- `IllegalStateException` - if this is not a START_ELEMENT or
public String getAttributeLocalName(int index) {
    String localName = attributeName;
    return localName;
}

getAttributeLocalName

String getAttributeLocalName(int index)

    Returns the localName of the attribute at the provided index

Parameters:
    index - the position of the attribute

Returns:
    the localName of the attribute

Throws:
    IllegalStateException - if this is not a START_ELEMENT or ATTRIBUTE

public String getAttributePrefix(int index) {
    String prefix = attributePrefix;
    return prefix;
}

getAttributePrefix

String getAttributePrefix(int index)

    Returns the prefix of this attribute at the provided index

    IllegalStateException - if this is not a START_ELEMENT or ATTRIBUTE
**getAttributeType**

*public String getAttributeType(int index)*

**Parameters:**
- `index` - the position of the attribute

**Returns:**
the prefix of the attribute

**Throws:**
- `IllegalStateException` - if this is not a START_ELEMENT or ATTRIBUTE

---

**getValue**

*public String getAttributeValue(int index)*

**Parameters:**
- `index` - the position of the attribute

**Returns:**
the XML type of the attribute

**Throws:**
- `IllegalStateException` - if this is not a START_ELEMENT or ATTRIBUTE
**getAttributeValue**

`String getAttributeValue(int index)`

Returns the value of the attribute at the index

**Parameters:**
- index - the position of the attribute

**Returns:**
- the attribute value

**Throws:**
- `IllegalStateException` - if this is not a START_ELEMENT or ATTRIBUTE

---

**public boolean isAttributeSpecified(int index)**

`boolean isAttributeSpecified(int index)`

`index`

`return true`

**Throws** `IllegalStateException`: START_ELEMENT ATTRIBUTE

---

**isAttributeSpecified**

`boolean isAttributeSpecified(int index)`

Returns a boolean which indicates if this attribute was created by default

**Parameters:**
- index - the position of the attribute

**Returns:**
- true if this is a default attribute

**Throws:**
- `IllegalStateException` - if this is not a START_ELEMENT or ATTRIBUTE
public int getNamespaceCount()

    START_ELEMENT END_ELEMENT
    START_ELEMENTEND_ELEMENT NAMESPACE
    END_ELEMENT SAX
    return
    Throws  IllegalStateException: START_ELEMENTEND_ELEMENT NAMESPACE

getNamespaceCount

    int getNamespaceCount()

    Returns the count of namespaces declared on this
    START ELEMENT or END ELEMENT, this method is only valid on
    a START ELEMENT, END ELEMENT or NAMESPACE. On an
    END ELEMENT the count is of the namespaces that are about to go
    out of scope. This is the equivalent of the information reported by
    SAX callback for an end element event.

    Returns:
    returns the number of namespace declarations on this specific
    element
    Throws:
    IllegalStateException - if this is not a START_ELEMENT,
    END_ELEMENT or NAMESPACE

public String getNamespacePrefix(int index)

    index  null
    index
    return
    Throws  IllegalStateException: START_ELEMENTEND_ELEMENT NAMESPACE

getNamespacePrefix
public String getNamespacePrefix(int index)

    Returns the prefix for the namespace declared at the index. Returns null if this is the default namespace declaration

    Parameters:
    index - the position of the namespace declaration

    Returns:
    returns the namespace prefix

    Throws:
    IllegalStateException - if this is not a START_ELEMENT, END_ELEMENT or NAMESPACE

public String getNamespaceURI(int index)

    Returns the uri for the namespace declared at the index.

    Parameters:
    index - the position of the namespace declaration

    Returns:
    returns the namespace uri

    Throws:
    IllegalStateException - if this is not a START_ELEMENT, END_ELEMENT or NAMESPACE

public javax.xml.namespace.NamespaceContext
getNamespaceContext()

transient next() reader

return

getNamespaceContext

NamespaceContext getNamespaceContext()

Returns a read only namespace context for the current position. The context is transient and only valid until a call to next() changes the state of the reader.

Returns:
return a namespace context

public int getEventType()

gETEVENType

int getEventType()

Returns an integer code that indicates the type of the event the cursor is pointing to.

public String getText()

getText

VARCHAR CHARACTERS COMMENT
ENTITY_REFERENCE CDATA SPACE DTD
ENTITY_REFERENCE CHARACTERS

return null

Throws IllegalStateException:
**getText**

`String getText()`

Returns the current value of the parse event as a string, this returns the string value of a CHARACTERS event, returns the value of a COMMENT, the replacement value for an ENTITY_REFERENCE, the string value of a CDATA section, the string value for a SPACE event, or the String value of the internal subset of the DTD. If an ENTITY_REFERENCE has been resolved, any character data will be reported as CHARACTERS events.

**Returns:**
the current text or null

**Throws:**
`IllegalStateException` - if this state is not a valid text state.

---

**public char[] getTextCharacters()**

`transient XMLStreamReader return`

`return` `transient` `XMLStreamReader`

```java
    return transient XMLStreamReader;
```

**Throws**
`IllegalStateException`: 

---

**getTextCharacters**

`char[] getTextCharacters()`

Returns an array which contains the characters from this event. This array should be treated as read-only and transient. I.e. the array will contain the text characters until the XMLStreamReader moves on to the next event. Attempts to hold onto the character array beyond that time or modify the contents of the array are breaches of the contract for this interface.

**Returns:**
the current text or an empty array

**Throws:**
`IllegalStateException` - if this state is not a valid text state.
public int getTextCharacters(int sourceStart, char[] target, int targetStart, int length) throws XMLStreamException

CHARACTERSSPACE CDATA "sourceStart" "targetStart" "target" "length" "sourceStart" 0 "sourceStart" 0

"length"

myBuffer = new char[length]; for (int sourceStart = 0; ; sourceStart += length) {
    int nCopied = stream.getTextCharacters(sourceStart, myBuffer, 0, length);
    if (nCopied < length) break;
} XML

XMLStreamException "targetStart" 0 "target"

Length 0 "targetStart + length" "target"

sourceStart

target

targetStart

length

return

Throws XMLStreamException: XML

Throws IndexOutOfBoundsException: targetStart < 0 

Throws IndexOutOfBoundsException: length < 0 targetStart + length

Throws UnsupportedOperationException:

Throws NullPointerException: null

getTextCharacters

int getTextCharacters(int sourceStart, char[] target, int targetStart, int length) throws XMLStreamException

Gets the the text associated with a CHARACTERS, SPACE or CDATA event. Text starting a "sourceStart" is copied into "target"
starting at "targetStart". Up to "length" characters are copied. The number of characters actually copied is returned. The "sourceStart" argument must be greater or equal to 0 and less than or equal to the number of characters associated with the event. Usually, one requests text starting at a "sourceStart" of 0. If the number of characters actually copied is less than the "length", then there is no more text. Otherwise, subsequent calls need to be made until all text has been retrieved. For example: int length = 1024; char[] myBuffer = new char[ length ]; for ( int sourceStart = 0 ; ; sourceStart += length ) { int nCopied = stream.getTextCharacters( sourceStart, myBuffer, 0, length ); if (nCopied < length) break; } XMLStreamException may be thrown if there are any XML errors in the underlying source. The "targetStart" argument must be greater than or equal to 0 and less than the length of "target", Length must be greater than 0 and "targetStart + length" must be less than or equal to length of "target".

Parameters:
- sourceStart - the index of the first character in the source array to copy
- target - the destination array
- targetStart - the start offset in the target array
- length - the number of characters to copy

Returns:
- the number of characters actually copied

Throws:
- XMLStreamException - if the underlying XML source is not well-formed
- IndexOutOfBoundsException - if targetStart < 0 or > than the length of target
- IndexOutOfBoundsException - if length < 0 or targetStart + length > length of target
- UnsupportedOperation Exception - if this method is not supported
- NullPointerException - if target is null

public int getTextStart()
**getTextStart**

```java
int getTextStart()
```

Returns the offset into the text character array where the first character (of this text event) is stored.

**Throws:**

*IllegalStateException* - if this state is not a valid text state.

**getTextLength**

```java
public int getTextLength()
```

**Throws**

IllegalStateException: 

**public String getEncoding()**

```java
null
```

```java
return null
```

**getEncoding**

```java
String getEncoding()
```
Return input encoding if known or null if unknown.

Returns: the encoding of this instance or null

public boolean hasText()
  true false CHARACTERSDTD ENTITY_REFERENCECOMMENTSPACE

hasText

boolean hasText()

Return true if the current event has text, false otherwise The following events have text: CHARACTERS, DTD, ENTITY_REFERENCE, COMMENT, SPACE

public Location getLocation()
  Location Location -1 publicId
systemId  null next()

getLocation

Location getLocation()

Return the current location of the processor. If the Location is unknown the processor should return an implementation of Location that returns -1 for the location and null for the publicId and systemId. The location information is only valid until next() is called.

public javax.xml.namespace.QName getName()
  START_ELEMENT END_ELEMENT QName

getName
**getLocalName**

Declares:

```
public String getLocalName()
```

**Returns:**

the (local) name of the current event. For START_ELEMENT or END_ELEMENT returns the (local) name of the current element. For ENTITY_REFERENCE it returns entity name. The current event must be START_ELEMENT or END_ELEMENT, or ENTITY_REFERENCE

**Throws:**

IllegalStateException - if this is not a START_ELEMENT or END_ELEMENT
Returns:
the localName

Throws:

IllegalStateException - if this not a START_ELEMENT, END_ELEMENT or ENTITY_REFERENCE

public boolean hasName()

START_ELEMENT  END_ELEMENT  true  false

hasName

boolean hasName()

returns true if the current event has a name (is a START_ELEMENT or END_ELEMENT) returns false otherwise

public String getNamespaceURI()

START_ELEMENT  END_ELEMENT  URI

null

return

URI null

getNamespaceURI

String getNamespaceURI()

If the current event is a START_ELEMENT or END_ELEMENT this method returns the URI of the prefix or the default namespace. Returns null if the event does not have a prefix.

Returns:
the URI bound to this elements prefix, the default namespace, or null
public String getPrefix()
null
        return null

getPrefix

String getPrefix()

Returns the prefix of the current event or null if the event does not have a prefix

Returns:
the prefix or null

public String getVersion()
xml xml null
        return XML null

getVersion

String getVersion()

Get the xml version declared on the xml declaration Returns null if none was declared

Returns:
the XML version or null

public boolean isStandalone()
xml
        return true false
isStandalone

boolean isStandalone()

Get the standalone declaration from the xml declaration

**Returns:**
true if this is standalone, or false otherwise

---

public boolean standaloneSet()

    return true false

standaloneSet

boolean standaloneSet()

Checks if standalone was set in the document

**Returns:**
true if standalone was set in the document, or false otherwise

---

public String getCharacterEncodingScheme()

    xml null

String getCharacterEncodingScheme()

    return null

getCharacterEncodingScheme

**Returns:**
Returns the character encoding declared on the xml declaration
Returns null if none was declared
the encoding declared in the document or null

```java
public String getPITarget()
```

```
return null
```

**getPITarget**

```java
String getPITarget()
```

Get the target of a processing instruction

**Returns:**

the target or null

```java
public String getPIData()
```

```
return null
```

**getPIData**

```java
String getPIData()
```

Get the data section of a processing instruction

**Returns:**

the data or null

PS :
javax.xml.stream Interface XMLStreamWriter

public interface XMLStreamWriter

XMLStreamWriter XMLXMLStreamWriter writeCharacters
<& >writeAttribute "
javax.xml.stream.isPrefixDefaulting false URI
javax.xml.stream.isPrefixDefaulting true XMLStreamWriter
URI

    version 1.0

See javax.xml.stream.XMLOutputFactory,
also javax.xml.stream.XMLStreamReader

The XMLStreamWriter interface specifies how to write XML. The
XMLStreamWriter does not perform well formedness checking on its
input. However the writeCharacters method is required to escape & , <
and > For attribute values the writeAttribute method will escape the
above characters plus " to ensure that all character content and attribute
values are well formed. Each NAMESPACE and ATTRIBUTE must be
individually written. If javax.xml.stream.isPrefixDefaulting is set to false it
is a fatal error if an element is written with namespace URI that has not
been bound to a prefix. If javax.xml.stream.isPrefixDefaulting is set to
true the XMLStreamWriter implementation must write a prefix for each
unbound URI that it encounters in the current scope.

</table>
Write text to the output

```java
void writeCharacters(String text)
    Write text to the output
```

```java
void writeComment(String data)
    Writes an xml comment with the data enclosed
```

```java
void writeDefaultNamespace(String namespaceURI)
    Writes the default namespace to the stream
```

```java
void writeDTD(String dtd)
    Write a DTD section.
```

```java
void writeEmptyElement(String localName)
    Writes an empty element tag to the output
```

```java
void writeEmptyElement(String namespaceURI, String localName)
    Writes an empty element tag to the output
```

```java
void writeEmptyElement(String prefix, String namespaceURI)
    Writes an empty element tag to the output
```

```java
void writeEndDocument()
    Closes any start tags and writes corresponding end tags.
```

```java
void writeEndElement()
    Writes an end tag to the output relying on the internal state of the writer to determine the prefix and local name of the event.
```

```java
void writeEntityRef(String name)
    Writes an entity reference
```

```java
void writeNamespace(String prefix, String namespaceURI)
    Writes a namespace to the output stream If the prefix argument to this method is the empty string, "xmlns", or null this method will delegate to writeDefaultNamespace
```

```java
void writeProcessingInstruction(String target)
    Writes a processing instruction
```

```java
void writeProcessingInstruction(String target, String data)
```

**Method Detail**

```java
public void writeStartElement(String localName) throws XMLStreamException {
    // Implementation
}
```

**writeStartElement**

```java
void writeStartElement(String localName) throws XMLStreamException {
    // Implementation
}
```

Writes a start tag to the output. All writeStartElement methods open a new scope in the internal namespace context. Writing the corresponding EndElement causes the scope to be closed.

**Parameters:**
public void writeStartElement(String namespaceURI, String localName) throws XMLStreamException

namespaceURI null
localName null

Writes a start tag to the output

Parameters:
namespaceURI - the namespaceURI of the prefix to use, may not be null
localName - local name of the tag, may not be null

Throws:
XMLStreamException - if the namespace URI has not been bound to a prefix and javax.xml.stream.isPrefixDefaulting has not been set to true

public void writeStartElement(String prefix, String localName, String namespaceURI) throws XMLStreamException

localName null
prefix null
writeStartElement

```java
void writeStartElement(String prefix,
                       String localName,
                       String namespaceURI)
  throws XMLStreamException
```

Writes a start tag to the output

**Parameters:**
- `localName` - local name of the tag, may not be null
- `prefix` - the prefix of the tag, may not be null
- `namespaceURI` - the uri to bind the prefix to, may not be null

**Throws:**
- `XMLStreamException`

writeEmptyElement

```java
public void writeEmptyElement(String namespaceURI,
                               String localName)
  throws XMLStreamException
```

```
namespaceURI URI null
localName URI null
Throws XMLStreamException: URI
javax.xml.stream.isPrefixDefaulting true
```

**Parameters:**
- `namespaceURI` - URI null
- `localName` - null

**Throws:**
- `XMLStreamException`

**javax.xml.stream.isPrefixDefaulting** is set to `true`.
namespaceURI - the uri to bind the tag to, may not be null
localName - local name of the tag, may not be null

Throws:
XMLStreamException - if the namespace URI has not been bound to a prefix and javax.xml.stream.isPrefixDefaulting has not been set to true

public void writeEmptyElement(String prefix, String localName, String namespaceURI) throws XMLStreamException

<table>
<thead>
<tr>
<th>prefix</th>
<th>null</th>
</tr>
</thead>
<tbody>
<tr>
<td>localName</td>
<td>null</td>
</tr>
<tr>
<td>namespaceURI</td>
<td>URI null</td>
</tr>
</tbody>
</table>

Throws: XMLStreamException:

writeEmptyElement

void writeEmptyElement(String prefix, String localName, String namespaceURI) throws XMLStreamException

Writes an empty element tag to the output

Parameters:
prefix - the prefix of the tag, may not be null
localName - local name of the tag, may not be null
namespaceURI - the uri to bind the tag to, may not be null

Throws: XMLStreamException

public void writeEmptyElement(String localName) throws XMLStreamException

writeEmptyElement

void writeEmptyElement(String prefix, String localName, String namespaceURI) throws XMLStreamException

Throws: XMLStreamException:

---

public void writeEmptyElement(String localName) throws XMLStreamException
writeEmptyElement

```java
void writeEmptyElement(String localName)
  throws XMLStreamException
```

Writes an empty element tag to the output

**Parameters:**
localName - local name of the tag, may not be null

**Throws:**
XMLStreamException

writeEndElement

```java
public void writeEndElement() throws XMLStreamException
```

writes an end tag to the output relying on the internal state of the writer to determine the prefix and local name of the event.

**Throws:**
XMLStreamException

writeEndDocument

```java
public void writeEndDocument() throws XMLStreamException
```

**Throws:**
XMLStreamException
writeEndDocument

void writeEndDocument() throws XMLStreamException

Closes any start tags and writes corresponding end tags.

Throws:
XMLStreamException

public void close() throws XMLStreamException

writer writer

Throws
XMLStreamException:

close

void close() throws XMLStreamException

Close this writer and free any resources associated with the writer. This must not close the underlying output stream.

Flushes:
XMLStreamException

public void flush() throws XMLStreamException

Flushes
XMLStreamException:

flush

void flush()
throws XMLStreamException

Write any cached data to the underlying output mechanism.

Throws:
   XMLStreamException

public void writeAttribute(String localName, String value)
throws XMLStreamException

localName
value

Throws     IllegalStateException:  Attribute
            XMLStreamException:

writeAttribute

void writeAttribute(String localName, String value)
throws XMLStreamException

Writes an attribute to the output stream without a prefix.

Parameters:
   localName - the local name of the attribute
   value - the value of the attribute

Throws:
   IllegalStateException - if the current state does not allow
   Attribute writing
   XMLStreamException

public void writeAttribute(String prefix, String namespaceURI, String localName, String value)
throws XMLStreamException
void writeAttribute(String prefix, String namespaceURI, String localName, String value)
throws XMLStreamException

writes an attribute to the output stream

Parameters:
  prefix - the prefix for this attribute
  namespaceURI - the uri of the prefix for this attribute
  localName - the local name of the attribute
  value - the value of the attribute

Throws:
  IllegalStateException - if the current state does not allow Attribute writing
  XMLStreamException - if the namespace URI has not been bound to a prefix and javax.xml.stream.isPrefixDefaulting has not been set to true

public void writeAttribute(String namespaceURI, String localName, String value) throws XMLStreamException
writeAttribute

```java
void writeAttribute(String namespaceURI,
                     String localName,
                     String value)
throws XMLStreamException
```

Writes an attribute to the output stream

**Parameters:**
- namespaceURI - the uri of the prefix for this attribute
- localName - the local name of the attribute
- value - the value of the attribute

**Throws:**
- `IllegalStateException` - if the current state does not allow Attribute writing
- `XMLStreamException` - if the namespace URI has not been bound to a prefix and `javax.xml.stream.isPrefixDefaulting` has not been set to true

writeDefaultNamespace

```java
public void writeNamespace(String prefix, String namespaceURI) throws XMLStreamException
```

prefix "xmlns" null

writeNamespace

```java
prefix
namespaceURI
```

**Throws:**
- `IllegalStateException` - if the current state does not allow Namespace writing
- `XMLStreamException` - if the namespace URI has not been bound to a prefix and `javax.xml.stream.isPrefixDefaulting` has not been set to true
void writeNamespace(String prefix, String namespaceURI) throws XMLStreamException

Writes a namespace to the output stream. If the prefix argument to this method is the empty string, "xmlns", or null this method will delegate to writeDefaultNamespace

**Parameters:**
- prefix - the prefix to bind this namespace to
- namespaceURI - the uri to bind the prefix to

**Throws:**
- IllegalStateException - if the current state does not allow Namespace writing
- XMLStreamException

---

public void writeDefaultNamespace(String namespaceURI) throws XMLStreamException

**namespaceURI**

**Throws**
- IlleagalStateException: Namespace writing
- XMLStreamException

---

writeDefaultNamespace

void writeDefaultNamespace(String namespaceURI) throws XMLStreamException

Writes the default namespace to the stream

**Parameters:**
- namespaceURI - the uri to bind the default namespace to

**Throws:**
- IlleagalStateException - if the current state does not allow Namespace writing
- XMLStreamException
public void writeComment(String data) throws XMLStreamException

 XML
data
null
Throws
XMLStreamException:

writeComment

void writeComment(String data)
throws XMLStreamException

Writes an xml comment with the data enclosed

Parameters:
data - the data contained in the comment, may be null

Throws:
XMLStreamException

public void writeProcessingInstruction(String target)
throws XMLStreamException

target
null
Throws
XMLStreamException:

writeProcessingInstruction

void writeProcessingInstruction(String target)
throws XMLStreamException

Writes a processing instruction

Parameters:
target - the target of the processing instruction, may not be null

Throws:
XMLStreamException
public void writeProcessingInstruction(String target, String data) throws XMLStreamException

    target null
    data null

    Throws XMLStreamException:

writeProcessingInstruction

void writeProcessingInstruction(String target, String data)
throws XMLStreamException

    Writes a processing instruction

    Parameters:
    target - the target of the processing instruction, may not be null
    data - the data contained in the processing instruction, may not be null

    Throws:
    XMLStreamException

public void writeCData(String data) throws XMLStreamException

    CData

    data CData null

    Throws XMLStreamException:

writeCData

void writeCData(String data)
throws XMLStreamException

    Writes a CData section
public void writeDTD(String dtd) throws XMLStreamException

Write a DTD section. This string represents the entire doctypedecl production from the XML 1.0 specification.

Parameters:
  dtd - the DTD to be written

Throws:
  XMLStreamException

public void writeEntityRef(String name) throws XMLStreamException

void writeEntityRef(String name)

Throws:
  XMLStreamException
Wants to write an entity reference

**Parameters:**
- **name** - the name of the entity

**Throws:**
- [XMLStreamException](#)

---

```java
public void writeStartDocument() throws XMLStreamException

XML XML 1.0 utf-8

Throws XMLStreamException:
```

**writeStartDocument**

```java
void writeStartDocument() throws XMLStreamException

Write the XML Declaration. Defaults the XML version to 1.0, and the encoding to utf-8

Throws:
- XMLStreamException
```

---

```java
public void writeStartDocument(String version) throws XMLStreamException

XML XML 1.0

version XML

Throws XMLStreamException:
```

**writeStartDocument**

```java
void writeStartDocument(String version) throws XMLStreamException

Throws XMLStreamException
```
Write the XML Declaration. Defaults the XML version to 1.0

Parameters:
version - version of the xml document

Throws:
XMLStreamException

public void writeStartDocument(String encoding, String version) throws XMLStreamException
XML XMLOutputFactory
XMLStreamWriter
encoding  XML
version  XML

Throws  XMLStreamException:

writeStartDocument

void writeStartDocument(String encoding, String version) throws XMLStreamException

Write the XML Declaration. Note that the encoding parameter does not set the actual encoding of the underlying output. That must be set when the instance of the XMLStreamWriter is created using the XMLOutputFactory

Parameters:
encoding - encoding of the xml declaration
version - version of the xml document

Throws:
XMLStreamException

public void writeCharacters(String text) throws XMLStreamException
XMLStreamException
writeCharacters

void writeCharacters(String text)
throws XMLStreamException

Write text to the output

Parameters:
  text - the value to write

Throws:
  XMLStreamException

public void writeCharacters(char[] text, int start, int len)
throws XMLStreamException

  text
  start
  len

Throws
  XMLStreamException:

writeCharacters

void writeCharacters(char[] text, int start, int len)
throws XMLStreamException

Write text to the output

Parameters:
  text - the value to write
  start - the starting position in the array
  len - the number of characters to write
public String getPrefix(String uri) throws XMLStreamException
URI

    return null

getPrefix

String getPrefix(String uri)
throws XMLStreamException

    Gets the prefix the uri is bound to

Returns:
    the prefix or null

Throws:
    XMLStreamException

public void setPrefix(String prefix, String uri) throws XMLStreamException
URI START_ELEMENT / END_ELEMENT
START_ELEMENT
    prefix URI null
    uri URI null

setPrefix

void setPrefix(String prefix,
    String uri)
throws XMLStreamException
Sets the prefix the uri is bound to. This prefix is bound in the scope of the current START_ELEMENT / END_ELEMENT pair. If this method is called before a START_ELEMENT has been written the prefix is bound in the root scope.

Parameters:
  prefix - the prefix to bind to the uri, may not be null
  uri - the uri to bind to the prefix, may be null

Throws:
  XMLStreamException

public void setDefaultNamespace(String uri) throws XMLStreamException

Binds a URI to the default namespace This URI is bound in the scope of the current START_ELEMENT / END_ELEMENT pair. If this method is called before a START_ELEMENT has been written the uri is bound in the root scope.

Parameters:
  uri - the uri to bind to the default namespace, may be null

Throws:
  XMLStreamException

public void setNamespaceContext(javax.xml.namespace.NamespaceContext

setNamespaceContext

```java
type void setNamespaceContext(NamespaceContext context)
throws XMLStreamException
```

Sets the current namespace context for prefix and uri bindings. This context becomes the root namespace context for writing and will replace the current root namespace context. Subsequent calls to setPrefix and setDefaultNamespace will bind namespaces using the context passed to the method as the root context for resolving namespaces. This method may only be called once at the start of the document. It does not cause the namespaces to be declared. If a namespace URI to prefix mapping is found in the namespace context it is treated as declared and the prefix may be used by the StreamWriter.

**Parameters:**
- `context` - the namespace context to use for this writer, may not be null

**Throws:**
- `XMLStreamException`

---

```java
public javax.xml.namespace.NamespaceContext getNamespaceContext()
```

```java
return NamespaceContext
```

getNamespaceContext
NamespaceContext getNamespaceContext()

Returns the current namespace context.

Returns:
the current NamespaceContext

public Object getProperty(String name) throws
IllegalArgumentException

/)

        name null
        return
        Throws IllegalArgumentException:
        Throws NullPointerException: null

getProperty

Object getProperty(String name)
throws IllegalArgumentException

Get the value of a feature/property from the underlying implementation

Parameters:
name - The name of the property, may not be null

Returns:
The value of the property

Throws:
IllegalArgumentException - if the property is not supported
NullPointerException - if the name is null

PS :
javax.xml.bind.annotation Annotation Type XmlTransient

@Retention(value=RUNTIME)
@Target(value={FIELD, METHOD})
public @interface XmlTransient

Implements: Annotation
@Retention(value=RUNTIME)
@Target(value={FIELD, METHOD})

JavaBean XML

@XmlTransient JavaBean / JavaBean

JavaBean

@XmlTransient

• JavaBean

@XmlTransient JAXB

javax.xml.bind.package javadoc ""

JavaBean

// Example: Code fragment
public class USAddress {

    // The field name "name" collides with the property name
    // obtained by bean decapitalization of getName() below
    @XmlTransient public String name;

    String getName() {..};
    String setName() {..};

}
Prevents the mapping of a JavaBean property to XML representation.

The `@XmlTransient` annotation is useful for resolving name collisions between a JavaBean property name and a field name or preventing the mapping of a field/property. A name collision can occur when the decapitalized JavaBean property name and a field name are the same. If the JavaBean property refers to the field, then the name collision can be resolved by preventing the mapping of either the field or the JavaBean property using the `@XmlTransient` annotation.

**Usage**

The `@XmlTransient` annotation can be used with the following program elements:

- a JavaBean property
- field

`@XmlTransient` is mutually exclusive with all other JAXB defined annotations.

**Example:** Resolve name collision between JavaBean property and field name

```java
// Example: Code fragment
class USAddress {
```
// The field name "name" collides with the property name
// obtained by bean decapitalization of getName() below
@XmlTransient public String name;

String getName() { ..};
String setName() { ..};
}

<!-- Example: XML Schema fragment -->
<xs:complexType name="USAddress">
  <xs:sequence>
    <xs:element name="name" type="xs:string"/>
  </xs:sequence>
</xs:complexType>

javax.xml.bind.annotation.XmlAttribute,
javax.xml.bind.annotation.XmlValue,
javax.xml.bind.annotation.XmlSchema

Maps a class or an enum type to a XML Schema type.
Usage

The @XmlType annotation can be used with the following program elements:

- a top level class
- an enum type

Mapping a Class

A class maps to a XML Schema type. A class is a data container for values represented by properties and fields. A schema type is a data container for values represented by schema components within a schema type's content model (e.g. model groups, attributes etc).

