working on, if there is one.

**int frame;**

The frame the server is currently rendering, if there is one.

**SYSTEMTIME frame\_started;**

The time the server had the frame assigned.

**WORD state;**

The current state of the server which is one of the following values:

**SERVER\_STATE\_ABSENT**

The server is absent.

**SERVER\_STATE\_IDLE**

The server is idle.

**SERVER\_STATE\_BUSY**

The server is busy.

**SERVER\_STATE\_ERROR**

The server is experiencing an error.

**SERVER\_STATE\_SUSPENDED**

The server has been suspended..

**ServerInfo info;**

The server information structure containing the server details.

**} ServerList;**

## Structure WeekSchedule

See Also: [Class MaxNetManager](#), [Structure Schedule](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store weekly scheduling information.

**typedef struct {**

**Schedule day[7];**

The hourly schedule configuration for each day of the week.

**int AttendedPriority;**

The attended priority value which is one of the following values:

**HIGHPRIORITY, LOWPRIORITY, or IDLEPRIORITY.**

**int UnattendedPriority;**

The unattended priority value which is one of the following values:

**HIGHPRIORITY, LOWPRIORITY, or IDLEPRIORITY.**

**} WeekSchedule;**

## Structure NetworkStatus

See Also: [Class MaxNetManager](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store network status information.

**typedef struct {**

**DWORD dropped\_packets;**

The number of packets dropped due to buffer overflows.

**DWORD bad\_packets;**

The number of bad formed packets.

**DWORD tcprequests;**

The total number of TCP requests since boot time.

**DWORD udprequests;**

The total number of UDP requests since boot time.

**SYSTEMTIME boot\_time;**

The system boot time.

**char reserved[32];**

Reserved for future use.

**} NetworkStatus;**

## List of MaxNet Errors

See Also: [Class MaxNetManager](#), [Class CJobText](#), [Structure JobText](#)

The list of the various MaxNet error codes available, defined as the enum `maxnet_error_t`.

### **MAXNET\_ERR\_NONE**

No error.

### **MAXNET\_ERR\_CANCEL**

Cancellation Error.

### **MAXNET\_ERR\_NOMEMORY**

An out of memory error has occurred.

### **MAXNET\_ERR\_FILEIO**

A file IO error has occurred.

### **MAXNET\_ERR\_BADARGUMENT**

Bad arguments were passed along.

### **MAXNET\_ERR\_NOTCONNECTED**

A connection was not established.

### **MAXNET\_ERR\_NOTREADY**

Windows Network Not Installed or Not Initialized.

### **MAXNET\_ERR\_IOERROR**

An IO error has occurred.

### **MAXNET\_ERR\_CMDERROR**

A command error has occurred.

### **MAXNET\_ERR\_HOSTNOTFOUND**

The specific host could not be found.

### **MAXNET\_ERR\_BADSOCKETVERSION**

Winsock.dll is obsolete.

### **MAXNET\_ERR\_WOULDBLOCK**

An internal blocking error has occurred.

### **MAXNET\_ERR\_SOCKETLIMIT**

No more available TCP/IP Sockets.

### **MAXNET\_ERR\_CONNECTIONREFUSED**

A connection has been refused. Service not installed on host computer.

**MAXNET\_ERR\_ACCESSDENIED**

Access to a host was denied.

**MAXNET\_ERR\_TIMEOUT**

A network time-out has occurred.

**MAXNET\_ERR\_BADADDRESS**

A bad network address was supplied.

**MAXNET\_ERR\_UNKNOWN**

An unknown error has occurred.

## List of Dimension Types

See Also: [Class ParamDimension](#).

One of the following values:

**DIM\_NONE**

**DIM\_WORLD**

**DIM\_ANGLE**

**DIM\_COLOR**

**DIM\_COLOR255**

**DIM\_PERCENT**

**DIM\_NORMALIZED**

**DIM\_SEGMENTS**

**DIM\_TIME**

**DIM\_CUSTOM**

## Class ParamBlockDesc

See Also: [Class ParamBlockDescID](#).

class ParamBlockDesc

### Description:

The parameter block descriptor describes each parameter in a parameter block.

```
class ParamBlockDesc {  
    public:  
        ParamType type;  
        UserType *user;  
        BOOL animatable;  
};
```

### Data Members:

#### **ParamType type**

The parameter type. See [List of Parameter Types](#).

#### **UserType \*user**

This value is not used -- it must always be passed as NULL.

#### **BOOL animatable**

This is a flag indicating if the parameter may be animated or not. Pass TRUE if the value may be animated and FALSE if it is constant.

## Class ParamVersionDesc

### Description:

This structure describes a version of the parameter block.

### Data Members:

**ParamBlockDescID \*desc;**

This is an array of parameter block descriptors.

**int count;**

This is the number of items in the array.

**DWORD version;**

This is the version number.

### Methods:

### Prototype:

**ParamVersionDesc(ParamBlockDescID \*d,int c,int v);**

### Remarks:

Constructor.

### Parameters:

**ParamBlockDescID \*d**

This is an array of parameter block descriptors.

**int c**

This is the number of items in the array.

**int v**

This is the version number.

## Structure DispInfo

Below is the display information structure. This structure holds the information describing 3ds max's current system of measurement. This includes the type of units used, how they are displayed and any custom unit name and scale.

**typedef struct {**

**int dispType;**

Unit Display Type. One of the following values:

**UNITDISP\_GENERIC**

**UNITDISP\_METRIC**

**UNITDISP\_US**

**UNITDISP\_CUSTOM**

**int metricDisp;**

Metric display option. One of the following values:

**UNIT\_METRIC\_DISP\_MM**

**UNIT\_METRIC\_DISP\_CM**

**UNIT\_METRIC\_DISP\_M**

**UNIT\_METRIC\_DISP\_KM**

**int usDisp;**

US display option. One of the following values:

**UNIT\_US\_DISP\_FRAC\_IN**

**UNIT\_US\_DISP\_DEC\_IN**

**UNIT\_US\_DISP\_FRAC\_FT**

**UNIT\_US\_DISP\_DEC\_FT**

**UNIT\_US\_DISP\_FT\_FRAC\_IN**

**UNIT\_US\_DISP\_FT\_DEC\_IN**

**int usFrac;**

US fraction option. One of the following values:

**UNIT\_FRAC\_1\_1**

**UNIT\_FRAC\_1\_2**

**UNIT\_FRAC\_1\_4**

**UNIT\_FRAC\_1\_8**

**UNIT\_FRAC\_1\_10**

**UNIT\_FRAC\_1\_16**  
**UNIT\_FRAC\_1\_32**  
**UNIT\_FRAC\_1\_64**  
**UNIT\_FRAC\_1\_100**

**const TCHAR \*customName;**

Custom unit name.

**float customValue;**

Custom unit value.

**int customUnit;**

Custom unit reference.

Note: The three custom settings above are related as follows: If for example the **customName** is set to "FL" for furlongs (which is equal to 660 feet), **customValue** should equal 660.0 and **customUnit** should equal **UNITS\_FEET**.

**} DispInfo;**

## Class AnimProperty

See Also: [Class Animatable](#).

class AnimProperty

### Description:

This is the base class for classes that can be hung off an animatable's property list. When an animatable is deleted, its properties will be deleted and their virtual destructor will be called.

### Methods:

#### Prototype:

**virtual BOOL DontDelete();**

#### Remarks:

Implemented by the Plug-In.

When the animatable is destroyed it will normally delete all the properties. If a plug-in wants to add a property to the list that it does not want deleted it can implement this method to return TRUE.

#### Return Value:

TRUE if the item should not be deleted; otherwise FALSE.

#### Default Implementation:

**{return FALSE;}**

#### Prototype:

**virtual DWORD ID()=0;**

#### Remarks:

Implemented by the Plug-In.

Returns the ID of the property. Values above **PROPID\_USER** can be used by plug-ins. Note: that a plug-in should only put user defined properties on its own list. So IDs only have to be unique within a plug-in. If a plug-in needs to attach data to another object, it can do so via APP\_DATA.

## Class InterpCtrlUI

See Also: [Class AnimProperty](#), [Class JointParams](#).

```
class InterpCtrlUI : public AnimProperty
```

### Description:

This is simply a container class to hold some data while the controllers parameters are being edited. All methods of this class are implemented by the system.

### Data Members:

public:

**HWND hParams;**

The window handle of the rollup page.

**IObjParam \*ip;**

The interface pointer.

**Control \*cont;**

The controller that is being edited.

### Methods:

### Prototype:

**InterpCtrlUI(HWND h,IObjParam \*i,Control \*c)**

### Remarks:

Constructor. The data members are initialized to the values passed.

### Prototype:

**~InterpCtrlUI();**

### Remarks:

Destructor.

### Prototype:

**DWORD ID();**

### Remarks:

Returns the property list of id: **PROPID\_INTERPUI**

## Class MtlBaseList

See Also: [Template Class Tab](#), [Class MtlBase](#), [Class Interface](#).

```
class MtlBaseList: public Tab<MtlBaseHandle>
```

### Description:

A simple list of MtlBases. All methods of this class are implemented by the system.

Note the following typedefs:

```
typedef MtlBase* MtlBaseHandle;  
typedef Mtl* MtlHandle;  
typedef Texmap* TexmapHandle;
```

### Methods:

#### Prototype:

```
int AddMtl(MtlBase *m, BOOL checkUnique=TRUE);
```

#### Remarks:

Adds the specified MtlBase to the list.

#### Parameters:

**MtlBase \*m**

The MtlBase to add.

**BOOL checkUnique=TRUE**

If TRUE this method checks to make sure the MtlBase is unique, and will only add it if so.

#### Return Value:

Nonzero if the MtlBase was added; otherwise zero.

#### Prototype:

```
int FindMtl(MtlBase *m);
```

#### Remarks:

Finds the specified MtlBase in this material list and returns its index. Returns -1 if not found.

#### Parameters:

**MtlBase \*m**

The MtlBase to find.

**Prototype:**

**int FindMtlByName(TSTR& name);**

**Remarks:**

Finds the specified material by name and returns its index. Returns -1 if not found.

**Parameters:**

**TSTR& name**

The name to find.

**Prototype:**

**void RemoveEntry(int n);**

**Remarks:**

Removes the specified MtlBase from the list.

**Parameters:**

**int n**

The index of the MtlBase to remove.

**Prototype:**

**void Empty();**

**Remarks:**

Removes all MtlBases from the list.

## Class DWORDTab

See Also: [Class Tab](#), [Class AdjEdgeList](#).

```
class DWORDTab : public Tab<DWORD>
```

### **Description:**

This class is simply a table of DWORDs (32-bit values.)

## Class MEdge

See Also: [Class AdjEdgeList](#), [Class Mesh](#).

class MEdge

### Description:

This class describes a single edge of a mesh object that is adjacent to a vertex. This is an edge that is coming out of the vertex. This is used in adjacency lists.

### Data Members:

public:

**DWORD f[2];**

The indices into the meshes face table of the two faces that share this edge.

**DWORD v[2];**

The indices into the meshes vertex table of the two vertices of this edge.

### Methods:

public:

### Prototype:

**int EdgeIndex(Face \*faces, int side);**

### Remarks:

Returns the index of the edge in the face on side **side**. So: given a Mesh mesh and an MEdge \*me, int eid = me->EdgeIndex (mesh.faces, 0); then mesh.faces[me->f[0]].v[eid] and mesh.faces[me->f[0]].v[(eid+1)%3] are the endpoints of the edge.

In particular, mesh.edgeSel[me->f[0]\*3+eid] tells whether this edge is selected.

### Parameters:

**Face \*faces**

The list of faces from the mesh.

**int side**

Either 0 or 1, indicating whether we should find this result for the face on side 0 or on side 1.

### Prototype:

**BOOL Selected(Face \*faces, BitArray &esel);**

**Remarks:**

Returns TRUE if this edge is selected on either side; or FALSE if it is not selected on either.

**Parameters:**

**Face \*faces**

The list of faces from the mesh.

**BitArray &esel**

The edge selection BitArray from the mesh.

**Prototype:**

**BOOL Visible(Face \*faces);**

**Remarks:**

Returns TRUE if this edge is visible on either side; or FALSE if it is not visible on either.

**Parameters:**

**Face \*faces**

The list of faces from the mesh.

**Prototype:**

**BOOL Hidden(Face \*faces);**

**Remarks:**

Returns TRUE if all the faces using this edge are hidden; otherwise FALSE.

**Parameters:**

**Face \*faces**

The list of faces from the mesh.

**Prototype:**

**Point3 Center(Point3 \*verts);**

**Remarks:**

Returns the center of this edge.

**Parameters:**

**Point3 \*verts**

The list of vertices from the mesh.

**Prototype:****BOOL AFaceSelected(BitArray &fsel);****Remarks:**

Returns TRUE if one (or both) of the faces sharing the edge is selected; otherwise FALSE.

**Parameters:****BitArray &fsel**

The face selection bit array.

**Prototype:****Point3 ButterflySubdivide(Mesh \*mesh, AdjFaceList \*af, float tens);****Remarks:**

Returns a point suitable for use in standard tessellation.

**Parameters:****Mesh \*mesh**

A pointer to the associated mesh.

**AdjFaceList \*af**

A pointer to the associated AdjFaceList.

**float tens**

The tension parameter, as seen in the Tessellate modifier.

**Prototype:****UVVert ButterflyMapSubdivide (Mesh \*mesh, AdjFaceList \*af, float tens, int mp, bool & seam, UVVert & side2);****Remarks:**

This method is available in release 4.0 and later only.

This method creates a map vertex for the middle of this edge using the Butterfly tessellation scheme. Designed to create map vertices to go with the

vertex created by **ButterFlySubdivide()**.

**Parameters:**

**Mesh \*mesh**

A pointer to the associated mesh.

**AdjFaceList \*af**

A pointer to the associated AdjFaceList.

**float tens**

The tension parameter, as seen in the Tessellate modifier.

**int mp**

The map channel we want to get a result for.

**bool & seam**

If this is set to true by the algorithm, then there's a mapping seam on this edge, and different map vertices should be used on each side.

**UVVert & side2**

If there's a seam, this contains the mapping result for the second side. The return value matches the mapping scheme on face f[0]; side2 matches the scheme on face f[1].

**Return Value:**

The desired mapping coordinates.

**Prototype:**

**DWORD OtherVert(DWORD vv);**

**Remarks:**

Returns the index of the other vertex using this edge.

**Parameters:**

**DWORD vv**

The index of a vertex using the edge.

**Prototype:**

**DWORD OtherFace(DWORD ff);**

**Remarks:**

Returns the index of the other face using this edge.

**Parameters:**

**DWORD ff**

The index of a face using this edge.

## Class AdjFace

See Also: [Class AdjFaceList](#).

class AdjFace

### Description:

This class describes a single face for use in AdjFaceLists.

### Data Members:

public:

**DWORD f[3];**

The indices of the faces adjacent to this one. These are indices into the mesh face table.

### Methods:

### Prototype:

**AdjFace();**

### Remarks:

Constructor. The face indices are set to **UNDEFINED**.

## List of NURBSObject Types

See Also: [Class NURBSObject](#), [Class NURBSSurface](#), [Class NURBSControlVertex](#), [Class NURBSPoint](#), [Class NURBSCurve](#).

One of the following enum values describes the type of **NURBSObject** this is. The sub-classed **NURBSObject** returns one of these values in **GetType()**.

### **kNPoint**

Specifies a [NURBSIndependentPoint](#) object.

### **kNPointCPoint**

Specifies a [NURBSPointConstPoint](#) object.

### **kNCurveCPoint**

Specifies a [NURBSCurveConstPoint](#) object.

### **kNCurveCurveIntersectionPoint**

Specifies a [NURBSCurveCurveIntersectionPoint](#) object.

### **kNSurfaceCPoint**

Specifies a [NURBSSurfConstPoint](#) object.

### **kNCurveSurfaceIntersectionPoint**

Specifies a [NURBSCurveSurfaceIntersectionPoint](#) object.

### **kNTexturePoint**

This option is available in release 3.0 and later only.

Specifies a [NURBSTexturePoint](#) object.

### **kNVCV**

Specifies a [NURBSControlVertex](#) object.

### **kNVCVCurve**

Specifies a [NURBSCVCurve](#) object.

### **kNPointCurve**

Specifies a [NURBSPointCurve](#) object.

### **kNBlendCurve**

Specifies a [NURBSBlendCurve](#) object.

### **kNOffsetCurve**

Specifies a [NURBSOffsetCurve](#) object.

### **kNXFormCurve**

Specifies a [NURBSXFormCurve](#) object.

**kNMirrorCurve**

Specifies a [NURBSMirrorCurve](#) object.

**kNFilletCurve**

Specifies a [NURBSFilletCurve](#) object.

**kNChamferCurve**

Specifies a [NURBSChamferCurve](#) object.

**kNIsoCurve**

Specifies a [NURBSIsoCurve](#) object.

**kNProjectVectorCurve**

Specifies a [NURBSProjectVectorCurve](#) object.

**kNProjectNormalCurve**

Specifies a [NURBSProjectNormalCurve](#) object.

**kNSurfSurfIntersectionCurve**

Specifies a [NURBSSurfSurfIntersectionCurve](#) object.

**kNCurveOnSurface**

Specifies a [NURBSCurveOnSurface](#) object.

**kNPointCurveOnSurface**

Specifies a [NURBSPointCurveOnSurface](#) object.

**kNSurfaceNormalCurve**

Specifies a [NURBSSurfaceNormalCurve](#) object.

**kNSurfaceEdgeCurve**

This option is available in release 3.0 and later only.

Specifies a [NURBSSurfaceEdgeCurve](#) object.

**kNCVSurface**

Specifies a [NURBSCVSurface](#) object.

**kNPointSurface**

Specifies a [NURBSPointSurface](#) object.

**kNBlendSurface**

Specifies a [NURBSBlendSurface](#) object.

**kNOffsetSurface**

Specifies a [NURBSOffsetSurface](#) object.

**kNXFormSurface**

Specifies a [NURBSXFormSurface](#) object.

**kNMirrorSurface**

Specifies a [NURBSMirrorSurface](#) object.

**kNRuledSurface**

Specifies a [NURBSRuledSurface](#) object.

**kNULoftSurface**

Specifies a [NURBSULoftSurface](#) object.

**kNExtrudeSurface**

Specifies a [NURBSExtrudeSurface](#) object.

**kNLatheSurface**

Specifies a [NURBSLatheSurface](#) object.

**kNUVLoftSurface**

Specifies a [NURBSUVLoftSurface](#) object.

**kNNBlendSurface**

Specifies a [NURBSNBlendSurface](#) object.

**kN1RailSweepSurface**

Specifies a [NURBS1RailSweepSurface](#) object.

**kN2RailSweepSurface**

Specifies a [NURBS2RailSweepSurface](#) object.

**kNCapSurface**

Specifies a [NURBSCapSurface](#) object.

**kNMultiCurveTrimSurface**

Specifies a [NURBSMultiCurveTrimSurface](#) object.

**kNFilletSurface**

This option is available in release 3.0 and later only.

Specifies a [NURBSFilletSurface](#) object.

## List of NURBSObject Kinds

See Also: [Class NURBSObject](#).

One of the following enum values describes the kind of **NURBSObject** this is (sub-classed from which base class). The sub-classed **NURBSObject** returns one of these values in **GetKind()**.

### **kNURBSPoint**

Specifies a [NURBSPoint](#) object.

### **kNURBSTexturePoint**

This option is available in release 3.0 and later only.

Specifies a [NURBSTexturePoint](#) object.

### **kNURBSCV**

Specifies a [NURBSControlVertex](#) object.

### **kNURBSCurve**

Specifies a [NURBSCurve](#) object.

### **kNURBSSurface**

Specifies a [NURBSSurface](#) object.

## List of NURBS Trim Directions

See Also: [Class NURBSTrimPoint](#).

One of the following enum values describes a direction for a trim to the curve. This defines the side of the curve to keep relative to the trim point.

### **kNone = 0**

Specifies the curve on both sides of the point should be kept -- no trimming is done.

### **kPositive = 1**

Specifies the curve on the positive side of the curve should be kept. The positive side is the side between the point towards greater values in the curve parameter space.

### **kNegative = 2**

Specifies the curve on the negative side of the curve should be kept. The negative side is the side between the point towards lesser values in the curve parameter space.

## List of NURBSConst Types

See Also: [Class NURBSPointConstPoint](#), [Class NURBSCurveConstPoint](#), [Class NURBSSurfConstPoint](#).

One of the following enum values describes the type of **NURBSConst** this is. For example, these correspond to the types of dependent points available in the NURBS Surface user interface in the 'Surface Point' rollup.

Constrained objects are those that exist in the parameter space of other objects.

### **kNConstOnObject**

Indicates the point is actually on the surface of the object.

### **kNConstOffset**

Indicates the points is offset some distance (specified in object space) from the surface of the object.

### **kNConstNormal**

Indicates the point is offset some distance along the normal to the curve or surface.

### **kNConstTangent**

Indicates the point is offset some U and/or V distance along the tangent from the curve or surface. If the value is positive it's the tangent that heads in the direction of increasing parameter value; if negative it's the tangent that heads in the direction of decreasing parameter value.

## List of NURBSAutoParam Types

See Also: [Class NURBSCVCurve](#), [Class NURBSCVSurface](#).

One of the following enum values describes how automatic reparameterization is handled.

### **kNotAutomatic**

Specifies that the reparameterization is **not** automatic. When it is automatic, curves are reparameterized as they are edited.

### **kAutoCentripetal**

Chooses the chord-length algorithm for reparameterization. Chord-length reparameterization spaces knots (in parameter space) based on the square root of the length of each curve segment.

### **kAutoUniform**

Spaces the knots uniformly. A uniform knot vector has the advantage that the curve or surface changes only locally when you edit it. With chord-length parameterization, moving any CV can potentially change the entire sub-object.

## List of NURBSParamaterization Types

See Also: [Class NURBSCVCurve](#), [Class NURBSCVSurface](#).

One of the following enum values describes the types or reparameterization.

### **kCentripetal**

Chooses the chord-length algorithm for reparameterization. Chord-length reparameterization spaces knots (in parameter space) based on the square root of the length of each curve segment.

### **kUniform**

Spaces the knots uniformly. A uniform knot vector has the advantage that the curve or surface changes only locally when you edit it. With chord-length parameterization, moving any CV can potentially change the entire sub-object.

## List of NURBSMirrorAxis Types

See Also: [Class NURBSMirrorCurve](#), [Class NURBSMirrorSurface](#).

One of the following enum values describe the axis of reflection for a mirror curve or surface.

**kMirrorX**

**kMirrorY**

**kMirrorZ**

**kMirrorXY**

**kMirrorXZ**

**kMirrorYZ**

## List of NURBS Texture Surface Types

See Also: [Class NURBSTextureSurface](#), [Class NURBSControlVertex](#), [Class NURBSSurface](#).

Determines the type of texture surface generated. One of the following values:

### **kNMapDefault**

Automatically generates a texture surface. This method evenly distributes the texture, and attempts to compensate for stretching of the surface.

### **kNMapUserDefined**

Generates a texture surface that the user can edit. A user may edit the user-defined texture surface either by using an Edit Texture Surface dialog (as in versions of 3ds max prior to release 3), or by editing texture points directly in the viewports.

### **kNMapSurfaceMapper**

Generates the texture surface by projecting the texture of another NURBS surface sub-object in the NURBS model. The projection travels along the direction of the normals of the source surface. Projected texture surfaces are relational.

## Class PatchCapInfo

See Also: [Working with Shapes and Splines](#).

class PatchCapInfo

### Description:

This is the information class for patch capping. All methods of this class are implemented by the system. Developers must only declare an instance of this class and then call **MakeCap()** on the shape.

### Data Members:

public:

**CapPatchTab patches;**

This is used internally.

**PatchCapVertTab verts;**

This is used internally.

**PatchCapVecTab vecs;**

This is used internally.

**Point3Tab newVerts;**

This is used internally.

**Point3Tab newVecs;**

This is used internally.

### Methods:

#### Prototype:

**void Init(BezierShape \*shape);**

#### Remarks:

This method is used internally.

#### Prototype:

**void FreeAll();**

#### Remarks:

This method is used internally.

### Operators:

**Prototype:**

**PatchCapInfo &operator=(PatchCapInfo &from)**

**Remarks:**

Assignment operator used internally.

## Class ShapeVSel

See Also: [Class BitArray](#), [Class PolyShape](#).

class ShapeVSel

### Description:

This class stores and provides access to shape vertex selection data. All methods of this class are implemented by the system.

### Data Members:

public:

**int polys;**

The number of splines in the shape.

**BitArray \*sel;**

An array of BitArrays, one for each spline.

### Methods:

### Prototype:

**ShapeVSel();**

### Remarks:

Constructor. The number of splines is set to 0. The BitArray pointer is set to NULL.

### Prototype:

**void Insert(int where, int count=0);**

### Remarks:

Creates and inserts a new BitArray into **sel**.

### Parameters:

**int where**

The index into **sel** indicating where to insert the new BitArray.

**int count=0**

The number of bits in the new BitArray.

### Prototype:

**void Delete(int where);**

**Remarks:**

Deletes the specified BitArray from the **sel** list.

**Parameters:**

**int where**

The index into **sel** indicating which BitArray to delete.

**Prototype:**

**void SetSize(BezierShape& shape, BOOL save=FALSE);**

**Remarks:**

Sets the number of splines and allocates the corresponding number of BitArrays based on the shape passed. The size of each BitArray is set to the number of vertices in each polyline.

**Parameters:**

**BezierShape& shape**

The shape whose splines determine the sizes set.

**BOOL save=FALSE**

TRUE to keep the previous BitArray contents. FALSE to discard it.

**Prototype:**

**void SetSize(PolyShape& shape, BOOL save=FALSE);**

**Remarks:**

Sets the number of splines and allocates the corresponding number of BitArrays based on the shape passed. The size of each BitArray is set to the number of vertices in each spline.

**Parameters:**

**PolyShape& shape**

The shape whose lines determine the sizes set.

**BOOL save=FALSE**

TRUE to keep the previous BitArray contents. FALSE to discard it.

**Prototype:**

**void ClearAll();**

**Remarks:**

Clears every bit for every poly.

**Prototype:**

**void Empty();**

**Remarks:**

Sets the size of every poly BitArray to 0.

**Prototype:**

**IOResult Save(ISave\* isave);**

**Remarks:**

Saves the ShapeVSEL to disk.

**Prototype:**

**IOResult Load(ILoad\* iload);**

**Remarks:**

Loads the ShapeVSEL from disk.

**Operators:**

**Prototype:**

**ShapeVSEL& operator=(ShapeVSEL& from);**

**Remarks:**

Assignment operator.

## Class ShapeSSel

See Also: [Class BitArray](#), [Class PolyShape](#).

class ShapeSSel

### Description:

This class stores and provides access to shape segment selection data. All methods of this class are implemented by the system.

### Data Members:

public:

**int polys;**

The number of splines in the shape.

**BitArray \*sel;**

An array of BitArrays, one for each spline.

### Methods:

#### Prototype:

**ShapeSSel();**

#### Remarks:

Constructor. Initialize the class members.