To be mapped, a class must either have a public no-arg constructor or a static no-arg factory method. The static factory method can be specified in factoryMethod() and factoryClass() annotation elements. The static factory method or the no-arg constructor is used during unmarshalling to create an instance of this class. If both are present, the static factory method overrides the no-arg constructor.

A class maps to either a XML Schema complex type or a XML Schema simple type. The XML Schema type is derived based on the mapping of JavaBean properties and fields contained within the class. The schema type to which the class is mapped can either be named or anonymous. A class can be mapped to an anonymous schema type by annotating the class with @XmlType(name="").

Either a global element, local element or a local attribute can be associated with an anonymous type as follows:

- **global element**: A global element of an anonymous type can be derived by annotating the class with @XmlElement. See Example 3 below.
- **local element**: A JavaBean property that references a class
annotated with @XmlType(name="") and is mapped to the element associated with the anonymous type. See Example 4 below.

- **attribute**: A JavaBean property that references a class annotated with @XmlType(name="") and is mapped to the attribute associated with the anonymous type. See Example 5 below.

**Mapping to XML Schema Complex Type**

- If class is annotated with @XmlType(name="") , it is mapped to an anonymous type otherwise, the class name maps to a complex type name. The XmlName() annotation element can be used to customize the name.
- Properties and fields that are mapped to elements are mapped to a content model within a complex type. The annotation element propOrder() can be used to customize the content model to be xs:all or xs:sequence. It is used for specifying the order of XML elements in xs:sequence.
- Properties and fields can be mapped to attributes within the complex type.
- The targetnamespace of the XML Schema type can be customized using the annotation element namespace().

**Mapping class to XML Schema simple type**

A class can be mapped to a XML Schema simple type using the @XmlValue annotation. For additional details and examples, see @XmlValue annotation type.

The following table shows the mapping of the class to a XML Schema complex type or simple type. The notational symbols used in the table are:

- <-> : represents a mapping
- [x]+ : one or more occurrences of x
- [ @XmlValue property ]: JavaBean property annotated with @XmlValue
- X : don't care

<table>
<thead>
<tr>
<th>Target</th>
<th>propOrder</th>
<th>ClassBody</th>
<th>ComplexType</th>
<th>SimpleType</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>[property]+ &lt;-&gt;</td>
<td>complexcontent</td>
<td></td>
</tr>
</tbody>
</table>
Mapping an enum type

An enum type maps to a XML schema simple type with enumeration facets. The following annotation elements are ignored since they are not meaningful: propOrder(), factoryMethod(), factoryClass().

Usage with other annotations

This annotation can be used with the following annotations: XmlRootElement, XmlAccessorType, XmlAccessorOrder, XmlAccessorType, XmlEnum. However, XmlAccessorOrder and XmlAccessorType are ignored when this annotation is used on an enum type.

Example 1: Map a class to a complex type with xs:sequence with a customized ordering of JavaBean properties.

```java
@XmlElement(propOrder={"street", "city", "state", "zip", "name"})
public class USAddress {
    String getName() {..};
    void setName(String) {..};

    String getStreet() {..};
    void setStreet(String) {..};
```
String getCity() {..};
void setCity(String) {..};

String getState() {..};
void setState(String) {..};

java.math.BigDecimal getZip() {..};
void setZip(java.math.BigDecimal) {..};

</xs:complexType>
</xs:typedef>

Example 2: Map a class to a complex type with xs:all

@XmlElement(propOrder={})
public class USAddress { ...}

</xs:complexType>
</xs:typedef>

Example 3: Map a class to a global element with an anonymous type.

@XmlRootElement
@XmlType(name="")
public class USAddress { ...}

</xs:complexType>
Example 4: Map a property to a local element with anonymous type.

```java
//Example: Code fragment
class Invoice {
    USAddress addr;
    ...
}
@XmlType(name="")
class USAddress {
    ...
}

<!-- XML Schema mapping for USAddress -->
<complexType name="Invoice">
    <sequence>
        <element name="addr">
            <complexType>
                <element name="name", type="xs:string"/>
                <element name="city", type="xs:string"/>
                <element name="state" type="xs:string"/>
                <element name="zip" type="xs:decimal"/>
            </complexType>
        ...
    </sequence>
</complexType>
```

Example 5: Map a property to an attribute with anonymous type.

```java
//Example: Code fragment
public class Item {
    public String name;
    @XmlAttribute
    public USPrice price;
}

// map class to anonymous simple type.
@XmlType(name="")
public class USPrice {
    @XmlValue
    public java.math.BigDecimal price;
}

<!-- Example: XML Schema fragment -->
<xsd:complexType name="Item">
    <xsd:sequence>
        <xsd:element name="name" type="xsd:string"/>
        <xsd:attribute name="price">
            <xsd:simpleType>
                <xsd:restriction base="xsd:decimal"/>
            </xsd:simpleType>
        </xsd:attribute>
    </xsd:sequence>
</xsd:complexType>

Example 6: Define a factoryClass and factoryMethod

@XmlType(name="USAddressType", factoryClass=USAddressFactory.class,
        factoryMethod="getUSAddress")
public class USAddress {
    private String city;
    private String name;
    private String state;
    private String street;
    private int zip;

    public USAddress(String name, String street, String city,
                      String state, int zip) {
        this.name = name;
        this.street = street;
        this.city = city;
        this.state = state;
        this.zip = zip;
    }
}

public class USAddressFactory {
    public static USAddress getUSAddress() {
        return new USAddress("Mark Baker", "23 Elm St", "Dayton", "OH", 90952);
    }
}
Example 7: Define factoryMethod and use the default factoryClass

```java
@XmlType(name="USAddressType", factoryMethod="getNewInstance")
public class USAddress {

    private String city;
    private String name;
    private String state;
    private String street;
    private int zip;

    private USAddress() {}

    public static USAddress getNewInstance(){
        return new USAddress();
    }
}
```

</tbody>
</table>

abstract public String name()

XML

name

public abstract String name

Name of the XML Schema type which the class is mapped.

Default:

"##default"

abstract public String[] propOrder()

XML XML

propOrder

propOrder JavaBean JavaBean Java
JavaBean JavaBean XML

XML JavaBean

propOrder JavaBean transient

JavaBean @ XmlAccessorOrder
propOrder

public abstract String[] propOrder

Specifies the order for XML Schema elements when class is mapped to a XML Schema complex type.

Refer to the table for how the propOrder affects the mapping of class

The propOrder is a list of names of JavaBean properties in the class. Each name in the list is the name of a Java identifier of the JavaBean property. The order in which JavaBean properties are listed is the order of XML Schema elements to which the JavaBean properties are mapped.

All of the JavaBean properties being mapped to XML Schema elements must be listed.

A JavaBean property or field listed in propOrder must not be transient or annotated with @XmlTransient.

The default ordering of JavaBean properties is determined by @XmlAccessorOrder.

Default:

abstract public String namespace()

XML

namespace

public abstract String namespace

Name of the target namespace of the XML Schema type. By default, this is the target namespace to which the package containing the class is mapped.
abstract public Class\(<T>\) factoryClass()

factoryClass DEFAULT.class factoryMethod ""

factoryClass DEFAULT.class factoryMethod ""
factoryMethod

factoryClass DEFAULT.class factoryMethod ""
factoryClass

Class containing a no-arg factory method for creating an instance of this class. The default is this class.

If factoryClass is DEFAULT.class and factoryMethod is "", then there is no static factory method.

If factoryClass is DEFAULT.class and factoryMethod is not "", then factoryMethod is the name of a static factory method in this class.

If factoryClass is not DEFAULT.class, then factoryMethod must not be "" and must be the name of a static factory method specified in factoryClass.

Default:
javax.xml.bind.annotation.XmlType.DEFAULT.class
abstract public String factoryMethod()

factoryClass factoryClass()

factoryMethod

public abstract String factoryMethod

Name of a no-arg factory method in the class specified in factoryClass factoryClass().

Default:

""

Field Detail

XSD_STRING

public static final QName XSD_STRING

The name of the xsd:string type.

XSD_FLOAT

public static final QName XSD_FLOAT

The name of the xsd:float type.
XSD_BOOLEAN

public static final QName XSD_BOOLEAN

   The name of the xsd:boolean type.

XSD_DOUBLE

public static final QName XSD_DOUBLE

   The name of the xsd:double type.

XSD_INTEGER

public static final QName XSD_INTEGER

   The name of the xsd:integer type.

XSD_INT

public static final QName XSD_INT

   The name of the xsd:int type.

XSD_LONG

public static final QName XSD_LONG
The name of the xsd:long type.

XSD_SHORT

public static final QName XSD_SHORT

The name of the xsd:short type.

XSD_DECIMAL

public static final QName XSD_DECIMAL

The name of the xsd:decimal type.

XSD_BASE64

public static final QName XSD_BASE64

The name of the xsd:base64Binary type.

XSD_HEXBINARY

public static final QName XSD_HEXBINARY

The name of the xsd:hexBinary type.
XSD_BYTE
public static final QName XSD_BYTE

The name of the xsd:byte type.

XSD_DATETIME
public static final QName XSD_DATETIME

The name of the xsd:dateTime type.

XSD_QNAME
public static final QName XSD_QNAME

The name of the xsd:QName type.

SOAP_STRING
public static final QName SOAP_STRING

The name of the SOAP-ENC:string type.

SOAP_BOOLEAN
public static final QName SOAP_BOOLEAN
The name of the SOAP-ENC:boolean type.

SOAP_DOUBLE
public static final QName SOAP_DOUBLE

The name of the SOAP-ENC:double type.

SOAP_BASE64
public static final QName SOAP_BASE64

The name of the SOAP-ENC:base64 type.

SOAP_FLOAT
public static final QName SOAP_FLOAT

The name of the SOAP-ENC:float type.

SOAP_INT
public static final QName SOAP_INT

The name of the SOAP-ENC:int type.
SOAP_LONG

public static final QName SOAP_LONG

     The name of the SOAP-ENC:long type.

-----------------------------

SOAP_SHORT

public static final QName SOAP_SHORT

     The name of the SOAP-ENC:short type.

-----------------------------

SOAP_BYTE

public static final QName SOAP_BYTE

     The name of the SOAP-ENC:byte type.

-----------------------------

SOAP_ARRAY

public static final QName SOAP_ARRAY

     The name of the SOAP-ENC:Array type.

Constructors

JavaBean XML
JavaBean simpleContent

1 XML simpleType

    // Example 1: Code fragment
    public class USPrice {
        @XmlValue
        public java.math.BigDecimal price;
    }
<!--
Example 1: XML Schema fragment -->
<xs:simpleType name="USPrice">
  <xs:restriction base="xs:decimal"/>
</xs:simpleType>

2 simpleContent XML complexType

// Example 2: Code fragment
public class InternationalPrice {
  @XmlValue
  public java.math.BigDecimal price;

  @XmlAttribute
  public String currency;
}

<!--
Example 2: XML Schema fragment -->
<xs:complexType name="InternationalPrice">
  <xs:simpleContent>
    <xs:extension base="xs:decimal">
      <xs:attribute name="currency" type="xs:string"/>
    </xs:extension>
  </xs:simpleContent>
</xs:complexType>

since JAXB2.0
version $Revision: 1.6 $
See also javax.xml.bind.annotation.XmlType

Enables mapping a class to a XML Schema complex type with a simpleContent or a XML Schema simple type.

Usage:

The @XmlValue annotation can be used with the following program elements:

- a JavaBean property.
- non static, non transient field.

The usage is subject to the following usage constraints:

- At most one field or property can be annotated with the @XmlValue annotation.
- @XmlValue can be used with the following annotations: XmlList. However this is redundant since XmlList maps a type to a simple schema type that derives by list just as XmlValue would.
- If the type of the field or property is a collection type, then the collection item type must map to a simple schema type.
- If the type of the field or property is not a collection type, then the type must map to a XML Schema simple type.

If the annotated JavaBean property is the sole class member being mapped to XML Schema construct, then the class is mapped to a simple type. If there are additional JavaBean properties (other than the JavaBean property annotated with @XmlValue annotation) that are mapped to XML attributes, then the class is mapped to a complex type with simpleContent.

**Example 1:** Map a class to XML Schema simpleType

```java
// Example 1: Code fragment
public class USPrice {
    @XmlValue
    public java.math.BigDecimal price;
}

<!-- Example 1: XML Schema fragment -->
<xs:simpleType name="USPrice">
    <xs:restriction base="xs:decimal"/>
</xs:simpleType>
```

**Example 2:** Map a class to XML Schema complexType with with simpleContent.

```java
// Example 2: Code fragment
```
public class InternationalPrice {
    @XmlValue
    public java.math.BigDecimal price;

    @XmlAttribute
    public String currency;
}

<xs:complexType name="InternationalPrice">
    <xs:simpleContent>
        <xs:extension base="xs:decimal">
            <xs:attribute name="currency" type="xs:string"/>
        </xs:extension>
    </xs:simpleContent>
</xs:complexType>

Adding a DDBean

**BEAN_REMOVED**

public static final `Object` BEAN_REMOVED

Removing a DDBean
public static final Object BEAN_CHANGED

Changing a DDBean

## Constructor Detail

**public XpathEvent(DDBean bean, Object typ)**

**ConfigBean**

```java
public XpathEvent(
    DDBean bean,
    Object typ)
```

A description of a change in the ConfigBean tree.

**Parameters:**
- **bean** - The ConfigBean being added/removed.
- **typ** - Indicates an add/remove event.

## Method Detail

**public java.beans.PropertyChangeEvent getChangeEvent()**

**getChangeEvent**

```java
public PropertyChangeEvent getChangeEvent()
```

---

**public void**
setChangeEvent(PropertyChangeEvent pce)

setChangeEvent
public void setChangeEvent(PropertyChangeEvent pce)

public DDBean getBean()
// Bean
            return // Bean

getBean
public DDBean getBean()

    The bean being added/removed/changed.

    Returns:
    The bean being added/removed/changed.

public boolean isAddEvent()
            return true

isAddEvent
public boolean isAddEvent()

    Is this an add event?

    Returns:
    true if this is an add event.
public boolean isRemoveEvent()

    return true

isRemoveEvent

public boolean isRemoveEvent()

    Is this a remove event?

    Returns:
    true if this is a remove event.

public boolean isChangeEvent()

    return true

isChangeEvent

public boolean isChangeEvent()

    Is this a change event?

    Returns:
    true if this is a change event.

Package javax.faces.event

Interfaces describing events and event listeners, and concrete event implementation classes.

See: Description

### Interface Summary

<table>
<thead>
<tr>
<th>Interface Summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActionListener</td>
<td>A listener interface for receiving ActionEvents.</td>
</tr>
<tr>
<td>FacesListener</td>
<td>A generic base interface for event listeners for various types of FacesEvents.</td>
</tr>
<tr>
<td>PhaseListener</td>
<td>An interface implemented by objects that wish to be notified at the beginning and ending of processing for each standard phase of the request processing lifecycle.</td>
</tr>
<tr>
<td>ValueChangeListener</td>
<td>A listener interface for receiving ValueChangeEvent.</td>
</tr>
</tbody>
</table>

### Class Summary

<table>
<thead>
<tr>
<th>Class Summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActionEvent</td>
<td>An ActionEvent represents the activation of a user interface component (such as a UICommand).</td>
</tr>
<tr>
<td>FacesEvent</td>
<td>FacesEvent is the base class of interface and application events that can be fired by UIComponents.</td>
</tr>
<tr>
<td>MethodExpressionActionListener</td>
<td>MethodExpressionActionListener is an ActionListener that wraps a MethodExpression.</td>
</tr>
<tr>
<td>MethodExpressionValueChangeListener</td>
<td>MethodExpressionValueChangeListener is a ValueChangeListener that wraps a MethodExpression.</td>
</tr>
</tbody>
</table>
| PhaseEvent               | PhaseEvent represents the beginning or
### PhaseEvent

Ending of processing for a particular phase of the request processing lifecycle, request encapsulated by the `FacesContext`.

### PhaseId

Typesafe enumeration of the legal values that may be returned by the `getPhaseId()` method of the `FacesEvent` interface.

### ValueChangeEvent

A `ValueChangeEvent` is a notification that the local value of the source component has been changed as a result of user interface activity.

## Exception Summary

<table>
<thead>
<tr>
<th>ExceptionSummary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AbortProcessingException</strong></td>
<td>An exception that may be thrown by event listeners to terminate the processing of the current event.</td>
</tr>
</tbody>
</table>
Package javax.faces.event Description

Interfaces describing events and event listeners, and concrete event implementation classes. All events extend from `FacesEvent` and all listeners extend from `FacesListener`.

For your convenience here is a UML class diagram of the classes in this package.

<tr>
<td>javax.enterprise.deploy.spi.DeploymentManager.distribute(Target[], InputStream, InputStream)</td>
<td>as of Java EE 5, replaced with DeploymentManager.distribute(Target[], ModuleType, InputStream, InputStream)</td>
</tr>
<tr>
<td>javax.faces.webapp.UIComponentClassicTagBase.encodeBegin()</td>
<td>No encoding is done during JSP page execution. Encoding is deferred until the page has completed executing to allow the entire tree to be built before any encoding occurs.</td>
</tr>
</tbody>
</table>
javax.faces.webapp.UIComponentClassicTagBase.encodeChildren()
No encoding is done during JSP page execution. Encoding is deferred executing to allow the entire tree to be built before any encoding occurs.

javax.faces.webapp.UIComponentClassicTagBase.encodeEnd()
No encoding is done during JSP page execution. Encoding is deferred executing to allow the entire tree to be built before any encoding occurs.

javax.servlet.http.HttpServletResponse.encodeRedirectUrl(String)
As of version 2.1, use encodeRedirectURL(String url) instead

javax.servlet.http.HttpServletResponse.encodeUrl(String)
As of version 2.1, use encodeURL(String url) instead

javax.faces.component.ActionSource.getAction()
This has been replaced by ActionSource2.getActionExpression().

javax.faces.component.UICommand.getAction()
This has been replaced by UICommand.getActionExpression().

javax.faces.component.ActionSource.getActionListener()
Use ActionSource.getActionListeners() instead.

javax.faces.component.UICommand.getActionListener()
Use UICommand.getActionListeners() instead.

javax.ejb.EJBContext.getCallerIdentity()
Use Principal.getCallerPrincipal() instead.

javax.faces.render.ResponseStateManager.getComponentStateToRestore(FacesContext)
This method has been replaced by ResponseStateManager.getState(javax.faces.context.FacesContext, java.lang.String). The default implementation returns null.

javax.faces.application.StateManager.getComponentStateToSave(FacesContext)
the distinction between tree structure and component state is now an implementation detail returns null.

javax.ejb.EJBContext.getEnvironment()
Use the JNDI naming context java:comp/env to access enterprise bean's environment.

javax.xml.bind.Validator.getEventHandler()
since JAXB2.0

javax.servlet.jsp.JspContext.getExpressionEvaluator()
As of JSP 2.1, replaced by JspApplicationContext.getExpressionFactory()

javax.servlet.http.HttpSessionContext.getIds()
As of Java Servlet API 2.1 with no replacement. This method must be removed in a future version of this API.
**javax.resource.ResourceException.getLinkedException()**

J2SE release 1.4 supports a chained exception facility that allows a throwable, if any, that caused it to get thrown. Refer to `getCause` and `initCause` in `java.lang.Throwable`.

**javax.resource.cci.ResourceWarning.getLinkedWarning()**

J2SE release 1.4 supports a chained exception facility that allows a throwable, if any, that caused it to get thrown. Refer to `getCause` and `initCause` in `java.lang.Throwable`.

**javax.enterprise.deploy.model.DDBeanRoot.getModuleDTDVersion()**

As of version 1.1 replaced by `DDBeanRoot.getDDBeanRootVersion()`.

**javax.enterprise.deploy.model.DeployableObject.getModuleDTDVersion()**

As of version 1.1 replaced by `DDBeanRoot.getDDBeanRootVersion()`.

**javax.xml.bind.Validator.getProperty(String)**

Since JAXB2.0

**javax.faces.application.Application.getPropertyResolver()**

This has been replaced by `Application.getELResolver()`.

**javax.servlet.ServletRequest.getRealPath(String)**

As of Version 2.1 of the Java Servlet API, use `ServletContext.getRealPath()`.

**javax.servlet.jsp.JspException.getRootCause()**

As of JSP 2.1, replaced by `Throwable.getCause()`.

**javax.servlet.UnavailableException.getServlet()**

As of Java Servlet API 2.2, with no replacement. Returns the servlet that is reporting its unavailability.

**javax.servlet.ServletContext.getServlet(String)**

As of Java Servlet API 2.1, with no direct replacement. This method was originally defined to retrieve a servlet from a `ServletContext`. It returns `null` and remains only to preserve binary compatibility. This method will be permanently removed in future version of the Java Servlet API.

In lieu of this method, servlets can share information using the `ServletContext` business logic by invoking methods on common non-servlet classes.

**javax.servlet.ServletContext.getServletNames()**

As of Java Servlet API 2.1, with no replacement. This method was originally defined to return an `Enumeration` of all the servlet names known to this context. In this version, this method always returns an empty `Enumeration` and remains only to preserve binary compatibility.
method will be permanently removed in a future version of the Java Servlet API.

<table>
<thead>
<tr>
<th>Method</th>

<tr>
<td>javax.faces.component.UIComponentBase.getValueBinding(String)</td>
<td>This has been replaced by <code>UIComponent.getValueExpression(java.lang.String)</code></td>
</tr>
<tr>
<td>javax.faces.component.UIGraphic.getValueBinding(String)</td>
<td>This has been replaced by <code>UIGraphic.getValueExpression(java.lang.String)</code></td>
</tr>
<tr>
<td>javax.faces.component.UISelectBoolean.getValueBinding(String)</td>
<td>This has been replaced by <code>UISelectBoolean.getValueExpression(java.lang.String)</code></td>
</tr>
<tr>
<td>javax.faces.component.UISelectMany.getValueBinding(String)</td>
<td>This has been replaced by <code>UISelectMany.getValueExpression(java.lang.String)</code></td>
</tr>
</tbody>
</table>
this has been replaced by `UISelectMany.getValueExpression(java.lang.String)`

`javax.faces.component.EditableValueHolder.getValueChangeListener()`  
Use `EditableValueHolder.getValueChangeListeners()` instead.

`javax.servlet.http.HttpSession.getValueNames()`  
As of Version 2.2, this method is replaced by `HttpSession.getAttributeNames()`.

`javax.faces.application.Application.getVariableResolver()`  
This has been replaced by `Application.getELResolver()`.

`javax.servlet.jsp.JspContext.getVariableResolver()`  
As of JSP 2.1, replaced by `ELContext.getELResolver()`, which can be obtained by `jspContext.getELContext().getELResolver()`.

`javax.ejb.EJBContext.isCallerInRole(Identity)`  
Use `boolean isCallerInRole(String roleName)` instead.

`javax.servlet.http.HttpServletRequest.isRequestedSessionIdFromUrl()`  
As of Version 2.1 of the Java Servlet API, use `HttpServletRequest.isRequestedSessionIdFromURL()` instead.

`javax.xml.bind.Unmarshaller.isValidating()`  
since JAXB2.0, please see `Unmarshaller.getSchema()`.

`javax.servlet.ServletContext.log(Exception, String)`  
As of Java Servlet API 2.1, use `ServletContext.log(String message, Throwable throwable)`.

This method was originally defined to write an exception’s stack trace and explanatory error message to the servlet log file.

`javax.activation.ActivationDataFlavor.normalizeMimeType(String)`

`javax.activation.ActivationDataFlavor.normalizeMimeTypeParameter(String, String)`

`javax.servlet.http.HttpSession.putValue(String, Object)`  
As of Version 2.2, this method is replaced by `HttpSession.setAttribute(java.lang.String, java.lang.Object)`.

`javax.servlet.http.HttpSession.removeValue(String)`  
As of Version 2.2, this method is replaced by `HttpSession.removeAttribute(java.lang.String)`.

`javax.faces.application.StateManager.restoreComponentState(FacesContext, UIViewRoot, String)`  
The distinction between tree structure and component state is now an implementation detail.
the distinction between tree structure and component state is now a
implementation returns null.

this has been replaced by StateManager.saveView(javax.faces.con
implementation returns null.

This has been replaced by ActionSource2.setActionExpression(javax.ax

This has been replaced by UICommand.setActionExpression(javax.faces.e

This has been replaced by UICommand.addActionListener(javax.faces.fac

since JAXB2.0

since JAXB2.0

J2SE release 1.4 supports a chained exception facility that allows a throwables, if any, that caused it to get thrown. Refer to getCause and ini
java.lang.Throwable class.

J2SE release 1.4 supports a chained exception facility that allows a throwables, if any, that caused it to get thrown. Refer to getCause and ini
java.lang.Throwable class.

since JAXB2.0

The recommended way to affect the execution of the EL is to provide a place in the application configuration resources which will be considered in eval
This method now will cause the argument resolver to be wrapped in an ELResolv
and exposed to the EL resolution system as if the user had called Application.addELResolv

As of version 2.1, due to ambiguous meaning of the message parameter, setStatus(int), to send an error with a description use sendError(int, S
javax.xml.bind.Unmarshaller.setValidating(boolean)
since JAXB2.0, please see Unmarshaller.setSchema(javax.xml.validation.Schema)

javax.faces.component.EditableValueHolder.setValidator(MethodBinding)
Use EditableValueHolder.addValidator(javax.faces.validator.Validator) by creating an instance of MethodExpressionValidator

javax.faces.component.UIInput.setValidator(MethodBinding)
Use UIInput.addValidator(javax.faces.validator.Validator) instead, obtaining the argument by creating an instance of MethodExpressionValidator.

javax.faces.component.UIComponent.setValueBinding(String, ValueBinding)
This has been replaced by UIComponent.setValueExpression(java.lang.String, javax.el.ValueExpression).

javax.faces.component.UIComponentBase.setValueBinding(String, ValueBinding)
This has been replaced by UIComponent.setValueExpression(java.lang.String, javax.el.ValueExpression).

javax.faces.component.UIData.setValueBinding(String, ValueBinding)
This has been replaced by UIData.setValueExpression(java.lang.String, javax.el.ValueExpression).

javax.faces.component.UIGraphic.setValueBinding(String, ValueBinding)
This has been replaced by UIGraphic.setValueExpression(java.lang.String, javax.el.ValueExpression).

javax.faces.component.UISelectBoolean.setValueBinding(String, ValueBinding)
This has been replaced by UISelectBoolean.setValueExpression(java.lang.String, javax.el.ValueExpression).

javax.faces.component.UISelectMany.setValueBinding(String, ValueBinding)
This has been replaced by UISelectMany.setValueExpression(java.lang.String, javax.el.ValueExpression).

javax.faces.component.EditableValueHolder.setValueChangeListener(MethodBinding)
Use EditableValueHolder.addValueChangeListener(javax.faces.event.ValueChangeListener) by creating an instance of MethodExpressionValueChangeListener.

javax.faces.component.UIInput.setValueChangeListener(MethodBinding)
Use UIInput.addValueChangeListener(javax.faces.event.ValueChangeListener) argument ValueChangeListener by creating an instance of MethodExpressionValueChangeListener.

javax.faces.application.Application.setVariableResolver(VariableResolver)
The recommended way to affect the execution of the EL is to provide place in the application configuration resources which will be considered in normal course of expression evaluation. This method now will cause the argument resolver to be wrapped inside an implementation of ELResolver and exposed to the EL resolution system as if the user had called Application.addELResolver(javax.el.ELResolver).

</tbody>
</table>
AbortProcessingException - Exception in javax.faces.event
An exception that may be thrown by event listeners to terminate the processing of the current event.

AbortProcessingException() - Constructor for exception javax.faces.event.AbortProcessingException
Construct a new exception with no detail message or root cause.

AbortProcessingException(String) - Constructor for exception javax.faces.event.AbortProcessingException
Construct a new exception with the specified detail message and no root cause.

AbortProcessingException(Throwable) - Constructor for exception javax.faces.event.AbortProcessingException
Construct a new exception with the specified root cause.

AbortProcessingException(String, Throwable) - Constructor for exception javax.faces.event.AbortProcessingException
Construct a new exception with the specified detail message and root cause.

AbstractMarshallerImpl - Class in javax.xml.bind.helpers
Partial default Marshaller implementation.

AbstractMarshallerImpl() - Constructor for class javax.xml.bind.helpers.AbstractMarshallerImpl

AbstractUnmarshallerImpl - Class in javax.xml.bind.helpers
Partial defaultUnmarshaller implementation.

AbstractUnmarshallerImpl() - Constructor for class javax.xml.bind.helpers.AbstractUnmarshallerImpl

accept(XMLEvent) - Method in interface javax.xml.stream.EventFilter
Tests whether this event is part of this stream.

accept(XMLStreamReader) - Method in interface javax.xml.stream.StreamFilter
Tests whether the current state is part of this stream.

AccessLocalException - Exception in javax.ejb
An AccessLocalException is thrown to indicate that the caller does not have permission to call the method.
**AccessException()** - Constructor for exception
javax.ejbAccessException

Constructs an AccessLocalException with no detail message.

**AccessException(String)** - Constructor for exception
javax.ejbAccessException

Constructs an AccessLocalException with the specified detail message.

**AccessException(String, Exception)** - Constructor for exception
javax.ejbAccessException

Constructs an AccessLocalException with the specified detail message and a nested exception.

**acknowledge()** - Method in interface javax.jms.Message

Acknowledges all consumed messages of the session of this consumed message.

**ActionEvent** - Class in javax.faces.event

An ActionEvent represents the activation of a user interface component (such as a UICommand).

**ActionEvent(UIComponent)** - Constructor for class
javax.faces.event.ActionEvent

Construct a new event object from the specified source component and action command.

**ActionListener** - Interface in javax.faces.event

A listener interface for receiving ActionEvents.

**ActionSource** - Interface in javax.faces.component

ActionSource is an interface that may be implemented by any concrete UIComponent that wishes to be a source of ActionEvents, including the ability to invoke application actions via the default ActionListener mechanism.

**ActionSource2** - Interface in javax.faces.component

ActionSource2 extends ActionSource and provides a JavaBeans property analogous to the "action" property on ActionSource.

**ActionType** - Class in javax.enterprise.deploy.shared

Class ActionTypes defines enumeration values for the J2EE DeploymentStatus actions.

**ActionType(int)** - Constructor for class
javax.enterprise.deploy.shared.ActionType

Construct a new enumeration value with the given integer value.

**ActivationConfigProperty** - Annotation Type in javax.ejb
**ActivationDataFlavor** - Class in `javax.activation`
   The ActivationDataFlavor class is a special subclass of `java.awt.datatransfer.DataFlavor`.

**ActivationDataFlavor(Class, String, String)** - Constructor for class `javax.activation.ActivationDataFlavor`
   Construct a DataFlavor that represents an arbitrary Java object.

**ActivationDataFlavor(Class, String)** - Constructor for class `javax.activation.ActivationDataFlavor`
   Construct a DataFlavor that represents a MimeType.

**ActivationDataFlavor(String, String)** - Constructor for class `javax.activation.ActivationDataFlavor`
   Construct a DataFlavor that represents a MimeType.

**ActivationSpec** - Interface in `javax.resource.spi`
   This interface serves as a marker.

**add(ELResolver)** - Method in class `javax.el.CompositeELResolver`
   Adds the given resolver to the list of component resolvers.

**add(FetchProfile.Item)** - Method in class `javax.mail.FetchProfile`
   Add the given special item as one of the attributes to be prefetched.

**add(String)** - Method in class `javax.mail.FetchProfile`
   Add the specified header-field to the list of attributes to be prefetched.

**add(Flags.Flag)** - Method in class `javax.mail.Flags`
   Add the specified system flag to this Flags object.

**add(String)** - Method in class `javax.mail.Flags`
   Add the specified user flag to this Flags object.

**add(Flags)** - Method in class `javax.mail.Flags`
   Add all the flags in the given Flags object to this Flags object.

**add(XMLEvent)** - Method in interface `javax.xml.stream.util.XMLEventConsumer`
   This method adds an event to the consumer.

**add(XMLEvent)** - Method in interface `javax.xml.stream.XMLEventWriter`
   Add an event to the output stream Adding a START_ELEMENT will open a new namespace scope that will be closed when the corresponding END_ELEMENT is written.

**add(XMLEventReader)** - Method in interface `javax.xml.stream.XMLEventWriter`
   Adds an entire stream to an output stream, calls next() on the inputStream argument until hasNext() returns false This should be treated as a convenience method that will perform the following loop
over all the events in an event reader and call add on each event.

**addActionListener(ActionListener)** - Method in interface
javax.faces.component.ActionSource

Add a new ActionListener to the set of listeners interested in being notified when ActionEvents occur.

**addActionListener(ActionListener)** - Method in class
javax.faces.component.UIComponent

**addAssociation(Association)** - Method in interface
javax.xml.registry.infomodel.RegistryObject

Adds specified Association to use this object as source.

**addAssociations(Collection)** - Method in interface
javax.xml.registry.infomodel.RegistryObject

Adds specified Associations to use this object as source.

**addAttachmentPart(AttachmentPart)** - Method in class
javax.xml.soap.SOAPMessage

Adds the given AttachmentPart object to this SOAPMessage object.

**addAttribute(Name, String)** - Method in interface
javax.xml.soap.SOAPElement

Adds an attribute with the specified name and value to this SOAPElement object.

**addAttribute(QName, String)** - Method in interface
javax.xml.soap.SOAPElement

Adds an attribute with the specified name and value to this SOAPElement object.

**addBody()** - Method in interface
javax.xml.soap.SOAPEnvelope

Creates a SOAPBody object and sets it as the SOAPBody object for this SOAPEnvelope object.

**addBodyElement(Name)** - Method in interface
javax.xml.soap.SOAPBody

Creates a new SOAPBodyElement object with the specified name and adds it to this SOAPBody object.

**addBodyElement(QName)** - Method in interface
javax.xml.soap.SOAPBody

Creates a new SOAPBodyElement object with the specified QName and adds it to this SOAPBody object.

**addBodyPart(BodyPart)** - Method in class
javax.mail.internet.MimeMultipart

Adds a Part to the multipart.
**addBodyPart(BodyPart, int)** - Method in class javax.mail.internet.MimeMultipart

  Adds a BodyPart at position index.

**addBodyPart(BodyPart)** - Method in class javax.mail.Multipart

  Adds a Part to the multipart.

**addBodyPart(BodyPart, int)** - Method in class javax.mail.Multipart

  Adds a BodyPart at position index.

**addChild(UIComponent)** - Method in class javax.faces.webapp.UIComponentClassicTagBase

  Adds a child UIComponent.

**addChild(UIComponent)** - Method in class javax.faces.webapp.UIComponentTagBase

  Add the component identifier of the specified UIComponent to the list of component identifiers created or located by nested UIComponentTags processing this request.

**addChildConcept(Concept)** - Method in interface javax.xml.registry.infomodel.ClassificationScheme

  Adds a child Concept.

**addChildConcept(Concept)** - Method in interface javax.xml.registry.infomodel.Concept

  Adds a child Concept.

**addChildConcepts(Collection)** - Method in interface javax.xml.registry.infomodel.ClassificationScheme

  Adds a Collection of Concept children.

**addChildConcepts(Collection)** - Method in interface javax.xml.registry.infomodel.Concept

  Adds a Collection of Concept children.

**addChildElement(Name)** - Method in interface javax.xml.soap.SOAPElement

  Creates a new SOAPElement object initialized with the given Name object and adds the new element to this SOAPElement object.

**addChildElement(QName)** - Method in interface javax.xml.soap.SOAPElement

  Creates a new SOAPElement object initialized with the given QName object and adds the new element to this SOAPElement object.

**addChildElement(String)** - Method in interface javax.xml.soap.SOAPElement

  Creates a new SOAPElement object initialized with the specified local name and adds the new element to this SOAPElement object.
**addChildElement(String, String)** - Method in interface `javax.xml.soap.SOAPElement`  
Creates a new `SOAPElement` object initialized with the specified local name and prefix and adds the new element to this `SOAPElement` object.

**addChildElement(String, String, String)** - Method in interface `javax.xml.soap.SOAPElement`  
Creates a new `SOAPElement` object initialized with the specified local name, prefix, and URI and adds the new element to this `SOAPElement` object.

**addChildElement(SOAPElement)** - Method in interface `javax.xml.soap.SOAPElement`  
Add a `SOAPElement` as a child of this `SOAPElement` instance.

**addChildOrganization(Organization)** - Method in interface `javax.xml.registry.infomodel.Organization`  
Adds a child Organization.

**addChildOrganizations(Collection)** - Method in interface `javax.xml.registry.infomodel.Organization`  
Adds a Collection of Organization children.

**addClassification(Classification)** - Method in interface `javax.xml.registry.infomodel.RegistryObject`  
Adds specified Classification to this object.

**addClassifications(Collection)** - Method in interface `javax.xml.registry.infomodel.RegistryObject`  
Adds specified Classifications to this object.

**addComponent(String, String)** - Method in class `javax.faces.application.Application`  
Register a new mapping of component type to the name of the corresponding `UIComponent` class.

**addConnectionEventListener(ConnectionEventListener)** - Method in interface `javax.resource.spi.ManagedConnection`  
Adds a connection event listener to the ManagedConnection instance.

**addConnectionListener(ConnectionListener)** - Method in class `javax.mail.Folder`  
Add a listener for Connection events on this Folder.

**addConnectionListener(ConnectionListener)** - Method in class `javax.mail.Service`  
Add a listener for Connection events on this service.
**addConverter(String, String)** - Method in class
javax.faces.application.Application

Register a new mapping of converter id to the name of the corresponding Converter class.

**addConverter(Class, String)** - Method in class
javax.faces.application.Application

Register a new converter class that is capable of performing conversions for the specified target class.

**addCookie(Cookie)** - Method in interface
javax.servlet.http.HttpServletResponse

Adds the specified cookie to the response.

**addCookie(Cookie)** - Method in class
javax.servlet.http.HttpServletResponseWrapper

The default behavior of this method is to call addCookie(Cookie cookie) on the wrapped response object.

**addDataModelListener(DataModelListener)** - Method in class
javax.faces.model.DataModel

Add a new DataModelListener to the set interested in notifications from this DataModel.

**addDateHeader(String, long)** - Method in interface
javax.servlet.http.HttpServletResponse

Adds a response header with the given name and date-value.

**addDateHeader(String, long)** - Method in class
javax.servlet.http.HttpServletResponseWrapper

The default behavior of this method is to call addDateHeader(String name, long date) on the wrapped response object.

**addDetail()** - Method in interface javax.xml.soap.SOAPFault

Creates an optional Detail object and sets it as the Detail object for this SOAPFault object.

**addDetailEntry(Name)** - Method in interface javax.xml.soap.Detail

Creates a new DetailEntry object with the given name and adds it to this Detail object.

**addDetailEntry(QName)** - Method in interface javax.xml.soap.Detail

Creates a new DetailEntry object with the given QName and adds it to this Detail object.

**addDocument(Document)** - Method in interface
javax.xml.soap.SOAPBody

Adds the root node of the DOM Document to this SOAPBody object.

**ADDED** - Static variable in class javax.mail.event.MessageCountEvent
The messages were added to their folder.

**addELContextListener(ELContextListener)** - Method in class `javax.faces.application.Application`

Provide a way for Faces applications to register an `ELContextListener` that will be notified on creation of `ELContext` instances.

Registers a `ELContextListener` so that context objects can be added whenever a new `ELContext` is created.

**addELResolver(ELResolver)** - Method in class `javax.faces.application.Application`

Cause an the argument `resolver` to be added to the resolver chain as specified in section 5.5.1 of the JavaServer Faces Specification.

**addELResolver(ELResolver)** - Method in interface `javax.servlet.jsp.JspApplicationContext`

Adds an `ELResolver` to affect the way EL variables and properties are resolved for EL expressions appearing in JSP pages and tag files.

**addExternalIdentifier(ExternalIdentifier)** - Method in interface `javax.xml.registry.infomodel.RegistryObject`

Adds specified `ExternalIdentifier` as an external identifier to this object.

**addExternalIdentifiers(Collection)** - Method in interface `javax.xml.registry.infomodel.RegistryObject`

Adds specified `ExternalIdentifiers` as an external identifiers to this object.

**addExternalLink(ExternalLink)** - Method in interface `javax.xml.registry.infomodel.RegistryObject`

Adds specified `ExternalLink` to this object.

**addExternalLinks(Collection)** - Method in interface `javax.xml.registry.infomodel.RegistryObject`

Adds specified `ExternalLinks` to this object.

**addFacesListener(FacesListener)** - Method in class `javax.faces.component.UIComponent`

Add the specified `FacesListener` to the set of listeners registered to receive event notifications from this `UIComponent`.

**addFacesListener(FacesListener)** - Method in class `javax.faces.component.UIComponentBase`

Add the specified `FacesListener` to the set of listeners registered to
receive event notifications from this `UIComponent`

**addFacet(String)** - Method in class
javax.faces.webapp.**UIComponentClassicTagBase**

**addFacet(String)** - Method in class
javax.faces.webapp.**UIComponentTagBase**
Add the facet name of the specified facet to the list of facet names created or located by nested **UIComponentTag**s processing this request.

**addFault()** - Method in interface javax.xml.soap.**SOAPBody**
Creates a new SOAPFault object and adds it to this SOAPBody object.

**addFault(Name, String, Locale)** - Method in interface
javax.xml.soap.**SOAPBody**
Creates a new SOAPFault object and adds it to this SOAPBody object.

**addFault(QName, String, Locale)** - Method in interface
javax.xml.soap.**SOAPBody**
Creates a new SOAPFault object and adds it to this SOAPBody object.

**addFault(Name, String)** - Method in interface
javax.xml.soap.**SOAPBody**
Creates a new SOAPFault object and adds it to this SOAPBody object.

**addFault(QName, String)** - Method in interface
javax.xml.soap.**SOAPBody**
Creates a new SOAPFault object and adds it to this SOAPBody object.

**addFaultReasonText(String, Locale)** - Method in interface
javax.xml.soap.**SOAPFault**
Appends or replaces a Reason Text item containing the specified text message and an `xml:lang` derived from locale.

**addFolderListener(FolderListener)** - Method in class javax.mail.**Folder**
Add a listener for Folder events on this Folder.

**addFolderListener(FolderListener)** - Method in class javax.mail.**Store**
Add a listener for Folder events on any Folder object obtained from this Store.

**addFrom(Address[])** - Method in class
javax.mail.internet.**MimeMessage**
Add the specified addresses to the existing "From" field.

**addFrom(Address[])** - Method in class javax.mail.**Message**
Add these addresses to the existing "From" attribute

**addHeader(String, String)** - Method in class
javax.mail.internet.**InternetHeaders**
Add a header with the specified name and value to the header list.

**addHeader(String, String)** - Method in class javax.mail.internet.MimeBodyPart

Add this value to the existing values for this header_name.

**addHeader(String, String)** - Method in class javax.mail.internet.MimeMessage

Add this value to the existing values for this header_name.

**addHeader(String, String)** - Method in interface javax.mail.Part

Add this value to the existing values for this header_name.

**addHeader(String, String)** - Method in interface javax.servlet.http.HttpServletResponse

Adds a response header with the given name and value.

**addHeader(String, String)** - Method in class javax.servlet.http.HttpServletResponseWrapper

The default behavior of this method is to return addHeader(String name, String value) on the wrapped response object.

**addHeader(String, String)** - Method in class javax.xml.soap.MimeHeaders

Adds a MimeHeader object with the specified name and value to this MimeHeaders object's list of headers.

**addHeader()** - Method in interface javax.xml.soap.SOAPEnvelope

Creates a SOAPHeader object and sets it as the SOAPHeader object for this SOAPEnvelope object.

**addHeaderElement(Name)** - Method in interface javax.xml.soap.SOAPHeader

Creates a new SOAPHeaderElement object initialized with the specified name and adds it to this SOAPHeader object.

**addHeaderElement(QName)** - Method in interface javax.xml.soap.SOAPHeader

Creates a new SOAPHeaderElement object initialized with the specified qname and adds it to this SOAPHeader object.

**addHeaderLine(String)** - Method in class javax.mail.internet.InternetHeaders

Add an RFC822 header line to the header store.

**addHeaderLine(String)** - Method in class javax.mail.internet.MimeBodyPart

Add a header line to this body part.

**addHeaderLine(String)** - Method in class javax.mail.internet.MimeMessage
Add a raw RFC 822 header-line.

**addHeaderLine(String)** - Method in interface javax.mail.internet.MimePart

Add a raw RFC822 header-line.

**addIntHeader(String, int)** - Method in interface javax.servlet.http.HttpServletResponse

Adds a response header with the given name and integer value.

**addIntHeader(String, int)** - Method in class javax.servlet.http.HttpServletResponseWrapper

The default behavior of this method is to call addIntHeader(String name, int value) on the wrapped response object.

**addLifecycle(String, Lifecycle)** - Method in class javax.faces.lifecycle.LifecycleFactory

Register a new Lifecycle instance, associated with the specified lifecycleId, to be supported by this LifecycleFactory.

**addLocalizedString(LocalizedString)** - Method in interface javax.xml.registry.infomodel.InternationalString

Adds a LocalizedString to this object.

**addLocalizedString(String)** - Method in interface javax.xml.registry.infomodel.InternationalString

Adds many LocalizedStrings to this object.

**addMailcap(String)** - Method in class javax.activation.MailcapCommandMap

Add entries to the registry.

**addMessage(String, FacesMessage)** - Method in class javax.faces.context.FacesContext

Append a FacesMessage to the set of messages associated with the specified client identifier, if clientId is not null.

**addMessageChangedListener(MessageChangedListener)** - Method in class javax.mail.Folder

Add a listener for MessageChanged events on this Folder.

**addMessageCountListener(MessageCountListener)** - Method in class javax.mail.Folder

Add a listener for MessageCount events on this Folder.

**addMimeHeader(String, String)** - Method in class javax.xml.soap.AttachmentPart

Adds a MIME header with the specified name and value to this AttachmentPart object.

**addMimeHeader(String, String)** - Method in class
javax.xml.soap.SOAPPart
   Creates a MimeHeader object with the specified name and value and adds it to this SOAPPart object.

addMimeTypes(String) - Method in class java.activation.MimetypesFileTypeMap
   Prepends the MIME type values to the registry.

addMtomAttachment(DataHandler, String, String) - Method in class javax.xml.bind.attachment.AttachmentMarshaller
   Consider MIME content data for optimized binary storage as an attachment.

addMtomAttachment(byte[], int, int, String, String, String) - Method in class javax.xml.bind.attachment.AttachmentMarshaller
   Consider binary data for optimized binary storage as an attachment.

addNamespaceDeclaration(String, String) - Method in interface javax.xml.soap.SOAPElement
   Adds a namespace declaration with the specified prefix and URI to this SOAPElement object.

addNotificationListener(ObjectName, NotificationListener, NotificationFilter, Object) - Method in interface javax.management.j2ee.ListenerRegistration
   Add a listener to a registered managed object.

addNotUnderstoodHeaderElement(QName) - Method in interface javax.xml.soap.SOAPHeader
   Creates a new NotUnderstood SOAPHeaderElement object initialized with the specified name and adds it to this SOAPHeader object.

addParameter(String, QName, ParameterMode) - Method in interface javax.xml.rpc.Call
   Adds a parameter type and mode for a specific operation.

addParameter(String, QName, Class, ParameterMode) - Method in interface javax.xml.rpc.Call
   Adds a parameter type and mode for a specific operation.

addPhaseListener(PhaseListener) - Method in class javax.faces.component.UIViewRoot
   Register a new PhaseListener instance that is interested in being notified before and after the processing for standard phases of the request processing lifecycle.
addPort(QName, String, String) - Method in class javax.xml.ws.Service
   Creates a new port for the service.
addPort(QName, String, String) - Method in class javax.xml.ws.spi.ServiceDelegate
   Creates a new port for the service.
addProgressListener(ProgressListener) - Method in interface javax.enterprise.deploy.spi.status.ProgressObject
   Add a listener to receive Progress events on deployment actions.
addProgressListener(PropertyChangeListener) - Method in interface javax.enterprise.deploy.spi.DConfigBean
   Register a property listener for this bean.
addProvider(Provider) - Method in class javax.mail.Session
   Add a provider to the session.
addRecipient(Message.RecipientType, Address) - Method in class javax.mail.Message
   Add this recipient address to the existing ones of the given type.
addRecipients(Message.RecipientType, Address[]) - Method in class javax.mail.internet.MimeMessage
   Add the given addresses to the specified recipient type.
addRecipients(Message.RecipientType, String) - Method in class javax.mail.internet.MimeMessage
   Add the given addresses to the specified recipient type.
addRecipients(Message.RecipientType, Address[]) - Method in class javax.mail.Message
   Add these recipient addresses to the existing ones of the given type.
addRegistryObject(RegistryObject) - Method in interface javax.xml.registry.infomodel.RegistryPackage
   Adds a child RegistryObject as member.
addRegistryObjects(Collection) - Method in interface javax.xml.registry.infomodel.RegistryPackage
   Adds a Collection of RegistryObject children as members.
addRenderer(String, String, Renderer) - Method in class javax.faces.render.RenderKit
   Register the specified Renderer instance, associated with the specified component family and renderertype, to the set of Renderers registered with this RenderKit, replacing any previously registered Renderer for this combination of identifiers.
addRenderKit(String, RenderKit) - Method in class javax.faces.render.RenderKitFactory
Register the specified RenderKit instance, associated with the specified renderKitId, to be supported by this RenderKitFactory, replacing any previously registered RenderKit for this identifier.

**Address** - Class in javax.mail
This abstract class models the addresses in a message.

**Address()** - Constructor for class javax.mail.Address

**address** - Variable in class javax.mail.internet.InternetAddress

**address** - Variable in class javax.mail.search.AddressTerm
The address.

**ADDRESS_LINES_SLOT** - Static variable in interface javax.xml.registry.infomodel.Slot
Name for pre-defined Slot used in PostalAddress by JAXR UDDI provider.

**AddressException** - Exception in javax.mail.internet
The exception thrown when a wrongly formatted address is encountered.

**AddressException()** - Constructor for exception javax.mail.internet.AddressException
Constructs an AddressException with no detail message.