**Constructor. The number of splines is set to 0. The BitArray pointer is set to NULL.**Prototype:

**~ShapeSSel();**

#### Remarks:

Destructor. Any BitArrays are freed.

#### Prototype:

**void Insert(int where, int count=0);**

#### Remarks:

Creates and inserts a new BitArray into **sel**.

#### Parameters:

**int where**

The index into **sel** indicating where to insert the new BitArray.

**int count=0**

The number of bits in the new BitArray.

**Prototype:**

**void Delete(int where);**

**Remarks:**

Deletes the specified BitArray from the **sel** list.

**Parameters:**

**int where**

The index into **sel** indicating which BitArray to delete.

**Prototype:**

**void SetSize(BezierShape& shape, BOOL save=FALSE);**

**Remarks:**

Sets the number of splines and allocates the corresponding number of BitArrays based on the shape passed. The size of each BitArray is set to the number of segments in each polyline.

**Parameters:**

**BezierShape& shape**

The shape whose splines determine the sizes set.

**BOOL save=FALSE**

TRUE to keep the previous BitArray contents. FALSE to discard it.

**Prototype:**

**void SetSize(PolyShape& shape, BOOL save=FALSE);**

**Remarks:**

Sets the number of splines and allocates the corresponding number of BitArrays based on the shape passed. The size of each BitArray is set to the number of segments in each spline.

**Parameters:**

**PolyShape& shape**

The shape whose lines determine the sizes set.

**BOOL save=FALSE**

TRUE to keep the previous BitArray contents. FALSE to discard it.

**Prototype:**

**void ClearAll();**

**Remarks:**

Clears every bit for every poly.

**Prototype:**

**void Empty();**

**Remarks:**

Sets the size of every poly BitArray to 0.

**Prototype:**

**IOResult Save(ISave\* isave);**

**Remarks:**

Saves the ShapeSSel to disk.

**Prototype:**

**IOResult Load(ILoad\* iload);**

**Remarks:**

Loads the ShapeSSel from disk.

**Operators:**

**Prototype:**

**ShapeSSel& operator=(ShapeSSel& from);**

**Remarks:**

Assignment operator.

## Class ShapePSel

See Also: [Class BitArray](#), [Class PolyShape](#).

class ShapePSel

### Description:

This class stores and provides access to shape polygon (spline) selection data. All methods of this class are implemented by the system.

### Data Members:

public:

**int polys;**

The number of splines in the shape.

**BitArray sel;**

One bit for each spline in the shape.

### Methods:

#### Prototype:

**ShapePSel();**

#### Remarks:

Constructor. Initialize the class members.

#### Prototype:

**~ShapePSel();**

#### Remarks:

Destructor.

#### Prototype:

**void Insert(int where);**

#### Remarks:

Resizes the BitArray **sel** to include a new bit at the specified location.

#### Parameters:

**int where**

The location for the new bit in the BitArray.

**Prototype:**

**void Delete(int where);**

**Remarks:**

Deletes the specified bit from the BitArray.

**Parameters:**

**int where**

Indicates which bit to delete.

**Prototype:**

**void SetSize(BezierShape& shape, BOOL save=FALSE);**

**Remarks:**

Sets the number of splines and resizes the BitArray based on the shape passed.

**Parameters:**

**BezierShape& shape**

The shape whose splines determine the sizes set.

**BOOL save=FALSE**

TRUE to keep the previous BitArray contents. FALSE to discard it.

**Prototype:**

**void SetSize(PolyShape& shape, BOOL save=FALSE);**

**Remarks:**

Sets the number of splines and resizes the BitArray based on the shape passed.

**Parameters:**

**PolyShape& shape**

The shape whose lines determine the sizes set.

**BOOL save=FALSE**

TRUE to keep the previous BitArray contents. FALSE to discard it.

**Prototype:**

**void Set(int index);**

**Remarks:**

Sets the bit specified by the index to 1.

**Parameters:**

**int index**

The bit to set.

**Prototype:**

**void Set(int index, int value);**

**Remarks:**

Sets the bit specified by the index to the value passed.

**Parameters:**

**int index**

The bit to set or clear.

**int value**

The value to set, either 0 or 1.

**Prototype:**

**void Clear(int index);**

**Remarks:**

Clears the bit specified by the index to 1.

**Parameters:**

**int index**

The bit to clear.

**Prototype:**

**void ClearAll();**

**Remarks:**

Clears all the bits in the array (sets them to 0).

**Prototype:**

**void Empty();**

**Remarks:**

Sets the size of **sel** to 0.

**Prototype:**

**IOResult Save(ISave\* isave);**

**Remarks:**

Saves the BitArray to disk.

**Prototype:**

**IOResult Load(ILoad\* iload);**

**Remarks:**

Loads the BitArray from disk.

**Operators:**

**Prototype:**

**ShapePSel& operator=(ShapePSel& from);**

**Remarks:**

Assignment operator.

**Prototype:**

**int operator[](int index) const;**

**Remarks:**

Array access operator.

## List of BezierShape Display Flags

See Also: [Class BezierShape](#).

One or more of the following values:

### **DISP\_VERTTICKS**

Display vertices as tick marks.

### **DISP\_BEZHANGLES**

Display bezier handles.

### **DISP\_SELVERTS**

Display selected vertices.

### **DISP\_SELSEGMENTS**

Display selected segments.

### **DISP\_SELPOLYS**

Display selected polygons.

### **DISP\_UNSELECTED**

Used by the lofter. Indicates the shape is unselected. The shape is drawn in white, overriding any colors that the BezierShape class would have used.

### **DISP\_SELECTED**

Used by the lofter. Indicate the shape is selected. The shape is drawn using the selection color, overriding any colors that the BezierShape class would have used.

### **DISP\_ATSHAPELEVEL**

Used by the lofter. Indicates the shape is at the current level. The shape is drawn in green, overriding any colors that the BezierShape class would have used.

### **DISP\_VERT\_NUMBERS**

This flag is available in release 3.0 and later only.

When this bit is set, and vertex ticks are being displayed, the shape is drawn with vertex numbers in addition to the ticks.

### **DISP\_VERT\_NUMBERS\_SELONLY**

This flag is available in release 3.0 and later only.

When this bit is set and the **DISP\_VERT\_NUMBERS** bit is set, only the numbers of selected vertices are displayed.

### **DISP\_SPLINES\_ORTHO**

This bit is reserved for internal use.

## Class MeshCapInfo

See Also: [Working with Shapes and Splines](#).

class MeshCapInfo

### Description:

The information class for mesh capping (MORPH or GRID). All the data members and methods of this class are used internally. Developers must only declare an instance of this class and then call **MakeCap()** on the shape.

### Data Members:

public:

**CapFaceTab faces;**

This is used internally.

**MeshCapVertTab verts;**

This is used internally.

**Point3Tab newVerts;**

This is used internally.

### Methods:

#### Prototype:

**void Init(PolyShape \*shape);**

#### Remarks:

This method is used internally.

#### Prototype:

**void FreeAll();**

#### Remarks:

This method is used internally.

### Operators:

#### Prototype:

**MeshCapInfo &operator=(MeshCapInfo &from);**

#### Remarks:

Assignment operator used internally.

## Class BezierShapeTopology

See Also: [Class BezierShape](#), [Template Class Tab](#), [Class BitArray](#).

class BezierShapeTopology

### Description:

This class is available in release 3.0 and later only.

This class has data members and methods used to build and store topology information on a BezierShape. This class is used with the

**BezierShape::GetTopology()** method.

### Data Members:

public:

#### **BOOL ready;**

TRUE if the data has been built; otherwise FALSE.

#### **IntTab kcount;**

A table of integers containing the knot count for each bezier spline in the shape.

#### **BitArray closed;**

A bit array containing a 1 for each closed spline or a 0 for each open one in the shape.

### Methods:

public:

### Prototype:

**BezierShapeTopology();**

### Remarks:

Constructor. The data members are initialized as follows:

**ready = FALSE;**

### Prototype:

**void Build(BezierShape &shape);**

### Remarks:

Builds the topology data for the specified shape.

**Parameters:**

**BezierShape &shape**

The shape whose topology data will be built.

**Prototype:**

**IOResult Save(ISave \*isave);**

**Remarks:**

Used internally to save the shape topology data.

**Prototype:**

**IOResult Load(ILoad \*iload);**

**Remarks:**

Used internally to load the shape topology data.

**Prototype:**

**int operator==(const BezierShapeTopology& t);**

**Remarks:**

Assignment operator.

## Class ShapeHitData

See Also: [Class HitData](#).

```
class ShapeHitData : public HitData
```

### Description:

This is a storage class for hit records used in hit testing to know which specific shape object was hit. All methods of this class are implemented by the system.

### Data Members:

public:

**BezierShape \*shape;**

The shape that was hit.

**int poly;**

The polygon of the shape that was hit.

**int index;**

The index of the sub-object entity that was hit.

### Methods:

### Prototype:

**ShapeHitData(BezierShape \*shape, int poly, int index)**

### Remarks:

Constructor. The data members are initialized to the values passed.

## Class ShapeContextCallback

See Also: [Class BezierShape](#), [Class ModContext](#).

class ShapeContextCallback

### Description:

This class is available in release 3.0 and later only.

This class has a method used for retrieving other shapes in the current editing context. This class provides a way for the

**BezierShape::PerformTrimOrExtend** method to access the shapes being trimmed.

### Methods:

public:

### Prototype:

```
virtual BezierShape *GetShapeContext(ModContext *context)=0;
```

### Remarks:

This method will be called with a ModContext pointer; the function should return the shape for that context. This is only used in modifier applications, where more than one shape object is being modified. See **\MAXSDK\SAMPLES\MODIFIERS\EDITSP.L.CPP** for an example of its use.

### Parameters:

**ModContext \*context**

Points to the ModContext for the shape the modifier is applied to.

### Return Value:

A pointer to the BezierShape for the context.

## Class PolyPt

See Also: [Class PolyLine](#).

class PolyPt

### Description:

This class represents a single point of a **PolyLine**. All methods of this class are implemented by the system.

### Data Members:

public:

#### **Point3 p;**

The location of the point.

#### **DWORD flags;**

Predefined **PolyPt** flags. Note that developers can use bits 0-7 of the flags for their own use. Bits 8 and above are used by the system.

If you are converting some other type of shape or spline to a **PolyShape** (and thus **PolyLines**) you can set certain flags to make things operate smoother.

These flags are described below:

#### **POLYPT\_KNOT**

This indicates if this point in the **PolyLine** corresponds to a knot in the original spline. For example if you had a circle that was a bezier spline it should have four of the points in the **PolyLine** designated as **POLYPT\_KNOT**. These are the points at the 12 o'clock, 3 o'clock, 6 o'clock and 9 o'clock positions. Then all the other points would be **POLYPT\_INTERPOLATED**. This is used to make capping more efficient, for example, the system generally tries to attach to a knot when making connections between polygons.

#### **POLYPT\_INTERPOLATED**

This indicates the point is an interpolated point (not a knot).

#### **POLYPT\_SMOOTH**

If you convert to a **PolyLine**, use this bit to control smoothing of the resulting shape. If this bit is set, it means that any mesh generated will share smoothing across the edge. For example, all the points on a curved section of a spline between knots will have this flag set. Then depending on the

knot type (if it's a corner or bezier corner) then this smooth flag will not be set. If this shape is then extruded or lofted this information is used to determine smoothing groups. If this flag is set you'll get a smooth transition however if this bit is not set you'll get a nice sharp corner.

### **POLYPT\_SEG\_SELECTED**

The segment that starts with this point is selected. This is used in the drawing routines so that PolyShapes generated from BezierShapes will still have the selected segments drawn in the selected color.

### **POLYPT\_BRIDGE**

This flag is used internally by the capping code.

### **POLYPT\_SPLICE**

This flag is used internally by the capping code.

### **POLYPT\_VISEEDGE**

This flag is used internally by the capping code.

### **POLYPT\_NO\_SPLICE**

This flag is used internally by the capping code.

### **int aux;**

Auxiliary data attached to this point (usually a mesh vertex number for capping).

### **DWORD flags2;**

This flag contains the material information for the segments. The mat ID is stored in the HIWORD.

```
#define POLYPT_MATID_SHIFT 16
```

```
#define POLYPT_MATID_MASK 0xFFFF
```

### **Methods:**

### **Prototype:**

```
PolyPt();
```

### **Remarks:**

Constructor. The point **p** is set to 0,0,0, **flags** and **flags2** are set to 0, **aux** is set to 0.

### **Prototype:**

**PolyPt(Point3 ip, DWORD f = 0, int a=0, DWORD f2=0);**

**Remarks:**

Constructor. The point, flags, aux and flags2 data members are initialized to the data passed.

**Prototype:**

**inline MtlID GetMatID();**

**Remarks:**

This method is available in release 3.0 and later only.

This method gets the material ID on a per-segment basis within the spline or polyline.

**Prototype:**

**inline void SetMatID(MtlID id);**

**Remarks:**

This method is available in release 3.0 and later only.

This method sets the material ID on a per-segment basis within the spline or polyline.

**Parameters:**

**MtlID id**

The ID to set.

## List of Parameter Types for PolyLine Interpolation

See Also: [Class PolyLine](#).

One of the following values:

### **POLYSHP\_INTERP\_SIMPLE**

Parameter space based on segments. This simple interpolation is interpolating based on parameter space -- If a polyline has 4 segments, the first segment is parameter values 0-0.25, the second 0.25-0.5, the third 0.5-0.75 and the fourth 0.75-1.0. This is regardless of the length of each segment.

### **POLYSHP\_INTERP\_NORMALIZED**

Parameter space normalized to curve length. This interpolation normalizes the parameter space to distance along the length of a polyline. So parameter space 0 is the start, 1.0 is the end and 0.5 is halfway along the actual length of the curve.

# Class EventRouter

See Also: [Class EventUser](#).

class EventRouter

## Description:

Event router functionality. All methods of this class are implemented by the system.

## Methods:

### Prototype:

**void Register(EventUser \*user);**

### Remarks:

Register and activate an event user.

### Parameters:

**EventUser \*user**

The EventUser to activate.

### Prototype:

**void UnRegister(EventUser \*user);**

### Remarks:

Remove an event user from the list (automatically re-activates the previous user).

### Parameters:

**EventUser \*user**

The EventUser to remove.

### Prototype:

**BOOL Process();**

### Remarks:

Process the event.

### Return Value:

TRUE if the event was handed off to a user.

# Class ArcballCallback

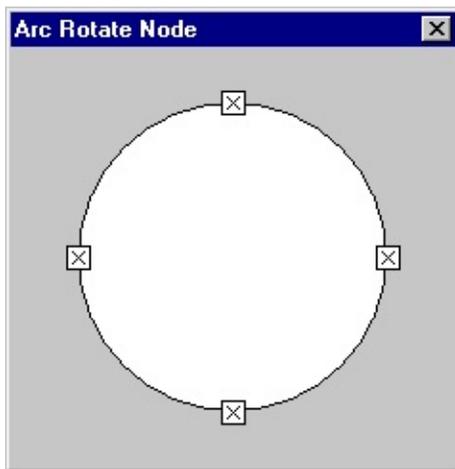

See Also: [Class ArcballDialog](#), [Class Quat](#).

class ArcballCallback

## Description:

This class is available in release 2.0 and later only.

This class provides methods to work with a general arcball dialog box for doing 3D rotations. This dialog appears below:

To use these APIs you'll need to **#include "arcdlg.h"**

All methods of this class are implemented by the plug-in.

Sample code can be found in

**\\MAXSDK\\SAMPLES\\HOWTO\\CUSTCTRL\\CUSTCTRL.CPP.**

## Function:

```
ArcballDialog *CreateArcballDialog(ArcballCallback *cb, HWND  
hWndOwner, TCHAR* title=NULL);
```

## Remarks:

This global function is provided by 3ds max and is used to create the arcball dialog box. Then the methods of your callback class are called based on the user's use of the dialog. Be sure to call the **ArcballDialog::DeleteThis()** method when done.

## Parameters:

**ArcballCallback \*cb**

The callback whose methods are called based on the user's interaction with the

dialog controls.

**HWND hwndOwner**

The window handle of the dialog owner.

**TCHAR\* title=NULL**

The title string to be displayed in the dialog.

**Return Value:**

A new instance of the **ArcballDialog** class. Be sure to call its **DeleteThis()** method when done.

**Methods:**

**Prototype:**

**virtual void StartDrag()=0;**

**Remarks:**

This method is called when a drag operation begins. The developer may want to save the start state at this point.

**Prototype:**

**virtual void EndDrag()=0;**

**Remarks:**

This method is called when a drag operation ends.

**Prototype:**

**virtual void Drag(Quat q, BOOL buttonUp)=0;**

**Remarks:**

This method is called during a drag operation.

**Parameters:**

**Quat q**

The relative rotation from the start rotation.

**BOOL buttonUp**

If TRUE this indicates if the mouse button is up (has been released); if FALSE the button is down.

**Prototype:**

**virtual void CancelDrag()=0;**

**Remarks:**

This method is called when the right mouse button is clicked during a drag operation to cancel it.

**Prototype:**

**virtual void BeingDestroyed()=0;**

**Remarks:**

This method is called if the dialog box window was closed. Note that developers should **not** call **ArcballDialog::DeleteThis()** from inside this method.

## Class IMergeManager

See Also: [Class InterfaceServer](#), [List of Reference Messages](#) , [Class ExclList](#)

```
class IMergeManager : public InterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

This class facilitates taking care of node handles when merging and xref'ing scenes.

When nodes are merged, their handles will be reassigned so that their handles will not conflict with existing nodes in the scene. After the merge process has completed, all merged objects will receive a reference notification;

**REFMSG\_NODE\_HANDLE\_CHANGED**. The PartID will be a pointer to a merge manager interface that you can use to see if a specific handle was converted and convert between the old and the new handle. **IMergeManager\* pMergeManager = (IMergeManager\*)partID**; If a plug-in uses node handles in a persistent manner it has to intercept this reference message and convert the previous handles to the newly generated handles.

### Methods:

public:

### Prototype:

```
virtual ULONG GetNewHandle(ULONG oldHandle) = 0;
```

### Remarks:

This method allows you to obtain a new handle.

### Parameters:

**ULONG oldHandle**

The old handle you wish to obtain a new one for.

### Return Value:

The new handle.

### Prototype:

**virtual bool HandleExist(ULONG handle) = 0;**

**Remarks:**

This method allows you to check if a handle already exists.

**Parameters:**

**ULONG handle**

The handle you wish to check for.

**Return Value:**

TRUE if the handle exists; otherwise FALSE.

## Class DllDesc

See Also: [Class DllDir](#), [Class ClassDesc](#), [Class Interface](#), [DLL Functions and Class Descriptors](#).

class DllDesc

### Description:

This class is available in release 2.0 and later only.

This class provides information about a DLL. Every DLL in 3ds max may implement any number of classes. This class has methods which return the number of classes implemented in the DLL, a description string for the DLL, and a method to unmap the DLL from memory.

All methods of this class are implemented by the system.

### Data Members:

public:

**HINSTANCE handle;**

The DLL instance handle.

**TSTR fname;**

The file name the DLL was loaded from.

### Methods:

#### Prototype:

**const TCHAR \*Description();**

#### Remarks:

Returns the Description defined in the **LibDescription()** function.

#### Prototype:

**int NumberOfClasses();**

#### Remarks:

Returns the number of classes implemented in the DLL. This is the value returned by the library function **LibNumberClasses()**.

#### Prototype:

**void Free();**

**Remarks:**

This method decrements the reference count of the DLL. When the reference count reaches zero, the module is unmapped from the address space of the calling process.

**Operators:**

**Prototype:**

**ClassDesc \*operator[](int i);**

**Remarks:**

Returns a pointer to the 'i-th' class descriptor.

**Parameters:**

**int i**

The zero based index of the ClassDesc to return.

**Prototype:**

**int operator==(const DllDesc& dd) const;**

**Remarks:**

Equality operator. Returns nonzero if the **DllDesc** passed matches this one; otherwise zero.

## List of System Error Log Message Types

See Also: [Class LogSys](#).

There are four types of log entries. In the preference dialog, the user can select what types of log entries they want to be generated. This is the way a user can control the verbosity of the log file in some meaningful way. Developers are encouraged to be very verbose about information and debug messages -- the **Log()** functions should be used to record any events out of the ordinary. As the user can elect to ignore these messages they are perfect for troubleshooting.

One or more of the following values (these values may be ORed together ( i.e. **SYSLOG\_ERROR|SYSLOG\_WARN**):

### **SYSLOG\_ERROR**

An error message. An example of this type is a fatal error.

### **SYSLOG\_WARN**

A warning message. An example of this type is a message telling the user the MAX file just loaded is obsolete and needs to be resaved. This option may not be selected by the MAX user via the UI but it is available for use (it's used internally often).

### **SYSLOG\_INFO**

An information message. An example of this is a message indicating a new MAX file has been loaded.

### **SYSLOG\_DEBUG**

A debugging message. This message type is for anything you think might help trace problems that the user is having with your program.

## Class TextureInfo

See Also: [Class MtlMakerCallback](#), [Class Material](#), [Class Matrix3](#).

```
class TextureInfo : public BaseInterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

This class describes a texture used by the interactive renderer. This includes all the information about the mapping channel, tiling, etc. A table of these is maintained by the **texture** data member of class **Material**.

There are data members related to maps which specify how the texture should be applied. These are specified independently for color and alpha and include a scale. For example, for normal multiplication (modulation) application of a texture, the entries would be:

```
colorOp = GW_TEX_MODULATE  
colorAlphaSource = GW_TEX_TEXTURE  
colorScale = GW_TEX_SCALE_1X  
alphaOp = GW_TEX_MODULATE  
alphaAlphaSource = GW_TEX_TEXTURE  
alphaScale = GW_TEX_SCALE_1X
```

For applying a texture with alpha blending, the entry would be:

```
colorOp = GW_TEX_ALPHA_BLEND  
colorAlphaSource = GW_TEX_TEXTURE  
colorScale = GW_TEX_SCALE_1X  
alphaOp = GW_TEX_LEAVE  
alphaAlphaSource = GW_TEX_TEXTURE  
alphaScale = GW_TEX_SCALE_1X
```

For applying an opacity map, the entry would be:

```
colorOp = GW_TEX_LEAVE  
colorAlphaSource = GW_TEX_TEXTURE  
colorScale = GW_TEX_SCALE_1X  
alphaOp = GW_TEX_REPLACE  
alphaAlphaSource = GW_TEX_TEXTURE  
alphaScale = GW_TEX_SCALE_1X
```

## Data Members:

public:

**int useTex;**

Indicates if the material uses textures. Nonzero indicates textures are used.

**int faceMap;**

Indicates if the material is face mapped. Nonzero indicates it is.

**DWORD\_PTR textHandle;**

The texture handle.

**int uvwSource;**

The UVW source used.

**UVSOURCE\_MESH**

Use UVW coordinates from a standard map channel.

**UVSOURCE\_XYZ**

Compute UVW from object XYZ.

**UVSOURCE\_MESH2**

Use UVW2 (Vertex Color) coordinates.

**UVSOURCE\_WORLDXYZ**

Use World XYZ as UVW.

**int mapChannel;**

The mapping channel used.

**Matrix3 textTM;**

The texture transformation matrix.

**UBYTE tiling[3];**

The UVW tiling. One of the following values:

**GW\_TEX\_REPEAT**

**GW\_TEX\_MIRROR**

**GW\_TEX\_NO\_TILING**

**UBYTE colorOp;**

The color texture operation. One of the following values:

**GW\_TEX\_LEAVE**

Use the source pixel value

**GW\_TEX\_REPLACE**

Use the texture pixel value

**GW\_TEX\_MODULATE**

Multiply the source with the texture

**GW\_TEX\_ADD**

Add the source and texture

**GW\_TEX\_ADD\_SIGNED**

Add the source and texture with an 0.5 subtraction

**GW\_TEX\_SUBTRACT**

Subtract the source from the texture

**GW\_TEX\_ADD\_SMOOTH**

Add the source and the texture then subtract their product

**GW\_TEX\_ALPHA\_BLEND**

Alpha blend the texture with the source

**GW\_TEX\_PREMULT\_ALPHA\_BLEND**

Alpha blend the source with a premultiplied alpha

**UBYTE colorAlphaSource;**

The color blend alpha source. One of the following values:

**GW\_TEX\_ZERO**

Use no alpha value

**GW\_TEX\_SOURCE**

Use the source alpha

**GW\_TEX\_TEXTURE**

Use the texture alpha

**GW\_TEX\_CONSTANT**

Use a constant BGRA color as an alpha

**GW\_TEX\_PREVIOUS**

Use the previous texture stage alpha

**UBYTE colorScale;**

The color scale factor. One of the following values:

**GW\_TEX\_SCALE\_1X**

Multiply the tex op result by 1

**GW\_TEX\_SCALE\_2X**

Multiply the tex op result by 2

**GW\_TEX\_SCALE\_4X**

Multiply the tex op result by 4

### **UBYTE alphaOp;**

The alpha texture operation. One of the following values:

#### **GW\_TEX\_LEAVE**

Use the source pixel value

#### **GW\_TEX\_REPLACE**

Use the texture pixel value

#### **GW\_TEX\_MODULATE**

Multiply the source with the texture

#### **GW\_TEX\_ADD**

Add the source and texture

#### **GW\_TEX\_ADD\_SIGNED**

Add the source and texture with an 0.5 subtraction

#### **GW\_TEX\_SUBTRACT**

Subtract the source from the texture

#### **GW\_TEX\_ADD\_SMOOTH**

Add the source and the texture then subtract their product

#### **GW\_TEX\_ALPHA\_BLEND**

Alpha blend the texture with the source

#### **GW\_TEX\_PREMULT\_ALPHA\_BLEND**

Alpha blend the source with a premultiplied alpha

### **UBYTE alphaAlphaSource;**

The alpha blend alpha source. One of the following values:

#### **GW\_TEX\_ZERO**

Use no alpha value

#### **GW\_TEX\_SOURCE**

Use the source alpha

#### **GW\_TEX\_TEXTURE**

Use the texture alpha

#### **GW\_TEX\_CONSTANT**

Use a constant BGRA color as an alpha

#### **GW\_TEX\_PREVIOUS**

Use the previous texture stage alpha

## **UBYTE alphaScale;**

The alpha scale factor. One of the following values:

**GW\_TEX\_SCALE\_1X**

Multiply the tex op result by 1

**GW\_TEX\_SCALE\_2X**

Multiply the tex op result by 2

**GW\_TEX\_SCALE\_4X**

Multiply the tex op result by 4

## **Methods:**

public:

## **Prototype:**

**TextureInfo();**

## **Remarks:**

Constructor. The data members are initialized as follows:

**useTex = 1;**

**faceMap = 0;**

**textHandle = 0;**

**uvwSource = UVSOURCE\_MESH;**

**mapChannel = 1;**

**tiling[0] = tiling[1] = tiling[2] = GW\_TEX\_REPEAT;**

**colorOp = GW\_TEX\_MODULATE;**

**colorAlphaSource = GW\_TEX\_TEXTURE;**

**colorScale = GW\_TEX\_SCALE\_1X;**

**alphaOp = GW\_TEX\_LEAVE;**

**alphaAlphaSource = GW\_TEX\_TEXTURE;**

**alphaScale = GW\_TEX\_SCALE\_1X;**

## **Prototype:**

**~TextureInfo();**

## **Remarks:**

Destructor.