**AddressException(String)** - Constructor for exception javax.mail.internet.AddressException
Constructs an AddressException with the specified detail message.

**AddressException(String, String)** - Constructor for exception javax.mail.internet.AddressException
Constructs an AddressException with the specified detail message and reference info.

**AddressException(String, String, int)** - Constructor for exception javax.mail.internet.AddressException
Constructs an AddressException with the specified detail message and reference info.

**AddressStringTerm** - Class in javax.mail.search
This abstract class implements string comparisons for Message addresses.

**AddressStringTerm(String)** - Constructor for class javax.mail.search.AddressStringTerm
Constructor.

**AddressTerm** - Class in javax.mail.search
This class implements Message Address comparisons.

**AddressTerm(Address)** - Constructor for class javax.mail.search.AddressTerm

**addService(Service)** - Method in interface javax.xml.registry.infomodel.Organization
   Adds a child Service.

**addServiceBinding(ServiceBinding)** - Method in interface javax.xml.registry.infomodel.Service
   Adds a child ServiceBinding.

**addServiceBindings(Collection)** - Method in interface javax.xml.registry.infomodel.Service
   Adds a Collection of ServiceBinding children.

**addServices(Collection)** - Method in interface javax.xml.registry.infomodel.Organization
   Adds a Collection of Service children.

**addSlot(Slot)** - Method in interface javax.xml.registry.infomodel.ExtensibleObject
   Adds a Slot to this object.

**addSlots(Collection)** - Method in interface javax.xml.registry.infomodel.ExtensibleObject
   Adds more Slots to this object.

**addSpecificationLink(SpecificationLink)** - Method in interface javax.xml.registry.infomodel.ServiceBinding
   Adds a child SpecificationLink.

**addSpecificationLinks(Collection)** - Method in interface javax.xml.registry.infomodel.ServiceBinding
   Adds a Collection of SpecificationLink children.

**addStoreListener(StoreListener)** - Method in class javax.mail.Store
   Add a listener for StoreEvents on this Store.

**addSwaRefAttachment(DataHandler)** - Method in class javax.xml.bind.attachment.AttachmentMarshaller
   Add MIME data as an attachment and return attachment's content-id, cid.

**addTextNode(String)** - Method in interface javax.xml.soap.SOAPElement
   Creates a new Text object initialized with the given String and adds it to this SOAPElement object.

**addToExcludedPolicy(PermissionCollection)** - Method in interface
javax.security.jacc.PolicyConfiguration
Used to add excluded policy statements to this PolicyConfiguration.

addToExcludedPolicy(Permission) - Method in interface

addToRole(String, PermissionCollection) - Method in interface

addToRole(String, Permission) - Method in interface

addToUncheckedPolicy(PermissionCollection) - Method in interface

addToUncheckedPolicy(Permission) - Method in interface

addTransformer(ClassTransformer) - Method in interface
JavaMail's PersistenceUnitInfo
Add a transformer supplied by the provider that will be called for every new class definition or class redefinition that gets loaded by the loader returned by the PersistenceUnitInfo.getClassLoader() method.

addTransportListener(TransportListener) - Method in class
JavaMail's Transport
Add a listener for Transport events.

addUpgradeHeaderElement(Iterator) - Method in interface
JavaMail's SOAPHeader
Creates a new Upgrade SOAPHeaderElement object initialized with the specified List of supported SOAP URIs and adds it to this SOAPHeader object.

addUpgradeHeaderElement(String[]) - Method in interface
JavaMail's SOAPHeader
Creates a new Upgrade SOAPHeaderElement object initialized with the specified array of supported SOAP URIs and adds it to this
SOAPHeader object.

**addUpgradeHeaderElement(String)** - Method in interface javax.xml.soap.SOAPHeader

- Creates a new Upgrade SOAPHeaderElement object initialized with the specified supported SOAP URI and adds it to this SOAPHeader object.

**addUser(User)** - Method in interface javax.xml.registry.infomodel.Organization

- Adds a User.

**addUsers(Collection)** - Method in interface javax.xml.registry.infomodel.Organization

- Adds a Collection of Users.

**addValidator(String, String)** - Method in class javax.faces.application.Application

- Register a new mapping of validator id to the name of the corresponding Validator class.

**addValidator(Validator)** - Method in interface javax.faces.componentEditableValueHolder

- Add a Validator instance to the set associated with this component.

**addValidator(Validator)** - Method in class javax.faces.component.UIInput

- Add a Validator instance to the set associated with this UIInput.

**addValueChangeListener(ValueChangeListener)** - Method in interface javax.faces.componentEditableValueHolder

- Add a new ValueChangeListener to the set of listeners interested in being notified when ValueChangeEvent occurs.

**addValueChangeListener(ValueChangeListener)** - Method in class javax.faces.component.UIInput

- Add a new ValueChangeListener to the set of listeners interested in being notified when ValueChangeEvent occurs.

**addVerbatimAfterComponent(UIComponentClassicTagBase, UIComponent, UIComponent)** - Method in class javax.faces.webapp.UIComponentClassicTagBase

- Add verbatim as a sibling of component in component in the parent's child list.

**addVerbatimBeforeComponent(UIComponentClassicTagBase, UIComponent, UIComponent)** - Method in class javax.faces.webapp.UIComponentClassicTagBase

- Add verbatim as a sibling of component in component in the parent's child list.
addXpathListener(String, XpathListener) - Method in interface javax.enterprise.deploy.model.DDBean
Register a listener for a specific XPath.
addXpathListener(ModuleType, String, XpathListener) - Method in interface javax.enterprise.deploy.model.J2eeApplicationObject
Register a listener for changes in XPath that are related to this deployableObject.

afterBegin() - Method in interface javax.ejb.SessionSynchronization
The afterBegin method notifies a session Bean instance that a new transaction has started, and that the subsequent business methods on the instance will be invoked in the context of the transaction.

afterCompletion(boolean) - Method in interface javax.ejb.SessionSynchronization
The afterCompletion method notifies a session Bean instance that a transaction commit protocol has completed, and tells the instance whether the transaction has been committed or rolled back.

afterCompletion(int) - Method in interface javax.transaction.Synchronization
This method is called by the transaction manager after the transaction is committed or rolled back.

afterDelivery() - Method in interface javax.resource.spi.endpoint.MessageEndpoint
This is called by a resource adapter after a message is delivered.

afterMarshal(Object) - Method in class javax.xml.bind.Marshaller.Listener
Callback method invoked after marshalling source to XML.

afterPhase(PhaseEvent) - Method in interface javax.faces.event.PhaseListener
Handle a notification that the processing for a particular phase has just been completed.

afterUnmarshal(Object, Object) - Method in class javax.xml.bind.Unmarshaller.Listener
Callback method invoked after unmarshalling XML data into target.

ALERT - Static variable in class javax.mail.event.StoreEvent
Indicates that this message is an ALERT.
**ALL** - Static variable in class `javax.mail.internet.MimeUtility`

**allocate(XMLStreamReader)** - Method in interface `javax.xml.stream.util.XMLEventAllocator`
This method allocates an event given the current state of the XMLStreamReader.

**allocate(XMLStreamReader, XMLEventConsumer)** - Method in interface `javax.xml.stream.util.XMLEventAllocator`
This method allocates an event or set of events given the current state of the XMLStreamReader and adds the event or set of events to the consumer that was passed in.

**allocateConnection(ManagedConnectionFactory, ConnectionRequestInfo)** - Method in interface `javax.resource.spi.ConnectionManager`
The method `allocateConnection` gets called by the resource adapter's connection factory instance.

**ALLOCATOR** - Static variable in class `javax.xml.stream.XMLInputFactory`
The property used to set/get the implementation of the allocator

**AND_ALL_KEYS** - Static variable in interface `javax.xml.registry.FindQualifier`

**AndTerm** - Class in `javax.mail.search`
This class implements the logical AND operator on individual SearchTerms.

**AndTerm(SearchTerm, SearchTerm)** - Constructor for class `javax.mail.search.AndTerm`
Constructor that takes two terms.

**AndTerm(SearchTerm[])** - Constructor for class `javax.mail.search.AndTerm`
Constructor that takes an array of SearchTerms.

**ANSWERED** - Static variable in class `javax.mail.Flags.Flag`
This message has been answered.

**ANY_PHASE** - Static variable in class `javax.faces.event.PhaseId`
Identifier that indicates an interest in events, no matter which request processing phase is being performed.

**appendFaultSubcode(QName)** - Method in interface `javax.xml.soap.SOAPFault`
Adds a Subcode to the end of the sequence of Subcodes contained
by this SOAPFault.

**appendMessages(Message[])** - Method in class `javax.mail.Folder`
  Append given Messages to this folder.

**Application** - Class in `javax.faces.application`
  **Application** represents a per-web-application singleton object where applications based on JavaServer Faces (or implementations wishing to provide extended functionality) can register application-wide singletons that provide functionality required by JavaServer Faces.

**Application()** - Constructor for class `javax.faces.application.Application`

**APPLICATION** - Static variable in class `javax.servlet.jsp.PageContext`
  Name used to store ServletContext in PageContext name table.

**APPLICATION_FACTORY** - Static variable in class `javax.faces.FactoryFinder`
  The property name for the **ApplicationFactory** class name.

**APPLICATION_SCOPE** - Static variable in class `javax.servlet.jsp.PageContext`
  Application scope: named reference remains available in the ServletContext until it is reclaimed.

**ApplicationException** - Annotation Type in `javax.ejb`
  Applied to an exception to denote that it is an application exception and should be reported to the client directly (i.e., unwrapped).

**ApplicationFactory** - Class in `javax.faces.application`
  **ApplicationFactory** is a factory object that creates (if needed) and returns **Application** instances.

**ApplicationFactory()** - Constructor for class `javax.faces.application.ApplicationFactory`

**ApplicationServerInternalException** - Exception in `javax.resource.spi`
  **ApplicationServerInternalException** is thrown by an application server to indicate error conditions specific to an application server.

**ApplicationServerInternalException()** - Constructor for exception `javax.resource.spi.ApplicationServerInternalException`
  Constructs a new instance with null as its detail message.

**ApplicationServerInternalException(String)** - Constructor for exception `javax.resource.spi.ApplicationServerInternalException`
  Constructs a new instance with the specified detail message.

**ApplicationServerInternalException(Throwable)** - Constructor for exception `javax.resource.spi.ApplicationServerInternalException`
exception javax.resource.spi.ApplicationServerInternalException
Constructs a new throwable with the specified cause.

**ApplicationServerInternalException(String, Throwable)** - Constructor for exception javax.resource.spi.ApplicationServerInternalException
Constructs a new throwable with the specified detail message and cause.

**ApplicationServerInternalException(String, String)** - Constructor for exception javax.resource.spi.ApplicationServerInternalException
Constructs a new throwable with the specified detail message and an error code.

**APPLY_REQUEST_VALUES** - Static variable in class javax.faces.event.PhaseId
Identifier that indicates an interest in events queued for the Apply Request Values phase of the request processing lifecycle.

**AroundInvoke** - Annotation Type in javax.interceptor

**ArrayDataModel** - Class in javax.faces.model
ArrayDataModel is a convenience implementation of DataModel that wraps an array of Java objects.

**ArrayDataModel()** - Constructor for class javax.faces.model.ArrayDataModel
Construct a new ArrayDataModel with no specified wrapped data.

**ArrayDataModel(Object[])** - Constructor for class javax.faces.model.ArrayDataModel
Construct a new ArrayDataModel wrapping the specified array.

**ArrayELResolver** - Class in javax.el
Defines property resolution behavior on arrays.

**ArrayELResolver()** - Constructor for class javax.el.ArrayELResolver
Creates a new read/write ArrayELResolver.

**ArrayELResolver(boolean)** - Constructor for class javax.el.ArrayELResolver
Creates a new ArrayELResolver whose read-only status is determined by the given parameter.

**asCharacters()** - Method in interface javax.xml.stream.events.XMLEvent
Returns this event as Characters, may result in a class cast exception if this event is not Characters.

**asEndElement()** - Method in interface javax.xml.stream.events.XMLEvent
Returns this event as an end element event, may result in a class
cast exception if this event is not a end element.

`associateConnection(Object, ManagedConnectionFactory, ConnectionRequestInfo)` - Method in interface `javax.resource.spi.LazyAssociatableConnectionManager`

This method is called by a resource adapter (that is capable of lazy connection association optimization) in order to lazily associate a connection object with a `ManagedConnection` instance.

`associateConnection(Object)` - Method in interface `javax.resource.spi.ManagedConnection`

Used by the container to change the association of an application-level connection handle with a `ManagedConnection` instance.

**Association** - Interface in `javax.xml.registry.infomodel`

A `RegistryObject` instance may be associated with zero or more `RegistryObject` instances.

**ASSOCIATION** - Static variable in interface `javax.xml.registry.LifeCycleManager`

**AssociationOverride** - Annotation Type in `javax.persistence`

This annotation is used to override a many-to-one or one-to-one mapping of property or field for an entity relationship.

**AssociationOverrides** - Annotation Type in `javax.persistence`

This annotation is used to override mappings of multiple many-to-one or one-to-one relationship properties or fields.

`asStartElement()` - Method in interface `javax.xml.stream.events.XMLEvent`

Returns this event as a start element event, may result in a class cast exception if this event is not a start element.

**AsyncHandler<T>** - Interface in `javax.xml.ws`

The `AsyncHandler` interface is implemented by clients that wish to receive callback notification of the completion of service endpoint operations invoked asynchronously.

**AT_BEGIN** - Static variable in class `javax.servlet.jsp.tagext.VariableInfo`

Scope information that scripting variable is visible after start tag.

**AT_END** - Static variable in class `javax.servlet.jsp.tagext.VariableInfo`

Scope information that scripting variable is visible after end tag.

**ATOM** - Static variable in class `javax.mail.internet.HeaderTokenizer.Token`

Token type indicating an ATOM.

`attachFile(File)` - Method in class `javax.mail.internet.MimeBodyPart`
Use the specified file to provide the data for this part.
attachFile(String) - Method in class javax.mail.internet.MimeBodyPart
Use the specified file to provide the data for this part.
ATTACHMENT - Static variable in interface javax.mail.Part
This part should be presented as an attachment.
AttachmentMarshaller - Class in javax.xml.bind.attachment
   Enable JAXB marshalling to optimize storage of binary data.
AttachmentMarshaller() - Constructor for class javax.xml.bind.attachment.AttachmentMarshaller

AttachmentPart - Class in javax.xml.soap
   A single attachment to a SOAPMessage object.
AttachmentPart() - Constructor for class javax.xml.soap.AttachmentPart

AttachmentUnmarshaller - Class in javax.xml.bind.attachment
   Enables JAXB unmarshalling of a root document containing optimized binary data formats.
AttachmentUnmarshaller() - Constructor for class javax.xml.bind.attachment.AttachmentUnmarshaller

Attribute - Interface in javax.xml.stream.events
   An interface that contains information about an attribute.
ATTRIBUTE - Static variable in interface javax.xml.stream.XMLStreamConstants
   Indicates an event is an attribute
attributeAdded(HttpSessionBindingEvent) - Method in interface javax.servlet.http.HttpSessionAttributeListener
   Notification that an attribute has been added to a session.
attributeAdded(ServletContextAttributeEvent) - Method in interface javax.servlet.ServletContextAttributeListener
   Notification that a new attribute was added to the servlet context.
attributeAdded(ServletRequestAttributeEvent) - Method in interface javax.servlet.ServletRequestAttributeListener
   Notification that a new attribute was added to the servlet request.
AttributeOverride - Annotation Type in javax.persistence
   The AttributeOverride annotation is used to override the mapping of a Basic (whether explicit or default) property or field or Id property or field.
AttributeOverrides - Annotation Type in javax.persistence
Is used to override mappings of multiple properties or fields. 

**attributeRemoved(HttpSessionBindingEvent)** - Method in interface javax.servlet.http.HttpSessionAttributeListener

Notification that an attribute has been removed from a session.

**attributeRemoved(ServletContextAttributeEvent)** - Method in interface javax.servlet.ServletContextAttributeListener

Notification that an existing attribute has been removed from the servlet context.

**attributeRemoved(ServletRequestAttributeEvent)** - Method in interface javax.servlet.ServletRequestAttributeListener

Notification that an existing attribute has been removed from the servlet request.

**attributeReplaced(HttpSessionBindingEvent)** - Method in interface javax.servlet.http.HttpSessionAttributeListener

Notification that an attribute has been replaced in a session.

**attributeReplaced(ServletContextAttributeEvent)** - Method in interface javax.servlet.ServletContextAttributeListener

Notification that an attribute on the servlet context has been replaced.

**attributeReplaced(ServletRequestAttributeEvent)** - Method in interface javax.servlet.ServletRequestAttributeListener

Notification that an attribute was replaced on the servlet request.

**AttributeTag** - Class in javax.faces.webapp

*Deprecated.* The Faces implementation must now provide the implementation for this class.

**AttributeTag()** - Constructor for class javax.faces.webapp.AttributeTag

*Deprecated.*

**AUDITABLE_EVENT** - Static variable in interface javax.xml.registry.LifeCycleManager

**AuditableEvent** - Interface in javax.xml.registry.infomodel

AuditableEvent instances provide a long term record of events that effect a change of state in a RegistryObject.

**AuthenticationFailedException** - Exception in javax.mail

This exception is thrown when the connect method on a Store or Transport object fails due to an authentication failure (e.g., bad user name or password).

**AuthenticationFailedException()** - Constructor for exception javax.mail.AuthenticationFailedException
Constructor

**AuthenticationFailedException(String)** - Constructor for exception `javax.mail.AuthenticationFailedException`

Constructor

**Authenticator** - Class in `javax.mail`

The class Authenticator represents an object that knows how to obtain authentication for a network connection.

**Authenticator()** - Constructor for class `javax.mail.Authenticator`

**AUTHORIZED_NAME SLOT** - Static variable in interface `javax.xml.registry.infomodel.Slot`

Name for pre-defined Slot used in Organization and ClassificationScheme by JAXR UDDI provider.

**AUTO_ACKNOWLEDGE** - Static variable in interface `javax.jms.Session`

With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to `receive` or when the message listener the session has called to process the message successfully returns.

**autoFlush** - Variable in class `javax.servlet.jsp.JspWriter`

Whether the JspWriter is autoflushing.

**available()** - Method in class `javax.mail.util.SharedFileInputStream`

Returns the number of bytes that can be read from this input stream without blocking.
Basic - Annotation Type in javax.persistence
   The Basic annotation is the simplest type of mapping to a database column.

BASIC_AUTH - Static variable in class
javax.faces.context.ExternalContext
   String identifier for BASIC authentication.

BASIC_AUTH - Static variable in interface
javax.servlet.http.HttpServletRequest
   String identifier for Basic authentication.

BCC - Static variable in class javax.mail.Message.RecipientType
   The "Bcc" (blind carbon copy) recipients.

BEAN_ADDED - Static variable in class
javax.enterprise.deploy.model.XpathEvent
   Adding a DDBean

BEAN_CHANGED - Static variable in class
javax.enterprise.deploy.model.XpathEvent
   Changing a DDBean

BEAN_REMOVED - Static variable in class
javax.enterprise.deploy.model.XpathEvent
   Removing a DDBean

BeanELResolver - Class in javax.el
   Defines property resolution behavior on objects using the JavaBeans component architecture.

BeanELResolver() - Constructor for class java.el.BeanELResolver
   Creates a new read/write BeanELResolver.

BeanELResolver(boolean) - Constructor for class java.el.BeanELResolver
   Creates a new BeanELResolver whose read-only status is determined by the given parameter.

BeanELResolver.BeanProperties - Class in javax.el

BeanELResolver.BeanProperties(Class<?>) - Constructor for class
java.el.BeanELResolver.BeanProperties

BeanELResolver.BeanProperty - Class in javax.el
**BeanELResolver.BeanProperty(Class<?>, PropertyDescriptor)** - Constructor for class `javax.el.BeanELResolver.BeanProperty`

**BeanNotFoundException** - Exception in `javax.enterprise.deploy.spi.exceptions`
   This exception is to report that the bean is not a child of the parent bean.

**BeanNotFoundException(String)** - Constructor for exception `javax.enterprise.deploy.spi.exceptions.BeanNotFoundException`
   Creates a new BeanNotFoundException object.

**beforeCompletion()** - Method in interface `javax.ejb.SessionSynchronization`
   The beforeCompletion method notifies a session Bean instance that a transaction is about to be committed.

**beforeCompletion()** - Method in interface `javax.transaction.Synchronization`
   The beforeCompletion method is called by the transaction manager prior to the start of the two-phase transaction commit process.

**beforeDelivery(Method)** - Method in interface `javax.resource.spi.endpoint.MessageEndpoint`
   This is called by a resource adapter before a message is delivered.

**beforeMarshal(Object)** - Method in class `javax.xml.bind.Marshaller.Listener`
   Callback method invoked before marshalling from source to XML.

**beforePhase(PhaseEvent)** - Method in interface `javax.faces.event.PhaseListener`
   Handle a notification that the processing for a particular phase of the request processing lifecycle is about to begin.

**beforeUnmarshal(Object, Object)** - Method in class `javax.xml.bind.Unmarshaller.Listener`
   Callback method invoked before unmarshalling into target.

**begin()** - Method in interface `javax.persistence.EntityTransaction`
   Start the resource transaction.

**begin()** - Method in interface `javax.resource.cci.LocalTransaction`
Begins a local transaction on an EIS instance.

**begin()** - Method in interface `javax.resource.spi.LocalTransaction`
Begin a local transaction

**begin()** - Method in interface `javax.transaction.TransactionManager`
Create a new transaction and associate it with the current thread.

**begin()** - Method in interface `javax.transaction.UserTransaction`
Create a new transaction and associate it with the current thread.

**BigDecimalConverter** - Class in `javax.faces.convert` Converter implementation for `java.math.BigDecimal` values.

**BigDecimalConverter()** - Constructor for class `javax.faces.convert.BigDecimalConverter`

**BigDecimalHolder** - Class in `javax.xml.rpc.holders`

**BigDecimalHolder()** - Constructor for class `javax.xml.rpc.holders.BigDecimalHolder`

**BigDecimalHolder(BigDecimal)** - Constructor for class `javax.xml.rpc.holders.BigDecimalHolder`

**BIGINTEGER_ID** - Static variable in class `javax.faces.convert.BigIntegerConverter`
The message identifier of the `FacesMessage` to be created if the conversion to `BigInteger` fails.

**BigIntegerConverter** - Class in `javax.faces.convert` Converter implementation for `java.math.BigInteger` values.

**BigIntegerConverter()** - Constructor for class `javax.faces.convert.BigIntegerConverter`

**BigIntegerHolder** - Class in `javax.xml.rpc.holders`

**BigIntegerHolder()** - Constructor for class `javax.xml.rpc.holders.BigIntegerHolder`

**BigIntegerHolder(BigInteger)** - Constructor for class `javax.xml.rpc.holders.BigIntegerHolder`

**Binder<XmlNode>** - Class in `javax.xml.bind` Enable synchronization between XML infoset nodes and JAXB
objects representing same XML document.

**Binder()** - Constructor for class `javax.xml.bind.Binder`

**Binding** - Interface in `javax.xml.ws`
   The `Binding` interface is the base interface for JAX-WS protocol bindings.

**BindingProvider** - Interface in `javax.xml.ws`
   The `BindingProvider` interface provides access to the protocol binding and associated context objects for request and response message processing.

**bindings** - Variable in class `javax.faces.component.UICOMPONENT`

**BindingType** - Annotation Type in `javax.xml.ws`
   The `BindingType` annotation is used to specify the binding to use for a web service endpoint implementation class.

**BODY_CONTENT_EMPTY** - Static variable in class `javax.servlet.jsp.tagext.TagInfo`
   Static constant for `getBodyContent()` when it is empty.

**BODY_CONTENT_JSP** - Static variable in class `javax.servlet.jsp.tagext.TagInfo`
   Static constant for `getBodyContent()` when it is JSP.

**BODY_CONTENT_SCRIPTLESS** - Static variable in class `javax.servlet.jsp.tagext.TagInfo`
   Static constant for `getBodyContent()` when it is scriptless.

**BODYCONTENT** - Static variable in class `javax.servlet.jsp.tagext.TagInfo`
   Static constant for `getBodyContent()` when it is Tag dependent.

**bodyContent** - Variable in class `javax.faces.webapp.UICOMPONENTClassicTagBase`
   The `bodyContent` for this tag handler.

**BodyContent** - Class in `javax.servlet.jsp.tagext`
   An encapsulation of the evaluation of the body of an action so it is available to a tag handler.

**BodyContent(JspWriter)** - Constructor for class `javax.servlet.jsp.tagext.BodyContent`
   Protected constructor.

**bodyContent** - Variable in class `javax.servlet.jsp.tagext.BodyTagSupport`
   The current `BodyContent` for this `BodyTag`.

**BodyPart** - Class in `javax.mail`
This class models a Part that is contained within a Multipart. 
**BodyPart()** - Constructor for class `javax.mail.BodyPart`

**BodyTag** - Interface in `javax.servlet.jsp.tagext`
The BodyTag interface extends IterationTag by defining additional methods that let a tag handler manipulate the content of evaluating its body.

**BodyTagSupport** - Class in `javax.servlet.jsp.tagext`
A base class for defining tag handlers implementing BodyTag. 
**BodyTagSupport()** - Constructor for class `javax.servlet.jsp.tagext.BodyTagSupport`
Default constructor, all subclasses are required to only define a public constructor with the same signature, and to call the superclass constructor.

**BodyTerm** - Class in `javax.mail.search`
This class implements searches on a Message Body.
**BodyTerm(String)** - Constructor for class `javax.mail.search.BodyTerm`

**BOOLEAN_ID** - Static variable in class `javax.faces.convert.BooleanConverter`
The message identifier of the `FacesMessage` to be created if the conversion to `Boolean` fails.

**BooleanConverter** - Class in `javax.faces.convert`
`Converter` implementation for `java.lang.Boolean` (and boolean primitive) values.
**BooleanConverter()** - Constructor for class `javax.faces.convert.BooleanConverter`

**BooleanHolder** - Class in `javax.xml.rpc.holders`

**BooleanHolder()** - Constructor for class `javax.xml.rpc.holders.BooleanHolder`

**BooleanHolder(boolean)** - Constructor for class `javax.xml.rpc.holders.BooleanHolder`

**BooleanWrapperHolder** - Class in `javax.xml.rpc.holders`

**BooleanWrapperHolder()** - Constructor for class
**BooleanWrapperHolder** - Constructor for class javax.xml.rpc.holders.BooleanWrapperHolder

**BootstrapContext** - Interface in javax.resource.spi
This provides a mechanism to pass a bootstrap context to a resource adapter instance when it is bootstrapped.

**BoundaryStatistic** - Interface in javax.management.j2ee.statistics
Specifies standard measurements of the upper and lower limits of the value of an attribute.

**BoundedRangeStatistic** - Interface in javax.management.j2ee.statistics
The BoundedRangeStatistic model aggregates the attributes of RangeStatistic and BoundaryStatistic and provides standard measurements of a range that has fixed limits.

**broadcast(FacesEvent)** - Method in class javax.faces.component/UICommand
In addition to to the default
UIComponent.broadcast(javax.faces.event.FacesEvent) processing, pass the ActionEvent being broadcast to the method referenced by actionListener (if any), and to the default ActionListener registered on the Application.

**broadcast(FacesEvent)** - Method in class javax.faces.component/UIComponent
Broadcast the specified FacesEvent to all registered event listeners who have expressed an interest in events of this type.

**broadcast(FacesEvent)** - Method in class javax.faces.component/UIComponentBase
Override the default
UIComponentBase.broadcast(javax.faces.event.FacesEvent) processing to unwrap any wrapped FacesEvent and reset the current row index, before the event is actually broadcast.

**bufferSize** - Variable in class javax.servlet.jsp.JspWriter
The size of the buffer used by the JspWriter.

**bufpos** - Variable in class javax.mail.util.SharedFileInputStream
The file offset that corresponds to the first byte in the read buffer.
bufsize - Variable in class javax.mail.util.**SharedFileInputStream**
The normal size of the read buffer.

BulkResponse - Interface in **javax.xml.registry**
Contains the response of a method in the API that performs a bulk operation and returns a bulk response.

BusinessLifeCycleManager - Interface in **javax.xml.registry**
The BusinessLifeCycleManager interface, which is exposed by the Registry Service, implements the life cycle management functionality of the Registry as part of a business level API.

BusinessQueryManager - Interface in **javax.xml.registry**
The BusinessQueryManager interface, which is exposed by the Registry Service, implements the business style query interface.

BYTE_ID - Static variable in class javax.faces.convert.**ByteConverter**
The message identifier of the **FacesMessage** to be created if the conversion to **Byte** fails.

ByteArrayDataSource - Class in **javax.mail.util**
A DataSource backed by a byte array.

ByteArrayDataSource(InputStream, String) - Constructor for class javax.mail.util.**ByteArrayDataSource**
Create a ByteArrayDataSource with data from the specified InputStream and with the specified MIME type.

ByteArrayDataSource(byte[], String) - Constructor for class javax.mail.util.**ByteArrayDataSource**
Create a ByteArrayDataSource with data from the specified byte array and with the specified MIME type.

ByteArrayDataSource(String, String) - Constructor for class javax.mail.util.**ByteArrayDataSource**
Create a ByteArrayDataSource with data from the specified String and with the specified MIME type.

ByteArrayHolder - Class in **javax.xml.rpc.holders**

ByteArrayHolder() - Constructor for class javax.xml.rpc.holders.**ByteArrayHolder**

ByteArrayHolder(byte[]) - Constructor for class javax.xml.rpc.holders.**ByteArrayHolder**

ByteConverter - Class in **javax.faces.convert**
Converter implementation for java.lang.Byte (and byte primitive)
values.

**ByteConverter()** - Constructor for class java.util.ByteConverter

**ByteHolder** - Class in javax.xml.rpc.holders

**ByteHolder()** - Constructor for class javax.xml.rpc.holders.ByteHolder

**ByteHolder(byte)** - Constructor for class javax.xml.rpc.holders.ByteHolder

**BytesMessage** - Interface in javax.jms

A `BytesMessage` object is used to send a message containing a stream of uninterpreted bytes.

**ByteWrapperHolder** - Class in javax.xml.rpc.holders

**ByteWrapperHolder()** - Constructor for class javax.xml.rpc.holders.ByteWrapperHolder

**ByteWrapperHolder(Byte)** - Constructor for class javax.xml.rpc.holders.ByteWrapperHolder
calculateCharacterEncoding(FacesContext) - Method in class javax.faces.application.ViewHandler
Returns the correct character encoding to be used for this request.

calculateCharacterEncoding(FacesContext) - Method in class javax.faces.application.ViewHandlerWrapper
The default behavior of this method is to call ViewHandler.calculateCharacterEncoding(javax.faces.context.FacesContext) on the wrapped ViewHandler object.

calculateLocale(FacesContext) - Method in class javax.faces.application.ViewHandler
Returns an appropriate Locale to use for this and subsequent requests for the current client.

calculateLocale(FacesContext) - Method in class javax.faces.application.ViewHandlerWrapper
The default behavior of this method is to call ViewHandler.calculateLocale(javax.faces.context.FacesContext) on the wrapped ViewHandler object.

calculateRenderKitId(FacesContext) - Method in class javax.faces.application.ViewHandler
Return an appropriate renderKitId for this and subsequent requests from the current client.

calculateRenderKitId(FacesContext) - Method in class javax.faces.application.ViewHandlerWrapper
The default behavior of this method is to call ViewHandler.calculateRenderKitId(javax.faces.context.FacesContext) on the wrapped ViewHandler object.

CalendarHolder - Class in javax.xml.rpc.holders

CalendarHolder() - Constructor for class javax.xml.rpc.holders.CalendarHolder

CalendarHolder(Calendar) - Constructor for class javax.xml.rpc.holders.CalendarHolder

Call - Interface in javax.xml.rpc
The javax.xml.rpc.Call interface provides support for the dynamic
invocation of a service endpoint.

**call(SOAPMessage, Object)** - Method in class javax.xml.soap.SOAPConnection
Sends the given message to the specified endpoint and blocks until it has returned the response.

**canBeRequestTime()** - Method in class javax.servlet.jsp.tagext.TagAttributeInfo
Whether this attribute has been specified in the TLD as rtexprvalue.

**cancel()** - Method in interface javax.ejb.Timer
Cause the timer and all its associated expiration notifications to be cancelled.

**CANCEL** - Static variable in class javax.enterprise.deploy.shared.ActionType
A cancel operation is being preformed on the DeploymentManager action command.

**cancel()** - Method in interface javax.enterprise.deploy.spi.status.ProgressObject
(optional) A cancel request on an in-process operation stops all further processing of the operation and returns the environment to its original state before the operation was executed.

**CapabilityProfile** - Interface in javax.xml.registry
Provides information about the capabilities of a JAXR provider.

**CAR** - Static variable in class javax.enterprise.deploy.shared.ModuleType
The module is an Client Application archive.

**CascadeType** - Enum in javax.persistence
Defines the set of cascadable operations that are propagated to the associated entity.

**CASE_SENSITIVE_MATCH** - Static variable in interface javax.xml.registry.FindQualifier

**cause** - Variable in exception javax.xml.registry.JAXRException

**CC** - Static variable in class javax.mail.Message.RecipientType
The "Cc" (carbon copy) recipients.

**CDATA** - Static variable in interface javax.xml.stream.XMLStreamConstants
Indicates an event is a CDATA section

**CHARACTER_ENCODING_KEY** - Static variable in class javax.faces.application.ViewHandler
The key, in the session's attribute set, under which the response character encoding may be stored and retrieved.

**CHARACTER_ID** - Static variable in class javax.faces.convert.CharacterConverter
The message identifier of the FacesMessage to be created if the conversion to Character fails.

**CHARACTER_SET_ENCODING** - Static variable in class javax.xml.soap.SOAPMessage
Specifies the character type encoding for the SOAP Message.

**CharacterConverter** - Class in javax.faces.convert
Converter implementation for java.lang.Character (and char primitive) values.

**CharacterConverter()** - Constructor for class javax.faces.convert.CharacterConverter

**Characters** - Interface in javax.xml.stream.events
This describes the interface to Characters events.

**CHARACTERS** - Static variable in interface javax.xml.stream.XMLStreamConstants
Indicates an event is characters

**Classification** - Interface in javax.xml.registry.infomodel
The Classification interface is used to classify RegistryObject instances.

**CLASSIFICATION** - Static variable in interface javax.xml.registry.LifeCycleManager

**CLASSIFICATION_SCHEME** - Static variable in interface javax.xml.registry.LifeCycleManager

**ClassificationScheme** - Interface in javax.xml.registry.infomodel
A ClassificationScheme instance represents a taxonomy that may be used to classify or categorize RegistryObject instances.

**ClassTransformer** - Interface in javax.persistence.spi
A persistence provider supplies an instance of this interface to the PersistenceUnitInfo.addTransformer method.

**cleanup()** - Method in interface javax.resource.spi.ManagedConnection
Application server calls this method to force any cleanup on the ManagedConnection instance.

**clear()** - Method in interface javax.persistence.EntityManager
Clear the persistence context, causing all managed entities to become detached.

**clear()** - Method in class `javax.servlet.jsp.JspWriter`
Clear the contents of the buffer.

**clear()** - Method in interface `javax.xml.rpc.encoding.TypeMappingRegistry`
Removes all registered TypeMappings and encodingStyleURIs from this TypeMappingRegistry.

**clearBody()** - Method in interface `javax.jms.Message`
Clears out the message body.

**clearBody()** - Method in class `javax.servlet.jsp.tagext.BodyContent`
Clear the body without throwing any exceptions.

**clearBuffer()** - Method in class `javax.servlet.jsp.JspWriter`
Clears the current contents of the buffer.

**clearContent()** - Method in class `javax.xml.soap.AttachmentPart`
Clears out the content of this AttachmentPart object.

**clearProperties()** - Method in interface `javax.jms.Message`
Clears a message's properties.

**clearWarnings()** - Method in interface `javax.resource.cci.Interaction`
Clears all the warning reported by this Interaction instance.

**CLIENT_ACKNOWLEDGE** - Static variable in interface `javax.jms.Session`
With this acknowledgment mode, the client acknowledges a consumed message by calling the message's **acknowledge** method.

**CLIENT_CERT_AUTH** - Static variable in class `javax.faces.context.ExternalContext`
String identifier for **CLIENT_CERT** authentication.

**CLIENT_CERT_AUTH** - Static variable in interface `javax.servlet.http.HttpServletRequest`
String identifier for Client Certificate authentication.

**ClientConfiguration** - Interface in `javax.enterprise.deploy.spi.status`
The ClientConfiguration object installs, configures and executes an Application Client.

**ClientExecuteException** - Exception in `javax.enterprise.deploy.spi.exceptions`
This exception reports errors in setting up an application client for execution.

**ClientExecuteException()** - Constructor for exception
`javax.enterprise.deploy.spi.exceptions.ClientExecuteException`
Creates new ClientExecuteException without detail message.  

**ClientExecuteException(String)** - Constructor for exception

```
javax.enterprise.deploy.spi.exceptions.ClientExecuteException
```

Constructs an ClientExecuteException with the specified detail message.

**clone()** - Method in class `javax.mail.Flags`

```
Returns a clone of this Flags object.
```

**clone()** - Method in class `javax.mail.internet.InternetAddress`

```
Return a copy of this InternetAddress object.
```

**clone()** - Method in interface `javax.resource.cci.Record`

```
Creates and returns a copy of this object.
```

**clone()** - Method in class `javax.servlet.http.Cookie`

```
Overrides the standard java.lang.Object.clone method to return a copy of this cookie.
```

**cloneWithWriter(Writer)** - Method in class `javax.faces.context.ResponseWriter`

```
Create and return a new instance of this ResponseWriter, using the specified Writer as the output destination.
```

**cloneWithWriter(Writer)** - Method in class `javax.faces.context.ResponseWriterWrapper`

```
The default behavior of this method is to call ResponseWriter.cloneWithWriter(java.io.Writer) on the wrapped ResponseWriter object.
```

**close()** - Method in class `javax.faces.context.ResponseWriterWrapper`

```
The default behavior of this method is to call Writer.close() on the wrapped ResponseWriter object.
```

**close()** - Method in interface `javax.jms.Connection`

```
Closes the connection.
```

**close()** - Method in interface `javax.jms.ConnectionConsumer`

```
Closes the connection consumer.
```

**close()** - Method in interface `javax.jms.MessageConsumer`

```
Closes the message consumer.
```

**close()** - Method in interface `javax.jms.MessageProducer`

```
Closes the message producer.
```

**close()** - Method in interface `javax.jms.QueueBrowser`

```
Closes the QueueBrowser.
```

**close()** - Method in class `javax.jms.QueueRequestor`