## Class CustomParticleDisplay

See Also: [Class ParticleSys](#), [Class GraphicsWindow](#).

class CustomParticleDisplay

### Description:

This class allow a plug-in particle system to provide its own custom drawing routine. Implement the **DrawParticle()** method of this class and register this callback with the **SetCustomDraw()** method of class **ParticleSys**.

### Methods:

### Prototype:

```
virtual void DrawParticle(GraphicsWindow *gw,  
    ParticleSys &parts, int i)=0;
```

### Remarks:

Implemented by the Plug-In.

Draws the 'i-th' particle of the specified particle system.

### Parameters:

**GraphicsWindow \*gw**

The window into which to draw the particle.

**ParticleSys &parts**

The particle system whose 'i-th' particle is to be drawn.

**int i**

The index of the particle to draw.

## Class ImpNode

See Also: [Class ImpInterface](#), [Class INode](#), [Class Matrix3](#), [Class Point3](#).

class ImpNode

### Description:

Import Node class. Methods of this class may be used to set various properties of the node. All methods of this class are implemented by the system.

### Sample Code:

The following sample code fragment (from `\MAXSDK\SAMPLES\IMPEXP\DXFIMP.CPP`) demonstrates the use of many of the methods of this class.

```
ImpNode *node = iface->CreateNode();
if (node) {
    TriObject *tri = CreateNewTriObject();
    // Now find the center of the vertices and use that as the pivot
    int verts = m->getNumVerts();
    Point3 accum(0,0,0);
    for(int i = 0; i < verts; ++i)
        accum += m->verts[i];
    Point3 delta = accum / (float)verts;
    for(i = 0; i < verts; ++i)
        m->verts[i] -= delta;
    tri->mesh = *m;
    node->Reference(tri);
    Matrix3 tm;
    tm.IdentityMatrix();// Reset initial matrix to identity
    tm.SetTrans(delta); // Add in the center point
    node->SetTransform(0,tm);
    iface->AddNodeToScene(node);
    node->SetName(_T(n->name));
}
```

Methods:

Prototype:

```
virtual RefResult Reference(ObjectHandle obj) = 0;
```

**Remarks:**

Sets the object that this node references.

**Parameters:****ObjectHandle obj**

The object to reference.

**Return Value:**

One of the following values:

**REF\_FAIL**

The operation failed.

**REF\_SUCCEED**

The operation succeeded.

**Prototype:**

```
virtual void SetTransform( TimeValue t, Matrix3 tm ) = 0;
```

**Remarks:**

Sets the transformation matrix of the node.

**Parameters:****TimeValue t**

The time to set the matrix.

**Matrix3 tm**

The new transformation matrix of the node.

**Prototype:**

```
virtual void SetName(const TCHAR *newname) = 0;
```

**Remarks:**

Sets the name of the node.

**Parameters:****const TCHAR \*newname**

The new name for the node.

**Prototype:**

```
virtual void SetPivot(Point3 p) = 0;
```

**Remarks:**

Sets the pivot point of the node.

**Parameters:****Point3 p**

The pivot point of the node.

**Prototype:****virtual INode \*GetINode()=0;****Remarks:**

Returns the INode pointer for the node.

## Class RendPickProc

See Also: [Class IRendParams](#).

class RendPickProc

### Description:

An instance of this class is passed to **IRendParams::SetPickMode()**. This is a callback that gets called as the user tries to pick objects in the scene.

### Methods:

#### Prototype:

```
virtual BOOL Pick(INode *node)=0;
```

#### Remarks:

Implemented by the Plug-In.

Called when the user picks something.

#### Parameters:

**INode \*node**

The node that was selected.

#### Return Value:

TRUE to end the pick mode; FALSE to continue.

#### Prototype:

```
virtual BOOL Filter(INode *node)=0;
```

#### Remarks:

Implemented by the Plug-In.

Return TRUE if this is an acceptable hit; otherwise FALSE.

#### Parameters:

**INode \*node**

The node that was selected.

#### Prototype:

```
virtual void EnterMode()
```

#### Remarks:

Implemented by the Plug-In.

This method is called as the mode is entered.

**Default Implementation:**

```
{}
```

**Prototype:**

```
virtual void ExitMode()
```

**Remarks:**

Implemented by the Plug-In.

This method is called when the mode is exited.

**Default Implementation:**

```
{}
```

**Prototype:**

```
virtual HCURSOR GetDefCursor()
```

**Remarks:**

Implemented by the Plug-In.

Returns the handle of the default cursor. This is the cursor to use when the user is NOT over a pickable object.

**Default Implementation:**

```
{return NULL;}
```

**Prototype:**

```
virtual HCURSOR GetHitCursor()
```

**Remarks:**

Implemented by the Plug-In.

Returns the handle of the hit cursor. This is the cursor to use when the user IS over a pickable object.

**Default Implementation:**

```
{return NULL;}
```

**Prototype:**

**virtual BOOL AllowMultiSelect();**

**Remarks:**

This method is available in release 2.0 and later only.

Implement this method to return TRUE to allow the user to pick more than one thing. In that case the **Pick()** method may be called more than once.

**Return Value:**

TRUE to allow multiple picks; otherwise FALSE.

**Default Implementation:**

**{return FALSE;}**

## Class TexHandle

See Also: [Class TexHandleMaker](#).

class TexHandle

### Description:

This class defines a texture handle. A pointer to an instance of this class is returned from the methods of **TexHandleMaker**. Methods of this class allow the handle to be retrieved and to delete the handle.

### Methods:

#### Prototype:

**virtual DWORD GetHandle() = 0;**

#### Remarks:

Implemented by the Plug-In.

This method is called to retrieve the texture handle.

#### Prototype:

**virtual void DeleteThis() = 0;**

#### Remarks:

Implemented by the Plug-In.

This method is called to delete the instance of the texture handle.

## Class ShaderParamDlg

See Also: [Class ParamDlg](#), [Class StdMat2](#), [Class Shader](#).

class ShaderParamDlg : public ParamDlg

### Description:

This class is available in release 3.0 and later only.

A pointer to an instance of this class is returned by a Shader when it is asked to put up its rollup page.

### Methods:

public:

### Prototype:

**virtual Class\_ID ClassID()=0;**

### Remarks:

Implemented by the Plug-In.

Returns the unique Class\_ID of this object.

### Prototype:

**virtual void SetThing(ReferenceTarget \*m)=0;**

### Remarks:

Implemented by the Plug-In.

This method sets the current shader being edited to the shader passed.

### Parameters:

**ReferenceTarget \*m**

The Shader to set as current.

### Prototype:

**virtual void SetThings(StdMat2\* pMtl, Shader\* pShader)=0;**

### Remarks:

Implemented by the Plug-In.

This method sets the current Standard material (and its shader) being edited to the ones passed.

**Parameters:**

**StdMtl2\* pMtl**

The Standard material to set as current.

**Shader\* pShader**

The Shader to set as current.

**Prototype:**

**virtual ReferenceTarget\* GetThing()=0;**

**Remarks:**

Returns the a pointer to the current **material** being edited. Note that in most of the Get/SetThing() methods in the SDK the 'Thing' is the actual plug-in. In this case it's not. It the material which is using this Shader.

**Prototype:**

**virtual Shader\* GetShader()=0;**

**Remarks:**

This method returns a pointer to the current Shader.

**Prototype:**

**virtual void SetTime(TimeValue t);**

**Remarks:**

This method is called when the current time has changed. This gives the developer an opportunity to update any user interface data that may need adjusting due to the change in time.

**Parameters:**

**TimeValue t**

The new current time.

**Default Implementation:**

**{}**

**Prototype:**

**virtual void DeleteThis()=0;**

**Remarks:**

This method is called to delete this instance of the class.

For dynamically created global utility plugins, this method has to be implemented and should have a implementation like **{ delete this; }**

**Prototype:**

**virtual BOOL PanelProc(HWND hwndDlg, UINT msg, WPARAM wParam, LPARAM lParam)=0;**

**Remarks:**

This is the dialog procedure for the user interface controls of the Shader.

**Parameters:****HWND hwndDlg**

The window handle of the rollup page.

**UINT msg**

The message to process.

**WPARAM wParam**

The first dialog parameter.

**LPARAM lParam**

The second dialog parameter.

**Return Value:**

Except in response to the WM\_INITDIALOG message, the procedure should return nonzero if it processes the message, and zero if it does not. In response to a WM\_INITDIALOG message, the dialog box procedure should return zero if it calls the SetFocus function to set the focus to one of the controls in the dialog. Otherwise, it should return nonzero, in which case the system sets the focus to the first control in the dialog that can be given the focus.

**Prototype:**

**virtual void LoadDialog(int draw)=0;**

**Remarks:**

This method is used to load the user interface controls with their current values.

**Parameters:**

**int draw**

This parameter is not currently used.

**Prototype:**

**virtual HWND GetHwnd()=0;**

**Remarks:**

This method returns the window handle of the rollup panel.

**Prototype:**

**virtual int FindSubTexFromHWND(HWND hw)=0;**

**Remarks:**

This method returns the index of the sub-texmap corresponding to the window whose handle is passed. If the handle is not valid return -1.

**Parameters:**

**HWND hw**

The window handle to check.

**Prototype:**

**virtual void UpdateOpacity()=0;**

**Remarks:**

This method is called to update the opacity parameter of the plug-in in the user interface.

**Prototype:**

**virtual void UpdateMapButtons()=0;**

**Remarks:**

This method is called to update the map buttons in the user interface. For example it can put a " " or "m" or "M" on the button face based on the state of the map.

## Class StdMat2

See Also: [Class StdMat](#), [Class Shader](#), [Class Sampler](#), [Class Class\\_ID](#).

class StdMat2 : public StdMat

### Description:

This class is available in release 3.0 and later only.

This is the base class for all materials supporting the plug-in shader mechanism. The 3ds max Standard material is derived from this class.

### Methods:

public:

### Prototype:

**virtual BOOL KeyAtTime(int id, TimeValue t)=0;**

### Remarks:

Returns TRUE if the specified parameter whose ID is passed has a key at the time passed; otherwise FALSE.

### Parameters:

**int id**

The ID of the parameter to check.

**TimeValue t**

The time to check.

### Prototype:

**virtual int GetMapState(int indx)=0;**

### Remarks:

Returns a value to indicate the state of the specified map. One of the following values:

**0:** No map present.

**1:** Map present but disabled.

**2:** Map present and on.

### Parameters:

**int indx**

The index of the map to check. See [List of Texture Map Indices](#).

**Prototype:**

```
virtual TSTR GetMapName(int indx)=0;
```

**Remarks:**

Returns the name of the map whose index is passed.

**Parameters:****int indx**

The index of the map to check. See [List of Texture Map Indices](#).

**Prototype:**

```
virtual void SyncADTexLock(BOOL lockOn)=0;
```

**Remarks:**

This method is called when the state of the Ambient/Diffuse Texture lock is toggled. The material should store the setting and update the UI as required.

**Parameters:****BOOL lockOn**

TRUE for on; FALSE for off.

**Prototype:**

```
virtual BOOL SwitchShader(Class_ID id)=0;
```

**Remarks:**

This method is called when a new Shader has been selected.

**Parameters:****Class\_ID id**

The Class\_ID of the new shader to switch to.

**Prototype:**

```
virtual Shader* GetShader()=0;
```

**Remarks:**

Returns a pointer to the Shader in use. See [Class Shader](#) for details on this

plug-in type.

**Prototype:**

**virtual BOOL IsFaceted()=0;**

**Remarks:**

Returns TRUE if the shader is faceted; otherwise FALSE. The pre-R3 Constant shader is faceted. The other shaders are not.

**Prototype:**

**virtual void SetFaceted(BOOL on)=0;**

**Remarks:**

Sets the faceted setting of the Shader.

**Parameters:**

**BOOL on**

TRUE if it is faceted; FALSE if not.

**Prototype:**

**virtual long StdIDToChannel(long id)=0;**

**Remarks:**

Returns the index of the mapping channels which corresponds to the specified Standard materials texture map ID.

**Parameters:**

**long id**

The ID whose corresponding channel to return. See [List of Texture Map Indices](#).

**Return Value:**

The zero based index of the channel. If there is not a corresponding channel return -1.

**Prototype:**

**virtual void SetShading(int s);**

**Remarks:**

Sets the active shader to the one specified. The supported types are the pre-R3 shaders.

**Parameters:**

**int s**

One of the following values (all other values are a NOOP):

**SHADE\_CONST** (Phong, faceted).

**SHADE\_PHONG**

**SHADE\_METAL**

**SHADE\_BLINN**

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual int GetShading();
```

**Remarks:**

Returns one of the pre-R3 shader types. If an R3 shader type is active, SHADE\_BLINN is returned.

**Return Value:**

One of the following values:

**SHADE\_CONST** (Phong, faceted).

**SHADE\_PHONG**

**SHADE\_METAL**

**SHADE\_BLINN**

**Default Implementation:**

```
{ return -1; }
```

**Prototype:**

```
virtual BOOL SwitchSampler(Class_ID id)=0;
```

**Remarks:**

This method is called when the active Sampler is switched.

**Parameters:**

**Class\_ID id**

The Class\_ID of the new Sampler.

**Prototype:**

**virtual Sampler \*GetPixelSampler()=0;**

**Remarks:**

Returns a pointer to the sampler used.

**Prototype:**

**virtual BOOL GetSelfIllumColorOn(int mtlNum=0, BOOL backFace=FALSE)=0;**

**Remarks:**

Returns the Self Illumination Color On setting. TRUE if on; FALSE if off.

**Parameters:**

These parameters are not used and may be ignored.

**Prototype:**

**virtual Color GetSelfIllumColor(int mtlNum, BOOL backFace)=0;**

**Remarks:**

Returns the Self Illumination Color setting.

**Parameters:**

These parameters are not used and may be ignored.

**Prototype:**

**virtual Color GetSelfIllumColor(TimeValue t)=0;**

**Remarks:**

Returns the Self Illumination Color setting at the specified time.

**Parameters:**

**TimeValue t**

The time at which to get the color.

**Prototype:**

**virtual void SetSelfIllumColorOn(BOOL on)=0;**

**Remarks:**

Sets the Self Illumination Color On setting

**Parameters:**

**BOOL on**

TRUE for on; FALSE for off.

**Prototype:**

**virtual void SetSelfIllumColor(Color c, TimeValue t)=0;**

**Remarks:**

Sets the Self Illumination Color setting at the specified time.

**Parameters:**

**Color c**

The color to set.

**TimeValue t**

The time at which to set the color.

## List of Shader Standard Parameter Flags

See Also: [Class Shader](#), [Class IllumParams](#).

These are the flags that are returned in **Shader::SupportStdParams()** or stored in **IllumParams::stdParams**.

One or more of the following values:

### **STD\_PARAM\_NONE**

This indicates none of the flags below.

### **STD\_PARAM\_ALL**

This indicates all of the flags below.

### **STD\_PARAM\_METAL**

This bit is only used by the Metal shader.

### **STD\_PARAM\_LOCKDS**

Indicate support for the Diffuse / Specular lock.

### **STD\_PARAM\_LOCKAD**

Indicates support for the Ambient / Diffuse lock.

### **STD\_PARAM\_LOCKADTEX**

Indicates support for the Ambient / Diffuse texture lock.

### **STD\_PARAM\_SELFILLUM**

Indicates support for the Self Illumination parameter.

### **STD\_PARAM\_SELFILLUM\_CLR**

Indicates support for the Self Illumination color parameter.

### **STD\_PARAM\_AMBIENT\_CLR**

Indicates support for the Ambient color parameter.

### **STD\_PARAM\_DIFFUSE\_CLR**

Indicates support for the Diffuse color parameter.

### **STD\_PARAM\_SPECULAR\_CLR**

Indicates support for the Specular color parameter.

### **STD\_PARAM\_FILTER\_CLR**

Indicates support for the Filter color parameter.

### **STD\_PARAM\_GLOSSINESS**

Indicates support for the Glossiness parameter.

### **STD\_PARAM\_SOFTEN\_LEV**

Indicates support for the Soften Level parameter.

### **STD\_PARAM\_SPECULAR\_LEV**

Indicates support for the Specular Level parameter.

### **STD\_PARAM\_DIFFUSE\_LEV**

Indicates support for the Diffuse Level parameter.

### **STD\_PARAM\_DIFFUSE\_RHO**

Indicates support for the Roughness parameter.

### **STD\_PARAM\_ANISO**

Indicates support for the Specular Highlight Anisotropy parameter.

### **STD\_PARAM\_ORIENTATION**

Indicates support for the Specular Highlight Orientation parameter.

### **STD\_PARAM\_REFL\_LEV**

This is reserved for future use.

### **STD\_PARAM\_SELFILLUM\_CLR\_ON**

Indicates support for the Self Illumination Color On/Off checkbox.

### **STD\_BASIC2\_DLG**

This bit is only set by the three pre-R3 shaders (Phong, Blinn, and Metal). If this bit is not set then the Basic Parameters dialog is replaced by the one provided by the plug-in shader.

### **STD\_EXTRA\_DLG**

Indicates support for the Extended Parameters rollout. If this bit is not set one provided by the plug-in shader will be used instead.

The following three flags, when set, enable the specified controls in the Extended Parameters rollout.

#### **STD\_EXTRA\_REFLECTION**

Indicates support for Reflection Dimming parameters (Apply, Dim Level, Refl Level).

#### **STD\_EXTRA\_REFRACTION**

Indicates support for Index of Refraction parameter.

#### **STD\_EXTRA\_OPACITY**

Indicates support for Opacity parameters (Amount, In/Out, Type).

## List of Color Conversion Utilities

The following global functions are available for color conversion. These are defined in `\MAXSDK\INCLUDE\HSV.H`.

**Prototype:**

```
void RGBtoHSV(DWORD rgb, int *ho, int *so, int *vo);
```

**Remarks:**

Converts the specified color in RGB to HSV.

**Parameters:**

**DWORD rgb**

The RGB color to convert.

**int \*ho**

The hue output.

**int \*so**

The saturation output.

**int \*vo**

The value output.

**Prototype:**

```
DWORD HSVtoRGB(int H, int S, int V);
```

**Remarks:**

Converts the specified color in HSV color to RGB.

**Parameters:**

**int H**

The input hue.

**int S**

The input saturation.

**int V**

The input value.

**Return Value:**

The RGB color as a DWORD. See [COLORREF](#).

**Prototype:**

```
void HSVtoHWBt(int h, int s, int v, int *ho, int *w, int *bt);
```

**Remarks:**

Converts the specified color in HSV color to Hue Whiteness and Blackness (HWBt).

**Parameters:**

**int h**

The input hue.

**int s**

The input saturation.

**int v**

The input value.

**int \*ho**

The hue output.

**int \*w**

The whiteness output.

**int \*bt**

The blackness output.

**Prototype:**

```
void HWBttoHSV(int h, int w, int bt, int *ho, int *s, int *v);
```

**Remarks:**

Converts the specified color in Hue Whiteness and Blackness (HWBt) color to HSV.

**Parameters:**

**int h**

The hue input.

**int w**

The whiteness input.

**int bt**

The blackness input.

**int \*ho**

The hue output.

**int \*s**

The saturation output.

**int \*v**

The value output.

## Class IMCParamDlg

See Also: [Class ReferenceMaker](#), [Class MCDeviceBinding](#), [Class IRollupWindow](#).

```
class IMCParamDlg : public ReferenceMaker
```

### Description:

This class is an interface to allow the plug-in to provide a user interface in the command panel. It has two data members.

### Data Members:

public:

**MCDeviceBinding \*binding;**

Returns a pointer to the device binding.

**IRollupWindow \*iRoll;**

This is an interface into the command panel. Its methods may be used to work with rollup pages and alter UI controls.

## Class MeshSubHitRec

See Also: [Class Mesh](#), [Class BitArray](#).

class MeshSubHitRec

### Description:

This class allows access to the sub-object hit records used in Mesh hit testing. All methods of this class are implemented by the system.

### Data Members:

public:

#### **DWORD dist;**

The distance of the hit. If the user is in wireframe mode, this is the distance in pixels to the item that was hit. If the user is in shaded mode, this is the Z depth distance. Smaller numbers indicate a closer hit.

#### **int index;**

The index of the sub-object component. For example, if faces were being hit tested, this would be the index of the mesh's BitArray **faceSel**. For edges, this is the index into the **edgeSel** BitArray, where the index is

**3\*faceIndex+edgeIndex.**

#### **DWORD flags;**

These are not currently used.

### Methods:

#### Prototype:

**MeshSubHitRec(DWORD dist, int index, MeshSubHitRec \*next);**

#### Remarks:

Constructor. The data members are initialized to the data members passed.

#### Prototype:

**MeshSubHitRec(DWORD dist, int index, DWORD flags,  
MeshSubHitRec \*next)**

#### Remarks:

Constructor. The data members are initialized to the data members passed.

**Prototype:**

**MeshSubHitRec \*Next();**

**Remarks:**

Returns the next mesh sub hit record.

# Class GenericHierarchy

See Also: [Class HierarchyEntry](#).

class GenericHierarchy

## Description:

This is a utility class for describing hierarchies of shapes. All methods of this class are implemented by the system.

This is used in generating mesh objects from shapes. In order for a mesh object to be generated correctly, nested shapes must be oriented clockwise or counter-clockwise depending on their level of nesting. For example, a donut shape with two circular curves will have the outer shape going counter-clockwise and the inner shape going clockwise. If a third shape was nested inside both of these, its points would be going counter-clockwise.

## Methods:

### Prototype:

**GenericHierarchy()**

### Remarks:

Constructor. The hierarchy is set as initially empty.

### Prototype:

**void AddEntry(int data, int parent = -1);**

### Remarks:

This method adds one entry given its parent.

### Parameters:

**int data**

The polygon index of the entry to add.

**int parent = -1**

The index of the parent of the entry.

### Prototype:

**int Entries();**

**Remarks:**

Returns the total number of members in the hierarchy.

**Prototype:**

**HierarchyEntry\* GetStart();**

**Remarks:**

Retrieves the first item under the root.

**Return Value:**

The first **HierarchyEntry** under the root.

**Prototype:**

**HierarchyEntry\* FindEntry(int data, HierarchyEntry\* start = NULL);**

**Remarks:**

Finds the specified entry in the hierarchy.

**Parameters:**

**int data**

The polygon index of the entry to find.

**HierarchyEntry\* start = NULL**

The entry at which to begin the search. If NULL is specified the search starts at the root.

**Return Value:**

A pointer to the **HierarchyEntry** of the found entry. If not found, NULL is returned.

**Prototype:**

**int NumberOfChildren(int data);**

**Remarks:**

Returns the number of children for this item.

**Parameters:**

**int data**

The index of the polygon to return the number of children of.

**Prototype:**

**int GetChild(int data, int index);**

**Remarks:**

Returns the specified child of the specified entry.

**Parameters:**

**int data**

The index of the polygon whose child is to be returned.

**int index**

Specifies which child to return.

**Return Value:**

The specified child of the entry.

**Prototype:**

**void New();**

**Remarks:**

Clear out the hierarchy tree.

**Prototype:**

**void Sort();**

**Remarks:**

Sorts the hierarchy tree by children / siblings. This is used internally as all the sorting is done automatically as the hierarchy is generated.

**Prototype:**

**BOOL IsCompatible(GenericHierarchy& hier);**

**Remarks:**

Determines if this hierarchy and the specified hierarchy are compatible.

**Parameters:**

**GenericHierarchy& hier**

The hierarchy to check for compatibility.

**Return Value:**

TRUE if the hierarchies are compatible; otherwise FALSE.

**Prototype:**

**void Dump(HierarchyEntry\* start = NULL);**

**Remarks:**

This method is used internally to **DebugPrint()** the tree. See [Debugging](#).

**Prototype:**

**TSTR& SortKey();**

**Remarks:**

Returns the sort key for the hierarchy. This is used internally.

**Operators:**

**Prototype:**

**GenericHierarchy& operator=(GenericHierarchy& from);**

**Remarks:**

Copy operator.

**Parameters:**

**GenericHierarchy& from**

The hierarchy to copy from.

## Class NoteKeyTab

See Also: [Class NoteKey](#), [Template Class Tab](#), [Class DefNoteTrack](#), [Class Animatable](#).

```
class NoteKeyTab : public Tab<NoteKey*>
```

### Description:

This class is table of pointers to **NoteKey** objects which store data about a Note Track in Track View. See **Template Class Tab** for details on manipulating this table.

### Methods:

public:

### Prototype:

```
~NoteKeyTab();
```

### Remarks:

Destructor. Deletes all the keys in the table.

### Prototype:

```
void Clear();
```

### Remarks:

Deletes all the keys in the table.

### Prototype:

```
void DelKey(int i);
```

### Remarks:

Deletes the specified key.

### Parameters:

```
int i
```

The zero based index of the key to delete.

### Prototype:

```
void KeysChanged();
```

**Remarks:**

This method is used internally to sort the keys by time.

**Operators:**

public:

**Prototype:**

**NoteKeyTab &operator=(NoteKeyTab &keys);**

**Remarks:**

Assignment operator.

**Parameters:**

**NoteKeyTab &keys**

The table of keys to assign.

## Structure SubRenderParams

See Also: [Class RenderMapsContext](#).

```
struct SubRenderParams : public BaseInterfaceServer
```

### Description:

This structure contains information on rendering for Mirror and Automatic Cubic materials. This is used by the methods of the **RenderMapsContext** class.

### Structure:

```
struct SubRenderParams {
```

#### **RenderType** renderType;

The rendering type being done. See the [List of Render Types](#) for more information.

#### **BOOL** fieldRender;

TRUE if field rendering is being used; otherwise FALSE.

#### **BOOL** evenLines;

This is used when field rendering. TRUE if doing even numbered scanlines; FALSE for odd numbered.

#### **BOOL** doingMirror;

This is used as part of implementing the Mirror material. It should be FALSE in all other cases.

#### **int** devWidth, devHeight;

The dimensions in pixels of Bitmap **tobm**.

#### **float** devAspect;

The aspect ratio of Bitmap **tobm**.

#### **int** xorg, yorg;

The location on the screen of the upper left corner of the output bitmap.

#### **int** xmin,xmax,ymin,ymax;

The area of the screen being rendered.

#### **Point2** blowupCenter;

This parameter is available in release 4.0 and later only.

The 2D point at the center of the render blowup region.

#### **Point2** blowupFactor;

This parameter is available in release 4.0 and later only.  
The X and Y scale factors for render blowup.

**Prototype:**

```
virtual INT_PTR Execute(int cmd, ULONG arg1=0, ULONG  
arg2=0, ULONG arg3=0);
```

**Remarks:**

This method is available in release 2.0 and later only.

This is a general purpose function that allows the API to be extended in the future. The 3ds max development team can assign new **cmd** numbers and continue to add functionality to this class without having to 'break' the API.

**Parameters:**

**int cmd**

The index of the command to execute.

**ULONG arg1=0**

Optional argument 1. See the documentation where the **cmd** option is discussed for more details on these parameters.

**ULONG arg2=0**

Optional argument 2.

**ULONG arg3=0**

Optional argument 3.

**Return Value:**

An integer return value. See the documentation where the **cmd** option is discussed for more details on the meaning of this value.

```
};
```

## Class Point4

See Also: [Class Point3](#).

class Point4

### Description:

This class describes a point using float x, y, z and w coordinates. Methods are provided to add and subtract points, multiply and divide by scalars, and element by element multiply and divide two points. All methods are implemented by the system.

This class is available in release 2.0 and later only.

### Data Members:

public:

**float x, y, z, w;**

The x, y, z and w components of the point.

**static const Point4 Origin;**

This is equivalent to **Point4(0.0f, 0.0f, 0.0f, 0.0f);**

**static const Point4 XAxis;**

This is equivalent to **Point4(1.0f, 0.0f, 0.0f, 0.0f);**

**static const Point4 YAxis;**

This is equivalent to **Point4(0.0f,1.0f, 0.0f, 0.0f);**

**static const Point4 ZAxis;**

This is equivalent to **Point4(0.0f, 0.0f,1.0f, 0.0f);**

**static const Point4 WAxis;**

This is equivalent to **Point4(0.0f, 0.0f, 0.0f,1.0f);**

### Methods:

### Prototype:

**Point4 ()**

### Remarks:

Constructor. No initialization is performed.

**Prototype:**

**Point4(float X, float Y, float Z, float W)**

**Remarks:**

Constructor. x, y, z and w are initialized to the values specified.

**Prototype:**

**Point4(double X, double Y, double Z, double W)**

**Remarks:**

Constructor. x, y, z and w are initialized to the specified values (cast as floats).

**Prototype:**

**Point4(int X, int Y, int Z, int W)**

**Remarks:**

Constructor. x, y, z and w are initialized to the specified values (cast as floats).

**Prototype:**

**Point4(const Point3& a, float W=0)**

**Remarks:**

Constructor. x, y, z and w are initialized to the specified Point3 and W.

**Prototype:**

**Point4(float af[4])**

**Remarks:**

Constructor. x, y, z and w are initialized to af[0], af[1], af[2] and af[3] respectively.

**Prototype:**

**inline Point4& Set(float X, float Y, float Z, float W);**

**Remarks:**

This method is available in release 3.0 and later only.

Sets the x, y, z and w coordinate to the values passed and returns a reference to this Point4.

**Parameters:****float X**

The new x value.

**float Y**

The new y value.

**float Z**

The new z value.

**float W**

The new w value.

**Return Value:**A reference to this **Point4**.**Prototype:****int Equals(const Point4& p, float epsilon = 1E-6f);****Remarks:**

This method is available in release 3.0 and later only.

Compares this Point4 and the specified one to see if the x, y, z and w values are within plus or minus the specified tolerance.

**Parameters:****const Point4& p**

The point to compare.

**float epsilon = 1E-6f**

The tolerance to use in the comparison.

**Return Value:**

Nonzero if the points are 'equal'; otherwise zero.

**Operators:****Prototype:****float& operator[](int i)****const float& operator[](int i) const****Remarks:**

Allows access to x, y, z and w using the subscript operator.

**Return Value:**

An value for **i** of 0 will return x, 1 will return y, 2 will return z and 3 will return w.

**Prototype:**

**operator float\*()**

**Remarks:**

Conversion function. Returns the address of the Point4.x

**Prototype:**

**Point4 operator-() const**

**Remarks:**

Unary - operator. Negates x, y, z and w.

**Prototype:**

**Point4 operator+() const**

**Remarks:**

Unary +. Returns the Point4.

**Prototype:**

**inline Point4& operator-=(const Point4&);**

**Remarks:**

Subtracts a Point4 from this Point4.

**Return Value:**

A Point4 that is the difference between two Point4s.

**Prototype:**

**inline Point4& operator+=(const Point4&);**

**Remarks:**

Adds a Point4 to this Point4.

**Return Value:**

A Point4 that is the sum of two Point4s.

**Prototype:**

**inline Point4& operator\*=(float);**

**Remarks:**

Multiplies this Point4 by a floating point value.

**Return Value:**

A Point4 multiplied by a float.

**Prototype:**

**inline Point4& operator/=(float);**

**Remarks:**

Divides this Point4 by a floating point value.

**Return Value:**

A Point4 divided by a float.

**Prototype:**

**inline Point4& operator\*=(const Point4&);**

**Remarks:**

Element-by-element multiplication of two Point4s:  
(**x\*x, y\*y, z\*z, w\*w**).

**Return Value:**

A Point4 element-by-element multiplied by another Point4.

**Prototype:**

**int operator==(const Point4& p) const**

**Remarks:**

Equality operator. Test for equality between two Point4's.

**Return Value:**

Nonzero if the Point4's are equal; otherwise 0.

**Prototype:**

**inline Point4 operator-(const Point4&) const;**

**Remarks:**

Subtracts a Point4 from a Point4.

**Return Value:**

A Point4 that is the difference between two Point4s.

**Prototype:**

```
inline Point4 operator+(const Point4&) const;
```

**Remarks:**

Adds a Point4 to a Point4.

**Return Value:**

A Point4 that is the sum of two Point4s.

**Prototype:**

```
inline Point4 operator/(const Point4&) const;
```

**Remarks:**

Divides a Point4 by a Point4 element by element.

**Return Value:**

A Point4 resulting from dividing a Point4 by a Point4 element by element.

**Prototype:**

```
inline Point4 operator*(const Point4&) const;
```

**Remarks:**

Multiplies a Point4 by a Point4 element by element.

**(x\*x, y\*y, z\*z, w\*w).**

**Return Value:**

A Point4 resulting from the multiplication of a Point4 and a Point4.

**Prototype:**

```
inline Point4 operator*(float f, const Point4& a)
```

**Remarks:**

Returns a Point4 that is the specified Point4 multiplied by the specified float.

**Prototype:**

**inline Point4 operator\*(const Point4& a, float f)**

**Remarks:**

Returns a Point4 that is the specified Point4 multiplied by the specified float.

**Prototype:**

**inline Point4 operator/(const Point4& a, float f)**

**Remarks:**

Returns a Point4 that is the specified Point4 divided by the specified float.

**Prototype:**

**inline Point4 operator+(const Point4& a, float f)**

**Remarks:**

Returns a Point4 that is the specified Point4 with the specified floating point valued added to each component x, y, z and w.

## Class RefListItem

See Also: [Class RefList](#).

class RefListItem

### Description:

This class represents a single entry in a RefList.

### Data Members:

public:

**RefMakerHandle maker;**

**RefListItem \*next;**

### Methods:

### Prototype:

**RefListItem(RefMakerHandle hmaker, RefListItem \*list)**

### Remarks:

Constructor. The data members are assigned.

## List of ParamTags Choices

See Also: [Class ParamBlockDesc2](#), [List of ParamType Choices](#), [Class PBAccessor](#), [Class PBValidator](#), [Class ParamDimension](#).

These are the parameter definition optional information tags. These tags are used in the **ParamBlockDesc2** main constructor as part of the <optional\_tagged\_param\_specs>. The typical format is:

<tag>, <optional\_param\_spec>,

The following options are available. The hyperlinks take you to the start of each tag description.

**enum ParamTags**

{

[p\\_default](#),

[p\\_ms\\_default](#),

[p\\_range](#),

[p\\_ui](#),

[p\\_uix](#),

[p\\_validator](#),

[p\\_accessor](#),

[p\\_vals](#),

[p\\_refno](#),

[p\\_subtexno](#),

[p\\_submtlno](#),

[p\\_dim](#),

[p\\_classID](#),

[p\\_prompt](#),

[p\\_caption](#),

[p\\_init\\_file](#),

```
p_file_types,  
end,  
};
```

## Option Descriptions:

### **p\_default**

The default value assigned when a block is first created. It must be of the correct type to match the **ParamType** of the parameter (for example float for TYPE\_FLOATs, int for TYPE\_INTs, Color(x,y,z) for TYPE\_RGBA, Point3(x,y,z) for TYPE\_POINT3s, etc.) Defaults can only be supplied for the following base types:

```
TYPE_ANGLE, TYPE_PCNT_FRAC,  
TYPE_COLOR_CHANNEL, TYPE_FLOAT,  
TYPE_TIMEVALUE, TYPE_INT, TYPE_BOOL,  
TYPE_RADIOBTN_INDEX, TYPE_POINT3, TYPE_RGBA,  
TYPE_STRING, TYPE_FILENAME, TYPE_MATRIX3
```

Examples:

```
p_default, FALSE,  
p_default, 1,  
p_default, Point3(0,0,0),  
p_default, 25.0,
```

### **p\_ms\_default**

This establishes the default value used during MAXScript creation. For example the MAXScript command **sphere.radius** defaults to 25.0 when created by the scripser, but **p\_default** is set to 0.0 so interactive creation starts out with a point-sized sphere when the first mouse click is made.

Example:

```
p_ms_default, 25.0,
```

### **p\_range**

This establishes allowable ranges used in MAXScript validation and spinner setup. Supplied as two values of the correct type (as described in **p\_default**, above). Ranges can only be supplied for the following types:

**TYPE\_ANGLE, TYPE\_PCNT\_FRAC,  
TYPE\_COLOR\_CHANNEL, TYPE\_FLOAT,  
TYPE\_TIMEVALUE, TYPE\_INT,  
TYPE\_RADIOBTN\_INDEX, TYPE\_POINT3, TYPE\_RGBA**

Example:

**p\_range, -99999999.0, 99999999.0,**

**p\_ui**

This is the user interface control specification.

This optional tag takes a variable list of arguments depending on the type of UI control specified. This sequence of arguments is similar in form to the ParamDescUI class constructors in the pre-release 3 ParamMap system.

Following the p\_ui tag, one of the following control types should be specified. Following that are further specs as defined in each type.

Note: If a p\_ui is supplied for a Tab<> parameter type and the control is \*not\* of on the ListBox types, the table size should be fixed and supplied in the <required\_param\_specs> table\_size field, and you should supply a set of dialog item ID's for each element in the table. See the example in TYPE\_SPINNER below.

[TYPE\\_FLOATLISTBOX](#)

[TYPE\\_STRINGLISTBOX](#)

[TYPE\\_POINT3LISTBOX](#)

**TYPE\_SPINNER:**

This is a standard MAX spinner control. It requires a spinner type, list of dialog item resource IDs and a display scale. The spinner type can be one of the **EditSpinnerType** values described below:

**EDITTYPE\_INT**

Any integer value.

**EDITTYPE\_FLOAT**

Any floating point value.

**EDITTYPE\_UNIVERSE**

This is a value in world space units. It respects the system's unit settings (for example feet and inches).

**EDITTYPE\_POS\_INT**

Any integer  $\geq 0$

**EDITTYPE\_POS\_FLOAT**

Any floating point value  $\geq 0.0$

**EDITTYPE\_POS\_UNIVERSE**

This is a positive value in world space units. It respects the system's unit settings (for example feet and inches) .

**EDITTYPE\_TIME**

This is a time value. It respects the system time settings (SMPTE for example).

The list of dialog item IDs depends on the ParamType of the parameter. For TYPE\_POINT3 and TYPE\_RGBA, you supply 3 pairs of IDs, one for

each coordinate, each pair specifying the editbox and spinner IDs. For the other you specify one editbox/spinner pair of IDs. The display scale can be a floating point value or the special value SPIN\_AUTOSCALE.

Eg:

**p\_ui, TYPE\_SPINNER, EDITTYPE\_UNIVERSE,  
IDC\_RADIUS, IDC\_RADSPINNER, SPIN\_AUTOSCALE,**

If the parameter is a table type then, as with all other control types, you must specify a fixed table size and supply a list of dialog item IDs, one set for each element in the tab. Eg, for a 3 element table:

**p\_ui, TYPE\_SPINNER, EDITTYPE\_UNIVERSE,  
IDC\_RADIUS1, IDC\_RADSPINNER1,  
IDC\_RADIUS2, IDC\_RADSPINNER2,  
IDC\_RADIUS3, IDC\_RADSPINNER3,  
SPIN\_AUTOSCALE,**

This control type can be used with any of the following ParamTypes:

**TYPE\_ANGLE, TYPE\_PCNT\_FRAC,  
TYPE\_COLOR\_CHANNEL, TYPE\_FLOAT,  
TYPE\_TIMEVALUE, TYPE\_INT, TYPE\_POINT3,  
TYPE\_RGBA**

#### **TYPE\_SLIDER:**

This is a standard 3ds max slider control. It requires a type, list of dialog item resource IDs and a number of ticks. The slider type can be one of the **EditSpinnerType** values described below:

**EDITTYPE\_INT**

Any integer value.

**EDITTYPE\_FLOAT**

Any floating point value.

**EDITTYPE\_UNIVERSE**

This is a value in world space units. It respects the system's unit settings (for example feet and inches).

**EDITTYPE\_POS\_INT**

Any integer  $\geq 0$

### **EDITTYPE\_POS\_FLOAT**

Any floating point value  $\geq 0.0$

### **EDITTYPE\_POS\_UNIVERSE**

This is a positive value in world space units. It respects the system's unit settings (for example feet and inches) .

### **EDITTYPE\_TIME**

This is a time value. It respects the system time settings (SMPTE for example).

The list of dialog item IDs depends on the ParamType of the parameter. For TYPE\_POINT3 and TYPE\_RGBA, you supply 3 pairs of IDs, one for each coordinate, each pair specifying the editbox and slider IDs. For the other you specify one editbox/slider pair of IDs. The segment count is the number of ticks in the slider.

Eg:

**p\_ui, TYPE\_SPINNER, EDITTYPE\_UNIVERSE,  
IDC\_EDITBOX, IDC\_SLIDER, numSegs**

For Point3 you can do the following:

**p\_ui, TYPE\_SPINNER, EDITTYPE\_UNIVERSE,  
IDC\_EDITBOX1, IDC\_SLIDER1, IDC\_EDITBOX2,  
IDC\_SLIDER2, IDC\_EDITBOX3, IDC\_SLIDER3, numSegs**

This control type can be used with any of the following ParamTypes:

**TYPE\_ANGLE, TYPE\_PCNT\_FRAC,  
TYPE\_COLOR\_CHANNEL, TYPE\_FLOAT,  
TYPE\_TIMEVALUE, TYPE\_INT, TYPE\_POINT3,  
TYPE\_RGBA**

### **TYPE\_RADIO:**

This is the standard Win32 radio button control. Following the **TYPE\_RADIO**, supply an int count of the number of radiobuttons in this group and then a list of dialog item IDs for each button. This can only be used with **TYPE\_INT** parameters. The value of the parameter defaults to the ordinal number of the radio button, starting at 0. You can

optionally supply a **p\_vals** tag immediately following the **TYPE\_RADIO p\_ui**, which should be followed by a list of numbers, one for each radio button. These numbers will become the (non-ordinal) parameter value corresponding to which button is set.

#### **TYPE\_CHECKBUTTON:**

This control functions just like **TYPE\_SINGLECHECKBOX** documented below but is represented by a button in either a pressed in or un-pressed state.

#### **TYPE\_SINGLECHECKBOX:**

This is the standard Win32 checkbox. Follow the **TYPE\_SINGLECHECKBOX** with the dialog item ID of the checkbox. This can only be used with **TYPE\_INT** or **TYPE\_BOOL** parameters.

#### **TYPE\_MULTICHECKBOX:**

This control type is not currently supported.

#### **TYPE\_COLORSWATCH:**

This is a 3ds max color-picker swatch. Follow the **TYPE\_COLORSWATCH** with the dialog item ID of the swatch custom control. This can only be used with **TYPE\_POINT3** or **TYPE\_RGBA** parameters.

#### **TYPE\_EDITBOX:**

This is a 3ds max custom editbox control. Follow the **TYPE\_EDITBOX** with the dialog item ID of the EditBox custom control. This can only be used with **TYPE\_STRING** and **TYPE\_FILENAMEAE** parameters.

#### **TYPE\_PICKNODEBUTTON:**

This is a 3ds max CustButton control used in a CBT\_CHECK mode with GREEN\_WASH highlight color, as per node picking button conventions. Follow the control type with the dialog item ID of the CustButton custom control. When the user presses this button a PickModeCallback command mode is entered and the user can pick a scene node under the filtering of any validation supplied (see tags **p\_validator**, **p\_classID** and **p\_sclassID**). This can only be used with **TYPE\_INODE** parameters. Use the **p\_prompt** tag to supply a status line prompt.

#### **TYPE\_TEXMAPBUTTON:**

This is a 3ds max CustButton control used in a CBT\_PUSH mode. Follow the control type with the dialog item ID of the CustButton custom control. This button throws up a Map selector dialog when pressed and is Map drag-and-drop sensitive. This can only be used with **TYPE\_TEXMAP** parameters. Use the **p\_prompt** tag to supply a status line prompt.

#### **TYPE\_MTLBUTTON:**

3ds max CustButton control used in a CBT\_PUSH mode. Follow the control type with the dialog item ID of the CustButton custom control. This button throws up a Material selector dialog when pressed and is Material drag-n-drop sensitive. This can only be used with **TYPE\_MTL** parameters. Use the **p\_prompt** tag to supply a status line prompt.

#### **TYPE\_BITMAPBUTTON:**

This is a 3ds max CustButton control used in a CBT\_PUSH mode. Follow the control type with the dialog item ID of the CustButton custom control. This button throws up a standard 3ds max Bitmap browser when pressed and is Bitmap drag-and-drop sensitive. Can only be used with **TYPE\_BITMAP** parameters. Use the **p\_prompt** tag to supply a status line prompt.

#### **TYPE\_FILEOPENBUTTON:**

This is a 3ds max CustButton control used in a CBT\_PUSH mode. Follow the control type with the dialog item ID of the CustButton custom control. This button throws up a standard Windows Open File dialog for selecting a file name. Can only be used with **TYPE\_STRING** and **TYPE\_FILENAME** parameters. Use any of the **p\_caption**, **p\_init\_file** and **p\_file\_types** tagsto further control the dialog.

#### **TYPE\_FILESAVEBUTTON:**

This is a 3ds max CustButton control used in a CBT\_PUSH mode. Follow control type with the dialog item ID of the CustButton custom control. This button throws up a standard Windows Save File dialog for selecting a file name. Can only be used with **TYPE\_STRING** and **TYPE\_FILENAME** parameters. Use any of the **p\_caption**, **p\_init\_file** and **p\_file\_types** tags to further control the dialog.

#### **TYPE\_INTLISTBOX:**

#### **TYPE\_FLOATLISTBOX:**

This specifies a series of controls for displaying and managing a ListBox

control containing an int or float Tab<> parameter. The setup consists of a ListBox control, 3 buttons for adding, replacing and deleting items in the list and a 3ds max spinner to supply source values for Add & Replace. After the control type, you supply 4 dialog item IDs. The first is the ListBox control, then dialog item IDs for 3 CustButton controls for an Add, Replace and Delete button, respectively. Follow these with a spinner type, editbox/spinner dialog item ID pair and a display scale, exactly as for TYPE\_SPINNER above. You can supply the value 0 for any of the Add, Replace, or Delete buttons if you don't need them in the dialog. This can only be used with the following parameter types:

For TYPE\_INTLISTBOX:

**TYPE\_TIMEVALUE\_TAB, TYPE\_INT, TYPE\_INT\_TAB**

For TYPE\_FLOATLISTBOX:

**TYPE\_ANGLE\_TAB, TYPE\_PCNT\_FRAC\_TAB,  
TYPE\_COLOR\_CHANNEL\_TAB, TYPE\_FLOAT\_TAB**

The Add/Replace/Delete buttons automatically keep the Tab<> parameter in step with the list.

The **TYPE\_INT** parameter type and **TYPE\_INTLISTBOX** control type combination is recognized specially and is used to allow a dropdown list to be associated with an int parameter such that the selection index in the dropdown becomes the integer parameter value. In this mode, after the control type you supply the ListBox control ID, then a count followed by that many string resource IDs. These strings are used to populate the dropdown.

Eg:

**p\_ui, TYPE\_INTLISTBOX, <list\_ctrl\_id>, <num\_items>, [  
<item1\_str\_id>, <item2\_str\_id>, ... ]**

These are the list control res ID, followed by a list of initial string items to load up given as a count (which can be 0 -- you can load them up dynamically in the dialog proc), and then a list of string resource IDs. See the **std2\_shader\_type** parameter in **\MAXSDK\SAMPLES\MATERIALS\STDMTL2.CPP** for an example.

**TYPE\_STRINGLISTBOX:**

A series a controls for displaying and managing a ListBox control

containing an string Tab<> parameter. The setup consists of a ListBox control, 3 buttons for adding, replacing and deleting items in the list and a 3ds max CustEdit box to supply source strings for Add & Replace. After the control type, you supply 4 dialog item IDs. The first is the ListBox control, then dialog item IDs for 3 CustButton controls for an Add, Replace and Delete button, respectively. Follow these with the CustEdit control dialog item ID. You can supply the value 0 for any of the Add, Replace, Delete buttons or CustEdit control IDs if you don't need them in the dialog. Can only use with TYPE\_STRING\_TAB parameters.

The Add/Replace/Delete buttons automatically keep the Tab<> parameter in step with the list.

#### **TYPE\_NODELISTBOX:**

A series a controls for displaying and managing a ListBox control containing an INode Tab<> parameter. The setup consists of a ListBox control, 3 buttons for picking, replacing and deleting items in the list. After the control type, you supply 4 dialog item IDs. The first is the ListBox control, then dialog item IDs for 3 CustButton controls for a Pick, Replace and Delete button, respectively. THE Pick and Replace buttons act exactly as TYPE\_PICKNODEBUTTONS to get nodes to add-to or replace-in the list. You can supply the value 0 for any of the Add, Replace, Delete buttons IDs if you don't need them in the dialog. Can only use with TYPE\_INODE\_TAB parameters.

The Pick/Replace/Delete buttons automatically keep the Tab<> parameter in step with the list, including managing References as needed.

#### **TYPE\_POINT3LISTBOX:**

A series a controls for displaying and managing a ListBox control containing an Point3 Tab<> parameter. The setup consists of a ListBox control, 3 buttons for adding, replacing and deleting items in the list, a source spinner type, three pairs of editboxes and spinners, and a display scale. After the control type, you supply 4 dialog item IDs. The first is the ListBox control, then dialog item IDs for 3 CustButton controls for an Add, Replace and Delete button, respectively. Follow this with the source spinner type, the editbox and spinner for the first item, the editbox and spinner for the second item, the editbox and spinner for the third item, and finally the display scale. Note that you can only use this with TYPE\_POINT3\_TAB parameters.

## **p\_uix**

This option is available in release 4.0 and later only.

This specifies which additional rollup/map the parameter is supposed to appear in.

## **p\_validator**

Specifies a validator object (see [Class PBValidator](#)). You supply a pointer to an instance of a class derived from **PBValidator**. This class has a **Validate()** method which can return TRUE if the **PB2Value** passed to it is valid and FALSE otherwise. This can be used for instance by a node pick button to check if a chosen node is acceptable.

Example:

**p\_validator, &fOutValidator,**

## **p\_accessor**

Specifies an accessor object (see [Class PBAccessor](#)). You supply a pointer to an instance of a class derived from **PBAccessor**. This class is used to provide a parameter Get/SetValue callback. The callback can be used to monitor parameter value changes, or to implement dynamically-computed virtual parameters. The class has two virtual methods, **Get()** and **Set()**, each given a **PB2Value&**, parameter ID, etc. In the case of a **Get()** you can modify the value in the **PB2Value&** to implement a virtual get.

Example:

**p\_accessor, &cmap\_accessor,**

## **p\_vals**

This defines radio button values in button order if button settings need to correspond to non-ordinal numbers. The value of the parameter defaults to the ordinal number of the radio button, starting at 0. You can optionally supply this tag immediately following the **TYPE\_RADIO p\_ui**. This tag should be followed by a list of numbers, one for each radio button. These numbers will become the (non-ordinal) parameter value corresponding to which button is set.

Example:

**p\_vals, 0,1,2,4,3 ,**

### **p\_refno**

This is used if the flag value in a <required\_param\_specs> includes **P\_OWNERS\_REF**. For these reftarg parameters this specifies the reference number in the block's owner for this reference. If the parameter is a Tab<>, then the reference number supplied is the base reference number of the 0'th element, with sequential reference numbers for the following elements.

Example:

**p\_refno, UVGEN\_REF,**

### **p\_subtexno**

For Texmap items in Mtls this defines the integer SubTexmap index for this Texmap in the owner Mtl. This is used by **TYPE\_TEXMAPBUTTON** ParamMap2 control types to give to the Material Editor for automatic button and Drag And Drop handling.

Example:

**p\_subtexno, 0,**

### **p\_submtlno**

Defines the sub-material integer index for this Mtl in an owner Mtl. This is used by **TYPE\_MTLBUTTON** ParamMap2 control types to give to the Material Editor for automatic button and Drag And Drop handling.

Example:

**p\_submtlno, 1,**

### **p\_dim**

This allows you to supply a dimension for this parameter. You specify a **ParamDimension\*** as the argument. Certain parameter types have an implied dimensions (see [List of ParamType Choices](#) for details). Defaults to **defaultDim**.

Example:

**p\_dim, stdWorldDim,**

### **p\_classID**

This specifies the class ID used as a validator for the various reftarg

parameters. This is used by the scripiter, picknode filter, etc. For example, if you supply this in a **TYPE\_INODE** parameter and use a **TYPE\_PICKNODE** parammap control, the picker uses this class ID in the picking filter. If you set **P\_CAN\_CONVERT** in the parameter's flag, it applies an **Object::CanConvertTo()** test to the node's world state using the Class\_ID supplied to perform the filter test.

### **p\_sclassID**

This specifies the super class ID used as a validator for the various reftarg parameters. For example, if you supply this in a **TYPE\_INODE** parameter and use a **TYPE\_PICKNODE** parammap control, the picker uses this super class ID in the picking filter.

Example:

**p\_sclassID, SHAPE\_CLASS\_ID,**

### **p\_enabled**

The associated UI controls are enabled by default.

supply TRUE or FALSE to indicate whether associated UI controls are enabled or disabled when the rollout dialog is first opened. If not supplied, defaults to enabled. Can be overridden by p\_enable\_ctrls below.

Example:

**p\_enabled, FALSE,**

### **p\_enable\_ctrls**

for TYPE\_BOOLs, lists which other params would be automatically UI enabled/disabled by this param

for TYPE\_BOOL parametes, lists which other params should be automatically UI enabled/disabled by changes in state of this parameter. This allows you to easily set up conditional enabling of other UI controls based on the state of the controlling parameter.

Example:

**p\_enable\_ctrls, 3, sel\_falloff, sel\_pinch, sel\_bubble,**

### **p\_prompt**

This sets the status line prompt string resource ID for various picker buttons.

Example:

**p\_prompt, IDS\_PICK\_CAM\_PROMPT,**

## **p\_caption**

This is a caption string resource ID for **TYPE\_FILEOPENBUTTON** or **TYPE\_FILESAVEBUTTON** open/save file dialogs.

## **p\_init\_file**

This establishes the initial filename for open/save file dlgs. Use a direct string for the argument, not a resource ID. The filename can be changed at runtime; do this by setting the `init_file` member of the `ParamDef` for the parameter, e.g.: **pbdesc->GetParamDef(file\_param).init\_file = new\_file\_name;**

## **p\_file\_types**

This is used by open/save file dialogs. The argument is a string resource ID. This string sets up the file type drop-down in the open/save dialog. It is in the following form:

**"<description1>|<pattern1>|<description2>|<pattern2>|...|"**

In other words, it is a sequence of file type descriptions and file type patterns each separated by a '|' vertical bar and terminated by a '|' vertical bar. For example:

**"Data(\*.dat)|\*.dat|Excel(\*.csv)|\*.csv|All|\*.\*|"**

specifies 3 types in the file type dropdown, the first reading "Data(\*.dat)" and matching \*.dat and the second reading "Excel(\*.csv)" and matching \*.csv and the third reading "All" and matching any file.

## **end**

Signals the end of the `<required_param_specs>` entry.

## Structure PB2Value

See Also: [Class IParamBlock2](#), [Class PBAccessor](#), [Class PBBitmap](#), [Class ReferenceTarget](#), [Class Control](#).

### Description:

This structure is available in release 3.0 and later only.

This structure holds the value in a ParamBlock2 or PBAccessor.

### typedef struct

{

**union**

{

**int i;**

This is used by: **TYPE\_INT**, **TYPE\_BOOL**.

**float f;**

This is used by: **TYPE\_FLOAT**, **TYPE\_ANGLE**,  
**TYPE\_PCNT\_FRAC**, **TYPE\_COLOR\_CHANNEL**.

**Point3\* p;**

This is used by: **TYPE\_POINT3**, **TYPE\_RGBA**.

**TimeValue t;**

This is used by **TYPE\_SPINNER** when the EditSpinnerType is  
**EDITTYPE\_TIME**.

**TCHAR\* s;**

This is used by **TYPE\_EDITBOX** or **TYPE\_STRING**.

**PBBitmap\* bm;**

This is used by **TYPE\_BITMAP**.

**ReferenceTarget\* r;**

A generic reference target pointer (**Mtl\***, **Texmap\***, **INode\***).

**Matrix3\* m;**

This is used by **TYPE\_MATRIX3**. This member is available in release  
4.0 and later only.

**Control\* control;**

This value replaces the **i,f,p** or **t** values if they are actually animated (and thus have a controller assigned).

**};**

**BYTE flags;**

These flags are for internal use only, do not alter them.

**} PB2Value;**

## Class ToolImageItem

See Also: [Class ToolItem](#).