```
Closes the QueueRequestor and its session.
```

**close()** - Method in interface `javax.jms.Session`
Closes the session.

**close()** - Method in class `javax.jms.TopicRequestor`
Closes the `TopicRequestor` and its session.

**close(boolean)** - Method in class `javax.mail.Folder`
Close this Folder.

**close()** - Method in class `javax.mail.Service`
Close this service and terminate its connection.

**close()** - Method in class `javax.mail.util.SharedFileInputStream`
Closes this input stream and releases any system resources associated with the stream.

**close()** - Method in interface `javax.persistence.EntityManager`
Close an application-managed `EntityManager`.

**close()** - Method in interface `javax.persistence.EntityManagerFactory`
Close the factory, releasing any resources that it holds.

**close()** - Method in interface `javax.resource.cci.Connection`
Initiates close of the connection handle at the application level.

**close()** - Method in interface `javax.resource.cci.Interaction`
Closes the current Interaction and release all the resources held for this instance by the resource adapter.

**close()** - Method in class `javax.servlet.jsp.JspWriter`
Close the stream, flushing it first.

**close()** - Method in interface `javax.xml.registry.Connection`
Closes a Connection when it is no longer needed.

**close()** - Method in class `javax.xml.soap.SOAPConnection`
Closes this SOAPConnection object.

**close()** - Method in class `javax.xml.stream.util.EventReaderDelegate`

**close()** - Method in class `javax.xml.stream.utilStreamReaderDelegate`

**close()** - Method in interface `javax.xml.stream.XMLEventReader`
Frees any resources associated with this Reader.

**close()** - Method in interface `javax.xml.stream.XMLEventWriter`
Frees any resources associated with this stream.

**close()** - Method in interface `javax.xml.stream.XMLStreamReader`
Frees any resources associated with this Reader.

**close()** - Method in interface `javax.xml.stream.XMLStreamWriter`
Close this writer and free any resources associated with the writer.

**close(MessageContext)** - Method in interface `javax.xml.ws.handler.Handler`
Called at the conclusion of a message exchange pattern just prior to
the JAX-WS runtime dispatching a message, fault or exception.

**closed(ConnectionEvent)** - Method in class
javax.mail.event.ConnectionAdapter

**CLOSED** - Static variable in class javax.mail.event.ConnectionEvent
A connection was closed.

**closed(ConnectionEvent)** - Method in interface
javax.mail.event.ConnectionListener
Invoked when a Store/Folder/Transport is closed.

**coerceToType(Object, Class<?>)** - Method in class
javax.el.ExpressionFactory
Coerces an object to a specific type according to the EL type
conversion rules.

**CollapsedStringAdapter** - Class in javax.xml.bind.annotation.adapters
Built-in XmlAdapter to handle xs:token and its derived types.

**CollapsedStringAdapter**() - Constructor for class
javax.xml.bind.annotation.adapters.CollapsedStringAdapter

**Column** - Annotation Type in javax.persistence
Is used to specify a mapped column for a persistent property or field.

**ColumnResult** - Annotation Type in javax.persistence
References name of a column in the SELECT clause of a SQL query
- i.e., column alias, if applicable.

**COMBINE_CLASSIFICATIONS** - Static variable in interface
javax.xml.registry.FindQualifier
Maps to UDDI combineCategoryBags.

**CommandInfo** - Class in javax.activation
The CommandInfo class is used by CommandMap implementations
to describe the results of command requests.

**CommandInfo(String, String)** - Constructor for class
javax.activation.CommandInfo
The Constructor for CommandInfo.

**CommandMap** - Class in javax.activation
The CommandMap class provides an interface to a registry of
command objects available in the system.

**CommandMap()** - Constructor for class javax.activation.CommandMap

**CommandObject** - Interface in javax.activation
JavaBeans components that are Activation Framework aware implement this interface to find out which command verb they're being asked to perform, and to obtain the DataHandler representing the data they should operate on.

**CommandType** - Class in javax.enterprise.deploy.shared
Class CommandTypes defines enumeration values for the DeploymentStatus object.

**CommandType(int)** - Constructor for class javax.enterprise.deploy.shared.CommandType
Construct a new enumeration value with the given integer value.

**COMMENT** - Static variable in class javax.mail.internet.HeaderTokenizer.Token
Token type indicating a comment.

**Comment** - Interface in javax.xml.stream.events
An interface for comment events

**COMMENT** - Static variable in interface javax.xml.stream.XMLStreamConstants
Indicates an event is a comment

**CommException** - Exception in javax.resource.spi
This indicates errors related to failed or interrupted communication with an EIS instance.

**CommException()** - Constructor for exception javax.resource.spi.CommException
Constructs a new instance with null as its detail message.

**CommException(String)** - Constructor for exception javax.resource.spi.CommException
Constructs a new instance with the specified detail message.

**CommException(Throwable)** - Constructor for exception javax.resource.spi.CommException
Constructs a new throwable with the specified cause.

**CommException(String, Throwable)** - Constructor for exception javax.resource.spi.CommException
Constructs a new throwable with the specified detail message and cause.

**CommException(String, String)** - Constructor for exception javax.resource.spi.CommException
Constructs a new throwable with the specified detail message and an error code.

**commit()** - Method in interface javax.jms.Session
Commits all messages done in this transaction and releases any locks currently held.

**commit()** - Method in interface javax.jms.XASession

Throws a TransactionInProgressException, since it should not be called for an XASession object.

**commit()** - Method in interface javax.persistence.EntityTransaction

Commit the current transaction, writing any unflushed changes to the database.

**commit()** - Method in interface javax.resource.cci.LocalTransaction

Commits the current local transaction and release all locks held by the underlying EIS instance.

**commit()** - Method in interface javax.resource.spi.LocalTransaction

Commit a local transaction

**commit(Xid, boolean)** - Method in interface javax.resource.spi.XATerminator

Commits the global transaction specified by xid.

**commit()** - Method in interface javax.security.jacc.PolicyConfiguration

This method is used to set to "inService" the state of the policy context whose interface is this PolicyConfiguration Object.

**commit()** - Method in interface javax.transaction.Transaction

Complete the transaction represented by this Transaction object.

**commit()** - Method in interface javax.transaction.TransactionManager

Complete the transaction associated with the current thread.

**commit()** - Method in interface javax.transaction.UserTransaction

Complete the transaction associated with the current thread.

**commit(Xid, boolean)** - Method in interface javax.transaction.xa.XAResource

Commits the global transaction specified by xid.

**compareTo(Object)** - Method in class javax.faces.application.FacesMessage.Severity

Compare this FacesMessage.Severity instance to the specified one.

**compareTo(Object)** - Method in class javax.faces.event.PhaseId

Compare this PhaseId instance to the specified one.

**compareValues(Object, Object)** - Method in class javax.faces.component.UInput

Return true if the new value is different from the previous value.

**compareValues(Object, Object)** - Method in class javax.faces.component.UISelectMany

Return true if the new value is different from the previous value.
**comparison** - Variable in class `javax.mail.search.ComparisonTerm`  
The comparison.

**ComparisonTerm** - Class in `javax.mail.search`  
This class models the comparison operator.

**ComparisonTerm()** - Constructor for class `javax.mail.search.ComparisonTerm`

**COMPLETED** - Static variable in class `javax.enterprise.deploy.shared.StateType`  
The action operation has completed normally.

**COMPONENT_FAMILY** - Static variable in class `javax.faces.component.UIColumn`  
The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class `javax.faces.component.UICommand`  
The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class `javax.faces.component.UIData`  
The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class `javax.faces.component.UIForm`  
The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class `javax.faces.component.UIGraphic`  
The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class `javax.faces.component.UIInput`  
The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class `javax.faces.component.UIMessage`  
The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class `javax.faces.component.UIMessages`  
The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class `javax.faces.component.UINamingContainer`  
The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class `javax.faces.component.UIOutput`  
The standard component family for this component.
The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class
javafx.faces.component.**UIPanel**

The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class
javafx.faces.component.**UIParameter**

The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class
javafx.faces.component.**UISelectBoolean**

The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class
javafx.faces.component.**UISelectItem**

The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class
javafx.faces.component.**UISelectItems**

The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class
javafx.faces.component.**UISelectMany**

The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class
javafx.faces.component.**UISelectOne**

The standard component family for this component.

**COMPONENT_FAMILY** - Static variable in class
javafx.faces.component.**UIViewRoot**

The standard component family for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.html.**HtmlColumn**

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.html.**HtmlCommandButton**

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.html.**HtmlCommandLink**

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.html.**HtmlDataTableView**

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.html.**HtmlForm**
The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javax.faces.component.html.HtmlGraphicImage

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javax.faces.component.html.HtmlInputHidden

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javax.faces.component.html.HtmlInputSecret

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javax.faces.component.html.HtmlInputText

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javax.faces.component.html.HtmlInputTextarea

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javax.faces.component.html.HtmlMessage

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javax.faces.component.html.HtmlMessages

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javax.faces.component.html.HtmlOutputFormat

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javax.faces.component.html.HtmlOutputLabel

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javax.faces.component.html.HtmlOutputLink

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javax.faces.component.html.HtmlOutputText

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javax.faces.component.html.HtmlPanelGrid

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javax.faces.component.html.HtmlPanelGroup
The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.html.HtmlSelectBooleanCheckbox

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.html.HtmlSelectManyCheckbox

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.html.HtmlSelectManyListbox

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.html.HtmlSelectManyMenu

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.html.HtmlSelectOneListbox

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.html.HtmlSelectOneMenu

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.html.HtmlSelectOneRadio

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.UIColumn

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.UICommand

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.UIData

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.UIForm

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.UIGraphic

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class
javafx.faces.component.UIInput
The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class javax.faces.component.**UIMessage**

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class javax.faces.component.**UIMessages**

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class javax.faces.component.**UINamingContainer**

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class javax.faces.component.**UIOutput**

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class javax.faces.component.**UIPanel**

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class javax.faces.component.**UIParameter**

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class javax.faces.component.**UISelectBoolean**

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class javax.faces.component.**UISelectItem**

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class javax.faces.component.**UISelectItems**

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class javax.faces.component.**UISelectMany**

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class javax.faces.component.**UISelectOne**

The standard component type for this component.

**COMPONENT_TYPE** - Static variable in class javax.faces.component.**UIViewRoot**

The standard component type for this component.

**CompositeELResolver** - Class in [javax.el](https://docs.oracle.com/en/java/javase/11/docs/api/javax/el/CompositeELResolver.html)

Maintains an ordered composite list of child **ELResolver**s.
**CompositeELResolver()** - Constructor for class javax.el.CompositeELResolver

**Concept** - Interface in javax.xml.registry.infomodel
   The Concept interface is used to represent taxonomy elements and their structural relationship with each other in order to describe an internal taxonomy.

**CONCEPT** - Static variable in interface javax.xml.registry.LifeCycleManager

**ConcurrentAccessException** - Exception in javax.ejb
   A ConcurrentAccessException indicates that the client has attempted an invocation on a stateful session bean while another invocation is in progress.

**ConcurrentAccessException()** - Constructor for exception javax.ejb.ConcurrentAccessException
   Constructs an ConcurrentAccessException with no detail message.

**ConcurrentAccessException(String)** - Constructor for exception javax.ejb.ConcurrentAccessException
   Constructs an ConcurrentAccessException with the specified detailed message.

**ConcurrentAccessException(String, Exception)** - Constructor for exception javax.ejb.ConcurrentAccessException
   Constructs an ConcurrentAccessException with the specified detail message and a nested exception.

**CONFIG** - Static variable in class javax.servlet.jsp.PageContext
   Name used to store ServletConfig in PageContext name table.

**CONFIG_FILES_ATTR** - Static variable in class javax.faces.webapp.FacesServlet
   Context initialization parameter name for a comma delimited list of context-relative resource paths (in addition to /WEB-INF/faces-config.xml which is loaded automatically if it exists) containing JavaServer Faces configuration information.

**ConfigurationException** - Exception in javax.enterprise.deploy.spi.exceptions
   This exception reports errors in generating a configuration bean.

**ConfigurationException()** - Constructor for exception javax.enterprise.deploy.spi.exceptionsConfigurationException
   Creates new ConfigurationException without detail message.
**ConfigurationException(String)** - Constructor for exception
java.enterprise.deploy.spi.exceptions.**ConfigurationException**
Constructs an `ConfigurationException` with the specified detail message.

**confirmAssociation(Association)** - Method in interface
javax.xml.registry.**BusinessLifeCycleManager**
Confirms this Association by the User associated with the caller.

**connect()** - Method in class javax.mail.**Service**
A generic connect method that takes no parameters.

**connect(String, String, String)** - Method in class javax.mail.**Service**
Connect to the current host using the specified username and password.

**connect(String, int, String, String)** - Method in class javax.mail.**Service**
Similar to `connect(host, user, password)` except a specific port can be specified.

**Connection** - Interface in **javax.jms**
A `Connection` object is a client's active connection to its JMS provider.

**Connection** - Interface in **javax.resource.cci**
A `Connection` represents an application-level handle that is used by a client to access the underlying physical connection.

**Connection** - Interface in **javax.xml.registry**
This class represents a connection between a JAXR client and a JAXR provider.

**CONNECTION_CLOSED** - Static variable in class
javax.resource.spi.**ConnectionEvent**
Event notification that an application component has closed the connection

**CONNECTION_ERROR_OCCURRED** - Static variable in class
javax.resource.spi.**ConnectionEvent**
Event notification that an error occurred on the connection.

**ConnectionAdapter** - Class in **javax.mail.event**
The adapter which receives connection events.

**ConnectionAdapter()** - Constructor for class
javax.mail.event.**ConnectionAdapter**

**connectionClosed(ConnectionEvent)** - Method in interface
javax.resource.spi.**ConnectionEventListener**
Notifies that an application component has closed the connection.

**ConnectionConsumer** - Interface in javax.jms
For application servers, **Connection** objects provide a special facility for creating a **ConnectionConsumer** (optional).

**connectionErrorOccurred(ConnectionEvent)** - Method in interface javax.resource.spi.**ConnectionEventListener**
Notifies a connection related error.

**ConnectionEvent** - Class in *javax.mail.event*
This class models Connection events.

**ConnectionEvent(Object, int)** - Constructor for class javax.mail.event.**ConnectionEvent**
Constructor

**ConnectionEvent** - Class in *javax.resource.spi*
The **ConnectionEvent** class provides information about the source of a connection related event. A **ConnectionEvent** instance contains the following information: Type of the connection event ManagedConnection instance that generated the connection event.

**ConnectionEvent(ManagedConnection, int)** - Constructor for class javax.resource.spi.**ConnectionEvent**
Construct a **ConnectionEvent** object.

**ConnectionEvent(ManagedConnection, int, Exception)** - Constructor for class javax.resource.spi.**ConnectionEvent**
Construct a **ConnectionEvent** object.

**ConnectionEventListener** - Interface in *javax.resource.spi*
The **ConnectionEventListener** interface provides an event callback mechanism to enable an application server to receive notifications from a **ManagedConnection** instance.

**ConnectionFactory** - Interface in *javax.jms*
A **ConnectionFactory** object encapsulates a set of connection configuration parameters that has been defined by an administrator.

**ConnectionFactory** - Interface in *javax.resource.cci*
**ConnectionFactory** provides an interface for getting connection to an EIS instance.

**ConnectionFactory** - Class in *javax.xml.registry*
This is the abstract base class for factory classes for creating a JAXR connection.

**ConnectionFactory()** - Constructor for class javax.xml.registry.**ConnectionFactory**
**ConnectionListener** - Interface in `javax.mail.event`
This is the Listener interface for Connection events.

**ConnectionManager** - Interface in `javax.resource.spi`
ConnectionManager interface provides a hook for the resource adapter to pass a connection request to the application server.

**ConnectionMetaData** - Interface in `javax.jms`
A ConnectionMetaData object provides information describing the Connection object.

**ConnectionMetaData** - Interface in `javax.resource.cci`
The interface ConnectionMetaData provides information about an EIS instance connected through a Connection instance.

**ConnectionRequestInfo** - Interface in `javax.resource.spi`
The ConnectionRequestInfo interface enables a resource adapter to pass its own request specific data structure across the connection request flow.

**ConnectionSpec** - Interface in `javax.resource.cci`
ConnectionSpec is used by an application component to pass connection request-specific properties to the ConnectionFactory.

**contains(FetchProfile.Item)** - Method in class `javax.mail.FetchProfile`
Returns true if the fetch profile contains given special item.

**contains(String)** - Method in class `javax.mail.FetchProfile`
Returns true if the fetch profile contains given header name.

**contains(Flags.Flag)** - Method in class `javax.mail.Flags`
Check whether the specified system flag is present in this Flags object.

**contains(String)** - Method in class `javax.mail.Flags`
Check whether the specified user flag is present in this Flags object.

**contains(Flags)** - Method in class `javax.mail.Flags`
Check whether all the flags in the specified Flags object are present in this Flags object.

**contains(Object)** - Method in interface `javax.persistence.EntityManager`
Check if the instance belongs to the current persistence context.

**containsHeader(String)** - Method in interface `javax.servlet.http.HttpServletResponse`
Returns a boolean indicating whether the named response header has already been set.

**containsHeader(String)** - Method in class `javax.servlet.http.HttpServletResponseWrapper`
The default behavior of this method is to call `containsHeader(String name)` on the wrapped response object.

- **containsProperty(String)**: Method in interface `javax.xml.rpc.handler.MessageContext`  
  Returns true if the `MessageContext` contains a property with the specified name.

- **content**: Variable in class `javax.mail.internet.MimeBodyPart`  
  Byte array that holds the bytes of the content of this Part.

- **content**: Variable in class `javax.mail.internet.MimeMessage`  
  Byte array that holds the bytes of this Message's content.

- **CONTENT_INFO**: Static variable in class `javax.mail.FetchProfile.Item`  
  This item is for fetching information about the content of the message.

- **ContentDisposition**: Class in `javax.mail.internet`  
  This class represents a MIME ContentDisposition value.

  - **ContentDisposition()**: Constructor for class `javax.mail.internet.ContentDisposition`  
    No-arg Constructor.

  - **ContentDisposition(String, ParameterList)**: Constructor for class `javax.mail.internet.ContentDisposition`  
    Constructor.

  - **ContentDisposition(String)**: Constructor for class `javax.mail.internet.ContentDisposition`  
    Constructor that takes a ContentDisposition string.

- **contentStream**: Variable in class `javax.mail.internet.MimeBodyPart`  
  If the data for this body part was supplied by an InputStream that implements the SharedInputStream interface, `contentStream` is another such stream representing the content of this body part.

- **contentStream**: Variable in class `javax.mail.internet.MimeMessage`  
  If the data for this message was supplied by an InputStream that implements the SharedInputStream interface, `contentStream` is another such stream representing the content of this message.

- **ContentType**: Class in `javax.mail.internet`  
  This class represents a MIME ContentType value.

  - **ContentType()**: Constructor for class `javax.mail.internet.ContentType`  
    No-arg Constructor.

  - **ContentType(String, String, ParameterList)**: Constructor for class `javax.mail.internet.ContentType`  
    Constructor.
**ContentType(String)** - Constructor for class `javax.mail.internet.ContentType`  
Constructors that takes a Content-Type string.

**contentType** - Variable in class `javax.mail.Multipart`  
This field specifies the content-type of this multipart object.

**ContextCallback** - Interface in `javax.faces.component`  
A simple callback interface that enables taking action on a specific `UIComponent` (either facet or child) in the view while preserving any contextual state for that component instance in the view.

**contextCreated(ELContextEvent)** - Method in interface `javax.el.ELContextListener`  
Invoked when a new `ELContext` has been created.

**contextDestroyed(ServletContextEvent)** - Method in interface `javax.servlet.ServletContextListener`  
Notification that the servlet context is about to be shut down.

**contextInitialized(ServletContextEvent)** - Method in interface `javax.servlet.ServletContextListener`  
Notification that the web application initialization process is starting.

**CONVERSION_MESSAGE_ID** - Static variable in class `javax.faces.component.UIInput`  
The message identifier of the `FacesMessage` to be created if a conversion error occurs, and neither the page author nor the `ConverterException` provides a message.

**convertClientId(FacesContext, String)** - Method in class `javax.faces.render.Renderer`  
Convert the component generated client id to a form suitable for transmission to the client.

**Converter** - Interface in `javax.faces.convert`  
**Converter** is an interface describing a Java class that can perform Object-to-String and String-to-Object conversions between model data objects and a String representation of those objects that is suitable for rendering.

**CONVERTER_ID** - Static variable in class `javax.faces.convert.BigDecimalConverter`  
The standard converter id for this converter.

**CONVERTER_ID** - Static variable in class `javax.faces.convert.BigIntegerConverter`  
The standard converter id for this converter.

**CONVERTER_ID** - Static variable in class
javax.faces.convert.**BooleanConverter**
   The standard converter id for this converter.

**CONVERTER_ID** - Static variable in class
javax.faces.convert.**ByteConverter**
   The standard converter id for this converter.

**CONVERTER_ID** - Static variable in class
javax.faces.convert.**CharacterConverter**
   The standard converter id for this converter.

**CONVERTER_ID** - Static variable in class
javax.faces.convert.**DateTimeConverter**
   The standard converter id for this converter.

**CONVERTER_ID** - Static variable in class
javax.faces.convert.**DoubleConverter**
   The standard converter id for this converter.

**CONVERTER_ID** - Static variable in class
javax.faces.convert.**EnumConverter**
   The standard converter id for this converter.

**CONVERTER_ID** - Static variable in class
javax.faces.convert.**FloatConverter**
   The standard converter id for this converter.

**CONVERTER_ID** - Static variable in class
javax.faces.convert.**IntegerConverter**
   The standard converter id for this converter.

**CONVERTER_ID** - Static variable in class
javax.faces.convert.**LongConverter**
   The standard converter id for this converter.

**CONVERTER_ID** - Static variable in class
javax.faces.convert.**NumberConverter**
   The standard converter id for this converter.

**CONVERTER_ID** - Static variable in class
javax.faces.convert.**ShortConverter**
   The standard converter id for this converter.

**ConverterELTag** - Class in javax.faces.webapp
   **ConverterELTag** is a base class for all JSP custom actions that
create and register a Converter instance on the **ValueHolder**
associated with our most immediate surrounding instance of a tag
whose implementation class is a subclass of
**UIComponentClassicTagBase**.

**ConverterELTag()** - Constructor for class
**ConverterException** - Exception in *javax.faces.convert*

*ConverterException* is an exception thrown by the `getAsObject()` or `getAsText()` method of a *Converter*, to indicate that the requested conversion cannot be performed.

**ConverterException()** - Constructor for exception

`javax.faces.convert.ConverterException` - Constructor for exception

Construct a new exception with no detail message or root cause.

**ConverterException(String)** - Constructor for exception

`javax.faces.convert.ConverterException(String)` - Constructor for exception

Construct a new exception with the specified detail message and no root cause.

**ConverterException(Throwables)** - Constructor for exception

`javax.faces.convert.ConverterException(Throwables)` - Constructor for exception

Construct a new exception with the specified root cause.

**ConverterException(String, Throwable)** - Constructor for exception

`javax.faces.convert.ConverterException(String, Throwable)` - Constructor for exception

Construct a new exception with the specified detail message and root cause.

**ConverterException(FacesMessage)** - Constructor for exception

`javax.faces.convert.ConverterException(FacesMessage)` - Constructor for exception

Construct a new exception with the specified detail message and no root cause.

**ConverterException(FacesMessage, Throwable)** - Constructor for exception

`javax.faces.convert.ConverterException(FacesMessage, Throwable)` - Constructor for exception

Construct a new exception with the specified detail message and root cause.

**ConverterTag** - Class in *javax.faces.webapp*

*Deprecated.* *This has been partially replaced by ConverterELTag.*

The remainder of the functionality, namely, the binding facility and the implementation of the *ConverterTag.createConverter()* method, is now an implementation detail.

**ConverterTag()** - Constructor for class *javax.faces.webapp ConverterTag*

*Deprecated.*

**Cookie** - Class in *javax.servlet.http*

Creates a cookie, a small amount of information sent by a servlet to a Web browser, saved by the browser, and later sent back to the server.
**Cookie(String, String)** - Constructor for class javax.servlet.http.Cookie
Constructs a cookie with a specified name and value.

**copyMessages(Message[], Folder)** - Method in class javax.mail.Folder
Copy the specified Messages from this Folder into another Folder.

**countAttachments()** - Method in class javax.xml.soap.SOAPMessage
Gets a count of the number of attachments in this message.

**CountStatistic** - Interface in javax.management.j2ee.statistics
Specifies standard count measurements.

**create(int)** - Method in class javax.mail.Folder
Create this folder on the Store.

**create()** - Method in interface javax.management.j2ee.ManagementHome
Creates an MEJB session object which provides access to the J2EE Management Model.

**create(Name)** - Method in class javax.xml.soap.SOAPElementFactory
*Deprecated. Use*  
javax.xml.soap.SOAPFactory.createElement(javax.xml.soap.Name)  
*instead*

**create(String)** - Method in class javax.xml.soap.SOAPElementFactory
*Deprecated. Use*  
javax.xml.soap.SOAPFactory.createElement(String localName)  
*instead*

**create(String, String, String)** - Method in class javax.xml.soap.SOAPElementFactory
*Deprecated. Use*  
javax.xml.soap.SOAPFactory.createElement(String localName,  
String prefix, String uri)  
*instead*

**create(Object)** - Static method in class javax.xml.ws.Endpoint
Creates an endpoint with the specified implementor object.

**create(String, Object)** - Static method in class javax.xml.ws.Endpoint
Creates an endpoint with the specified binding type and implementor object.

**create(URL, QName)** - Static method in class javax.xml.ws.Service
Create a Service instance.

**create(QName)** - Static method in class javax.xml.ws.Service
Create a Service instance.

**createAndPublishEndpoint(String, Object)** - Method in class javax.xml.ws.spi.Provider
Creates and publishes an endpoint object with the specified address.
and implementation object.

**createAssociation(RegistryObject, Concept)** - Method in interface javax.xml.registry.LifecycleManager

  Creates an Association instance using the specified parameters.

**createAttachmentPart()** - Method in class javax.xml.soap.SOAPMessage

  Creates a new empty AttachmentPart object.

**createAttachmentPart(DataHandler)** - Method in class javax.xml.soap.SOAPMessage

  Creates an AttachmentPart object and populates it using the given DataHandler object.

**createAttachmentPart(Object, String)** - Method in class javax.xml.soap.SOAPMessage

  Creates an AttachmentPart object and populates it with the specified data of the specified content type.

**createAttribute(String, String, String, String)** - Method in class javax.xml.stream.XMLEventFactory

  Create a new Attribute

**createAttribute(String, String)** - Method in class javax.xml.stream.XMLEventFactory

  Create a new Attribute

**createAttribute(QName, String)** - Method in class javax.xml.stream.XMLEventFactory

  Create a new Attribute

**createBinder(Class<T>)** - Method in class javax.xml.bind.JAXBContext

  Creates a Binder object that can be used for associative/in-place unmarshalling/marshalling.

**createBinder()** - Method in class javax.xml.bind.JAXBContext

  Creates a Binder for W3C DOM.

**createBrowser(Queue)** - Method in interface javax.jms.QueueSession

  Creates a QueueBrowser object to peek at the messages on the specified queue.

**createBrowser(Queue, String)** - Method in interface javax.jms.QueueSession

  Creates a QueueBrowser object to peek at the messages on the specified queue using a message selector.

**createBrowser(Queue)** - Method in interface javax.jms.Session

  Creates a QueueBrowser object to peek at the messages on the specified queue.
**createBrowser(Queue, String)** - Method in interface `javax.jms.Session`
   Creates a `QueueBrowser` object to peek at the messages on the specified queue using a message selector.

**createBytesMessage()** - Method in interface `javax.jms.Session`
   Creates a `BytesMessage` object.

**createCall(QName)** - Method in interface `javax.xml.rpc.Service`
   Creates a `Call` instance.

**createCall(QName, QName)** - Method in interface `javax.xml.rpc.Service`
   Creates a `Call` instance.

**createCall(QName, String)** - Method in interface `javax.xml.rpc.Service`
   Creates a `Call` instance.

**createCall()** - Method in interface `javax.xml.rpc.Service`
   Creates a `Call` object not associated with specific operation or target service endpoint.

**createCData(String)** - Method in class `javax.xml.stream.XMLEventFactory`
   Create a Characters event with the CData flag set to true

**createCharacters(String)** - Method in class `javax.xml.stream.XMLEventFactory`
   Create a Characters event, this method does not check if the content is all whitespace.

**createClassification(ClassificationScheme, String, String)** - Method in interface `javax.xml.registry.LifeCycleManager`
   Creates a Classification instance for an external Classification using the specified String name and String value that identify a taxonomy element within the specified ClassificationScheme.

**createClassification(ClassificationScheme, InternationalString, String)** - Method in interface `javax.xml.registry.LifeCycleManager`
   Creates a Classification instance for an external Classification using the specified InternationalString name and String value that identify a taxonomy element within the specified ClassificationScheme.

**createClassification(Concept)** - Method in interface `javax.xml.registry.LifeCycleManager`
   Creates a Classification instance for an internal Classification using the specified Concept that identifies a taxonomy element within an internal ClassificationScheme.

**createClassificationScheme(String, String)** - Method in interface `javax.xml.registry.LifeCycleManager`
   Creates a ClassificationScheme given the specified String
createClassificationScheme(InternationalString, InternationalString) - Method in interface javax.xml.registry.LifeCycleManager
   Creates a ClassificationScheme given the specified InternationalString parameters.
createClassificationScheme(Concept) - Method in interface javax.xml.registry.LifeCycleManager
   Creates a ClassificationScheme from a Concept that has no ClassificationScheme or parent Concept.
createComment(String) - Method in class javax.xml.stream.XMLEventFactory
   Create a comment
createComponent(String) - Method in class javax.faces.application.Application
   Instantiate and return a new UIComponent instance of the class specified by a previous call to addComponent() for the specified component type.
createComponent(ValueBinding, FacesContext, String) - Method in class javax.faces.application.Application
   Deprecated. This has been replaced by Application.createComponent(javax.el.ValueExpression, javax.faces.FacesContext, String)
createComponent(ValueExpression, FacesContext, String) - Method in class javax.faces.application.Application
   Call the getValue() method on the specified ValueExpression.
createComponent(FacesContext, String) - Method in class javax.faces.webapp.UIComponentClassicTagBase
   Create and return a new child component of the type returned by calling getComponentType().
createComponent(FacesContext, String) - Method in class javax.faces.webapp.UIComponentELTag
   Create and return a new child component of the type returned by calling getComponentType().
createComponent(FacesContext, String) - Method in class javax.faces.webapp.UIComponentTag
   Deprecated. Implement createComponent using Faces 1.1 EL API.
createConcept(RegistryObject, String, String) - Method in interface javax.xml.registry.LifeCycleManager
   Creates a Concept instance using the specified parameters, where the name is a String.
createConcept(RegistryObject, InternationalString, String) - Method in interface javax.xml.registry.LifeCycleManager
Creates a Concept instance using the specified parameters, where the name is an InternationalString.

createConfiguration(DeployableObject) - Method in interface javax.enterprise.deploy.spi.DeploymentManager
Retrieve the object that provides server-specific deployment configuration information for the J2EE deployable component.

createConnection() - Method in interface javax.jms.ConnectionFactory
Creates a connection with the default user identity.

createConnection(String, String) - Method in interface javax.jms.ConnectionFactory
Creates a connection with the specified user identity.

createConnection() - Method in class javax.xml.registry.ConnectionFactory
Create a named connection.

createConnection() - Method in class javax.xml.soap.SOAPConnectionFactory
Create a new SOAPConnection.

createConnectionConsumer(Destination, String, ServerSessionPool, int) - Method in interface javax.jms.Connection
Creates a connection consumer for this connection (optional operation).

createConnectionConsumer(Queue, String, ServerSessionPool, int) - Method in interface javax.jms.QueueConnection
Creates a connection consumer for this connection (optional operation).

createConnectionConsumer(Topic, String, ServerSessionPool, int) - Method in interface javax.jms.TopicConnection
Creates a connection consumer for this connection (optional operation).

createConnectionFactory(ConnectionManager) - Method in interface javax.resource.spi.ManagedConnectionFactory
Creates a Connection Factory instance.

createConnectionFactory() - Method in interface javax.resource.spi.ManagedConnectionFactory
Creates a Connection Factory instance.

createConsumer(Destination) - Method in interface javax.jms.Session
Creates a MessageConsumer for the specified destination.
**createConsumer(Destination, String)** - Method in interface javax.jms.Session

Creates a MessageConsumer for the specified destination, using a message selector.

**createConsumer(Destination, String, boolean)** - Method in interface javax.jms.Session

Creates MessageConsumer for the specified destination, using a message selector.

**createContainerEntityManagerFactory(PersistenceUnitInfo, Map)** - Method in interface javax.persistence.spi.PersistenceProvider

Called by the container when an EntityManagerFactory is to be created.

**createConverter(String)** - Method in class javax.faces.application.Application

Instantiate and return a new Converter instance of the class specified by a previous call to addConverter() for the specified converter id.

**createConverter(Class)** - Method in class javax.faces.application.Application

Instantiate and return a new Converter instance of the class that has registered itself as capable of performing conversions for objects of the specified type.

**createConverter()** - Method in class javax.faces.webapp.ConverterELTag

Create and return a new Converter to be registered on our surrounding UICOMPONENT.

**createConverter()** - Method in class javax.faces.webapp.ConverterTag

Deprecated. Create and return a new Converter to be registered on our surrounding UICOMPONENT.

**CREATED** - Static variable in class javax.mail.event.FolderEvent

The folder was created.

**createDataContentHandler(String)** - Method in class javax.activation.CommandMap

Locate a DataContentHandler that corresponds to the MIME type.

**createDataContentHandler(String, DataSource)** - Method in class javax.activation.CommandMap

Locate a DataContentHandler that corresponds to the MIME type.

**createDataContentHandler(String)** - Method in interface javax.activation.DataContentHandlerFactory
Creates a new DataContentHandler object for the MIME type.