```
class ToolImageItem : public ToolItem
```

### Description:

This class allows a developer to use an image in the toolbar. This is used internally as part of the object snap code. All methods of this class are implemented by the system.

### Methods:

### Prototype:

```
ToolImageItem(int w,int h,int k,int id, int  
y=CENTER_TOOL_VERTICALLY,DWORD hID=0);
```

### Remarks:

Constructor. The data members are initialized to the values passed. The type parameter of ToolItem is set to CTB\_IMAGE.

## List of Tool Item Types

See Also: [Class ToolItem](#).

One of the following values:

### **CTB\_PUSHBUTTON**

A push button. These buttons pop back out as soon as they are released by the user.

### **CTB\_CHECKBUTTON**

A check button. These buttons stay pressed in until the user presses them again.

### **CTB\_MACROBUTTON**

This option is available in release 3.0 and later only.

A macro button. These may contain icons or text.

### **CTB\_SEPARATOR**

A separator or spacer. This is used to separate groups of items in the toolbar.

### **CTB\_STATUS**

A status control. These may be used to display text.

### **CTB\_IMAGE**

An image control.

### **CTB\_OTHER**

A user defined tool type.

## Class MNFaceClusters

See Also: [Class MNTempData](#), [Class MNMesh](#)

class MNFaceClusters

### Description:

This class is available in release 4.0 and later only.

This class may be used for grouping faces in an **MNMesh** into clusters for applying transformations. Depending on the constructor used, it may group faces into clusters based on minimal angles between faces, on face selections, or on both. The class contains a list of face "clusters" for a given mesh. A typical application would be in Editable Poly, where the user has selected two separate groups of faces on different parts of the mesh and wants to extrude them both, or rotate both around their local centers. Each "cluster" is a contiguous group of selected faces. This class is only defined in relation to some **MNMesh**.

For convenient caching, it is recommended that you use this class through the **MNTempData** class.

All methods of this class are implemented by the system.

### Data Members:

public:

**Tab<int> clust;**

The cluster number, one for each face. Note that non-selected faces have UNDEFINED for their id.

**int count;**

The total number of clusters in the MNMesh.

### Methods:

public:

### Prototype:

**MNFaceClusters (MNMesh &mesh, DWORD clusterFlags);**

### Remarks:

Constructor.

This method will create face cluster lists based on the specified MNMesh.

Each contiguous group of selected faces is grouped into a cluster.

**Parameters:**

**MNMesh &mesh**

The mesh these clusters are based on.

**DWORD clusterFlags**

The face flags to cluster the faces by.

For instance, if this value was set to **MN\_SEL**, then faces would be clustered by their selection.

**Prototype:**

**MNFaceClusters (MNMesh & mesh, float angle, DWORD clusterFlags);**

**Remarks:**

This method is available in release 4.0 and later only.

This method will create face cluster lists based on the specified MNMesh. Cluster boundaries will be determined by the angle between faces and optionally by the face flags.

**Parameters:**

**MNMesh &mesh**

The mesh these clusters are based on.

**float angle**

The minimum edge angle (in radians) used to define a separation between clusters.

**DWORD clusterFlags**

The face flags to cluster the faces by.

For instance, if this value was set to **MN\_SEL**, then faces would be clustered by their selection. If this value is set to 0, then the clusters are based only on edge angles.

**Prototype:**

**int operator[](int i);**

**Remarks:**

Index operator for accessing cluster data.

**Default Implementation:**

```
{ return clust[i]; }
```

**Prototype:**

```
void MakeVertCluster(MNMesh &mesh, Tab<int> & vclust);
```

**Remarks:**

This method will create a table indicating which face cluster each vertex in the mesh is in.

**Parameters:****MNMesh &mesh**

The mesh this face cluster is based on.

**Tab<int> & vclust**

The table of vertex clusters. This is set to size **mesh.VNum()**. Values of UNDEFINED (0xffffffff) in the table indicate that a vertex is not in any cluster. If a vertex is in two clusters (because it's a point where corners of two clusters touch), the higher-indexed face's cluster is dominant.

**Prototype:**

```
void GetNormalsCenters (MNMesh &mesh, Tab<Point3> & norm,  
Tab<Point3> & ctr);
```

**Remarks:**

Computes average normals and centers for each of the face clusters.

**Parameters:****MNMesh &mesh**

The mesh this face cluster is based on.

**Tab<Point3> & norm**

The tables where the normals should be put. Each of these tables has its size set to the number of clusters, and is indexed by cluster.

**Tab<Point3> & ctr**

The tables where the centers should be put. Each of these tables has its size set to the number of clusters, and is indexed by cluster.

**Prototype:**

```
void GetBorder (MNMesh &mesh, int clustID, Tab<int> &  
cbord);
```

**Remarks:**

This method will find the edge list that borders this cluster. This edge list is a set of closed loops of edges, which may be empty. For instance, if the mesh is a sphere, and all the faces are in the cluster, there are no border edges for the cluster. But if one horizontal row of faces, such as the faces just above the equator, are in the cluster, then the edges above those faces form one loop, while the edges below form another.

**Parameters:**

**MNMesh &mesh**

The mesh this face cluster is based on.

**int clustID**

The ID of the cluster we want to get the border of.

**Tab<int> &cbord**

The table for putting the border output. This table is set up as follows: each border loop is represented by a series of edge indices, followed by a -1 to indicate a separation between loops. So a result of size 10 with data 1, 4, 6, 9, -1, 2, 10, 15, 14, -1, would indicate two border loops consisting of four edges each. The order of the edges in the loops is chosen so that as you look from outside the mesh and follow the path of the edges, the face cluster will always be on the left.

**Prototype:**

```
void GetOutlineVectors (MNMesh & m, Tab<Point3> &cnorms,  
Tab<Point3> &odir);
```

**Remarks:**

This method will retrieve the "outline" direction for the border of the cluster. This is the direction used in the "Outline" feature in Editable Poly face level, as well as in the Bevel command mode.

**Parameters:**

**MNMesh &m**

The mesh this face cluster is based on.

### **Tab<Point3> & cnorms**

The cluster normals, as computed in the GetNormalsCenters method. (This data is input, not output.)

### **Tab<Point3> & odir**

This is where the outline vectors are stored. This table is set to size **mesh.VNum()**, and stores one direction vector for each vertex. Most direction vectors are usually zero, since most vertices are not on the cluster's border. All vectors are scaled so that moving along them moves the cluster's border edges by one unit. (For instance, the length of a vector at a right angle between two border edges would be **sqrt(2)**, so that each edge can move by 1 unit "out" from the cluster.)

## Class MNEdgeClusters

See Also: [Class MNTempData](#), [Class MNMesh](#)

class MNEdgeClusters

### Description:

This class is available in release 4.0 and later only.

This class represents a list of edge "clusters" for a given **MNMesh**. A typical application would be in Editable Poly, where the user has selected a two separate groups of edges on different parts of the mesh and wants to rotate both around their local centers. Each "cluster" is a contiguous group of selected edges (ie they all touch each other). This class is only defined in relation to some **MNMesh**.

For convenient caching, it is recommended that you use this class through the **MNTempData** class.

### Data Members:

public:

**Tab<int> clust;**

The cluster IDs of all the edges – this table has size **MNMesh::nume**. **clust[i]** is UNDEFINED if edge i is not in any cluster.

**int count;**

The total number of clusters.

### Methods:

public:

### Prototype:

**MNEdgeClusters (MNMesh &mesh, DWORD clusterFlags);**

### Remarks:

Constructor.

### Parameters:

**MNMesh &m**

The mesh these clusters are based on.

**DWORD clusterFlags**

The edge flags to cluster the edges by.

For instance, if this value was set to **MN\_SEL**, then edges would be clustered by their selection.

**Prototype:**

```
int operator[](int i);
```

**Remarks:**

Index operator to access cluster data.

**Default Implementation:**

```
{ return clust[i]; }
```

**Prototype:**

```
void MakeVertCluster (MNMesh &mesh, Tab<int> & vclust);
```

**Remarks:**

This method will create a list of cluster IDs for vertices.

**Parameters:**

**MNMesh &m**

The mesh associated with these **MNEdgeClusters**.

**Tab<int> & vclust**

This is where the output goes: **vclust** is set to size **MNMesh::numv**, and the value of each entry in this table tells which cluster the vertex has been assigned to, based on the edges using it. If vertex "v" is not in any clusters (i.e. none of the edges that use it are in any clusters), **vclust[v]** is UNDEFINED.

**Prototype:**

```
void GetNormalsCenters (MNMesh &mesh, Tab<Point3> & norm,  
Tab<Point3> & ctr);
```

**Remarks:**

This method extracts normal and center information for each of the edge clusters.

**Parameters:**

## **MNMesh & m**

The mesh associated with these **MNEdgeClusters**.

## **Tab<Point3> & norm**

This table has its size set to the number of clusters in the cluster list. Normals are computed as the normalized average of the normal vectors of all edges in the cluster.

## **Tab<Point3> & ctr**

This table has its size set to the number of clusters in the cluster list. Centers are the average location of the edge centers -- thus a point on three edges in the same cluster has more weight than a point on only one edge in the cluster.

## Class MNFaceElement

See Also: [Class MNTempData](#), [Class MNMesh](#)

class MNFaceElement

### Description:

This class is available in release 4.0 and later only.

This class is used to assist in the process of sorting **MNMesh** faces into separate elements.

For convenient caching, it is recommended that you use this class through the **MNTempData** class.

### Data Members:

public:

**Tab<int> elem;**

The list indicating which element each face is in. The size is the number of faces in the associated MNMesh.

**int count;**

The total number of elements in the associated MNMesh.

### Methods:

public:

### Prototype:

**MNFaceElement (MNMesh &mesh);**

### Remarks:

Constructor.

This method will create an element list based on the specified MNMesh.

### Parameters:

**MNMesh &mesh**

A reference to the MNMesh for which to create the element list.

### Prototype:

**int operator[] (int i);**

**Remarks:**

Index operator for accessing elements.

**Default Implementation:**

```
{ return elem[i]; }
```

## Class PatchSubHitRec

See Also: [Class PatchMesh](#).

class PatchSubHitRec

### Description:

This class represents a single hit record for sub-patch level hit testing. All methods of this class are implemented by the system.

### Data Members:

public:

#### **DWORD dist;**

The distance of the hit. If the user is in wireframe mode, this is the distance in pixels to the item that was hit. If the user is in shaded mode, this is the Z depth distance. Smaller numbers indicate a closer hit.

#### **PatchMesh \*patch;**

The PatchMesh associated with this sub-patch hit.

#### **int index;**

The index of the sub-object component. For example, if vertices were being hit tested, this would be the index into the vertex table.

#### **int type;**

The type of the hit. One of the following values:

**PATCH\_HIT\_PATCH**  
**PATCH\_HIT\_EDGE**  
**PATCH\_HIT\_VERTEX**  
**PATCH\_HIT\_VECTOR**  
**PATCH\_HIT\_INTERIOR**

### Methods:

### Prototype:

**PatchSubHitRec(DWORD dist, PatchMesh \*patch, int index,  
int type, PatchSubHitRec \*next);**

### Remarks:

Constructor. The data members are set to the values passed.

**Prototype:**

**PatchSubHitRec \*Next();**

**Remarks:**

Returns the next sub hit record.

## Class IObject

See Also: [Class BaseInterfaceServer](#), [Class FPInterface](#), [Class FPInterfaceDesc](#), [Function Publishing](#), [Class InterfaceServer](#),

```
class IObject : public BaseInterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

This is the base class used to publish functions from those objects not derived from Animatable. A developer inherits from this class and implements the methods of this class to provide information about the interfaces published by the class.

There is a corresponding **ParamType2** type code, **TYPE\_IOBJECT**, that allows instances of these classes to be passed and returned in FPInterface methods. This provides a simple form of user-defined type, in the sense that these instance collections are passed as interfaces rather than pointers.

MAXScript has wrapper value classes for IObjects and so this mechanism provides a light-weight alternative to the MAXScript SDK facilities for adding new wrapper value classes to the scripter.

MAXScript also calls the **AcquireInterface()** and **ReleaseInterface()** methods on IObjects as it creates and collects these wrappers, so that IObject objects can keep track of MAXScript's extant references to them.

### Methods:

public:

### Prototype:

```
virtual TCHAR* GetIObjectName() = 0;
```

### Remarks:

Returns the object/class name.

### Default Implementation:

```
{ return _T(""); }
```

### Prototype:

```
virtual int NumInterfaces() const = 0;
```

**Remarks:**

Returns the number of interfaces published by this object.

**Default Implementation:**

```
{ return 0; }
```

**Prototype:**

```
virtual BaseInterface *GetInterfaceAt(int i) const = 0;
```

**Remarks:**

Returns a pointer to the 'i-th' interface.

**Parameters:**

**int i**

The zero based index of the interface to return.

**Default Implementation:**

```
{ return NULL; }
```

**Prototype:**

```
virtual BaseInterface* GetInterface(Interface_ID id) = 0;
```

**Remarks:**

Returns a pointer to the interface whose ID is specified.

**Parameters:**

**Interface\_ID id**

The ID of the interface to return.

**Default Implementation:**

```
{ return NULL; }
```

**Prototype:**

```
virtual void AcquireIObject();
```

**Remarks:**

This method is called when MAXScript makes a reference to this object. This is part of the IObject reference management and can be implemented by dynamically allocated IObjects for ref-count based lifetime control.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void ReleaseIObject();
```

**Remarks:**

This method is called when MAXScript deletes a reference to this object. This is part of the IObject reference management and can be implemented by dynamically allocated IObjects for ref-count based lifetime control.

**Default Implementation:**

```
{ }
```

**Prototype:**

```
virtual void DeleteIObject();
```

**Remarks:**

This method is the virtual destructor for the IObject.

**Default Implementation:**

```
{ }
```

## Class IIRenderMgrSelector

See Also: [Class InterfaceServer](#), [Class IInteractiveRender](#) , [Class InterfaceServer](#), [Class INode](#)

```
class IIRenderMgrSelector : public InterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

This class represents the abstract (interface) for an interactive rendering manager selector to assist in the process of determining the nodes that are selected by the interactive rendering manager.

### Methods:

public:

### Prototype:

```
virtual BOOL IsSelected(INode* pINode);
```

### Remarks:

This method returns whether the specified node is selected. By default all nodes are selected and should therefore be shaded.

### Parameters:

**INode\* pINode**

The node to test.

### Default Implementation:

```
{ return TRUE; }
```

## Class InterfaceNotifyCallback

See Also: [Class BaseInterface](#), [Function Publishing System](#).

class InterfaceNotifyCallback

### Description:

This class is available in release 4.0 and later only.

This class provides a callback mechanism which can be registered with an interface on Acquire() so that it can be notified when the interface goes away as the server controls the lifetime.

### Methods:

public:

### Prototype:

**virtual void InterfaceDeleted(BaseInterface\* bi);**

### Remarks:

This method gets called to notify the server is deleting the interface.

### Parameters:

**BaseInterface\* bi**

A pointer to the appropriate BaseInterface.

### Default Implementation:

{ }

### Prototype:

**virtual BaseInterface\* GetInterface(Interface\_ID id);**

### Remarks:

Returns a pointer to the interface whose ID is specified, for future notification extensions.

### Parameters:

**Interface\_ID id**

The ID of the interface to return.

### Return Value:

```
{ return NULL; }
```

# Class IMenuItemElement

See Also: [Class IMenuItem](#), [Class IPoint2](#), [Class Box2](#)

class IMenuItemElement

## Description:

This class is available in release 4.0 and later only.

This abstract class represents an interface for any menu element. Methods that are marked as internal should not be used.

## Methods:

public:

## Prototype:

```
virtual void SetOrigin(const IPoint2& origin, OriginLocation location) = 0;
```

## Remarks:

This method is used internally.

This method allows you to set the element's origin and origin location.

## Parameters:

**IPoint2& origin**

The x, y coordinates of the origin.

**OriginLocation location**

The origin location, either one of; **UPPER\_LEFT**, **LOWER\_LEFT**, **LOWER\_RIGHT**, or **UPPER\_RIGHT**.

## Prototype:

```
virtual const IPoint2& GetOrigin() const = 0;
```

## Remarks:

This method is used internally.

This method returns the x, y coordinates of the element's origin.

## Prototype:

**virtual void SetVisible(bool visible) = 0;**

**Remarks:**

This method allows you to set the visibility of the element.

**Parameters:**

**bool visible**

TRUE for visible, FALSE for invisible.

**Prototype:**

**virtual bool GetVisible() = 0;**

**Remarks:**

This method returns the visibility of the element. TRUE if the element is visible, otherwise FALSE.

**Prototype:**

**virtual void SetTitle(const TCHAR \*customTitle) = 0;**

**Remarks:**

This method allows you to set the item's title.

**Parameters:**

**TCHAR \*customTitle**

The title string.

**Prototype:**

**virtual const TSTR& GetTitle() = 0;**

**Remarks:**

This method returns the item's title string.

**Prototype:**

**virtual void SetEnabled(bool enabled) = 0;**

**Remarks:**

This method allows you to enable and disable the element.

**Parameters:**

**bool enabled**

TRUE to enable, FALSE to disable.

**Prototype:**

**virtual bool GetEnabled() = 0;**

**Remarks:**

This method returns the state of the element. TRUE if it's enabled, FALSE if it's disabled.

**Prototype:**

**virtual const IPoint2& GetSize() = 0;**

**Remarks:**

This method is used internally.

This method returns the element's size in the menu's coordinate space.

**Prototype:**

**virtual const Box2& GetRect() = 0;**

**Remarks:**

This method is used internally.

This method returns the element's rectangle size in the menu's coordinate space.

**Prototype:**

**virtual bool IsInRect(const IPoint2& point) = 0;**

**Remarks:**

This method is used internally.

This method determines if a specific point is inside the element's rectangle.

**Parameters:**

**IPoint2& point**

The point to test.

**Return Value:**

TRUE if the point is inside the rectangle, otherwise FALSE.

## Class IMenuItem

See Also: [Class IMenuItemElement](#), [Class IMenuItemGlobalContext](#), [Class IMenuItemLocalContext](#), [Class ActionItem](#), [Class IMenuItem](#), [Class MaxIcon](#) , [Class IQuadMenuSettings](#)

class IMenuItem : public IMenuItemElement, public FPMixinInterface

### Description:

This class is available in release 4.0 and later only.

This abstract class represents an interface for a menu item. Methods that are marked as internal should not be used.

### Methods:

public:

### Prototype:

```
virtual void SetMenuItemLocalContext(IMenuItemLocalContext*  
pMenuItemLocalContext) = 0;
```

### Remarks:

This method is used internally.

This method allows you to set a new (local) context for the menu, invalidating the menu's cache.

### Parameters:

**IMenuItemLocalContext\* pMenuItemLocalContext**

A pointer to the new local context object you wish to set.

### Prototype:

```
virtual ActionMode GetActionMode() const = 0;
```

### Remarks:

This method returns the current action mode. When item selection instigates an action item, calls functions, or displays a submenu the action mode changes to indicate the exact state the system is in.

### Return Value:

Either of the following; **AM\_INACTIVE**, **AM\_SEPARATOR**,

**AM\_ITEM, AM\_FN, AM\_SUBMENU, AM\_ITEM\_SUBMENU**

**Prototype:**

**virtual bool ExecuteAction() const = 0;**

**Remarks:**

This method will execute the current action.

**Return Value:**

TRUE if the action was executed successfully, otherwise FALSE.

**Prototype:**

**virtual void ActAsSeparator() = 0;**

**Remarks:**

This method allows you to make the item act as an item separator.

**Prototype:**

**virtual bool IsSeparator() const = 0;**

**Remarks:**

This method determines if the item is acting as a separator (TRUE) or not (FALSE).

**Prototype:**

**virtual void SetActionItem(ActionItem\* pActionItem) = 0;**

**Remarks:**

This method allows you to set the current action item. Note that **GetActionItem()** returns NULL if the ActionMode is not **AM\_ITEM**.

**Parameters:**

**ActionItem\* pActionItem**

The action item you wish to set.

**Prototype:**

**virtual ActionItem\* GetActionItem() const = 0;**

**Remarks:**

This method returns a pointer to the current action item, or NULL if the ActionMode is not **AM\_ITEM**.

**Prototype:**

```
virtual void SetActionFn(ActionFn actionFn) = 0;
```

**Remarks:**

This method allows you to set the current action function. Note that **GetActionFn()** returns NULL if the ActionMode is not **AM\_FN**. Also note: **typedef void (\* ActionFn)(void);**

**Parameters:**

**ActionFn actionFn**

The action function you wish to set.

**Prototype:**

```
virtual const ActionFn GetActionFn() const = 0;
```

**Remarks:**

This method returns the current action function, or NULL if the ActionMode is not **AM\_FN**.

Note: **typedef void (\* ActionFn)(void);**

**Prototype:**

```
virtual void SetSubMenu(IMenu* menu) = 0;
```

**Remarks:**

This method allows you to set the submenu. Note that **GetSubMenu()** returns NULL if the ActionMode is not **AM\_SUBMENU**.

**Parameters:**

**IMenu\* menu**

The submenu you wish to set.

**Prototype:**

```
virtual IMenu* GetSubMenu() = 0;
```

**Remarks:**

This method returns a pointer to the submenu, or NULL if the ActionMode is not **AM\_SUBMENU**.

**Prototype:**

```
virtual void SetPreDisplayCB(PreDisplayCB preDisplayCB) = 0;
```

**Remarks:**

This method allows you to set the pre-display callback.

Note: **typedef void (\* PreDisplayCB)(IMenuItem& menuItem);**

**Parameters:**

**PreDisplayCB preDisplayCB**

The callback to set.

**Prototype:**

```
virtual const PreDisplayCB GetPreDisplayCB() const = 0;
```

**Remarks:**

This method returns the pre-display callback.

**Prototype:**

```
virtual void Display(bool leftToRight) = 0;
```

**Remarks:**

This method is used internally.

**Prototype:**

```
virtual TCHAR GetAccelerator() = 0;
```

**Remarks:**

This method is used internally.

This method returns the item's accelerator, or 0 if none is assigned.

**Prototype:**

```
virtual void SetIcon(MaxIcon* pMaxIcon) = 0;
```

**Remarks:**

This method allows you to set the item's icon.

**Parameters:**

**MaxIcon\* pMaxIcon**

A pointer to a MaxIcon to set.

**Prototype:**

**virtual const MaxIcon\* GetIcon() const = 0;**

**Remarks:**

This method returns a pointer to the item's icon.

**Prototype:**

**virtual void SetChecked(bool checked) = 0;**

**Remarks:**

This method allows you to set the checked state of the item.

**Parameters:**

**bool checked**

TRUE to check the item, FALSE to uncheck the item.

**Prototype:**

**virtual bool GetChecked() = 0;**

**Remarks:**

This method returns TRUE if the item is checked or FALSE if it is unchecked.

**Prototype:**

**virtual void SetHighlighted(bool highlighted) = 0;**

**Remarks:**

This method allows you to set the highlighted state of the item.

**Parameters:**

**bool highlighted**

TRUE to highlight the item, FALSE if you do not want to highlight the item.

**Prototype:**

**virtual bool GetHighlighted() const = 0;**

**Remarks:**

This method returns TRUE if the item is highlighted, otherwise FALSE.

**Prototype:**

**virtual void SetUseCustomTitle(bool useCustomTitle) = 0;**

**Remarks:**

This method allows you to tell the item it should use a custom title, which is set through **SetTitle()**.

**Parameters:**

**bool useCustomTitle**

TRUE to use a custom title, FALSE to use the default.

**Prototype:**

**virtual bool GetUseCustomTitle() const = 0;**

**Remarks:**

This method returns TRUE if the item is using a custom title or FALSE if it's using a default.

**Prototype:**

**virtual void SetDisplayFlat(bool displayFlat) = 0;**

**Remarks:**

This method allows you to set whether the submenu-item should be displayed 'flat'.

**Parameters:**

**bool displayFlat**

TRUE to set to flat, otherwise FALSE.

**Prototype:**

**virtual bool GetDisplayFlat() const = 0;**

**Remarks:**

This method returns TRUE if the submenu-item should be displayed 'flat', otherwise FALSE.

**Prototype:**

**virtual void PostMenuInteraction() = 0;**

**Remarks:**

This method is used internally.

This method is called after the user/menu interaction is done after which it will clear the caches for ActionItem handler values.

**The following functions are not part of the class but are available for use.**

**Function:**

**IMenuItem \* GetIMenuItem();**

**Remarks:**

This method will return a pointer to the IMenuItem.

**Prototype:**

**void ReleaseIMenuItem(IMenuItem \*);**

**Remarks:**

This method will release the specified IMenuItem.

**Parameters:**

**IMenuItem \***

A pointer to the IMenuItem you wish to release.