**createDataContentHandler(String)** - Method in class javax.activation.MailcapCommandMap

Return the DataContentHandler for the specified MIME type.

**createDetail()** - Method in class javax.xml.soap.SOAPFactory

Creates a new Detail object which serves as a container for DetailEntry objects.

**createDispatch(QName, Class<T>, Service.Mode)** - Method in class javax.xml.ws.Service

 Creates a Dispatch instance for use with objects of the users choosing.

**createDispatch(QName, JAXBContext, Service.Mode)** - Method in class javax.xml.ws.Service

 Creates a Dispatch instance for use with JAXB generated objects.

**createDispatch(QName, Class<T>, Service.Mode)** - Method in class javax.xml.ws.spi.ServiceDelegate

 Creates a Dispatch instance for use with objects of the users choosing.

**createDispatch(QName, JAXBContext, Service.Mode)** - Method in class javax.xml.ws.spi.ServiceDelegate

 Creates a Dispatch instance for use with JAXB generated objects.

**createDTD(String)** - Method in class javax.xml.stream.XMLEventFactory

Create a document type definition event This string contains the entire document type declaration that matches the doctypedecl in the XML 1.0 specification

**createDurableConnectionConsumer(Topic, String, String, ServerSessionPool, int)** - Method in interface javax.jms.Connection

Create a durable connection consumer for this connection (optional operation).

**createDurableConnectionConsumer(Topic, String, String, ServerSessionPool, int)** - Method in interface javax.jms.TopicConnection

Create a durable connection consumer for this connection (optional operation).

**createDurableSubscriber(Topic, String)** - Method in interface javax.jms.Session

Create a durable subscriber to the specified topic.

**createDurableSubscriber(Topic, String, String, boolean)** - Method in interface javax.jms.Session

Creates a durable subscriber to the specified topic, using a message selector and specifying whether messages published by its own connection should be delivered to it.

**createDurableSubscriber(Topic, String)** - Method in interface javax.jms.TopicSession
- Creates a durable subscriber to the specified topic.

**createDurableSubscriber(Topic, String, String, boolean)** - Method in interface javax.jms.TopicSession
- Creates a durable subscriber to the specified topic, using a message selector or specifying whether messages published by its own connection should be delivered to it.

**createElement(Element)** - Method in class javax.xml.soap.SOAPFactory
- Creates a SOAPElement object from an existing DOM Element.

**createElement(Name)** - Method in class javax.xml.soap.SOAPFactory
- Creates a SOAPElement object initialized with the given Name object.

**createElement(QName)** - Method in class javax.xml.soap.SOAPFactory
- Creates a SOAPElement object initialized with the given QName object.

**createElement(String)** - Method in class javax.xml.soap.SOAPFactory
- Creates a new SOAPElement object initialized with the given local name.

**createElement(String, String, String)** - Method in class javax.xml.soap.SOAPFactory
- Creates a new SOAPElement object with the given local name, prefix and uri.

**createEmailAddress(String)** - Method in interface javax.xml.registry.LifeCycleManager
- Creates an EmailAddress instance using an address as the parameter.

**createEmailAddress(String, String)** - Method in interface javax.xml.registry.LifeCycleManager
- Creates an EmailAddress instance using both an address and a type as parameters.

**createEndDocument()** - Method in class javax.xml.stream.XMLEventFactory
- Creates a new instance of an EndDocument event

**createEndElement(QName, Iterator)** - Method in class javax.xml.stream.XMLEventFactory
- Create a new EndElement

**createEndElement(String, String, String)** - Method in class javax.xml.stream.XMLEventFactory
Create a new EndElement
createEndElement(String, String, String, Iterator) - Method in class javax.xml.stream.XMLEventFactory
    Create a new EndElement
createEndpoint(XAResource) - Method in interface javax.resource.spi.endpoint.MessageEndpointFactory
    This is used to create a message endpoint.
createEndpoint(String, Object) - Method in class javax.xml.ws.spi.Provider
    Creates an endpoint object with the provided binding and implementation object.
createEntityManager() - Method in interface javax.persistence.EntityManagerFactory
    Create a new EntityManager.
createEntityManager(Map) - Method in interface javax.persistence.EntityManagerFactory
    Create a new EntityManager with the specified Map of properties.
createEntityManagerFactory(String) - Static method in class javax.persistence.Persistence
    Create and return an EntityManagerFactory for the named persistence unit.
createEntityManagerFactory(String, Map) - Static method in class javax.persistence.Persistence
    Create and return an EntityManagerFactory for the named persistence unit using the given properties.
createEntityManagerFactory(String, Map) - Method in interface javax.persistence.spi.PersistenceProvider
    Called by Persistence class when an EntityManagerFactory is to be created.
createEntityReference(String, EntityDeclaration) - Method in class javax.xml.stream.XMLEventFactory
    Creates a new instance of a EntityReference event
CreateException - Exception in javax.ejb
    The CreateException exception must be included in the throws clauses of all create methods defined in an enterprise Bean's home interface.
CreateException() - Constructor for exception javax.ejb.CreateException
    Constructs a CreateException with no detail message.
CreateException(String) - Constructor for exception
javax.ejb.**CreateException**
Constructs a CreateException with the specified detail message.

**createExternalIdentifier(ClassificationScheme, String, String)** - Method in interface javax.xml.registry.LifeCycleManager
Creates an ExternalIdentifier instance using the specified parameters, where the name is a String.

**createExternalIdentifier(ClassificationScheme, InternationalString, String)** - Method in interface javax.xml.registry.LifeCycleManager
Creates an ExternalIdentifier instance using the specified parameters, where the name is an InternationalString.

**createExternalLink(String, String)** - Method in interface javax.xml.registry.LifeCycleManager
Creates an ExternalLink instance using the specified parameters, where the description is a String.

**createExternalLink(String, InternationalString)** - Method in interface javax.xml.registry.LifeCycleManager
Creates an ExternalLink instance using the specified parameters, where the description is an InternationalString.

**createExtrinsicObject(DataHandler)** - Method in interface javax.xml.registry.LifeCycleManager
Creates an ExtrinsicObject instance using the specified parameters.

**createFault(String, QName)** - Method in class javax.xml.soap.SOAPFactory
Creates a new SOAPFault object initialized with the given reasonText and faultCode

**createFault()** - Method in class javax.xml.soap.SOAPFactory
Creates a new default SOAPFault object

**createFederatedConnection(Collection)** - Method in class javax.xml.registry.ConnectionFactory
Create a FederatedConnection.

**createFilteredReader(XMLStreamReader, StreamFilter)** - Method in class javax.xml.stream.XMLInputFactory
Create a filtered reader that wraps the filter around the reader

**createFilteredReader(XMLEventReader, EventFilter)** - Method in class javax.xml.stream.XMLInputFactory
Create a filtered event reader that wraps the filter around the event reader

**createIgnorableSpace(String)** - Method in class javax.xml.stream.XMLEventFactory
Create an ignorable space

**createIndexedRecord(String)** - Method in interface
javax.resource.cci.**RecordFactory**
creates a IndexedRecord.

**createInteraction()** - Method in interface javax.resource.cci.**Connection**
creates an Interaction associated with this Connection.

**createInternationalString()** - Method in interface
javax.xml.registry.**LifeCycleManager**
creates an empty InternationalString instance.

**createInternationalString(String)** - Method in interface
ejavax.xml.registry.**LifeCycleManager**
creates an InternationalString instance using a String parameter and the default Locale.

**createInternationalString(Locale, String)** - Method in interface
ejavax.xml.registry.**LifeCycleManager**
creates an InternationalString instance using the specified Locale and String parameters.

**createInternetHeaders(InputStream)** - Method in class
javax.mail.internet.**MimeMessage**
create and return an InternetHeaders object that loads the headers from the given InputStream.

**createInternetHeaders(InputStream)** - Method in class
javax.mail.internet.**MimeMultipart**
create and return an InternetHeaders object that loads the headers from the given InputStream.

**createJAXBIntrospector()** - Method in class
javax.xml.bind.**JAXBContext**
create a JAXBIntrospector object that can be used to introspect JAXB objects.

**createKey(String)** - Method in interface
javax.xml.registry.**LifeCycleManager**
creates a Key instance from an ID.

**createLocalizedString(Locale, String)** - Method in interface
javax.xml.registry.**LifeCycleManager**
creates aLocalizedString instance using the specified Locale and String parameters.

**createLocalizedString(Locale, String, String)** - Method in interface
javax.xml.registry.**LifeCycleManager**
creates aLocalizedString instance using the specified Locale,
String, and character set parameters.

**createManagedConnection(Subject, ConnectionRequestInfo)** - Method in interface javax.resource.spi.**ManagedConnectionFactory**

    Creates a new physical connection to the underlying EIS resource manager.

**createMapMessage()** - Method in interface javax.jms.**Session**

    Creates a MapMessage object.

**createMappedRecord(String)** - Method in interface javax.resource.cci.**RecordFactory**

    Creates a MappedRecord.

**createMarshaller()** - Method in class javax.xml.bind.**JAXBContext**

    Create a Marshaller object that can be used to convert a java content tree into XML data.

**createMessage()** - Method in interface javax.jms.**Session**

    Creates a Message object.

**createMessage()** - Method in class javax.xml.soap.**MessageFactory**

    Creates a new SOAPMessage object with the default SOAPPart, SOAPEnvelope, SOAPBody, and SOAPHeader objects.

**createMessage(MimeHeaders, InputStream)** - Method in class javax.xml.soap.**MessageFactory**

    Internalizes the contents of the given InputStream object into a new SOAPMessage object and returns the SOAPMessage object.

**createMethodBinding(String, Class[])** - Method in class javax.faces.application.**Application**

    **Deprecated.** *This has been replaced by calling*

        Application.getExpressionFactory() then
        ExpressionFactory.createMethodExpression(javax.el.ELContext, java.lang.String, java.lang.Class, java.lang.Class[]).

**createMethodExpression(ELContext, String, Class<?>, Class<?>[])** - Method in class javax.el.**ExpressionFactory**

    Parses an expression into a MethodExpression for later evaluation.

**createMimeBodyPart(InternetHeaders, byte[])** - Method in class javax.mail.internet.**MimeMultipart**

    Create and return a MimeBodyPart object to represent a body part parsed from the InputStream.

**createMimeBodyPart(InputStream)** - Method in class javax.mail.internet.**MimeMultipart**

    Create and return a MimeBodyPart object to represent a body part parsed from the InputStream.
**createMimeMessage(Session)** - Method in class javax.mail.internet.MimeMessage
Create and return a MimeMessage object.

**createName(String, String, String)** - Method in interface javax.xml.soap.SOAPEnvelope
Creates a new Name object initialized with the given local name, namespace prefix, and namespace URI.

**createName(String)** - Method in interface javax.xml.soap.SOAPEnvelope
Creates a new Name object initialized with the given local name.

**createName(String, String, String)** - Method in class javax.xml.soap.SOAPFactory
Creates a new Name object initialized with the given local name, namespace prefix, and namespace URI.

**createName(String)** - Method in class javax.xml.soap.SOAPFactory
Creates a new Name object initialized with the given local name.

**createNamedQuery(String)** - Method in interface javax.persistence.EntityManager
Create an instance of Query for executing a named query (in the Java Persistence query language or in native SQL).

**createNamespace(String)** - Method in class javax.xml.stream.XMLEventFactory
Create a new default Namespace

**createNamespace(String, String)** - Method in class javax.xml.stream.XMLEventFactory
Create a new Namespace

**createNativeQuery(String)** - Method in interface javax.persistence.EntityManager
Create an instance of Query for executing a native SQL statement, e.g., for update or delete.

**createNativeQuery(String, Class)** - Method in interface javax.persistence.EntityManager
Create an instance of Query for executing a native SQL query.

**createNativeQuery(String, String)** - Method in interface javax.persistence.EntityManager
Create an instance of Query for executing a native SQL query.

**createObject(String)** - Method in interface javax.xml.registry.LifecycleManager
Creates instances of information model interfaces (factory method).
**createObjectMessage()** - Method in interface `javax.jms.Session`
  Creates an `ObjectMessage` object.

**createObjectMessage(Serializable)** - Method in interface `javax.jms.Session`
  Creates an initialized `ObjectMessage` object.

**createOrganization(String)** - Method in interface `javax.xml.registry.LifeCycleManager`
  Creates an Organization instance using the specified name, where the name is a String.

**createOrganization(InternationalString)** - Method in interface `javax.xml.registry.LifeCycleManager`
  Creates an Organization instance using the specified name, where the name is an `InternationalString`.

**createOutput(String, String)** - Method in class `javax.xml.bind.SchemaOutputResolver`
  Decides where the schema file (of the given namespace URI) will be written, and return it as a `Result` object.

**createPersonName(String, String, String)** - Method in interface `javax.xml.registry.LifeCycleManager`
  Creates a `PersonName` instance using the specified first, middle, and last names.

**createPersonName(String)** - Method in interface `javax.xml.registry.LifeCycleManager`
  Creates a `PersonName` instance using the specified full name.

**createPostalAddress(String, String, String, String, String, String, String)** - Method in interface `javax.xml.registry.LifeCycleManager`
  Creates a `PostalAddress` instance using the specified parameters.

**createProcessingInstruction(String, String)** - Method in class `javax.xml.stream.XMLEventFactory`
  Create a processing instruction

**createProducer(Destination)** - Method in interface `javax.jms.Session`
  Creates a `MessageProducer` to send messages to the specified destination.

**createPublisher(Topic)** - Method in interface `javax.jms.TopicSession`
  Creates a publisher for the specified topic.

**createQName(String, String)** - Method in interface `javax.xml.soap.SOAPElement`
  Creates a `QName` whose namespace URI is the one associated with the parameter, prefix, in the context of this `SOAPElement`. 
**createQuery(String)** - Method in interface javax.persistence.EntityManager
Create an instance of Query for executing a Java Persistence query language statement.

**createQuery(int, String)** - Method in interface javax.xml.registry.DeclarativeQueryManager
Creates a Query object given a queryType (for example, QUERY_TYPE_SQL) and a String that represents a query in the syntax appropriate for queryType.

**createQueue(String)** - Method in interface javax.jms.QueueSession
Creates a queue identity given a queue name.

**createQueue(String)** - Method in interface javax.jms.Session
Creates a queue identity given a queue name.

**createQueueConnection()** - Method in interface javax.jms.QueueConnectionFactory
Creates a queue connection with the default user identity.

**createQueueConnection(String, String)** - Method in interface javax.jms.QueueConnectionFactory
Creates a queue connection with the specified user identity.

**createQueueSession(boolean, int)** - Method in interface javax.jms.QueueConnection
Creates a QueueSession object.

**createQueueSession(boolean, int)** - Method in interface javax.jms.XAQueueConnection
Creates an XAQueueSession object.

**createReceiver(Queue)** - Method in interface javax.jms.QueueSession
Creates a QueueReceiver object to receive messages from the specified queue.

**createReceiver(Queue, String)** - Method in interface javax.jms.QueueSession
Creates a QueueReceiver object to receive messages from the specified queue using a message selector.

**createRegistryPackage(String)** - Method in interface javax.xml.registry.LifecycleManager
Creates a RegistryPackage instance using the specified name, where the name is a String.

**createRegistryPackage(InternationalString)** - Method in interface javax.xml.registry.LifecycleManager
Creates a RegistryPackage instance using the specified name,
where the name is an InternationalString.

**createResponseStream(OutputStream)** - Method in class javax.faces.render.RenderKit

Use the provided OutputStream to create a new ResponseStream instance.

**createResponseWriter(Writer, String, String)** - Method in class javax.faces.render.RenderKit

Use the provided Writer to create a new ResponseWriter instance for the specified (optional) content type, and character encoding.

**createSender(Queue)** - Method in interface javax.jms.QueueSession

Creates a QueueSender object to send messages to the specified queue.

**createService(String)** - Method in interface javax.xml.registry.LifeCycleManager

Creates a Service instance using the specified name, where the name is a String.

**createService(InternationalString)** - Method in interface javax.xml.registry.LifeCycleManager

Creates a Service instance using the specified name, where the name is an InternationalString.

**createService(URL, QName)** - Method in class javax.xml.rpc.ServiceFactory

Create a Service instance.

**createService(QName)** - Method in class javax.xml.rpc.ServiceFactory

Create a Service instance.

**createServiceBinding()** - Method in interface javax.xml.registry.LifeCycleManager

Creates an empty ServiceBinding instance.

**createServiceDelegate(URL, QName, Class)** - Method in class javax.xml.ws.spi.Provider

Creates a service delegate object.

**createSession(boolean, int)** - Method in interface javax.jms.Connection

Creates a Session object.

**createSession(boolean, int)** - Method in interface javax.jms.XAConnection

Creates an Session object.

**createSlot(String, String, String)** - Method in interface javax.xml.registry.LifeCycleManager

Creates a Slot instance using the specified parameters, where the
value is a String.

**createSlot(String, Collection, String)** - Method in interface javax.xml.registry.LifeCycleManager

Creates a Slot instance using the specified parameters, where the value is a Collection of Strings.

**createSpace(String)** - Method in class javax.xml.stream.XMLEventFactory

Create a Characters event with the isSpace flag set to true

**createSpecificationLink()** - Method in interface javax.xml.registry.LifeCycleManager

Creates an empty SpecificationLink instance.

**createStartDocument()** - Method in class javax.xml.stream.XMLEventFactory

Creates a new instance of a StartDocument event

**createStartDocument(String, String, boolean)** - Method in class javax.xml.stream.XMLEventFactory

Creates a new instance of a StartDocument event

**createStartDocument(String, String)** - Method in class javax.xml.stream.XMLEventFactory

Creates a new instance of a StartDocument event

**createStartDocument(String)** - Method in class javax.xml.stream.XMLEventFactory

Creates a new instance of a StartDocument event

**createStartElement(QName, Iterator, Iterator)** - Method in class javax.xml.stream.XMLEventFactory

Create a new StartElement.

**createStartElement(String, String, String)** - Method in class javax.xml.stream.XMLEventFactory

Create a new StartElement.

**createStartElement(String, String, String, Iterator, Iterator)** - Method in class javax.xml.stream.XMLEventFactory

Create a new StartElement.

**createStartElement(String, String, String, Iterator, Iterator, NamespaceContext)** - Method in class javax.xml.stream.XMLEventFactory

Create a new StartElement.

**createStreamMessage()** - Method in interface javax.jms.Session

Creates a StreamMessage object.

**createSubscriber(Topic)** - Method in interface javax.jms.TopicSession
Creates a nondurable subscriber to the specified topic. 
**createSubscriber(Topic, String, boolean)** - Method in interface 
javax.jms.**TopicSession**
Creates a nondurable subscriber to the specified topic, using a 
message selector or specifying whether messages published by its 
own connection should be delivered to it.

**createTelephoneNumber()** - Method in interface 
javax.xml.registry.**LifeCycleManager**
Creates an empty TelephoneNumber instance.

**createTemporaryQueue()** - Method in interface javax.jms.**QueueSession**
Creates a TemporaryQueue object.

**createTemporaryQueue()** - Method in interface javax.jms.**Session**
Creates a TemporaryQueue object.

**createTemporaryTopic()** - Method in interface javax.jms.**Session**
Creates a TemporaryTopic object.

**createTemporaryTopic()** - Method in interface javax.jms.**TopicSession**
Creates a TemporaryTopic object.

**createTextMessage()** - Method in interface javax.jms.**Session**
Creates a TextMessage object.

**createTextMessage(String)** - Method in interface javax.jms.**Session**
Creates an initialized TextMessage object.

**createTimer(long, Serializable)** - Method in interface javax.ejb.**TimerService**
Create a single-action timer that expires after a specified duration.

**createTimer(long, long, Serializable)** - Method in interface javax.ejb.**TimerService**
Create an interval timer whose first expiration occurs after a 
specified duration, and whose subsequent expirations occur after a 
specified interval.

**createTimer(Date, Serializable)** - Method in interface javax.ejb.**TimerService**
Create a single-action timer that expires at a given point in time.

**createTimer(Date, long, Serializable)** - Method in interface javax.ejb.**TimerService**
Create an interval timer whose first expiration occurs at a given point 
in time and whose subsequent expirations occur after a specified 
interval.

**createTimer()** - Method in interface javax.resource.spi.**BootstrapContext**
Creates a new java.util.Timer instance.
**createTopic(String)** - Method in interface javax.jms.Session
Creates a topic identity given a Topic name.

**createTopic(String)** - Method in interface javax.jms.TopicSession
Creates a topic identity given a Topic name.

**createTopicConnection()** - Method in interface javax.jms.TopicConnectionFactory
Creates a topic connection with the default user identity.

**createTopicConnection(String, String)** - Method in interface javax.jms.TopicConnectionFactory
Creates a topic connection with the specified user identity.

**createTopicSession(boolean, int)** - Method in interface javax.jms.TopicConnection
Creates a TopicSession object.

**createTopicSession(boolean, int)** - Method in interface javax.jms.XATopicConnection
Creates an XATopicSession object.

**createTypeMapping()** - Method in interface javax.xml.rpc.encoding.TypeMappingRegistry
Creates a new empty TypeMapping object.

**createUniqueld()** - Method in class javax.faces.component.UIViewRoot
Generate an identifier for a component.

**createUnmarshalException(SAXException)** - Method in class javax.xml.bind.helpers.AbstractUnmarshallerImpl
Creates an UnmarshalException from a SAXException.

**createUnmarshaller(ValidationEventHandler)** - Method in interface javax.xml.bind.annotation.DomHandler
When a JAXB provider needs to unmarshal a part of a document into an infoset representation, it first calls this method to create a Result object.

**createUnmarshaller(ValidationEventHandler)** - Method in class javax.xml.bind.annotation.W3CDomHandler

**createUnmarshaller()** - Method in class javax.xml.bind.JAXBContext
Create an Unmarshaller object that can be used to convert XML data into a java content tree.

**createUser()** - Method in interface javax.xml.registry.LifeCycleManager
Creates an empty User instance.

**createValidator(String)** - Method in class javax.faces.application.Application
Instantiate and return a new `validator` instance of the class specified by a previous call to `addValidator()` for the specified validator id.

`createValidator()` - Method in class `javax.faces.webapp.ValidatorELTag`
Create and return a new `validator` to be registered on our surrounding `UIComponent`.

`createValidator()` - Method in class `javax.faces.webapp.ValidatorTag`
`Deprecated`. Create and return a new `validator` to be registered on our surrounding `UIComponent`.

`createValidator()` - Method in class `javax.xml.bind.JAXBContext`
`Deprecated. since JAXB2.0`

`createValueBinding(String)` - Method in class `javax.faces.application.Application`
`Deprecated. This has been replaced by calling
`Application.getExpressionFactory()` then`ExpressionFactory.createValueExpression(javax.el.ELContext, java.lang.String, java.lang.Class)`.

`createValueExpression(ELContext, String, Class<?>)` - Method in class `javax.el.ExpressionFactory`
Parses an expression into a `ValueExpression` for later evaluation.

`createValueExpression(Object, Class<?>)` - Method in class `javax.el.ExpressionFactory`
Creates a `ValueExpression` that wraps an object instance.

`createVerbatimComponent()` - Method in class `javax.faces.webapp.UIComponentClassicTagBase`
Use the `Application` instance to create a new component with the following characteristics.

`createVerbatimComponentFromBodyContent()` - Method in class `javax.faces.webapp.UIComponentClassicTagBase`
Create a transient UIOutput component from the body content, of this tag instance or return null if there is no body content, the body content is whitespace, or the body content is a comment.

`createView(FacesContext, String)` - Method in class `javax.faces.application.ViewHandler`
Create and return a new `UIViewRoot` instance initialized with information from the argument `FacesContext` and `viewId`.

`createView(FacesContext, String)` - Method in class `javax.faces.application.ViewHandlerWrapper`
The default behavior of this method is to call
ViewHandler.createView(javax.faces.context.FacesContext, String) on the wrapped ViewHandler object.

createXAConnection() - Method in interface javax.jms.XAConnectionFactory
  Creates an XAConnection with the default user identity.

createXAConnection(String, String) - Method in interface javax.jms.XAConnectionFactory
  Creates anXA connection with the specified user identity.

createXAQueueConnection() - Method in interface javax.jms.XAQueueConnectionFactory
  Creates anXA queue connection with the default user identity.

createXAQueueConnection(String, String) - Method in interface javax.jms.XAQueueConnectionFactory
  Creates anXA queue connection with the specified user identity.

createXAQueueSession() - Method in interface javax.jms.XAQueueConnection
  Creates anXAQueueSession object.

createXASession() - Method in interface java.jms.XAConnection
  Creates anXASession object.

createXATopicConnection() - Method in interface javax.jms.XATopicConnectionFactory
  Creates anXA topic connection with the default user identity.

createXATopicConnection(String, String) - Method in interface javax.jms.XATopicConnectionFactory
  Creates anXA topic connection with the specified user identity.

createXATopicSession() - Method in interface javax.jms.XATopicConnection
  Creates anXATopicSession object.

createXMLEventReader(Reader) - Method in class javax.xml.stream.XMLInputFactory
  Create a new XMLEventReader from a reader

createXMLEventReader(String, Reader) - Method in class javax.xml.stream.XMLInputFactory
  Create a new XMLEventReader from a reader

createXMLEventReader(XMLStreamReader) - Method in class javax.xml.stream.XMLInputFactory
  Create a new XMLEventReader from an XMLStreamReader.

createXMLEventReader(Source) - Method in class javax.xml.stream.XMLInputFactory
Create a new XMLEventReader from a JAXP source.

**createXMLEventReader(InputStream)** - Method in class javax.xml.stream.XMLInputFactory

Create a new XMLEventReader from a java.io.InputStream

**createXMLEventReader(InputStream, String)** - Method in class javax.xml.stream.XMLInputFactory

Create a new XMLEventReader from a java.io.InputStream

**createXMLEventReader(String, InputStream)** - Method in class javax.xml.stream.XMLInputFactory

Create a new XMLEventReader from a java.io.InputStream

**createXMLEventWriter(Result)** - Method in class javax.xml.stream.XMLOutputFactory

Create a new XMLEventWriter that writes to a JAXP result.

**createXMLEventWriter(OutputStream)** - Method in class javax.xml.stream.XMLOutputFactory

Create a new XMLEventWriter that writes to a stream

**createXMLEventWriter(OutputStream, String)** - Method in class javax.xml.stream.XMLOutputFactory

Create a new XMLEventWriter that writes to a stream

**createXMLEventWriter(Writer)** - Method in class javax.xml.stream.XMLOutputFactory

Create a new XMLEventWriter that writes to a writer

**createXMLStreamReader(Reader)** - Method in class javax.xml.stream.XMLInputFactory

Create a new XMLStreamReader from a reader

**createXMLStreamReader(Source)** - Method in class javax.xml.stream.XMLInputFactory

Create a new XMLStreamReader from a JAXP source.

**createXMLStreamReader(InputStream)** - Method in class javax.xml.stream.XMLInputFactory

Create a new XMLStreamReader from a java.io.InputStream

**createXMLStreamReader(InputStream, String)** - Method in class javax.xml.stream.XMLInputFactory

Create a new XMLStreamReader from a java.io.InputStream

**createXMLStreamReader(String, InputStream)** - Method in class javax.xml.stream.XMLInputFactory

Create a new XMLStreamReader from a java.io.InputStream

**createXMLStreamReader(String, Reader)** - Method in class javax.xml.stream.XMLInputFactory
Create a new XMLStreamReader from a java.io.InputStream
createXMLStreamReader(Writer) - Method in class
javax.xml.stream.XMLOutputFactory
Create a new XMLStreamWriter that writes to a writer
createXMLStreamWriter(OutputStream) - Method in class
javax.xml.stream.XMLOutputFactory
Create a new XMLStreamWriter that writes to a stream
createXMLStreamWriter(OutputStream, String) - Method in class
javax.xml.stream.XMLOutputFactory
Create a new XMLStreamWriter that writes to a stream
createXMLStreamWriter(Result) - Method in class
javax.xml.stream.XMLOutputFactory
Create a new XMLStreamWriter that writes to a JAXP result.
CURRENCY_ID - Static variable in class
javax.faces.convert.NumberConverter
The message identifier of the FacesMessage to be created if the conversion to Number fails.
**DataContentHandler** - Interface in `javax.activation`
- The DataContentHandler interface is implemented by objects that can be used to extend the capabilities of the DataHandler's implementation of the Transferable interface.

**DataContentHandlerFactory** - Interface in `javax.activation`
- This interface defines a factory for DataContentHandlers.

**DataHandler** - Class in `javax.activation`
- The DataHandler class provides a consistent interface to data available in many different sources and formats.

**DataHandler(DataSource)** - Constructor for class `javax.activation.DataHandler`
- Create a DataHandler instance referencing the specified DataSource.

**DataHandler(Object, String)** - Constructor for class `javax.activation.DataHandler`
- Create a DataHandler instance representing an object of this MIME type.

**DataHandler(URL)** - Constructor for class `javax.activation.DataHandler`
- Create a DataHandler instance referencing a URL.

**datalen** - Variable in class `javax.mail.util.SharedFileInputStream`
- The amount of data in this subset of the file.

**DataModel** - Class in `javax.faces.model`
- DataModel is an abstraction around arbitrary data binding technologies that can be used to adapt a variety of data sources for use by JavaServer Faces components that support per-row processing for their child components (such as UIData).

**DataModel()** - Constructor for class `javax.faces.model.DataModel`

**DataModelEvent** - Class in `javax.faces.model`
- DataModelEvent represents an event of interest to registered listeners that occurred on the specified DataModel.

**DataModelEvent(DataModel, int, Object)** - Constructor for class `javax.faces.model.DataModelEvent`
- Construct an event object that is associated with the specified row index and associated data.

**DataModelListener** - Interface in `javax.faces.model`
**DataModelListener** represents an event listener that wishes to be notified of **DataModelEvent**s occurring on a particular **DataModel** instance.

**DataSource** - Interface in **javax.activation**
The DataSource interface provides the JavaBeans Activation Framework with an abstraction of an arbitrary collection of data.

**DatatypeConverter** - Class in **javax.xml.bind**
The javaType binding declaration can be used to customize the binding of an XML schema datatype to a Java datatype.

**DatatypeConverterInterface** - Interface in **javax.xml.bind**
The DatatypeConverterInterface is for JAXB provider use only.

**date** - Variable in class **javax.mail.search**.**DateTime**
The date.

**DATE_ID** - Static variable in class **javax.faces.convert**.**DateTimeConverter**
The message identifier of the **FacesMessage** to be created if the conversion to **Date** fails.

**DateTerm** - Class in **javax.mail.search**
This class implements comparisons for Dates

**DateTerm(int, Date)** - Constructor for class **javax.mail.search**.**DateTerm**
Constructor.

**DATETIME_ID** - Static variable in class **javax.faces.convert**.**DateTimeConverter**
The message identifier of the **FacesMessage** to be created if the conversion to **DateTime** fails.

**DateTimeConverter** - Class in **javax.faces.convert**
Converter implementation for **java.util.Date** values.

**DateTimeConverter()** - Constructor for class **javax.faces.convert**.**DateTimeConverter**

**DConfigBean** - Interface in **javax.enterprise.deploy.spi**
The DConfigBean is a deployment configuration bean (DConfigBean) that is associated with one or more deployment descriptor beans, (DDBean).

**DConfigBeanRoot** - Interface in **javax.enterprise.deploy.spi**
A J2EE component module consists of one or more deployment descriptor files and zero or more non-deployment descriptor XML instance documents.

**DConfigBeanVersionType** - Class in **javax.enterprise.deploy.shared**
Class DConfigBeanVersionTypes defines enumeration values for the J2EE Platform version number.

**DConfigBeanVersionType(int)** - Constructor for class javax.enterprise.deploy.shared.DConfigBeanVersionType

Construct a new enumeration value with the given integer value.

**DConfigBeanVersionUnsupportedException** - Exception in javax.enterprise.deploy.spi.exceptions

This exception is to report that there is no support for the DConfigBean version requested.

**DConfigBeanVersionUnsupportedException(String)** - Constructor for exception javax.enterprise.deploy.spi.exceptions.DConfigBeanVersionUnsupportedException

Creates an new DConfigBeanVersionUnsupportedException object.

**DDBean** - Interface in javax.enterprise.deploy.model

An interface for beans that represent a fragment of a standard deployment descriptor.

**DDBeanCreateException** - Exception in javax.enterprise.deploy.model.exceptions

This exception reports errors in generating a DDBean.

**DDBeanCreateException()** - Constructor for exception javax.enterprise.deploy.model.exceptions.DDBeanCreateException

Creates new DDBeanCreateException without detail message.

**DDBeanCreateException(String)** - Constructor for exception javax.enterprise.deploy.model.exceptions.DDBeanCreateException

Constructs an DDBeanCreateException with the specified detail message.

**DDBeanRoot** - Interface in javax.enterprise.deploy.model

An interface that represents the root of a standard deployment descriptor.

**debug** - Variable in class javax.mail.Service

Debug flag for this service.

**DECIMAL_ID** - Static variable in class javax.faces.convert.BigDecimalConverter

The message identifier of the FacesMessage to be created if the conversion to BigDecimal fails.

**DeclarativeQueryManager** - Interface in javax.xml.registry

This interface provides the ability to execute declarative queries (e.g. declaredType)

**declaredType** - Variable in class javax.xml.bind.JAXBElement

Java datatype binding for xml element declaration's type.
DeclareRoles - Annotation Type in javax.annotation.security
Used by application to declare roles.
declare(FacesContext) - Method in class
javax.faces.component.UIComponent
Decode any new state of this UIComponent from the request contained in the specified FacesContext, and store this state as needed.
declare(FacesContext) - Method in class
javax.faces.component.UIComponentBase
declare(FacesContext) - Method in class
javax.faces.component.UIInput
decode(FacesContext, UIComponent) - Method in class
javax.faces.render.Renderer
Decode any new state of the specified UIComponent from the request contained in the specified FacesContext, and store that state on the UIComponent.
declare(InputStream, String) - Static method in class
javax.mail.internet.MimeUtility
Decode the given input stream.
declareText(String) - Static method in class
javax.mail.internet.MimeUtility
Decode "unstructured" headers, that is, headers that are defined as "*text" as per RFC 822.
declareWord(String) - Static method in class
javax.mail.internet.MimeUtility
The string is parsed using the rules in RFC 2047 for parsing an "encoded-word".
DEFAULT BUFFER - Static variable in class javax.servlet.jsp.JspWriter
Constant indicating that the Writer is buffered and is using the implementation default buffer size.
DEFAULT_CHARSET_NAME - Static variable in interface
javax.xml.registry.infomodelLocalizedString
The default name returned by getCharsetName if no other name has explicitly been set.
DEFAULT_DELIVERY_MODE - Static variable in interface
javax.jms.Message
The message producer's default delivery mode is PERSISTENT.
**DEFAULT_LIFECYCLE** - Static variable in class `javax.faces.lifecycle.LifecycleFactory`
   The lifecycle identifier for the default `Lifecycle` instance for this JavaServer Faces implementation.

**DEFAULT_PRIORITY** - Static variable in interface `javax.jms.Message`
   The message producer's default priority is 4.

**DEFAULT_SOAP_PROTOCOL** - Static variable in interface `javax.xml.soap.SOAPConstants`
   The default protocol: SOAP 1.1 for backwards compatibility.

**DEFAULT_SUFFIX** - Static variable in class `javax.faces.application.ViewHandler`
   The value to use for the default extension if the webapp is using url extension mapping.

**DEFAULT_SUFFIX_PARAM_NAME** - Static variable in class `javax.faces.application.ViewHandler`
   Allow the web application to define an alternate suffix for pages containing JSF content.

**DEFAULT_TIME_TO_LIVE** - Static variable in interface `javax.jms.Message`
   The message producer's default time to live is unlimited; the message never expires.

**DefaultValidationEventHandler** - Class in `javax.xml.bind.helpers`
   JAXB 1.0 only default validation event handler.

**DefaultValidationEventHandler()** - Constructor for class `javax.xml.bind.helpers.DefaultValidationEventHandler`

**delete()** - Method in interface `javax.jms.TemporaryQueue`
   Deletes this temporary queue.

**delete()** - Method in interface `javax.jms.TemporaryTopic`
   Deletes this temporary topic.

**delete(boolean)** - Method in class `javax.mail.Folder`
   Delete this Folder.

**delete()** - Method in interface `javax.security.jacc.PolicyConfiguration`
   Causes all policy statements to be deleted from this PolicyConfiguration and sets its internal state such that calling any method, other than delete, getContextID, or inService on the PolicyConfiguration will be rejected and cause an UnsupportedOperationException to be thrown.

**deleteAssociations(Collection)** - Method in interface
javax.xml.registry.**BusinessLifeCycleManager**

Deletes the Associations corresponding to the specified Keys.

**deleteClassificationSchemes(Collection)** - Method in interface javax.xml.registry.**BusinessLifeCycleManager**

Deletes the ClassificationSchemes corresponding to the specified Keys.

**deleteConcepts(Collection)** - Method in interface javax.xml.registry.**BusinessLifeCycleManager**

Deletes the Concepts corresponding to the specified Keys.

**DELETED** - Static variable in class javax.mail.event.**FolderEvent**

The folder was deleted.

**DELETED** - Static variable in class javax.mail.**Flags.Flag**

This message is marked deleted.

**DeleteException** - Exception in javax.xml.registry

A RegistryException that occurs during a delete action.

**DeleteException()** - Constructor for exception javax.xml.registry.**DeleteException**

Constructs a JAXRException object with no reason or embedded Throwable.