## Class IMenuGlobalContext

See Also: [Class IMenuItem](#), [Class IMenuSettings](#), [Class IMenuTimer](#), [Class ItemID](#), [Class IPoint2](#)

class IMenuGlobalContext

### Description:

This class is available in release 4.0 and later only.

This abstract class represents an global context interface for all menus that might be displayed during a user's menuing action and is used internally. Methods that are marked as internal should not be used.

### Methods:

public:

### Prototype:

```
virtual void SetIMenuSettings(IMenuSettings* pIMenuSettings) = 0;
```

### Remarks:

This method is used internally.

This method allows you to set the menu settings associated with this global context.

### Parameters:

**IMenuSettings\* pIMenuSettings**

A pointer to a menu settings object.

### Prototype:

```
virtual IMenuSettings* GetIMenuSettings() const = 0;
```

### Remarks:

This method is used internally.

This method returns a pointer to the menu settings associated with this global context.

### Prototype:

**virtual void UpdateCursorPosition() = 0;**

**Remarks:**

This method is used internally.

This method updates the cursor position from Win32.

**Prototype:**

**virtual const IPoint2& GetCursorPosition() const = 0;**

**Remarks:**

This method is used internally.

This method returns the cached cursor position.

**Return Value:**

The x and y coordinates of the cursor.

**Prototype:**

**virtual const IPoint2& GetInitialCursorPosition() const = 0;**

**Remarks:**

This method is used internally.

This method returns the cached initial cursor position (i.e. the coordinate where the user clicked).

**Return Value:**

The x and y coordinates of the cached initial cursor position.

**Prototype:**

**virtual void SetInitialCursorPosition(IPoint2& initPos) = 0;**

**Remarks:**

This method is used internally.

This method allows you to set the cached initial cursor position (i.e. the coordinate where the user clicked).

**Parameters:**

**IPoint2& initPos**

The x and y coordinate of the cursor position.

**Prototype:**

**virtual void SetIMenuTimer(IMenuTimer\* pIMenuTimer) = 0;**

**Remarks:**

This method is used internally.

This method allows you to set a global timer for the menu's global context.

**Parameters:**

**IMenuTimer\* pIMenuTimer**

A pointer to the menu timer object,

**Prototype:**

**virtual IMenuTimer\* GetIMenuTimer() const = 0;**

**Remarks:**

This method is used internally.

This method returns a pointer to the global timer for the menu's global context.

**Prototype:**

**virtual void SetHDisplayWnd(HWND hDisplayWnd) = 0;**

**Remarks:**

This method is used internally.

This method allows you to set the handle to the display window.

**Parameters:**

**HWND hDisplayWnd**

The handle to the display window.

**Prototype:**

**virtual HWND GetHDisplayWnd() const = 0;**

**Remarks:**

This method is used internally.

This method returns the handle to the display window.

**Prototype:**

**virtual void SetHMessageWnd(HWND hDisplayWnd) = 0;**

**Remarks:**

This method is used internally.

This method allows you to set the handle to the message window

**Parameters:**

**HWND hDisplayWnd**

The handle to the message window.

**Prototype:**

**virtual HWND GetHMessageWnd() const = 0;**

**Remarks:**

This method is used internally.

This method returns the handle to the message window.

**Prototype:**

**virtual void SetHDisplayDC(HDC hDisplayDC) = 0;**

**Remarks:**

This method is used internally.

This method allows you to set a handle to the display device context.

**Parameters:**

**HDC hDisplayDC**

The handle to the display device context.

**Prototype:**

**virtual HDC GetHDisplayDC() const = 0;**

**Remarks:**

This method is used internally.

This method returns the handle to the display device context.

**Prototype:**

**virtual void SetTitleHFont(HFONT hTitleFont) = 0;**

**Remarks:**

This method is used internally.

This method allows you to set the handle to the title font.

**Parameters:**

**HFONT hTitleFont**

The handle to the title font.

**Prototype:**

**virtual HFONT GetTitleHFont() const = 0;**

**Remarks:**

This method is used internally.

This method returns the handle to the title font.

**Prototype:**

**virtual void SetItemHFont(HFONT hItemFont) = 0;**

**Remarks:**

This method is used internally.

This method allows you to set the handle to the item font.

**Parameters:**

**HFONT hItemFont**

The handle to the item font.

**Prototype:**

**virtual HFONT GetItemHFont() const = 0;**

**Remarks:**

This method is used internally.

This method returns the handle to the item font.

**Prototype:**

**virtual void SetAcceleratorHFont(HFONT hItemFont) = 0;**

**Remarks:**

This method is used internally.

This method allows you to set the handle to the accelerator font.

**Parameters:**

**HFONT hItemFont**

The handle to the accelerator font.

**Prototype:**

**virtual HFONT GetAcceleratorHFont() const = 0;**

**Remarks:**

This method is used internally.

This method returns the handle to the accelerator font.

**Prototype:**

**virtual void SetUniformItemSize(const IPoint2& itemSize) = 0;**

**Remarks:**

This method is used internally.

This method allows you to set the menu's maximum uniform item size.

**Parameters:**

**IPoint2& itemSize**

The size rectangle.

**Prototype:**

**virtual const IPoint2& GetUniformItemSize() const = 0;**

**Remarks:**

This method is used internally.

This method returns the menu's maximum uniform item size as a rectangle.

**Prototype:**

**virtual int GetTitleBarHeight() = 0;**

**Remarks:**

This method is used internally.

This method returns the height of the title bar, not counting the border.

**Prototype:**

**virtual ItemID& GetCurrentItemID() = 0;**

**Remarks:**

This method is used internally.

This method returns the ItemID of the menu/item triplet that's currently being traversed.

**Prototype:**

**virtual ItemID& GetSelectedItemID() = 0;**

**Remarks:**

This method is used internally.

This method returns the ItemID of the menu/item triplet that's currently selected.

**Prototype:**

**virtual bool HasSelection() = 0;**

**Remarks:**

This method is used internally.

This method will determine selection is available and will return TRUE if selection is available or FALSE if it is not.

**Prototype:**

**virtual bool IsCurrentMenuSelected() = 0;;**

**Remarks:**

This method is used internally.

This method will determine the selection status of the current menu and will return TRUE if the current menu is selected or FALSE if it is not.

**Prototype:**

**virtual bool IsCurrentItemSelected() = 0;**

**Remarks:**

This method is used internally.

This method will determine the selection status of the current menu and item and will return TRUE if the current menu and item are selected or FALSE if they are not.

**Prototype:**

**virtual void SelectCurrentItem() = 0;**

**Remarks:**

This method is used internally.

This method selects the current item.

## Class IMenuLocalContext

See Also: [Class IMenuItem](#), [Class IMenuColors](#), [Class IPoint2](#)

class IMenuLocalContext

### Description:

This class is available in release 4.0 and later only.

This abstract class represents a local context interface for a specific menu and is used internally. Methods that are marked as internal should not be used.

### Methods:

public:

### Prototype:

**virtual void SetHDrawDC(HDC hDrawDC) = 0;**

### Remarks:

This method is used internally.

This method allows you to set the handle to the drawing device context.

### Parameters:

**HDC hDrawDC**

The handle to the drawing device context.

### Prototype:

**virtual HDC GetHDrawDC() const = 0;**

### Remarks:

This method is used internally.

This method returns the handle to the drawing device context.

### Prototype:

**virtual void SetLocalCursorPosition(const IPoint2& localCursorPos) = 0;**

### Remarks:

This method is used internally.

This method allows you to set the cursor position in the local coordinate system of the menu.

**Parameters:**

**const IPoint2& localCursorPos**

The cursor position coordinates.

**Prototype:**

**virtual const IPoint2& GetLocalCursorPosition() const = 0;**

**Remarks:**

This method is used internally.

This method returns the cursor position in the local coordinate system of the menu.

**Prototype:**

**virtual void SetMenuItemWidth(int menuItemWidth) = 0;**

**Remarks:**

This method is used internally.

This method allows you to set the menu's current width.

**Parameters:**

**int menuItemWidth**

The menu width.

**Prototype:**

**virtual int GetMenuItemWidth() const = 0;**

**Remarks:**

This method is used internally.

This method returns the menu's current width.

**Prototype:**

**virtual void SetLevel(int level) = 0;**

**Remarks:**

This method is used internally.

This method allows you to set the menu's current level. Submenus are indexed by a level > 0.

**Parameters:**

**int level**

The current level to set.

**Prototype:**

**virtual int GetLevel() const = 0;**

**Remarks:**

This method is used internally.

This method returns the menu's current level.

**Prototype:**

**virtual void SetLastExecutedItemPath(Tab<IMenuItem \*>  
\*pExecutedItemPath) = 0;**

**Remarks:**

This method is used internally.

This method allows you to set the menu's last executed item path. The item path is a table of IMenuItem entries, listing the selected item at each menu level.

**Parameters:**

**Tab<IMenuItem \*> \*pExecutedItemPath**

A pointer to the item path.

**Prototype:**

**virtual Tab<IMenuItem \*> \*GetLastExecutedItemPath() = 0;**

**Remarks:**

This method is used internally.

This method returns the menu's last executed item path. The item path is a table of IMenuItem entries, listing the selected item at each menu level.

**Prototype:**

**virtual void SetMenuColors(const MenuColors \*pMenuColors) = 0;**

**Remarks:**

This method is used internally.

This method allows you to set the menu's current colors.

**Parameters:**

**MenuColors \*pMenuColors**

A pointer to the menu colors.

**Prototype:**

**virtual const MenuColors \*GetMenuColors() const = 0;**

**Remarks:**

This method is used internally.

This method returns a pointer to the menu's current colors.

**Prototype:**

**virtual void SetIMenuGlobalContext(IMenuGlobalContext\* pIMenuGlobalContext, int level, Tab<IMenuItem \*> \*pExecutedItemPath, const MenuColors \*pMenuColors) = 0;**

**Remarks:**

This method is used internally.

This method allows you to set the global menu context.

**Parameters:**

**IMenuGlobalContext\* pIMenuGlobalContext**

A pointer to the menu's global context object.

**int level**

The menu level.

**Tab<IMenuItem \*> \*pExecutedItemPath**

A pointer to the item path. The item path is a table of IMenuItem entries, listing the selected item at each menu level.

**MenuColors \*pMenuColors**

A pointer to the menu colors.

**Prototype:**

```
virtual IMenuGlobalContext* GetIMenuGlobalContext() const =  
0;
```

**Remarks:**

This method is used internally.

This method returns a pointer to the menu's global context object.

## Structure MenuEvent

See Also: [Class IMenu](#), [Class Interface](#).

Structure MenuEvent

### Description:

This structure is available in release 4.0 and later only.

This structure is used internally.

**struct MenuEvent**

```
{  
    Event mEvent;  
        EVENT_BEGIN_TRACK  
        EVENT_CURSOR_DOWN  
        EVENT_RIGHT_CURSOR_DOWN  
        EVENT_CURSOR_MOVED  
        EVENT_CURSOR_UP  
        EVENT_END_TRACK  
        EVENT_KEY  
        EVENT_RIGHT_CURSOR_UP  
    unsigned int mEventParam;  
        EP_NULL  
        EP_SHOW_SUBMENU  
        EP_HIDE_SUBMENU  
};
```

## Class IMenuContext

See Also: [Class InterfaceServer](#), [Class IMenuBarContext](#), [Class Interface](#).

class IMenuContext : public InterfaceServer

### Description:

This class is available in release 4.0 and later only.

This class represents the interface to the various menu types such as MenuBar, QuadMenus, and right-click Popup Menus. The class provides the fundamental basis for the ID, Type, and Name.

### Methods:

public:

### Prototype:

**virtual MenuContextId GetId() = 0;**

### Remarks:

This method returns the Menu Context ID.

### Prototype:

**virtual MenuContextType GetType() = 0;**

### Remarks:

This method returns the Menu Context Type. One of the following values:

**kMenuContextMenuBar**

The context for the main menu bar.

**kMenuContextQuadMenu**

The context for the quad menu.

**kMenuContextPopupMenu**

The context for the Ctrl-right click popup menu.

### Prototype:

**virtual TSTR& GetName() = 0;**

### Remarks:

This method returns the name of the Menu Context.

## Class DropType

See Also: [Class DropClipFormat](#), [Class FileDropType](#), [Class DropScriptDropType](#) , [List of DropTypes](#)

```
class DropType : public IDropSource, public IDataObject
```

### Description:

This class is available in release 4.0 and later only.

This is the base class for droppable content types. Distinguished instances of subclasses represent different types of drop content, such as a file distinguished by file suffix or a scene object. The active **DropClipFormat** parses dropped **IDataObject** into one of these dropped types, filling its data members with appropriate guff from the data object.

Each **DropClipFormat** can encompass multiple possible types of dropped data. For example, the **iDrop** package can drop max files, image files, script files, etc. The **DropClipFormat** classes parse raw dropped clipboard data into one of the **DropType** family of classes. These contain recognizer predicates, extracted data from the current drop, and utilities for working with the data, such as URL downloads, script compile & execution, etc. Custom drop-types can be created by subclassing one of the **DropType** base classes. The built-in **DropTypes** are listed in the [List of DropTypes](#)

### Data Members:

protected:

```
static IDragAndDropMgr* dndMgr;
```

Cached pointer to the DnD manager.

```
static bool dragging;
```

The drop source state.

```
static POINT startPt;
```

The drag and drop starting point.

```
static WPARAM startKeyState;
```

The starting state of the keyboard.

```
static HWND startWnd;
```

The handle to the starting window.

```
static bool loaded;
```

Flags if the current packages is already downloaded.

public:

**static IDataObject\* current\_dataobject;**

Currently dropping **IDataObject**. Filled in by the low-level **DragEnter()** code.

**Methods:**

public:

**Prototype:**

**DropType();**

**Remarks:**

Constructor.

**Prototype:**

**static void Init();**

**Remarks:**

This method clears the currently-parsed drop data.

**Default Implementation:**

**{ current\_dataobject = NULL; loaded = false; }**

**Prototype:**

**virtual int TypeCode()=0;**

**Remarks:**

This method returns the typecode of the DropType.

**Prototype:**

**virtual bool IsDropType(int code);**

**Remarks:**

This method returns TRUE if the DropType is of the specified DropType code, otherwise FALSE.

Each **DropType** subclass is given a unique integer code that can be used for

type-testing, switching, etc. The **TypeCode()** method must be implemented to return this code and **isDropType()** to test against the given code (this is provided to that intermediate **DropType** base classes with codes can effectively support superclass testing). The codes for the built-in **DropTypes** are given by the following defined symbols which are listed in the [List of DropTypes](#)

**Parameters:**

**int code**

The DropType code.

**Default Implementation:**

```
{ return code == TypeCode(); }
```

**Prototype:**

```
virtual bool Load(bool showProgress = true);
```

**Remarks:**

Subclasses should implement this method if they need to perform any droptype-specific loading prior to clipformat data use. For example, the URL package types all download any web-resident files in this method. Control any implemented progress dialog with the showProgress parameter.

**Parameters:**

**bool showProgress = true**

The download progress dialog can be displayed by passing true.

**Default Implementation:**

```
{ return true; }
```

**Prototype:**

```
virtual DWORD DropEffect();
```

**Remarks:**

This method returns the dropeffect currently supported by the accepted dropping type.

**Default Implementation:**

```
{ return DROPEFFECT_MOVE; }
```

## Structure Color24

See Also: [Structure Color48](#), [Structure Color64](#).

Note: **typedef uchar UBYTE;**

```
struct Color24 {
```

```
    uchar r,g,b;
```

8 bits for each of the Red, Green and Blue components.

```
};
```

## Class MNNormalFace

class MNNormalFace

### Description:

This class is available in release 5.0 and later only.

This class is a face used to store specified normal information for a given face. An array of these faces is used as a data member of class MNNormalSpec, in much the same way as an MNMapFace array is a data member of class MNMap.

.

### Methods:

### Prototype:

**MNNormalFace ()**

### Remarks:

Constructor - initializes mDegree to 0, mpNormalID to NULL.

### Prototype:

**MNNormalFace (int degree)**

### Remarks:

Constructor - initializes to the degree specified.

.

### Prototype:

**~MNNormalFace ()**

### Remarks:

Destructor - frees data members.

**Prototype:**  
**void Init();**

**Remarks:**

Initializes data members. This is useful in situations where the default constructor may not have been properly called, such as  
MNNormalFace \*fc = new MNNormalFace[10];

It should not be called on an MNNormalFace with data allocated, or that memory will leak.

**Prototype:**  
**void Clear();**

**Remarks:**

Frees all allocated data, sets degree to 0.

**Prototype:**  
**int GetDegree();**

**Remarks:**

Returns the face's degree.

**Prototype:**  
**int SetDegree (int degree);**

**Remarks:**

Sets the face's degree.

**Prototype:**

**int GetNormalID(int corner);**

**Remarks:**

Accessor for normal in a particular corner of the face.

**Parameters:**

**int corner**

The (zero-based) index of the corner of the face. (A quad face has corners 0, 1, 2, and 3.)

**Return Value:**

Index of normal (in parent MNNormalSpec's normal array), or -1 if "corner" is out of range.

**Prototype:**

**int SetNormalID (int corner, int norm);**

**Remarks:**

Sets the normal ID used in a particular corner.

**Parameters:**

**int corner**

The (zero-based) index of the corner of the face. (A quad face has corners 0, 1, 2, and 3.)

**int norm**

The index of the normal (in the parent MNNormalSpec's normal array).

**Prototype:**

**bool GetSpecified (int corner)**

**Remarks:**

Indicates whether the normal used in a particular corner is specified or not.

**Parameters:****int corner**

The (zero-based) index of the corner of the face. (A quad face has corners 0, 1, 2, and 3.)

**Prototype:**

**void SetSpecified (int corner, bool value=true);**

**Remarks:**

Controls whether the normal used in a particular corner of the face is specified or not.

**Parameters:****int corner**

The (zero-based) index of the corner of the face. (A quad face has corners 0, 1, 2, and 3.)

**Parameters:****bool value**

Whether the corner should have a specified (true) or unspecified (false) normal.

**Prototype:**

**void SpecifyNormalID (int corner, int norm);**

**Remarks:**

Specifies that a particular corner of the face should use a given normal index.

**Parameters:**

**int corner**

The (zero-based) index of the corner of the face. (A quad face has corners 0, 1, 2, and 3.)

**Parameters:**

**int norm**

The index of the normal (in the parent MNNormalSpec's normal array).

**Prototype:**

**void Insert (int pos, int num=1);**

**Remarks:**

Inserts space for more normals into an existing face. (Designed to be used in conjunction with MNFace::Insert, to increase the size of a polygon and add new vertices & normals.)

.

**Parameters:**

**int pos**

The location within the face where the new normals will be added.

**Parameters:**

**int num=1**

The number of new normals to add.

**Prototype:**

**void Delete (int pos, int num=1);**

**Remarks:**

Deletes normals from this map face. (Designed to be used in conjunction with MNFace::Delete, to decrease the size of a polygon and remove vertices & normals.).

**Parameters:****int pos**

The location within the face where the new normals will be deleted.

**Parameters:****int num=1**

The number of new normals to delete.

**Prototype:****void RotateStart (int newstart);****Remarks:**

Deletes normals from this map face. (Designed to be used in conjunction with MNFace::Delete, to decrease the size of a polygon and remove vertices & normals.).

**Parameters:****int newstart**

The new first normal

**Prototype:****void Flip ();****Remarks:**

Reverses order of normals, effectively inverting the face. (Designed

to be used in conjunction with MNFace::Flip.)

**Prototype:**

**MNNormalFace & operator= (const MNNormalFace & from);**

**Remarks:**

Typical = operator - calls SetDegree to make this face the same size as "from", then copies the specification data and the normalIDs.

**Prototype:**

**MNNormalFace & operator= (const MNFace & from);**

**Remarks:**

Sets the degree of this NormalFace to that of the MNFace given..

**Prototype:**

**void ShallowTransfer (MNNormalFace & from);**

**Remarks:**

"Shallow-copies" data from "from". This is dangerous to use - the pointer to the normal ID array is the same in both faces after this is called. It's typically used by MNNormal::FAlloc, when resizing the whole face array.

**Prototype:**

**void MNDebugPrint (bool printAll=false);**

**Remarks:**

Uses "DebugPrint" to output information about this MNNormalFace to the Debug buffer in DevStudio. Output is formatted as follows: suppose we have a 5-sided face, with normals {4,5,6,7,8}, and only the normals in corners 1 and 2 (i.e. normals 5 and 6) are specified.

MNDebugPrint (true) would generate:

```
_4 5 6 _7 _8
```

MNDebugPrint (false) would generate:

```
_ 5 6 _ _
```

This is mainly used as part of MNNormalSpec::MNDebugPrint.

**Prototype:**

**IOResult Save (ISave \*isave);**

**Remarks:**

Called by the system. Saves the face's data to the stream given.

**Prototype:**

**IOResult Load (ILoad \*iload);**

**Remarks:**

Called by the system. Loads the face's data from the stream given.

## Structure ConfigurationBlock

See Also: [Class MaxNetManager](#), [Structure ManagerInfo](#), [Structure ServerInfo](#), [Structure ClientInfo](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store information about the system.

### typedef struct {

**DWORD dwTotalPhys;**

The system's total physical memory, retrieved through **GlobalMemoryStatus()**.

**DWORD dwNumberOfProcessors;**

The number of processors in the system, retrieved through **GetSystemInfo()**.

**DWORD dwMajorVersion;**

The system's major version, retrieved through **GetVersionEx()**.

**DWORD dwMinorVersion;**

The system's minor version, retrieved through **GetVersionEx()**.

**DWORD dwBuildNumber;**

The system's build number, retrieved through **GetVersionEx()**.

**DWORD dwPlatformId;**

The system's platform ID, retrieved through **GetVersionEx()**.

**TCHAR szCSDVersion[128];**

The system's CSD version, retrieved through **GetVersionEx()**.

**char user[MAX\_PATH];**

The logged in user's name, retrieved through **GetUserName()**.

**char tempdir[MAX\_PATH];**

The temporary directory, retrieved through **ExpandEnvironmentStrings()**.

**char name[MAX\_PATH];**

The name of the computer, retrieved through **GetComputerName()**.

**char workDisk;**

The disk, indexed by drive letter, used for server files such as incoming jobs. The index is alphabetical, disk A = 0, disk B = 1, etc.

**DWORD disks;**

The bit map representing the available disks. Disk A = 0x1, B = 0x2, C = 0x4, etc.

**DWORD diskSpace[26];**

The space available on disks in MegaBytes, indexed by drive letter. Disk A = diskSpace[0], B = diskSpace[1], etc.

**BYTE mac[8];**

The computer NIC hardware address (00:00:00:00:00:00), which is 6 bytes and 2 padding bytes.

**char reserved[32];**

Reserved for future use.

**} ConfigurationBlock;**

## Structure AlertData

See Also: [Class MaxNetManager](#), [Structure Job](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store information about the alert notifications.

### typedef struct {

**bool alertEnabled;**

This flag specifies if the alerts are enabled.

**int nthFrames;**

Use every n-th frame for a progress report.

**DWORD notifications;**

This bit map represents the enabled alerts, which are following values:

**NOTIFY\_FAILURE**

Notify on failure.

**NOTIFY\_PROGRESS**

Notify on progress.

**NOTIFY\_COMPLETION**

Notify on completion.

**} AlertData;**

## Structure MaxJob

See Also: [Class MaxNetManager](#), [Structure Job](#), [Structure SceneInfo](#), [Structure MaxJobRenderElements](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store information about a 3ds max specific job.

### **typedef struct {**

#### **bool init;**

This flag determines if the structure is valid.

#### **bool gammacorrection;**

This flag determines if gamma correction is used.

#### **float gammavaluein;**

The input gamma value for maps.

#### **float gammavalueout;**

The output gamma value for output images.

#### **float pixelaspect;**

The pixel aspect ratio.

#### **SceneInfo sceneInfo;**

The scene information data structure.

#### **MaxJobRenderElements re;**

The render elements data structure.

#### **char reserved[64];**

Reserved for future use.

### **} MaxJob;**

## Structure CombustionJob

See Also: [Class MaxNetManager](#), [Structure Job](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store information about a Combustion specific job.

**typedef struct {**

**bool init;**

This flag determines if the structure is valid.

**char reserved[128];**

Reserved for future use.

**} CombustionJob;**

## Structure JobText

See Also: [Class MaxNetManager](#), [Class CJobText](#), [Structure TextBufferOutput](#), [Structure JobRenderElements](#), [List of Job Text Types](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store textural information regarding a job.

### typedef struct {

**JOB\_TEXT\_TYPE type;**

The Job Text type. See the [List of Job Text Types](#) for details.

### union {

**TCHAR text[256];**

The text buffer contents.

**TextBufferOutput output**

The output text buffer.

**JobRenderElement re**

The Render Elements details of the job.

}

**} JobText;**

## List of Job Text Types

See Also: [Class MaxNetManager](#), [Class CJobText](#), [Structure JobText](#)

The list of the various JobText types (**JOB\_TEXT\_TYPE**) available.

### **JOB\_TEXT\_USER**

The user name.

### **JOB\_TEXT\_COMPUTER**

The computer name for job submissions.

### **JOB\_TEXT\_MANAGER\_SHARE**

The manager's share where it can find jobs. Filled by the Manager.

### **JOB\_TEXT\_FRAMES**

The frame sequence (such as the "1,2,4,5-40" types). Otherwise frames are defined in Job.

### **JOB\_TEXT\_MAX\_OUTPUT**

The output image file name, for 3ds max jobs.

### **JOB\_TEXT\_CMB\_OUTPUT**

The output image file name, for Combustion jobs.

### **JOB\_TEXT\_RENDER\_ELEMENT**

The list of Render Elements.

### **JOB\_TEXT\_CAMERA**

The list of cameras.

### **JOB\_TEXT\_RESERVED**

This type is reserved for future use.

## Structure ServerInfo

See Also: [Class MaxNetManager](#), [Structure NetworkStatus](#), [Structure ConfigurationBlock](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store information about a Server.

### typedef struct {

**DWORD size;**

The size of the structure, being **sizeof(ServerInfo)**.

**DWORD version;**

The version information, defined by **\_SERVER\_INFO\_VERSION**.

**float total\_frames;**

The total number of frames rendered.

**float total\_time;**

The total time spent rendering, in hours.

**ConfigurationBlock cfg;**

The network system configuration data. Refer to this structure for more information.

**NetworkStatus net\_status;**

The network status information.

**char reserved[32];**

Reserved for future use.

**} ServerInfo;**

## Structure Schedule

See Also: [Class MaxNetManager](#), [Structure WeekSchedule](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store hourly scheduling information.

**typedef struct {**

**DWORD hour;**

This bit map represents the hourly schedule where 24 bits represent the hours. A bit set to 0 indicates it's allowed to work, a bit set to 1 indicates it's not allowed to work.

**} JOBFAMES;**

## Class HierarchyEntry

See Also: [Class GenericHierarchy](#).

class HierarchyEntry

### Description:

This class represents an entry in a **GenericHierarchy**. All methods of the class are implemented by the system.

### Data Members:

public:

#### **int data;**

This is the polygon number. For example a donut shape will have polygon 0 and polygon 1. This is an index into the list of polygons for the shape.

#### **int children;**

Number of children of this entry.

#### **HierarchyEntry \*parent;**

Points to the parent entry.

#### **HierarchyEntry \*sibling;**

Points to the first sibling.

#### **HierarchyEntry \*child;**

Points to the first child.

#### **TSTR sortKey;**

The sort key. This is used internally by the hierarchy so that it can determine whether two hierarchies are compatible. Developers shouldn't alter this value.

### Methods:

### Prototype:

**HierarchyEntry();**

### Remarks:

Constructor. The entry is initialized as empty.

### Prototype:

**HierarchyEntry(int d, HierarchyEntry \*p, HierarchyEntry \*s);**

**Remarks:**

Constructor. The entry is initialized to the data passed.

**Parameters:****int d**

The value for **data**. This is the polygon number.

**HierarchyEntry \*p**

The **parent** pointer is initialized to this value.

**HierarchyEntry \*s**

The **sibling** pointer is initialized to this value.

**Prototype:****int HierarchyLevel();****Remarks:**

Returns the level in the hierarchy this entry represents. This is the number of parents this item has. The root level is not counted.

**Return Value:**

The level in the hierarchy of this entry.

**Prototype:****void AddChild(int d);****Remarks:**

Adds a new child entry to this entry using the data specified.

**Parameters:****int d**

The **data** value of the child. This is the polygon number.

**Prototype:****int GetChild(int index);****Remarks:**

Returns the specified child of this entry.

**Parameters:**

**int index**

The child to retrieve.

**Return Value:**

The specified child of this entry. If the specified index is greater than or equal to the number of children **INVALID\_HIERARCHY** is returned.

**Prototype:**

**int Children()**

**Remarks:**

Returns the number of children of this entry.

**Prototype:**

**void Sort();**

**Remarks:**

Sorts the hierarchy using the **sortKeys**.

## Class NoteKey

See Also: [Class NoteKeyTab](#), [Class DefNoteTrack](#), [Class Animatable](#).

class NoteKey

### Description:

This class contains the data for a single note of a Note track in Track View. This includes the time, text and flags for the notes.

### Data Members:

public:

**TimeValue time;**

The time of the note.

**TSTR note;**

The text of the note.

**DWORD flags;**

The note flags. One or more of the following values:

**NOTEKEY\_SELECTED**

The key is selected.

**NOTEKEY\_LOCKED**

The key is locked.

**NOTEKEY\_FLAGGED**

The key is flagged.

### Methods:

public:

### Prototype:

**NoteKey(TimeValue t,const TSTR &n,DWORD f=0);**

### Remarks:

Constructor. The data members are initialized to the values passed.

### Prototype:

**NoteKey(NoteKey& n);**

### Remarks:

Constructor. The data members are initialized from the NoteKey passed.

**Prototype:**

**void SetFlag(DWORD mask);**

**Remarks:**

Sets the specified flags.

**Parameters:**

**DWORD mask**

The flags to set.

**Prototype:**

**void ClearFlag(DWORD mask);**

**Remarks:**

Clears (sets to zero) the specified flags.

**Parameters:**

**DWORD mask**

The flags to clear.

**Prototype:**

**BOOL TestFlag(DWORD mask);**

**Remarks:**

Tests the specified flags. Returns TRUE if set; otherwise FALSE.

**Parameters:**

**DWORD mask**

The flags to test.

## Class IQuadMenuSettings

See Also: [Class IMenuItem](#) , [Class IMenuSettings](#), [Class IMenuColors](#)

class IQuadMenuSettings : public IMenuSettings, public FPStaticInterface

### Description:

This class is available in release 4.0 and later only.

This abstract class represents an interface for quad menu settings. The methods contained in this class allow you to access and control all quad menu related settings and configuration parameters.

### Methods:

public:

### Prototype:

```
virtual void SetFirstQuadDisplayed(QuadIndex  
firstQuadDisplayed) = 0;
```

### Remarks:

This method allows you to set the first quad which will be displayed when a quad menu pops up.

### Parameters:

**QuadIndex firstQuadDisplayed**

The quad index, one of the following; **QUAD\_ONE**, **QUAD\_TWO**, **QUAD\_THREE**, or **QUAD\_FOUR**.

### Prototype:

```
virtual QuadIndex GetFirstQuadDisplayed() const = 0;
```

### Remarks:

This method returns the index of the first quad which will be displayed.

### Return Value:

The quad index, one of the following; **QUAD\_ONE**, **QUAD\_TWO**, **QUAD\_THREE**, or **QUAD\_FOUR**.

### Prototype:

**virtual void SetUseUniformQuadWidth(bool useUniformQuadWidth) = 0;**

**Remarks:**

This method allows you to set whether the quad menu has a uniform width.

**Parameters:**

**bool useUniformQuadWidth**

TRUE to set the uniform width, FALSE to set it to non-uniform.

**Prototype:**

**virtual bool GetUseUniformQuadWidth() const = 0;**

**Remarks:**

This method returns the status of the uniform width flag for the quad menu.

TRUE if the quad menu has been set to use uniform width, otherwise FALSE.

**Prototype:**

**virtual void SetUseUniformQuadWidthBOOL(BOOL useUniformQuadWidth) = 0;**

**Remarks:**

This method allows you to set whether the quad menu has a uniform width.

This version of **SetUseUniformQuadWidth()** is provided for the function publishing system.

**Parameters:**

**BOOL useUniformQuadWidth**

TRUE to set the uniform width, FALSE to set it to non-uniform.

**Prototype:**

**virtual BOOL GetUseUniformQuadWidthBOOL() const = 0;**

**Remarks:**

This method returns the status of the uniform width flag for the quad menu.

TRUE if the quad menu has been set to use uniform width, otherwise FALSE.

This version of **GetUseUniformQuadWidth()** is provided for the function publishing system.

**Prototype:**

**virtual void SetMirrorQuad(bool mirrorQuad) = 0;**

**Remarks:**

This method allows you to set whether the quad menus are mirrored left to right.

**Parameters:**

**bool mirrorQuad**

TRUE to mirror the menus, otherwise FALSE.

**Prototype:**

**virtual bool GetMirrorQuad() const = 0;**

**Remarks:**

This method returns TRUE if the quad menu is mirrored left to right, otherwise FALSE.

**Prototype:**

**virtual void SetMirrorQuadBOOL(BOOL mirrorQuad) = 0;**

**Remarks:**

This method allows you to set whether the quad menus are mirrored left to right. This version of **SetMirrorQuad()** is provided for the function publishing system.

**Parameters:**

**BOOL mirrorQuad**

TRUE to mirror the menus, otherwise FALSE.

**Prototype:**

**virtual BOOL GetMirrorQuadBOOL() const = 0;**

**Remarks:**

This method returns TRUE if the quad menu is mirrored left to right, otherwise FALSE. This version of **GetMirrorQuad()** is provided for the function publishing system.

**Prototype:**

**virtual void SetMoveCursorOnReposition(bool  
moveCursorOnReposition) = 0;**

**Remarks:**

This method allows you to set whether the cursor moves when the quad menu is repositioned because of clipping the edge of the screen.

**Parameters:**

**bool moveCursorOnReposition**  
TRUE to move the cursor, otherwise FALSE.

**Prototype:**

**virtual bool GetMoveCursorOnReposition() const = 0;**

**Remarks:**

This method returns TRUE if the cursor moves when the quad menu is repositioned because of clipping the edge of the screen, otherwise FALSE.

**Prototype:**

**virtual void SetMoveCursorOnRepositionBOOL(BOOL  
moveCursorOnReposition) = 0;**

**Remarks:**

This method allows you to set whether the cursor moves when the quad menu is repositioned because of clipping the edge of the screen. This version of **SetMoveCursorOnReposition()** is provided for the function publishing system.

**Parameters:**

**BOOL moveCursorOnReposition**  
TRUE to move the cursor, otherwise FALSE.

**Prototype:**

**virtual BOOL GetMoveCursorOnRepositionBOOL() const = 0;**

**Remarks:**

This method returns TRUE if the cursor moves when the quad menu is

repositioned because of clipping the edge of the screen, otherwise FALSE.  
This version of **GetMoveCursorOnReposition()** is provided for the function publishing system.

**Prototype:**

**virtual void SetReturnCursorAfterReposition(bool returnCursorAfterReposition) = 0;**

**Remarks:**

This method allows you to set whether the cursor is moved the opposite distance that it was automatically moved when the quad menu is repositioned because of clipping the edge of the screen.

**Parameters:**

**bool returnCursorAfterReposition**  
TRUE to set the flag, otherwise FALSE.

**Prototype:**

**virtual bool GetReturnCursorAfterReposition() const = 0;**

**Remarks:**

This method returns TRUE if the cursor is moved the opposite distance that it was automatically moved when the quad menu is repositioned because of clipping the edge of the screen, otherwise FALSE.

**Prototype:**

**virtual void SetReturnCursorAfterRepositionBOOL(BOOL returnCursorAfterReposition) = 0;**

**Remarks:**

This method allows you to set whether the cursor is moved the opposite distance that it was automatically moved when the quad menu is repositioned because of clipping the edge of the screen. This version of **GetReturnCursorAfterReposition()** is provided for the function publishing system.

**Parameters:**

**BOOL returnCursorAfterReposition**

TRUE to set the flag, otherwise FALSE.

**Prototype:**

**virtual BOOL GetReturnCursorAfterRepositionBOOL() const = 0;**

**Remarks:**

This method returns TRUE if the cursor is moved the opposite distance that it was automatically moved when the quad menu is repositioned because of clipping the edge of the screen, otherwise FALSE. This version of **GetReturnCursorAfterReposition()** is provided for the function publishing system.

**Prototype:**

**virtual void SetCursorLocInBox\_0to1(float x, float y) = 0;**

**Remarks:**

This method allows you to set the initial location of the cursor in the center quad box.

**Parameters:**

**float x, float y**

The location of the cursor, as a ratio of the box size, between 0.0 and 1.0.

**Prototype:**

**virtual float GetCursorLocXInBox\_0to1() const = 0;**

**Remarks:**

This method returns the initial x location of the cursor in the center quad box, as a ratio of the box size, between 0.0 and 1.0.

**Prototype:**

**virtual float GetCursorLocYInBox\_0to1() const = 0;**

**Remarks:**

This method returns the initial y location of the cursor in the center quad box, as a ratio of the box size, between 0.0 and 1.0.

**Prototype:**

```
virtual const MenuColors *GetMenuColors(int quadNum) const = 0;
```

**Remarks:**

This method returns the color array for a specific quad.

**Parameters:**

**int quadNum**

The quad to obtain the color array for, (numbered 1 through 4).

**Prototype:**

```
virtual void SetTitleBarBackgroundColor(int quadNum, const Color& color) = 0;
```

**Remarks:**

This method allows you to set the title bar background color for a specific quad.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Color& color**

The color to set.

**Prototype:**

```
virtual const Color& GetTitleBarBackgroundColor(int quadNum) const = 0;
```

**Remarks:**

This method returns the title bar background color of a specific quad. This method returns the color as a **Color**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

**virtual COLORREF GetTitleBarBackgroundColorRef(int quadNum) const = 0;**

**Remarks:**

This method returns the title bar background color of a specific quad. This method returns the color as a **COLORREF**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

**virtual void SetTitleBarTextColor(int quadNum, const Color& color) = 0;**

**Remarks:**

This method allows you to set the title bar text color for a specific quad.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Color& color**

The color to set.

**Prototype:**

**virtual const Color& GetTitleBarTextColor(int quadNum) const = 0;**

**Remarks:**

This method returns the title bar text color of a specific quad. This method returns the color as a **Color**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

**virtual COLORREF GetTitleBarTextColorRef(int quadNum)**

**const = 0;**

**Remarks:**

This method returns the title bar text color of a specific quad. This method returns the color as a **COLORREF**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

**virtual void SetItemBackgroundColor(int quadNum, const Color& color) = 0;**

**Remarks:**

This method allows you to set the item background color for a specific quad.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Color& color**

The color to set.

**Prototype:**

**virtual const Color& GetItemBackgroundColor(int quadNum) const = 0;**

**Remarks:**

This method returns the item background color of a specific quad. This method returns the color as a **Color**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

**virtual COLORREF GetItemBackgroundColorRef(int quadNum) const = 0;**

**Remarks:**

This method returns the item background color of a specific quad. This method returns the color as a **COLORREF**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

```
virtual void SetItemTextColor(int quadNum, const Color& color) = 0;
```

**Remarks:**

This method allows you to set the item text color for a specific quad.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Color& color**

The color to set.

**Prototype:**

```
virtual const Color& GetItemTextColor(int quadNum) const = 0;
```

**Remarks:**

This method returns the item text color of a specific quad. This method returns the color as a **Color**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

```
virtual COLORREF GetItemTextColorRef(int quadNum) const = 0;
```

**Remarks:**

This method returns the item text color of a specific quad. This method returns

the color as a **COLORREF**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

```
virtual void SetLastExecutedItemTextColor(int quadNum, const  
Color& color) = 0;
```

**Remarks:**

This method allows you to set the last executed item text color for a specific quad.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Color& color**

The color to set.

**Prototype:**

```
virtual const Color& GetLastExecutedItemTextColor(int  
quadNum) const = 0;
```

**Remarks:**

This method returns the last executed item text color of a specific quad. This method returns the color as a **Color**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

```
virtual COLORREF GetLastExecutedItemTextColorRef(int  
quadNum) const = 0;
```

**Remarks:**

This method returns the last executed item text color of a specific quad. This

method returns the color as a **COLORREF**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

**virtual void SetHighlightedItemBackgroundColor(int quadNum, const Color& color) = 0;**

**Remarks:**

This method allows you to set the highlighted item background color for a specific quad.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Color& color**

The color to set.

**Prototype:**

**virtual const Color& GetHighlightedItemBackgroundColor(int quadNum) const = 0;**

**Remarks:**

This method returns the highlighted item background color of a specific quad.  
This method returns the color as a **Color**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

**virtual COLORREF GetHighlightedItemBackgroundColorRef(int quadNum) const = 0;**

**Remarks:**

This method returns the highlighted item background color of a specific quad.

This method returns the color as a **COLORREF**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

```
virtual void SetHighlightedItemTextColor(int quadNum, const  
Color& color) = 0;
```

**Remarks:**

This method allows you to set the highlighted item text color for a specific quad.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Color& color**

The color to set.

**Prototype:**

```
virtual const Color& GetHighlightedItemTextColor(int quadNum)  
const = 0;
```

**Remarks:**

This method returns the highlighted item text color of a specific quad. This method returns the color as a **Color**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

```
virtual COLORREF GetHighlightedItemTextColorRef(int  
quadNum) const = 0;
```

**Remarks:**

This method returns the highlighted item text color of a specific quad. This

method returns the color as a **COLORREF**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

```
virtual void SetBorderColor(int quadNum, const Color& color) = 0;
```

**Remarks:**

This method allows you to set the border color for a specific quad.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Color& color**

The color to set.

**Prototype:**

```
virtual const Color& GetBorderColor(int quadNum) const = 0;
```

**Remarks:**

This method returns the border color of a specific quad. This method returns the color as a **Color**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

```
virtual COLORREF GetBorderColorRef(int quadNum) const = 0;
```

**Remarks:**

This method returns the border color of a specific quad. This method returns the color as a **COLORREF**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

**virtual void SetDisabledShadowColor(int quadNum, const Color& color) = 0;**

**Remarks:**

This method allows you to set the disabled shadow color for a specific quad.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Color& color**

The color to set.

**Prototype:**

**virtual const Color& GetDisabledShadowColor(int quadNum)  
const = 0;**

**Remarks:**

This method returns the disabled shadow color of a specific quad. This method returns the color as a **Color**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

**virtual COLORREF GetDisabledShadowColorRef(int quadNum)  
const = 0;**

**Remarks:**

This method returns the disabled shadow color of a specific quad. This method returns the color as a **COLORREF**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

```
virtual void SetDisabledHighlightColor(int quadNum, const  
Color& color) = 0;
```

**Remarks:**

This method allows you to set the disabled highlight color for a specific quad.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Color& color**

The color to set.

**Prototype:**

```
virtual const Color& GetDisabledHighlightColor(int quadNum)  
const = 0;
```

**Remarks:**

This method returns the disabled highlight color of a specific quad. This method returns the color as a **Color**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

**Prototype:**

```
virtual COLORREF GetDisabledHighlightColorRef(int  
quadNum) const = 0;
```

**Remarks:**

This method returns the disabled highlight color of a specific quad. This method returns the color as a **COLORREF**.

**Parameters:**

**int quadNum**

The quad (numbered 1 through 4).

# Class IMenuSettings

See Also: [Class IMenuGlobalContext](#)

class IMenuSettings

## Description:

This class is available in release 4.0 and later only.

This abstract class represents an interface for all general menu settings. Methods that are marked as internal should not be used.

## Methods:

public:

## Prototype:

```
virtual bool IsTokenValid(const ValidityToken& token) = 0;
```

## Remarks:

This method is used internally.

This method checks if a token is valid.

## Parameters:

**ValidityToken& token**

A reference to a token for which to check its validity.

## Return Value:

TRUE if the token is valid, otherwise FALSE.

## Prototype:

```
virtual void UpdateValidityToken(ValidityToken& token) const = 0;
```

## Remarks:

This method is used internally.

This method updates the validity token.

## Parameters:

**ValidityToken& token**

A reference to a token to update.

**Prototype:**

**virtual void ResetDefaults() = 0;**

**Remarks:**

This method will reset the menu settings to their defaults.

**Prototype:**

**virtual void SetBorderSz(int borderSz) = 0;**

**Remarks:**

This method allows you to set the menu border size.

**Parameters:**

**int borderSz**

The border size in pixels.

**Prototype:**

**virtual int GetBorderSz() const = 0;**

**Remarks:**

This method returns the menu border size.

**Prototype:**

**virtual void SetHorizontalMarginInPoints(int horizontalMarginInPoints) = 0;**

**Remarks:**

This method allows you to set the menu's horizontal margin size.

**Parameters:**

**int horizontalMarginInPoints**

The horizontal margin size in points.

**Prototype:**

**virtual int GetHorizontalMarginInPoints() const = 0;**

**Remarks:**

This method returns the menu's horizontal margin size (in points).

**Prototype:**

**virtual int GetHorizontalMargin(HDC hDC) const = 0;**

**Remarks:**

This method returns the menu's horizontal margin, in pixels.

**Parameters:**

**HDC hDC**

A handle to a device context.

**Prototype:**

**virtual void SetVerticalMarginInPoints(int verticalMarginInPoints) = 0;**

**Remarks:**

This method allows you to set the menu's vertical margin size.

**Parameters:**

**int verticalMarginInPoints**

The vertical margin size in points.

**Prototype:**

**virtual int GetVerticalMarginInPoints() const = 0;**

**Remarks:**

This method returns the menu's vertical margin size (in points).

**Prototype:**

**virtual int GetVerticalMargin(HDC hDC) const = 0;**

**Remarks:**

This method returns the menu's vertical margin, in pixels.

**Parameters:**

**HDC hDC**

A handle to a device context.

**Prototype:**

**virtual void SetItemFontFace(TCHAR\* szItemFontFace) = 0;**

**Remarks:**

This method allows you to set the menu item's font typeface.

**Parameters:**

**TCHAR\* szItemFontFace**

A string containing the typeface name.

**Prototype:**

**virtual const TCHAR\* GetItemFontFace() const = 0;**

**Remarks:**

This method returns the name of the menu item's font typeface.

**Prototype:**

**virtual void SetTitleFontFace(TCHAR\* szTitleFontFace) = 0;**

**Remarks:**

This method allows you to set the menu title's font typeface.

**Parameters:**

**TCHAR\* szTitleFontFace**

A string containing the typeface name.

**Prototype:**

**virtual const TCHAR\* GetTitleFontFace() const = 0;**

**Remarks:**

This method returns the name of the menu title's font typeface.

**Prototype:**

**virtual void SetItemFontSize(int itemFontSize) = 0;**

**Remarks:**

This method allows you to set the menu item's font size.

**Parameters:**

### **int itemFontSize**

The size of the font, in points.

#### **Prototype:**

```
virtual int GetItemFontSize() const = 0;
```

#### **Remarks:**

This method returns the menu item's font size, in points.

#### **Prototype:**

```
virtual void SetTitleFontSize(int titleFontSize) = 0;
```

#### **Remarks:**

This method allows you to set the menu title's font size.

#### **Parameters:**

### **int titleFontSize**

The size of the font, in points.

#### **Prototype:**

```
virtual int GetTitleFontSize() const = 0;
```

#### **Remarks:**

This method returns the menu title's font size, in points.

#### **Prototype:**

```
virtual void SetUseUniformItemHeight(bool  
useUniformItemHeight) = 0;
```

#### **Remarks:**

This method allows you to set the status of a menu item's uniform height flag.

#### **Parameters:**

### **bool useUniformItemHeight**

TRUE to set the uniform height flag ON, FALSE to set it to OFF.

#### **Prototype:**

**virtual bool GetUseUniformItemHeight() const = 0;**

**Remarks:**

This method returns TRUE or FALSE if the menu item's uniform height flag is set or not set, respectively.

**Prototype:**

**virtual void SetUseUniformItemHeight(BOOL useUniformItemHeight) = 0;**

**Remarks:**

This method allows you to set the status of a menu item's uniform height flag. This version of **SetUniformItemHeight()** is provided for the function publishing system.

**Parameters:**

**BOOL useUniformItemHeight**

TRUE to set the uniform height flag ON, FALSE to set it to OFF.

**Prototype:**

**virtual BOOL GetUseUniformItemHeight(BOOL) const = 0;**

**Remarks:**

This method returns TRUE or FALSE if the menu item's uniform height flag is set or not set, respectively. This version of **GetUniformItemHeight()** is provided for the function publishing system.

**Prototype:**

**virtual void SetOpacity(float opacity) = 0;**

**Remarks:**

This method allows you to set the menu's opacity value.

**Parameters:**

**float opacity**

The opacity value, ranging from 0.0 – 1.0.

**Prototype:**

**virtual float GetOpacity() const = 0;**

**Remarks:**

This method returns the menu's opacity value.

**Prototype:**

**virtual void SetDisplayMethod(DisplayMethod displayMethod) = 0;**

**Remarks:**

This method allows you to set a menu's display method.

**Parameters:**

**DisplayMethod displayMethod**

The display method (enum), which is either of the following;

**DM\_NORMAL, DM\_STRETCH, DM\_FADE,  
DM\_NUM\_METHODS**

**Prototype:**

**virtual DisplayMethod GetDisplayMethod() const = 0;**

**Remarks:**

This method returns the menu's display method, which is either of the following; **DM\_NORMAL, DM\_STRETCH, DM\_FADE, DM\_NUM\_METHODS**

**Prototype:**

**virtual void SetAnimatedSteps(unsigned int steps) = 0;**

**Remarks:**

This method allows you to set the menu's number of animated steps for the 'growing' effect.

**Parameters:**

**unsigned int steps**

The number of steps.

**Prototype:**

**virtual unsigned int GetAnimatedSteps() const = 0;**

**Remarks:**

This method returns the menu's number of animated steps used for the 'growing' effect.

**Prototype:**

**virtual void SetAnimatedStepTime(unsigned int ms) = 0;**

**Remarks:**

This method allows you to set the menu's animated step time.

**Parameters:**

**unsigned int ms**

The animated step time, in milliseconds.

**Prototype:**

**virtual unsigned int GetAnimatedStepTime() const = 0;**

**Remarks:**

This method returns the menu's animated step time, in milliseconds.

**Prototype:**

**virtual void SetSubMenuPauseTime(unsigned int ms) = 0;**

**Remarks:**

This method allows you to set the delay before a submenu is displayed.

**Parameters:**

**unsigned int ms**

The delay, in milliseconds.

**Prototype:**

**virtual unsigned int GetSubMenuPauseTime() const = 0;**

**Remarks:**

This method returns the delay before a submenu is displayed, in milliseconds.

**Prototype:**

```
virtual void SetUseLastExecutedItem(bool useLastExecutedItem)  
= 0;
```

**Remarks:**

This method allows you to set the "last executed item" flag which determines whether to use the menu's last executed item when the user clicks on the menu's titlebar.

**Parameters:**

**bool useLastExecutedItem**

TRUE to turn ON the flag, FALSE to turn the flag off.

**Prototype:**

```
virtual bool GetUseLastExecutedItem() const = 0;
```

**Remarks:**

This method returns whether the "last executed item" flag is set (TRUE) or not set (FALSE). The flag determines whether to use the menu's last executed item when the user clicks on the menu's titlebar.

**Prototype:**

```
virtual void SetUseLastExecutedItemBOOL(BOOL  
useLastExecutedItem) = 0;
```

**Remarks:**

This method allows you to set the "last executed item" flag which determines whether to use the menu's last executed item when the user clicks on the menu's titlebar. This version of **SetUseLastExecutedItem()** is provided for the function publishing system.

**Parameters:**

**BOOL useLastExecutedItem**

TRUE to turn ON the flag, FALSE to turn the flag off.

**Prototype:**

**virtual BOOL GetUseLastExecutedItemBOOL() const = 0;**

**Remarks:**

This method returns whether the "last executed item" flag is set (TRUE) or not set (FALSE). The flag determines whether to use the menu's last executed item when the user clicks on the menu's titlebar. This version of **GetUseLastExecutedItem()** is provided for the function publishing system.

**Prototype:**

**virtual void SetRepositionWhenClipped(bool repositionWhenClipped) = 0;**

**Remarks:**

This method allows you to set the flag which controls and determines whether the menu is repositioned when near the edge of the screen.

**Parameters:**

**bool repositionWhenClipped**

TRUE to turn repositioning ON, FALSE to turn it OFF.

**Prototype:**

**virtual bool GetRepositionWhenClipped() const = 0;**

**Remarks:**

This method returns the status of the flag which controls and determines whether the menu is repositioned when near the edge of the screen.

**Return Value:**

TRUE if the flag is ON, otherwise FALSE.

**Prototype:**

**virtual void SetRepositionWhenClippedBOOL(BOOL repositionWhenClipped) = 0;**

**Remarks:**

This method allows you to set the flag which controls and determines whether the menu is repositioned when near the edge of the screen. This version of **SetRepositionWhenClipped()** is provided for the function publishing

system.

**Parameters:**

**BOOL repositionWhenClipped**

TRUE to turn repositioning ON, FALSE to turn it OFF.

**Prototype:**

**virtual BOOL GetRepositionWhenClipped() const = 0;**

**Remarks:**

This method returns the status of the flag which controls and determines whether the menu is repositioned when near the edge of the screen. This version of **GetRepositionWhenClipped()** is provided for the function publishing system.

**Return Value:**

TRUE if the flag is ON, otherwise FALSE.

**Prototype:**

**virtual void SetRemoveRedundantSeparators(bool  
removeRedundantSeparators) = 0;**

**Remarks:**

This method allows you to set the flag which controls and determines whether the menu should remove redundant separators.

**Parameters:**

**bool removeRedundantSeparators**

TRUE to turn the flag ON, FALSE to turn it OFF.

**Prototype:**

**virtual bool GetRemoveRedundantSeparators() const = 0;**

**Remarks:**

This method returns the status of the flag which controls and determines whether the menu should remove redundant separators.

**Return Value:**

TRUE if the flag is ON, otherwise FALSE.

**Prototype:**

```
virtual void SetRemoveRedundantSeparators(BOOL removeRedundantSeparators) = 0;
```

**Remarks:**

This method allows you to set the flag which controls and determines whether the menu should remove redundant separators. This version of **SetRemoveRedundantSeparators()** is provided for the function publishing system.

**Parameters:**

**BOOL removeRedundantSeparators**  
TRUE to turn the flag ON, FALSE to turn it OFF.

**Prototype:**

```
virtual BOOL GetRemoveRedundantSeparators(BOOL) const = 0;
```

**Remarks:**

This method returns the status of the flag which controls and determines whether the menu should remove redundant separators. This version of **GetRemoveRedundantSeparators()** is provided for the function publishing system.

**Return Value:**

TRUE if the flag is ON, otherwise FALSE.

# Class IMenuTimer

See Also: [Class IMenu](#) , [Class IMenuGlobalContext](#)

class IMenuTimer

## Description:

This class is available in release 4.0 and later only.

This abstract class represents an interface for a timer and is used internally.

Methods that are marked as internal should not be used.

## Methods:

public:

## Prototype:

**virtual bool IsRunning() = 0;**

## Remarks:

This method is used internally.

This method indicates whether the timer is running or not by returning TRUE or FALSE.

## Prototype:

**virtual void Start(IMenu\* pIMenu, EventParam timingType) = 0;**

## Remarks:

This method is used internally.

This method starts or restarts a timer for a specified IMenu.

## Prototype:

**virtual void Stop() = 0;**

## Remarks:

This method is used internally.

This method will stop the timer.

## Prototype:

**virtual void CheckTime() = 0;**

**Remarks:**

This method is used internally.

This method instructs the timer to check the time. If the time has elapsed it will notify its IMenu client.

**Prototype:**

**virtual bool HasElapsed() = 0;**

**Remarks:**

This method is used internally.

This method indicates whether the timer has elapsed by returning TRUE or FALSE.

**Prototype:**

**virtual void SetElapsedTime(unsigned int elapsedTime) = 0;**

**Remarks:**

This method is used internally.

This method allows you to set the elapse time for the timer.

**Parameters:**

**unsigned int elapsedTime**

The time at which the timer should elapse

**Prototype:**

**virtual unsigned int GetElapsedTime() const = 0;**

**Remarks:**

This method is used internally.

This method returns the elapse time that's been set for the timer.

**Prototype:**

**virtual IMenu\* GetIMenu() const = 0;**

**Remarks:**

This method is used internally.

This method returns a pointer to the IMenu client associated with the timer.

**Prototype:**

**virtual EventParam GetTimingType() const = 0;**

**Remarks:**

This method is used internally.

This method returns the timing type for the timer.

## Class ItemID

See Also: [Class IMenu](#), [Class IMenuItem](#) , [Class IMenuGlobalContext](#)

class ItemID

### Description:

This class is available in release 4.0 and later only.

This class is used internally. Methods that are marked as internal should not be used.

### Data Members:

public:

**IMenu\* mpMenu;**

**IMenuItem\* mpItem;**

### Methods:

public:

### Prototype:

**ItemID();**

### Remarks:

This method is used internally.

Constructor. Initialized **mpMenu(NULL)** and **mpItem(NULL)**.

### Default Implementation:

**{ }**

### Prototype:

**void Null();**

### Remarks:

This method is used internally.

Set **mpMenu = NULL** and **mpItem = NULL**.

### Prototype:

**friend bool operator==(ItemID& a, ItemID& b);**

**Remarks:**

This method is used internally.

This operator tests for equality of two ItemID's.

**Parameters:**

**ItemID& a, ItemID& b**

The two ItemID's you wish to test for equality.

**Prototype:**

**friend bool operator!=(ItemID& a, ItemID& b);**

**Remarks:**

This method is used internally.

This operator tests for inequality of two ItemID's.

**Parameters:**

**ItemID& a, ItemID& b**

The two ItemID's you wish to test for inequality.

**Default Implementation:**

```
{ return !(a == b); }
```

# Class IMenuColors

See Also: [Class Color](#)

class IMenuColors

## Description:

This class is available in release 4.0 and later only.

This class represents the container for a menu's color settings and is used internally. Methods that are marked as internal should not be used.

## Data Members:

public:

**Color mTitleBarBackgroundColor;**

The title bar background color.

**Color mTitleBarTextColor;**

The title bar text color.

**Color mItemBackgroundColor;**

The item background color.

**Color mItemTextColor;**

The item text color

**Color mLastExecutedItemTextColor;**

The last executed item text color.

**Color mHighlightedItemBackgroundColor;**

The highlighted item background color.

**Color mHighlightedItemTextColor;**

The highlighted item text color.

**Color mBorderColor;**

The border color.

**Color mDisabledShadowColor;**

The disabled shadow color.

**Color mDisabledHighlightColor;**

The disabled highlight color.

## Methods:

public:

**Prototype:**

**MenuColors();**

**Remarks:**

This method is used internally.

Constructor.

**Default Implementation:**

**{ ResetDefaults(); }**

**Prototype:**

**void ResetDefaults();**

**Remarks:**

This method is used internally.

This method resets the menu colors to their defaults.

**Default Implementation:**

```
{  
  mTitleBarBackgroundColor = Color(.0f, .0f, .0f);  
  mTitleBarTextColor = Color(.75f, .75f, .75f);  
  mItemBackgroundColor = Color(.75f, .75f, .75f);  
  mItemTextColor = Color(.0f, .0f, .0f);  
  mLastExecutedItemTextColor = Color(.95f, .85f, .0f);  
  mHighlightedItemBackgroundColor = Color(.95f, .85f, .0f);  
  mHighlightedItemTextColor = Color(.0f, .0f, .0f);  
  mBorderColor = Color(.0f, .0f, .0f);  
  mDisabledShadowColor = Color(.5f, .5f, .5f);  
  mDisabledHighlightColor = Color(1.0f, 1.0f, 1.0f);  
}
```

## Class DropClipFormat

See Also: [Class DropType](#), [Class VIZableClipFmt](#), [Class DropScriptClipFmt](#), [List of DropTypes](#)

```
class DropClipFormat : public InterfaceServer
```

### Description:

This class is available in release 4.0 and later only.

**DropClipFormat** is the base class for the various supported clipboard formats contained in a dropped **IDataObject**. Subclasses represent particular **IDataObject** clip format or package of related formats that can be accepted by various windows in 3ds max. The prime responsibility of each is to recognize its presence in a dropped **IDataObject** and to parse the data object into one of the supported **DropTypes**. Each subclass should have a singleton instance created. This is automatically registered with the DnD system for use in the clipform recognition routines.

### Data Members:

protected:

```
static Tab<DropClipFormat*> clipFmts;
```

The table of supported clip formats.

### Methods:

public:

### Prototype:

```
DropClipFormat();
```

### Remarks:

Constructor.

Each **DropClimFormat** instance created is kept in the **clipFmts** table

### Prototype:

```
static DropClipFormat* FindClipFormat(IDataObject*  
pDataObject);
```

### Remarks:

This method returns a pointer to the **DropClipFormat** (singleton) corresponding to the clip format in the given **IDataObject**, or NULL if the **IDataObject** contains no recognizable formats. This is primarily used by the low-level default **DragEnter()** function in DnD manager.

**Parameters:**

**IDataObject\* pDataObject**

The data object you wish to return the clip format for.

**Prototype:**

**virtual bool CheckClipFormat(IDataObject\* pDataObject)**

**Remarks:**

This method should be implemented by each subclass to detect the presence of its clipformat(s) in the given **IDataObject**. See **ParseDataObject()** below for a detailed example.

**Parameters:**

**IDataObject\* pDataObject**

The data object.

**Return Value:**

TRUE if the data was queried successfully, otherwise FALSE.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

**virtual DropType\* ParseDataObject(IDataObject\* pDataObject);**

**Remarks:**

This method should be implemented by each subclass to parse its clipformat(s) in the given **IDataObject** into the corresponding **DropType** subclass instance. For example, the **DropClipFormats** that accept dropped files will typically return one of the **FileDropType** subclasses depending on the filename suffix. A list of built-in clipformats:

**IDropPackageClipFmt** iDrop XML package

**VIZableClipFmt** VIZable file URL

**DropScriptClipFmt** internal dropScript

Here's an example (simplified) **VIZableClipFmt** implementation, which accepts a custom **CF\_MAXURL** clip format containing the URL of a file. **CheckClipFormat()** returns true if it finds the **CF\_MAXURL** clipboard format present in the given **IDataObject**. Because this is a dropping file, **ParseDataObject()** clears the current droptype data (the **FileDropType::Init()**), extracts the file name from the **IDataObject** and installs it into the **FileDropType current\_package** variable. It then asks the **FileDropType** class to recognize the actual file type being dropped and return the corresponding **FileDropType** subclass instance (using **FileDropType::FindDropType()**).

```
bool VIZableClipFmt::CheckClipFormat(IDataObject*
pDataObject)
{
    // accept CF_MAXURL clip formats
    FORMATETC fmt = { NULL, NULL, DVASPECT_CONTENT,
-1, NULL };
    fmt.cfFormat = RegisterClipboardFormat(_T("CF_MAXURL"));
    fmt.tymed = TYMED_HGLOBAL;
    return SUCCEEDED(pDataObject->QueryGetData(&fmt)) ==
TRUE;
}
DropType* VIZableClipFmt::ParseDataObject(IDataObject*
pDataObject)
{
    // parse a CF_MAXURL clipformat into one of the FileDropTypes
&
    // fill in the FileDropType::current_package URLTab
HRESULT hr;
```

```

FORMATETC fmt = { NULL, NULL, DVASPECT_CONTENT,
-1, NULL };
STGMEDIUM stg = { TYMED_NULL, NULL, NULL };

fmt.tymed = TYMED_HGLOBAL;
fmt.cfFormat = RegisterClipboardFormat(_T("CF_MAXURL"));

// clear out the file drop current data
FileDropType::Init();

// look for CF_MAXURL formats
hr = pDataObject->GetData(&fmt, &stg);
if(SUCCEEDED(hr))
{
    // found, get the max file name
    TCHAR szUrl[MAX_PATH];
ZeroMemory(szUrl, sizeof(szUrl));
wcstombs(szUrl,
    reinterpret_cast<wchar_t*>(GlobalLock(stg.hGlobal)),
    MAX_PATH-1);
GlobalUnlock(stg.hGlobal);
ReleaseStgMedium(&stg);
    // add it to the current_package URLTab
FileDropType::current_package.Add(szUrl);
}

// if we have a non-NULL package, get the appropriate
// FileDropType (usually based on file extension), by asking the
// utility DropType finder in FileDropType
if (FileDropType::current_package.Count() > 0)
    return FileDropType::FindDropType(

```

```
        FileDropType::current_package[0], pDataObject);  
else  
    return NULL;  
}
```

**Parameters:**

**IDataObject\* pDataObject**

The data object.

**Return Value:**

A pointer to the drop-type.

**Default Implementation:**

```
{ return NULL; }
```

## Class FileDropType

See Also: [Class DropType](#), , [Class URLTab](#), [Class SceneFileDropType](#), [Class ImageFileDropType](#), [Class ImportFileDropType](#), [Class ScriptFileDropType](#), [List of DropTypes](#)

```
class FileDropType : public DropType
```

### Description:

This class is available in release 4.0 and later only.

This is an intermediate base class for drop content that comes in the form of a package of filenames or URLs. This class maintains a list of all its subclass singleton instances and provides utility methods for finding an appropriate subclass instance, based on the dropped filename, and for download URL packages.

### Data Members:

protected:

```
static Tab<FileDropType*> fileDropTypes;
```

The table of FileDropTypes.

```
static TSTR download_directory;
```

Cache for current default URL package download directory .

public

```
static URLTab current_package;
```

Currently dropping URL package. Filled in by the active **DropClipFormat** in its **ParseDataObject()** method .

### Methods:

public:

### Prototype:

```
FileDropType();
```

### Remarks:

Constructor.

### Prototype:

**static void Init();**

**Remarks:**

This method clears the currently-parsed drop data.

**Default Implementation:**

```
{ current_package.Clear(); DropType::Init(); }
```

**Prototype:**

```
virtual int TypeCode()=0;
```

**Remarks:**

This method returns the typecode of the DropType.

**Default Implementation:**

```
{ return FILE_DROPTYPE; }
```

**Prototype:**

```
virtual bool IsDropType(int code);
```

**Remarks:**

This method returns TRUE if the DropType is of the specified DropType code, otherwise FALSE.

**Parameters:**

**int code**

The DropType code.

**Default Implementation:**

```
{ return code == TypeCode() || code == FILE_DROPTYPE; }
```

**Prototype:**

```
virtual bool Load(bool showProgress = true);
```

**Remarks:**

This method will load the URLTab in current\_package (filled in by the current DropClipFormat).

**Parameters:**

**bool showProgress = true**

The download progress dialog can be displayed by passing true.

**Prototype:**

```
static FileDropType* FindDropType(TCHAR* filename,  
IDataObject* pDataObject = NULL);
```

**Remarks:**

This method finds and returns the **FileDropType** subclass corresponding to the given filename suffix. See the [List of DropTypes](#) for more details.

**Parameters:**

**TCHAR\* filename**

The filename suffix.

**IDataObject\* pDataObject = NULL**

A pointer to the IDataObject.

**Return Value:**

The FileDropType that corresponds to the filename suffix. This could be one of the following; **sceneFileDropType**, **imageFileDropType**, **importFileDropType**, **dropScriptFileDropType**.

**Prototype:**

```
virtual bool CheckDropType(TCHAR* filename);
```

**Remarks:**

Subclasses should implement this method to recognize the file types associated with this drop type. This is used by **FindDropType()**.

**Parameters:**

**TCHAR\* filename**

The filename suffix.

**Return Value:**

TRUE if the filename suffix checks out, otherwise FALSE.

**Default Implementation:**

```
{ return false; }
```

**Prototype:**

**static bool DownloadPackage(URLTab& package, TCHAR\* szDirectory, HWND hwnd = NULL, bool showProgress = true);**

**Remarks:**

This method serves as a utility function that can be used to download a package of URLs to the specified directory. If the **hwnd** argument is supplied, any progress or other messages are centered over that window.

**Parameters:**

**URLTab& package**

A reference to the local copies of the URL strings.

**TCHAR\* directory**

The directory path string to download to.

**HWND hwnd = NULL**

A handle to the window. If this is set to NULL, the default 3ds max window is used.

**bool showProgress = false**

The download progress dialog can be displayed by passing true.

**Return Value:**

TRUE if the download was successful, otherwise FALSE.

**Prototype:**

**static TCHAR\* GetDownloadDirectory();**

**Remarks:**

This method returns the fully-specified path to the directory in which package drops are downloaded.

**Prototype:**

**static bool DownloadUrlToDisk(HWND hwnd, TCHAR\* szUrl, TCHAR\* szPathname, DWORD flags=0);**

**Remarks:**

This method allows you to download the file referenced by the URL to disk.

**Parameters:**

**HWND hwnd = NULL**

A handle to the window.

**TCHAR\* url**

The URL string of the file to download.

**TCHAR\* fileName**

The filename string of the URL to store on disk.

**DWORD flags=0**

Additional controls to the download behavior. Currently only one flag is supported, **DOWNLOADDLG\_NOPLACE**, which hides an option in the progress dialog that allows the user to place (move) a dropped object immediately after being dropped.

**Return Value:**

TRUE if the download was successful, otherwise FALSE.

## Class DropScriptDropType

See Also: [Class DropType](#), [Class DragAndDropHandler](#), [Class FPParams](#), [Class MacroEntry](#), [List of DropTypes](#)

```
class DropScriptDropType : public DropType
```

### Description:

This class is available in release 4.0 and later only.

This class is an intermediate base class for drop content that comes in the form of a dropScript. This is a special kind of macroScript that implements dropScript event handlers (see the DropScript documentation for details.) The prime subclass is **DropScriptFileDropType** which recognizes files of type .ds. The parsed data for this type is a single parsed macroScript, represented as a **MacroEntry** pointer. The **DropScriptDropType** class provides utility methods for compiling a .ds file into the **current\_dropscript** slot and for running the DnD-associated handlers in the current dropScript.

The methods **RunDropScriptDragEnter(FPParams\* params)**, **RunDropScriptDragOver(FPParams\* params)** and **RunDropScriptDrop(FPParams\* params)** take care of the 'on droppable' handler in the **current\_dropscript**, if supplied. The **DragAndDropHandler::DragEnter** call is usually made once on initial entry to a registered DnD target window and **DragAndDropHandler::DragOver** is usually called as the mouse moves over this window. In both cases, the handler returns true or false to indicate whether the dropping dropScript will be accepted. If a handler is not supplied, the dropScript is always deemed droppable. If the handler returns false, the not-droppable cursor is shown.

The handler is called with a set of arguments, supplied by the **DragAndDropHandler**, that usually depends on the window currently under the mouse pointer. For example, over a viewport, the current mouse coordinates, scene node under the mouse, slot number in a list window, etc. By convention, the first argument is positional and always a window type name, such as "Viewport" or "MaterialEditor", and all the others are keyword arguments, since they will vary from window to window. They are delivered to the RunDropScriptXXX methods in a Function Publishing **FPParam** object, so

that handler code needs to deal as little as possible with the MAXScript SDK. Here's an example code fragment from the default drop handler:

```
FPParams params (6,  
    TYPE_NAME, (vpwin ? _T("viewport") : _T("max")),  
    TYPE_KEYARG_MARKER,  
    TYPE_NAME, _T("node"),  
    TYPE_INODE, m_nodectx,  
    TYPE_NAME, _T("point"),  
    TYPE_POINT, &pt);  
// run the dragEnter handler & set dropeffect based on result  
if (dropScriptFileDropType.RunDropScriptDragEnter(&params))  
    *pdwEffect = DROPEFFECT_COPY;  
else  
    *pdwEffect = DROPEFFECT_NONE;
```

In the above code, the handler is called with 3 actual arguments, one position and two keyword. They are loaded into the 'params' instance with the **FPParams varargs** constructor. The first is the positional window name, in this case either #viewport or #max, then comes a special **TYPE\_KEYARG\_MARKER** signalling that the following arguments are keyword. The keyword args are given in pairs, name then value, in this case node: and point:. See the Function Publishing system documentation for full details on using the **FPParams** class for passing parameter blocks. An example droppable handler might be as follows:

**on droppable window node: do**

**return window == #viewport and superclassOf node == Shape**

This handler effectively makes the dropScript droppable if the mouse is over a Shape object in a viewport window. Notice that the function only looks at the node: keyword argument in this definition; arguments delivered as keyword arguments can vary from call to call and the called function can choose to look at only subset of them.

## Data Members:

public

**static MacroEntry\* current\_dropscript;**

Cache for current macroScript. See

`\MAXSDK\INCLUDE\iMacroScript.h` for the MacroScript manager

public API. There are also utility methods in DropScriptDropType that do all the necessary DnD compiling & running of macroScripts, so you only have to deal with the MacroScript manager for special processing.

## Methods:

public:

### Prototype:

**virtual int TypeCode()=0;**

### Remarks:

This method returns the typecode of the DropType.

### Default Implementation:

```
{ return DROPSCRIPT_DROPTYPE; }
```

### Prototype:

**virtual bool IsDropType(int code);**

### Remarks:

This method returns TRUE if the DropType is of the specified DropType code, otherwise FALSE.

### Parameters:

**int code**

The DropType code.

### Default Implementation:

```
{ return code == TypeCode() || code ==  
DROPSCRIPT_DROPTYPE; }
```

### Prototype:

**virtual DWORD DropEffect();**

**Remarks:**

This method returns the dropeffect currently supported by the accepted dropping type.

**Default Implementation:**

```
{ return DROPEFFECT_MOVE; }
```

The following methods provide assistance for developing custom drag-and-drop handlers that want to accept dropScripts. They work on the shared `current_dropscript` static data member in **DropScriptDropType**.

**Prototype:**

**BOOL CompileDropScript(TCHAR\* filename);**

**Remarks:**

This method parses the given file, looking for a single macroScript definition. If successful, interns the macroScript and places its corresponding **MacroEntry\*** in the **current\_dropscript** static data member. Note that if there is more code than just a single macroScript in the file, only the last macroScript definition is taken; the other code is NOT executed, so you cannot include auxiliary global functions and other prep code in the file. These should be inside the body of the macroScript, as local data and functions.

**Parameters:**

**TCHAR\* filename**

The filename of the script.

**Return Value:**

TRUE if successfully compiled, otherwise FALSE.

**Prototype:**

**BOOL RunDropScriptDragEnter(FPParams\* params);**

**Remarks:**

This methods takes care of the 'on droppable' handler in the **current\_dropscript**, if supplied. If the handler returns false, the not-droppable cursor is shown.

**Parameters:**

**FPParams\* params**

The set of arguments for the handler.

**Return Value:**

TRUE if droppable script will be accepted, otherwise FALSE.

**Prototype:**

**BOOL RunDropScriptDragOver(FPParams\* params);**

**Remarks:**

This methods takes care of the 'on droppable' handler in the **current\_dropscript**, if supplied, during the process of dragging contents over the drop target. If the handler returns false, the not-droppable cursor is shown.

**Parameters:**

**FPParams\* params**

The set of arguments for the handler.

**Return Value:**

TRUE if droppable script will be accepted, otherwise FALSE.

**Prototype:**

**BOOL RunDropScriptDrop(FPParams\* params);**

**Remarks:**

This methods takes care of the 'on droppable' handler in the **current\_dropscript**, if supplied and handles the parsing of the dropped script. If the handler returns false, the not-droppable cursor is shown.

**Parameters:**

**FPParams\* params**

The set of arguments for the handler.

**Return Value:**

TRUE if droppable script will be accepted, otherwise FALSE.

**Prototype:**

```
void InitDragDropCheck(MacroEntry* dropscript, LPARAM  
mousePt, WPARAM keyState, HWND hwnd);
```

**Remarks:**

This method will initialize a drag and drop check.

**Parameters:**

**MacroEntry\* dropscript**

The drop script macro entry.

**LPARAM mousePt**

The initial mouse cursor position.

**WPARAM keyState**

The initial state of the keyboard.

**HWND hwnd**

The handle to the initial start window.

**Prototype:**

```
bool ReadyToDrag();
```

**Remarks:**

This method returns TRUE if the system is ready to drag, otherwise FALSE.

**Default Implementation:**

```
{ return current_dropscript != NULL; }
```

## List of DropTypes

See Also: [Class DropType](#) , [Class DragAndDropHandler](#)

The following is the list of built-in DropTypes provided with 3ds max. The DropTypes are listed by their class name and DropType code. This type code can be obtained by using the **DropType::TypeCode()** method. Third-party DropType subclasses should use random codes above **0x1000000**.

### **FileDropType (FILE\_DROPTYPE)**

Intermediate base class for drop content in the form of a package of file names or URL's.

### **SceneFileDropType (SCENEFILE\_DROPTYPE)**

The \*.max scene file.

### **ImageFileDropType (IMAGEFILE\_DROPTYPE)**

The image files (.bmp, .tga, etc.).

### **ImportFileDropType (IMPORTFILE\_DROPTYPE)**

The importable files (.3ds, .dxf, etc.).

### **ScriptFileDropType (SCRIPTFILE\_DROPTYPE)**

The script files (.ms, .mse, .mcr).

### **DropScriptDropType (DROPSCRIPT\_DROPTYPE)**

Intermediate base class for drop content in the form of a dropScript.

### **DropScriptFileDropType (DROPSCRIPTFILE\_DROPTYPE)**

The drop script files (.ds, .dse).

### **MSZipPackageFileDropType (MSZIPFILE\_DROPTYPE)**

The script zip package files (.mzp).

### **BitmapDropType (BITMAP\_DROPTYPE)**

The bitmap type.

## Structure Color48

See Also: [Class Structure Color24](#), [Structure Color64](#).

Note: **typedef unsigned short USHORT;**

```
struct Color48 {
```

```
    UWORD r,g,b;
```

16 bits for each of the Red, Green and Blue components.

```
};
```

## Structure SceneInfo

See Also: [Class MaxNetManager](#), [Structure MaxJob](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to store information about the scene.

### typedef struct {

#### **int objects;**

The number of objects in the scene.

#### **int faces;**

The total number of faces in the scene.

#### **int lights;**

The total number of lights in the scene.

#### **int start;**

The scene start time.

#### **int end;**

The scene end time.

#### **DWORD flags;**

This variable contains all the flags relating to the scene's rendering options, which are following values:

#### **SCENE\_SHADOWMAPPED**

The shadowmapped flag.

#### **SCENE\_RAYTRACED**

The raytraced flag.

#### **SCENE\_VIDEOCOLORCHECK**

The video color check flag.

#### **SCENE\_TWOSIDED**

The render two sided flag..

#### **SCENE\_RENDERHIDEN**

The render hidden objects flag.

#### **SCENE\_RENDERATMOSPHER**

The render atmospheric effects flag.

**SCENE\_SUPERBLACK**

The render super black flag.

**SCENE\_RENDERALPHA**

The render alpha data flag.

**SCENE\_SERIALNUMBERING**

The serial numbering flag.

**SCENE\_DITHER256**

The dither 256 color flag.

**SCENE\_DITHERTRUE**

The dither true color flag.

**SCENE\_RENDERFIELDS**

The render fields flag.

**SCENE\_DISPLACEMENT**

The render displacement flag.

**SCENE\_EFFECTS**

The render effects flag.

**SCENE\_FIELDORDER**

The field ordering, 0 for even and 1 for odd.

**} SceneInfo;**

## Structure MaxJobRenderElements

See Also: [Class MaxNetManager](#), [Structure MaxJob](#)

### Description:

This structure is available in release 4.0 and later only.

This structure is used by the Network Rendering API to enable or disable Render Elements.

**typedef struct {**

**bool enabled;**

    This flag determines if render elements are enabled or not.

**} MaxJobRenderElements;**

## Structure TextBufferOutput

See Also: [Class MaxNetManager](#), [Structure JobText](#)

### Description:

This structure is available in release 4.0 and later only.

This structure contains the actual information for the output text buffer.

**typedef struct {**

**bool device;**

The device flag will be set to TRUE if the output is sent to a device instead of a file.

**float gamma;**

The output gamma for the device, which is optional. If the gamma value is set to 0.0, this value will be ignored.

**TCHAR data[256];**

The text output buffer.

**} TextBufferOutput;**

## Structure JobRenderElement

See Also: [Class MaxNetManager](#), [Structure JobText](#)

### Description:

This structure is available in release 4.0 and later only.

This structure contains the details on a specific Render Element for a job.

**typedef struct {**

**bool enabled;**

This flag indicates if the Render Element is enabled or disabled.

**bool filterenabled;**

This flag indicates if filters are enabled or disabled for the Render Element.

**bool atmosphere\_applied;**

This flag indicates if atmospheric effects are enabled or disabled for the Render Effect.

**bool shadows\_applied;**

This flag indicates if shadows are to be applied for the Render Effect.

**TCHAR name[128];**

The name of the Render Effect.

**TCHAR output[MAX\_PATH];**

The output path and file name of the resulting Render Element.

**} JobRenderElement;**