**DeleteException(String)** - Constructor for exception javax.xml.registry.**DeleteException**

Constructs a JAXRException object with the given String as the reason for the exception being thrown.

**DeleteException(String, Throwable)** - Constructor for exception javax.xml.registry.**DeleteException**

Constructs a JAXRException object with the given String as the reason for the exception being thrown and the given Throwable object as an embedded Throwable.

**DeleteException(Throwable)** - Constructor for exception javax.xml.registry.**DeleteException**

Constructs a JAXRException object initialized with the given Throwable object.

**deleteObjects(Collection)** - Method in interface javax.xml.registry.**LifeCycleManager**

Deletes one or more previously submitted objects from the registry using the object keys.

**deleteObjects(Collection, String)** - Method in interface javax.xml.registry.**LifeCycleManager**

Deletes one or more previously submitted objects from the registry using the object keys.
using the object keys and a specified objectType attribute.

**deleteOrganizations(Collection)** - Method in interface
javax.xml.registry.BusinessLifeCycleManager
Deletes the organizations corresponding to the specified Keys.

**deletesAreDetected(int)** - Method in interface
javax.resource.cci.ResultSetInfo

**deleteServiceBindings(Collection)** - Method in interface
javax.xml.registry.BusinessLifeCycleManager
Deletes the ServiceBindings corresponding to the specified Keys.

**deleteServices(Collection)** - Method in interface
javax.xml.registry.BusinessLifeCycleManager
Deletes the services corresponding to the specified Keys.

**delistResource(XAResource, int)** - Method in interface
javax.transaction.Transaction
Disassociate the resource specified from the transaction associated with the target Transaction object.

**DeliveryMode** - Interface in javax.jms
The delivery modes supported by the JMS API are PERSISTENT and NON_PERSISTENT.

**DenyAll** - Annotation Type in javax.annotation.security
Specifies that no security roles are allowed to invoke the specified method(s) - i.e that the methods are to be excluded from execution in the J2EE container.

**DeployableObject** - Interface in javax.enterprise.deploy.model
The DeployableObject interface is an abstract representation of a J2EE deployable module (JAR, WAR, RAR, EAR).

**DeploymentConfiguration** - Interface in javax.enterprise.deploy.spi
An interface that defines a container for all the server-specific configuration information for a single top-level J2EE module.

**DeploymentFactory** - Interface in javax.enterprise.deploy.spi.factories
The DeploymentFactory interface is a deployment driver for a J2EE plaform product.

**DeploymentFactoryManager** - Class in javax.enterprise.deploy.shared.factories
The DeploymentFactoryManager class is a central registry for J2EE DeploymentFactory objects.

**DeploymentManager** - Interface in javax.enterprise.deploy.spi
The DeploymentManager object provides the core set of functions a
J2EE platform must provide for J2EE application deployment.

**DeploymentManagerCreationException** - Exception in `javax.enterprise.deploy.spi.exceptions`
This exception is to report problems in returning a DeploymentManager object cause by such things as server down, unable to authenticate and the like.

**DeploymentManagerCreationException(String)** - Constructor for exception
`javax.enterprise.deploy.spi.exceptionsDeploymentManagerCreationException`
Creates an new DeploymentManagerCreationException object.

**DeploymentStatus** - Interface in `javax.enterprise.deploy.spi.status`
The DeploymentStatus interface provides information about the progress status of a deployment action.

**deprecateObjects(Collection)** - Method in interface `javax.xml.registry.LifeCycleManager`
Deprecates one or more previously submitted objects.

**DeserializationContext** - Interface in `javax.xml.rpc.encoding`
The javax.xml.rpc.encoding.DeserializationContext interface is implemented by the JAX-RPC runtime system in an XML processing mechanism specific manner.

**Deserializer** - Interface in `javax.xml.rpc.encoding`
The javax.xml.rpc.encoding.Deserializer interface defines a base interface for deserializers.

**DeserializerFactory** - Interface in `javax.xml.rpc.encoding`
The javax.xml.rpc.encoding.DeserializerFactory is a factory of deserializers.

**Destination** - Interface in `javax.jms`
A Destination object encapsulates a provider-specific address.

**destroy()** - Method in class `javax.faces.webapp.FacesServlet`
Release all resources acquired at startup time.

**destroy()** - Method in interface `javax.resource.spi.ManagedConnection`
Destroys the physical connection to the underlying resource manager.

**destroy()** - Method in interface `javax.servlet.Filter`
Called by the web container to indicate to a filter that it is being taken out of service.

**destroy()** - Method in class `javax.servlet.GenericServlet`
Called by the servlet container to indicate to a servlet that the servlet is being taken out of service.
**destroy()** - Method in interface `javax.servlet.Servlet`
   Called by the servlet container to indicate to a servlet that the servlet is being taken out of service.

**destroy()** - Method in class `javax.xml.rpc.handler.GenericHandler`
   The `destroy` method indicates the end of lifecycle for a Handler instance.

**destroy()** - Method in interface `javax.xml.rpc.handler.Handler`
   The `destroy` method indicates the end of lifecycle for a Handler instance.

**destroy()** - Method in interface `javax.xml.rpc.handler.HandlerChain`
   Indicates the end of lifecycle for a HandlerChain.

**destroy()** - Method in interface `javax.xml.rpc.server.ServiceLifecycle`
   JAX-RPC runtime system ends the lifecycle of a service endpoint instance by invoking the destroy method.

**detachNode()** - Method in interface `javax.xml.soap.Node`
   Removes this `Node` object from the tree.

**Detail** - Interface in `javax.xml.soap`
   A container for `DetailEntry` objects.

**DetailEntry** - Interface in `javax.xml.soap`
   The content for a `Detail` object, giving details for a `SOAPFault` object.

**dh** - Variable in class `javax.mail.internet.MimeBodyPart`
   The DataHandler object representing this Part's content.

**dh** - Variable in class `javax.mail.internet.MimeMessage`
   The DataHandler object representing this Message's content.

**DIGEST_AUTH** - Static variable in class `javax.faces.context.ExternalContext`
   String identifier for DIGEST authentication.

**DIGEST_AUTH** - Static variable in interface `javax.servlet.http.HttpServletRequest`
   String identifier for Digest authentication.

**disconnected(ConnectionEvent)** - Method in class `javax.mail.event.ConnectionAdapter`

**DISCONNECTED** - Static variable in class `javax.mail.event.ConnectionEvent`
   A connection was disconnected (not currently used).

**disconnected(ConnectionEvent)** - Method in interface `javax.mail.event.ConnectionListener`
   Invoked when a Store is disconnected.
**DiscriminatorColumn** - Annotation Type in `javax.persistence`
Is used to define the discriminator column for the SINGLE_TABLE and JOINED inheritance mapping strategies.

**DiscriminatorType** - Enum in `javax.persistence`
Defines supported types of the discriminator column.

**DiscriminatorValue** - Annotation Type in `javax.persistence`
Is used to specify the value of the discriminator column for entities of the given type.

**dispatch(String)** - Method in class `javax.faces.context.ExternalContext`
Dispatch a request to the specified resource to create output for this response.

**dispatch(Object)** - Method in class `javax.mail.event.ConnectionEvent`
Invokes the appropriate ConnectionListener method.

**dispatch(Object)** - Method in class `javax.mail.event.FolderEvent`
Invokes the appropriate FolderListener method.

**dispatch(Object)** - Method in class `javax.mail.event.MailEvent`
This method invokes the appropriate method on a listener for this event.

**dispatch(Object)** - Method in class `javax.mail.event.MessageChangedEvent`
Invokes the appropriate MessageChangedListener method.

**dispatch(Object)** - Method in class `javax.mail.event.MessageCountEvent`
Invokes the appropriate MessageCountListener method.

**dispatch(Object)** - Method in class `javax.mail.event.StoreEvent`
Invokes the appropriate StoreListener method.

**dispatch(Object)** - Method in class `javax.mail.event.TransportEvent`
Invokes the appropriate TransportListener method.

**Dispatch**<T> - Interface in `javax.xml.ws`
The `dispatch` interface provides support for the dynamic invocation of a service endpoint operations.

**DissociatableManagedConnection** - Interface in `javax.resource.spi`
This is a mix-in interface that may be optionally implemented by a ManagedConnection implementation.

**dissociateConnections()** - Method in interface `javax.resource.spi.DissociatableManagedConnection`
This method is called by an application server (that is capable of lazy connection association optimization) in order to dissociate a ManagedConnection instance from all of its connection handles.
**DISTRIBUTE** - Static variable in class
javax.enterprise.deploy.shared.**CommandType**
The DeploymentManager action operation being processed is distribute.

**distribute(Target[], File, File)** - Method in interface
javax.enterprise.deploy.spi.**DeploymentManager**
The distribute method performs three tasks; it validates the deployment configuration data, generates all container specific classes and interfaces, and moves the fully baked archive to the designated deployment targets.

**distribute(Target[], InputStream, InputStream)** - Method in interface
javax.enterprise.deploy.spi.**DeploymentManager**
Deprecated. as of Java EE 5, replaced with
**DeploymentManager.distribute(Target[], ModuleType, InputStream, InputStream)**

**distribute(Target[], ModuleType, InputStream, InputStream)** - Method in interface
javax.enterprise.deploy.spi.**DeploymentManager**
The distribute method performs three tasks; it validates the deployment configuration data, generates all container specific classes and interfaces, and moves the fully baked archive to the designated deployment targets.

**doAfterBody()** - Method in class
javax.faces.webapp.**UIComponentClassicTagBase**
Perform any processing necessary to handle the content implications of CASE 4 in the class description.

**doAfterBody()** - Method in class
javax.servlet.jsp.tagext.**BodyTagSupport**
After the body evaluation: do not reevaluate and continue with the page.

**doAfterBody()** - Method in interface javax.servlet.jsp.tagext.**IterationTag**
Process body (re)evaluation.

**doAfterBody()** - Method in class javax.servlet.jsp.tagext.**TagSupport**
Default processing for a body.

**doCatch(Throwable)** - Method in interface javax.servlet.jsp.tagext.**TryCatchFinally**
Invoked if a Throwable occurs while evaluating the BODY inside a tag or in any of the following methods: Tag.doStartTag(), Tag.doEndTag(), IterationTag.doAfterBody() and BodyTag.doInitBody.
**doDelete(HttpServletResponse)** - Method in class `javax.servlet.http.HttpServlet`
   Called by the server (via the `service` method) to allow a servlet to handle a DELETE request.

**doEndTag()** - Method in class `javax.faces.webapp.AttributeTag`
   Deprecated.

**doEndTag()** - Method in class `javax.faces.webapp.UIComponentClassicTagBase`
   Perform any processing necessary to handle the content implications of CASE 3 in the class description.

**doEndTag()** - Method in class `javax.servlet.jsp.tagext.BodyTagSupport`
   Default processing of the end tag returning EVAL_PAGE.

**doEndTag()** - Method in interface `javax.servlet.jsp.tagext.Tag`
   Process the end tag for this instance.

**doEndTag()** - Method in class `javax.servlet.jsp.tagext.TagAdapter`
   Must not be called.

**doEndTag()** - Method in class `javax.servlet.jsp.tagext.TagSupport`
   Default processing of the end tag returning EVAL_PAGE.

**doFilter(ServletRequest, ServletResponse, FilterChain)** - Method in interface `javax.servlet.Filter`
   The `doFilter` method of the Filter is called by the container each time a request/response pair is passed through the chain due to a client request for a resource at the end of the chain.

**doFilter(ServletRequest, ServletResponse)** - Method in interface `javax.servlet.FilterChain`
   Causes the next filter in the chain to be invoked, or if the calling filter is the last filter in the chain, causes the resource at the end of the chain to be invoked.

**doFinally()** - Method in interface `javax.servlet.jsp.tagext.TryCatchFinally`
   Invoked in all cases after `doEndTag()` for any class implementing Tag, IterationTag or BodyTag.

   Called by the server (via the `service` method) to allow a servlet to handle a GET request.

**doHead(HttpServletRequest, HttpServletResponse)** - Method in class `javax.servlet.http.HttpServlet`
   Receives an HTTP HEAD request from the protected `service` method and handles the request.
doInitBody() - Method in class javax.faces.webapp.UICOMPONENTCLASSICTAGBASE
Prepare for evaluation of the body.
doInitBody() - Method in interface javax.servlet.jsp.tagext.BODYTAG
Prepare for evaluation of the body.
doInitBody() - Method in class javax.servlet.jsp.tagext.BODYTAGSUPPORT
Prepare for evaluation of the body just before the first body evaluation: no action.

DomHandler<ELEMENTT,RESULTT> extends Result> - Interface in javax.xml.bind.annotation
Converts an element (and its descendants) from/to DOM (or similar) representation.

doOptions(HttpServletRequest, HttpServletResponse) - Method in class javax.servlet.http.HttpServletRequest
Called by the server (via the service method) to allow a servlet to handle a OPTIONS request.
doPost(HttpServletRequest, HttpServletResponse) - Method in class javax.servlet.http.HttpServletRequest
Called by the server (via the service method) to allow a servlet to handle a POST request.
doPut(HttpServletRequest, HttpServletResponse) - Method in class javax.servlet.http.HttpServletRequest
Called by the server (via the service method) to allow a servlet to handle a PUT request.
doStartTag() - Method in class javax.faces.webapp.AttributeTag
Deprecated. Register the specified attribute name and value with the UICOMPONENT instance associated with our most immediately surrounding UICOMPONENT instance, if this UICOMPONENT does not already have a value for the specified attribute name.
doStartTag() - Method in class javax.faces.webapp.ConverterELTag
Create a new instance of the specified Converter class, and register it with the UICOMPONENT instance associated with our most immediately surrounding UICOMPONENTCLASSICTAGBASE instance, if the UICOMPONENT instance was created by this execution of the containing JSP page.
doStartTag() - Method in class javax.faces.webapp.ConverterTag
Deprecated. Create a new instance of the specified Converter class, and register it with the UICOMPONENT instance associated with our most immediately surrounding UICOMPONENT instance, if the
**UIComponent** instance was created by this execution of the containing JSP page.

**doStartTag()** - Method in class `javax.faces.webapp.FacetTag`
Return `EVAL_BODY_INCLUDE` to cause nested body content to be evaluated.

**doStartTag()** - Method in class `javax.faces.webapp.UIComponentClassicTagBase`
Perform any processing necessary to find (or create) the **UIComponent** instance in the view corresponding to this tag instance in the page and, if and only if a component was created, insert it into the tree at the proper location as expected by the page author.

**doStartTag()** - Method in class `javax.faces.webapp.ValidatorELTag`
Create a new instance of the specified **Validator** class, and register it with the **UIComponent** instance associated with our most immediately surrounding **UIComponentTagBase** instance, if the **UIComponent** instance was created by this execution of the containing JSP page.

**doStartTag()** - Method in class `javax.faces.webapp.ValidatorTag`
Deprecated. Create a new instance of the specified **Validator** class, and register it with the **UIComponent** instance associated with our most immediately surrounding **UIComponentTag** instance, if the **UIComponent** instance was created by this execution of the containing JSP page.

**doStartTag()** - Method in class `javax.servlet.jsp.tagext.BodyTagSupport`
Default processing of the start tag returning `EVAL_BODY_BUFFERED`.

**doStartTag()** - Method in class `javax.servlet.jsp.tagext.Tag`
Process the start tag for this instance.

**doStartTag()** - Method in class `javax.servlet.jsp.tagext.TagAdapter`
Must not be called.

**doStartTag()** - Method in class `javax.servlet.jsp.tagext.TagSupport`
Default processing of the start tag, returning `SKIP_BODY`.

**doTag()** - Method in interface `javax.servlet.jsp.tagext.SimpleTag`
Called by the container to invoke this tag.

**doTag()** - Method in class `javax.servlet.jsp.tagext.SimpleTagSupport`
Default processing of the tag does nothing.

**doTrace(HttpServletRequest, HttpServletResponse)** - Method in class `javax.servlet.http.HttpServlet`
Called by the server (via the **service** method) to allow a servlet to
handle a TRACE request.

**DOUBLE_ID** - Static variable in class javax.faces.convert.DoubleConverter

The message identifier of the FacesMessage to be created if the conversion to Double fails.

**DoubleConverter** - Class in javax.faces.convert Converter implementation for java.lang.Double (and double primitive) values.

**DoubleConverter()** - Constructor for class javax.faces.convert.DoubleConverter

**DoubleHolder** - Class in javax.xml.rpc.holders

**DoubleHolder()** - Constructor for class javax.xml.rpc.holders.DoubleHolder

**DoubleHolder(double)** - Constructor for class javax.xml.rpc.holders.DoubleHolder

**DoubleRangeValidator** - Class in javax.faces.validator

DoubleRangeValidator is a Validator that checks the value of the corresponding component against specified minimum and maximum values.

**DoubleRangeValidator()** - Constructor for class javax.faces.validator.DoubleRangeValidator

Construct a Validator with no preconfigured limits.

**DoubleRangeValidator(double)** - Constructor for class javax.faces.validator.DoubleRangeValidator

Construct a Validator with the specified preconfigured limit.

**DoubleRangeValidator(double, double)** - Constructor for class javax.faces.validator.DoubleRangeValidator

Construct a Validator with the specified preconfigured limits.

**DoubleWrapperHolder** - Class in javax.xml.rpc.holders

**DoubleWrapperHolder()** - Constructor for class javax.xml.rpc.holders.DoubleWrapperHolder

**DoubleWrapperHolder(Double)** - Constructor for class javax.xml.rpc.holders.DoubleWrapperHolder
**doWork(Work)** - Method in interface javax.resource.spi.work.WorkManager
  Accepts a Work instance for processing.

**doWork(Work, long, ExecutionContext, WorkListener)** - Method in interface javax.resource.spi.work.WorkManager
  Accepts a Work instance for processing.

**DRAFT** - Static variable in class javax.mail.Flags.Flag
  This message is a draft.

**ds** - Variable in class javax.mail.internet.MimeMultipart
  The DataSource supplying our InputStream.

**DTD** - Interface in javax.xml.stream.events
  This is the top level interface for events dealing with DTDs

**DTD** - Static variable in interface javax.xml.stream.XMLStreamConstants
  Indicates an event is a DTD

**DuplicateKeyException** - Exception in javax.ejb
  The DuplicateKeyException exception is thrown if an entity EJB object cannot be created because an object with the same key already exists.

**DuplicateKeyException()** - Constructor for exception javax.ejb.DuplicateKeyException
  Constructs a DuplicateKeyException with no detail message.

**DuplicateKeyException(String)** - Constructor for exception javax.ejb.DuplicateKeyException
  Constructs a DuplicateKeyException with the specified detail message.

**DUPS_OK_ACKNOWLEDGE** - Static variable in interface javax.jms.Session
  This acknowledgment mode instructs the session to lazily acknowledge the delivery of messages.

**DYNAMIC_SOAP_PROTOCOL** - Static variable in interface javax.xml.soap.SOAPConstants
  Used to create MessageFactory instances that create SOAPMessages whose concrete type is based on the Content-Type MIME header passed to the createMessage method.

**DynamicAttributes** - Interface in javax.servlet.jsp.tagext
  For a tag to declare that it accepts dynamic attributes, it must implement this interface.
EAR - Static variable in class javax.enterprise.deploy.shared.ModuleType
The module is an EAR archive.

EditableValueHolder - Interface in javax.faces.component
EditableValueHolder is an extension of ValueHolder that describes additional features supported by editable components, including ValueChangeEvent and Validators.

EISSystemException - Exception in javax.resource.spi
An EISSystemException is used to indicate any EIS specific system-level error conditions.

EISSystemException() - Constructor for exception javax.resource.spi.EISSystemException
Constructs a new instance with null as its detail message.

EISSystemException(String) - Constructor for exception javax.resource.spi.EISSystemException
Constructs a new instance with the specified detail message.

EISSystemException(Throwables) - Constructor for exception javax.resource.spi.EISSystemException
Constructs a new throwable with the specified cause.

EISSystemException(String, Throwable) - Constructor for exception javax.resource.spi.EISSystemException
Constructs a new throwable with the specified detail message and cause.

EISSystemException(String, String) - Constructor for exception javax.resource.spi.EISSystemException
Constructs a new throwable with the specified detail message and an error code.

EJB - Annotation Type in javax.ejb
Indicates a dependency on the local or remote view of an Enterprise Java Bean.

EJB - Static variable in class javax.enterprise.deploy.shared.ModuleType
The module is an Enterprise Java Bean archive.

EJBAccessException - Exception in javax.ejb
This exception indicates that client access to a business method was denied.

EJBAccessException() - Constructor for exception
javax.ejb.**EJBAccessException**

Constructs an EJBAccessException with no detail message.

**EJBAccessException(String)** - Constructor for exception

javax.ejb.**EJBAccessException**

Constructs an EJBAccessException with the specified detailed message.

**ejbActivate()** - Method in interface javax.ejb.**EntityBean**

A container invokes this method when the instance is taken out of the pool of available instances to become associated with a specific EJB object.

**ejbActivate()** - Method in interface javax.ejb.**SessionBean**

The activate method is called when the instance is activated from its "passive" state.

**EJBContext** - Interface in javax.ejb

The EJBContext interface provides an instance with access to the container-provided runtime context of an enterprise Bean instance.

**EJBException** - Exception in javax.ejb

The EJBException exception is thrown by an enterprise Bean instance to its container to report that the invoked business method or callback method could not be completed because of an unexpected error (e.g. the instance failed to open a database connection).

**EJBException()** - Constructor for exception javax.ejb.**EJBException**

Constructs an EJBException with no detail message.

**EJBException(String)** - Constructor for exception

javax.ejb.**EJBException**

Constructs an EJBException with the specified detailed message.

**EJBException(Substring)** - Constructor for exception

javax.ejb.**EJBException**

Constructs an EJBException that embeds the originally thrown exception.

**EJBException(String, Exception)** - Constructor for exception

javax.ejb.**EJBException**

Constructs an EJBException that embeds the originally thrown exception with the specified detail message.

**EJBHome** - Interface in javax.ejb

The EJBHome interface must be extended by all enterprise Beans' remote home interfaces.

**ejbLoad()** - Method in interface javax.ejb.**EntityBean**

A container invokes this method to instruct the instance to synchronize its state by loading it state from the underlying database.

**EJBLocalHome** - Interface in `javax.ejb`
The EJBLocalHome interface must be extended by all enterprise Beans' local home interfaces.

**EJBLocalObject** - Interface in `javax.ejb`
The EJBLocalObject interface must be extended by all enterprise Beans' local interfaces.

**EJBMetaData** - Interface in `javax.ejb`
The EJBMetaData interface allows a client to obtain the enterprise Bean's meta-data information.

**EJBMETHODPermission** - Class in `javax.security.jacc`
Class for EJB method permissions.

**EJBMETHODPermission(String, String)** - Constructor for class `javax.security.jacc.EJBMETHODPermission`
Creates a new EJBMETHODPermission with the specified name and actions.

**EJBMETHODPermission(String, String, String, String[])** - Constructor for class `javax.security.jacc.EJBMETHODPermission`
Creates a new EJBMETHODPermission with name corresponding to the EJBName and actions composed from methodName, methodInterface, and methodParams.

**EJBMETHODPermission(String, String, Method)** - Constructor for class `javax.security.jacc.EJBMETHODPermission`
Creates a new EJBMETHODPermission with name corresponding to the EJBName and actions composed from methodInterface, and the Method object.

**EJBObject** - Interface in `javax.ejb`
The EJBObject interface is extended by all enterprise Beans' remote interfaces.

**ejbPassivate()** - Method in interface `javax.ejb.EntityBean`
A container invokes this method on an instance before the instance becomes disassociated with a specific EJB object.

**ejbPassivate()** - Method in interface `javax.ejb.SessionBean`
The passivate method is called before the instance enters the "passive" state.

**ejbRemove()** - Method in interface `javax.ejb.EntityBean`
A container invokes this method before it removes the EJB object.
that is currently associated with the instance.

**ejbRemove()** - Method in interface javax.ejb.MessageDrivenBean
A container invokes this method before it ends the life of the message-driven object.

**ejbRemove()** - Method in interface javax.ejb.SessionBean
A container invokes this method before it ends the life of the session object.

**EJBRoleRefPermission** - Class in javax.security.jacc
Class for EJB isCallerInRole (String reference) permissions.

**EJBRoleRefPermission(String, String)** - Constructor for class javax.security.jacc.EJBRoleRefPermission
Creates a new EJBRoleRefPermission with the specified name and actions.

**EJBs** - Annotation Type in javax.ejb
Declares multiple TYPE-level @EJB annotations.

**EJBStats** - Interface in javax.management.j2ee.statistics
Specifies statistics provided by all EJB component types.

**ejbStore()** - Method in interface javax.ejb.EntityBean
A container invokes this method to instruct the instance to synchronize its state by storing it to the underlying database.

**ejbTimeout(Timer)** - Method in interface javax.ejb.TimedObject
Invoked by the EJB container upon timer expiration.

**EJBTransactionRequiredException** - Exception in javax.ejb
This exception indicates that a request carried a null transaction context, but the target object requires an active transaction.

**EJBTransactionRequiredException()** - Constructor for exception javax.ejb.EJBTransactionRequiredException
Constructs an EJBTransactionRequiredException with no detail message.

**EJBTransactionRequiredException(String)** - Constructor for exception javax.ejb.EJBTransactionRequiredException
Constructs an EJBTransactionRequiredException with the specified detailed message.

**EJBTransactionRolledbackException** - Exception in javax.ejb
This exception indicates that the transaction associated with processing of the request has been rolled back, or marked to roll back.

**EJBTransactionRolledbackException()** - Constructor for exception javax.ejb.EJBTransactionRolledbackException
Constructs an EJBTransactionRolledbackException with no detail message.

EJBTransactionRolledbackException(String) - Constructor for exception javax.ejb.EJBTransactionRolledbackException
   Constructs an EJBTransactionRolledbackException with the specified detailed message.

EJBTransactionRolledbackException(String, Exception) - Constructor for exception javax.ejb.EJBTransactionRolledbackException
   Constructs an EJBTransactionRolledbackException with the specified detail message and a nested exception.

ELContext - Class in javax.el
   Context information for expression evaluation.

ELContext() - Constructor for class javax.el.ELContext

ELContextEvent - Class in javax.el
   An event which indicates that an ELContext has been created.

ELContextEvent(ELContext) - Constructor for class javax.el.ELContextEvent
   Constructs an ELContextEvent object to indicate that an ELContext has been created.

ELContextListener - Interface in javax.el
   The listener interface for receiving notification when an ELContext is created.

Element - Interface in javax.xml.bind
   This is an element marker interface.

ELException - Exception in javax.el
   Represents any of the exception conditions that can arise during expression evaluation.

ELException() - Constructor for exception javax.el.ELException
   Creates an ELException with no detail message.

ELException(String) - Constructor for exception javax.el.ELException
   Creates an ELException with the provided detail message.

ELException(throwable) - Constructor for exception javax.el.ELException
   Creates an ELException with the given cause.

ELException(String, Throwable) - Constructor for exception javax.el.ELException
   Creates an ELException with the given detail message and root cause.
**ELException** - Exception in `javax.servlet.jsp.el`
   
   Deprecated. As of JSP 2.1, replaced by `ELException`

**ELException()** - Constructor for exception `javax.servlet.jsp.el.ELException`
   
   Deprecated. Creates an ELException with no detail message.

**ELException(String)** - Constructor for exception `javax.servlet.jsp.el.ELException`
   
   Deprecated. Creates an ELException with the provided detail message.

**ELException(Throwlable)** - Constructor for exception `javax.servlet.jsp.el.ELException`
   
   Deprecated. Creates an ELException with the given root cause.

**ELParseException()** - Constructor for exception `javax.servlet.jsp.el.ELParseException`
   
   Deprecated. Creates an ELParseException with no detail message.

**ELParseException(String)** - Constructor for exception `javax.servlet.jsp.el.ELParseException`
   
   Deprecated. Creates an ELParseException with the provided detail message.

**ELParseException(Throwable)** - Constructor for exception `javax.servlet.jsp.el.ELParseException`
   
   Deprecated. Creates an ELParseException with the given root cause.

**ELParseException(String, Throwable)** - Constructor for exception `javax.servlet.jsp.el.ELParseException`
   
   Deprecated. Creates an ELParseException with the given detail message and root cause.

**ELResolver** - Class in `javax.el`

   Enables customization of variable and property resolution behavior for EL expression evaluation.

**ELResolver()** - Constructor for class `javax.el.ELResolver`

**EMAIL_ADDRESS** - Static variable in interface `javax.xml.registry.LifeCycleManager`

**EmailAddress** - Interface in `javax.xml.registry.infomodel`

   Represents an email address.

**Embeddable** - Annotation Type in `javax.persistence`

   Defines a class whose instances are stored as an intrinsic part of an owning entity and share the identity of the entity.

**Embedded** - Annotation Type in `javax.persistence`
Defines a persistent field or property of an entity whose value is an instance of an embeddable class.

**EmbeddedId** - Annotation Type in [javax.persistence](https://docs.oracle.com/javaee/8/api/javax/persistence/)

Is applied to a persistent field or property of an entity class or mapped superclass to denote a composite primary key that is an embeddable class.

**encode(OutputStream, String)** - Static method in class javax.mail.internet.MimeUtility

Wrap an encoder around the given output stream.

**encode(OutputStream, String, String)** - Static method in class javax.mail.internet.MimeUtility

Wrap an encoder around the given output stream.

**encodeActionURL(String)** - Method in class javax.faces.context.ExternalContext

Return the input URL, after performing any rewriting needed to ensure that it will correctly identify an addressable action in the current application.

**encodeAll(FacesContext)** - Method in class javax.faces.component.UIComponent

If this component returns true from UIComponent.isRendered(), render this component and all its children that return true from isRendered(), regardless of the value of the UIComponent.getRendersChildren() flag.

**encodeBegin(FacesContext)** - Method in class javax.faces.component.UIComponent

If our rendered property is true, render the beginning of the current state of this UIComponent to the response contained in the specified FacesContext.

**encodeBegin(FacesContext)** - Method in class javax.faces.component.UIComponentBase

**encodeBegin(FacesContext)** - Method in class javax.faces.component.UIData

In addition to the default behavior, ensure that any saved per-row state for our child input components is discarded unless it is needed to rerender the current page with errors.
UIComponentBase.encodeBegin(javax.faces.context.FacesContext) behavior.

encodeBegin(FacesContext, UIComponent) - Method in class javax.faces.render.Renderer
  Render the beginning specified UIComponent to the output stream or writer associated with the response we are creating.

encodeBegin() - Method in class javax.faces.webapp.UIComponentClassicTagBase
  Deprecated. No encoding is done during JSP page execution. Encoding is deferred until the page has completed executing to allow the entire tree to be built before any encoding occurs.

encodeChildren(FacesContext) - Method in class javax.faces.component.UIComponent
  If our rendered property is true, render the child UIComponent's of this UIComponent.

encodeChildren(FacesContext) - Method in class javax.faces.component.UIComponentBase

encodeChildren(FacesContext, UIComponent) - Method in class javax.faces.render.Renderer
  Render the child components of this UIComponent, following the rules described for encodeBegin() to acquire the appropriate value to be rendered.

encodeChildren() - Method in class javax.faces.webapp.UIComponentClassicTagBase
  Deprecated. No encoding is done during JSP page execution. Encoding is deferred until the page has completed executing to allow the entire tree to be built before any encoding occurs.

encodedPersonal - Variable in class javax.mail.internet.InternetAddress
  The RFC 2047 encoded version of the personal name.

encodeEnd(FacesContext) - Method in class javax.faces.component.UIComponent
  If our rendered property is true, render the ending of the current state of this UIComponent.

encodeEnd(FacesContext) - Method in class javax.faces.component.UIComponentBase

encodeEnd(FacesContext) - Method in class javax.faces.component.UIViewRoot
Override the default
UIComponentBase.encodeEnd(javax.faces.context.FacesContext)
behavior.

**encodeEnd(FacesContext, UIComponent)** - Method in class
javax.faces.render.Renderer
Render the ending of the current state of the specified UIComponent,
following the rules described for encodeBegin() to acquire the
appropriate value to be rendered.

**encodeEnd()** - Method in class
javax.faces.webapp.UIComponentClassicTagBase

**Deprecated. No encoding is done during JSP page execution.**
Encoding is deferred until the page has completed executing to allow
the entire tree to be built before any encoding occurs.

**encodeNamespace(String)** - Method in class
javax.faces.context.ExternalContext
Return the specified name, after prefixing it with a namespace that
ensures that it will be unique within the context of a particular page.

**encodeRedirectURL(String)** - Method in interface
javax.servlet.http.HttpServletResponse
Encodes the specified URL for use in the sendRedirect method or, if
encoding is not needed, returns the URL unchanged.

**encodeRedirectUrl(String)** - Method in interface
javax.servlet.http.HttpServletResponse

**Deprecated. As of version 2.1, use encodeRedirectURL(String url) instead**

**encodeRedirectURL(String)** - Method in class
javax.servlet.http.HttpServletResponseWrapper
The default behavior of this method is to return
encodeRedirectURL(String url) on the wrapped response object.

**encodeRedirectUrl(String)** - Method in class
javax.servlet.http.HttpServletResponseWrapper
The default behavior of this method is to return
encodeRedirectUrl(String url) on the wrapped response object.

**encodeResourceURL(String)** - Method in class
javax.faces.context.ExternalContext
Return the input URL, after performing any rewriting needed to
ensure that it will correctly identify an addressable resource in the
current application.

**encodeText(String)** - Static method in class
javax.mail.internet.MimeUtility
   Encode a RFC 822 "text" token into mail-safe form as per RFC 2047.
   **encodeText(String, String, String)** - Static method in class
javax.mail.internet.MimeUtility
   Encode a RFC 822 "text" token into mail-safe form as per RFC 2047.
   **encodeURL(String)** - Method in interface
javax.servlet.http.HttpServletResponse
   Encodes the specified URL by including the session ID in it, or, if
   encoding is not needed, returns the URL unchanged.
   **encodeUrl(String)** - Method in interface
javax.servlet.http.HttpServletResponse
   Deprecated. As of version 2.1, use encodeURL(String url) instead
   **encodeURL(String)** - Method in class
javax.servlet.http.HttpServletResponseWrapper
   The default behavior of this method is to call encodeURL(String url)
   on the wrapped response object.
   **encodeUrl(String)** - Method in class
javax.servlet.http.HttpServletResponseWrapper
   The default behavior of this method is to call encodeUrl(String url) on
   the wrapped response object.
   **encodeWord(String)** - Static method in class
javax.mail.internet.MimeUtility
   Encode a RFC 822 "word" token into mail-safe form as per RFC
   2047.
   **encodeWord(String, String, String)** - Static method in class
javax.mail.internet.MimeUtility
   Encode a RFC 822 "word" token into mail-safe form as per RFC
   2047.
   **encodingSet()** - Method in interface
javax.xml.stream.events.StartDocument
   Returns true if CharacterEncodingScheme was set in the encoding
   declaration of the document
   **ENCODINGSTYLE_URI_PROPERTY** - Static variable in interface
javax.xml.rpc.Call
   Standard property for encoding Style: Encoding style specified as a
   namespace URI.
   **end(Xid, int)** - Method in interface javax.transaction.xa.XAResource
   Ends the work performed on behalf of a transaction branch.
   **END_DOCUMENT** - Static variable in interface
javax.xml.stream.XMLStreamConstants
Indicates an event is an end document
**END** **ELEMENT** - Static variable in interface
javax.xml.stream.XMLStreamConstants
Indicates an event is an end element
**endDocument()** - Method in class javax.faces.context.ResponseWriter
Write whatever text should end a response.
**endDocument()** - Method in class javax.faces.context.ResponseWriterWrapper
The default behavior of this method is to call
ResponseWriter.endDocument() on the wrapped ResponseWriter object.
**EndDocument** - Interface in javax.xml.stream.events
A marker interface for the end of the document
**endElement(String)** - Method in class javax.faces.context.ResponseWriter
Write the end of an element, after closing any open element created by a call to startElement().
**endElement(String)** - Method in class javax.faces.context.ResponseWriterWrapper
The default behavior of this method is to call
ResponseWriter.endElement(String) on the wrapped ResponseWriter object.
**EndElement** - Interface in javax.xml.stream.events
An interface for the end element event.
**Endpoint** - Class in javax.xml.ws
A Web service endpoint.
**Endpoint()** - Constructor for class javax.xml.ws.Endpoint
**ENDPOINT_ADDRESS_PROPERTY** - Static variable in interface
javax.xml.rpc.Stub
Standard property: Target service endpoint address.
**ENDPOINT_ADDRESS_PROPERTY** - Static variable in interface
javax.xml.ws.BindingProvider
Standard property: Target service endpoint address.
This is called during the activation of a message endpoint.
**endpointDeactivation(MessageEndpointFactory, ActivationSpec)** -
Method in interface javax.resource.spi.**ResourceAdapter**
   This is called when a message endpoint is deactivated.

**enlistResource(XAResource)** - Method in interface
java.transaction.**Transaction**
   Enlist the resource specified with the transaction associated with the
target Transaction object.

**EnterpriseBean** - Interface in **javax.ejb**
   The EnterpriseBean interface must be implemented by every
enterprise Bean class.

**Entity** - Annotation Type in **javax.persistence**
   Specifies that the class is an entity.

**ENTITY_DECLARATION** - Static variable in interface
javax.xml.stream.**XMLStreamConstants**
   Indicates a Entity Declaration

**ENTITY_REFERENCE** - Static variable in interface
javax.xml.stream.**XMLStreamConstants**
   Indicates an event is an entity reference

**EntityBean** - Interface in **javax.ejb**
   The EntityBean interface is implemented by every entity enterprise
Bean class.

**EntityBeanStats** - Interface in **javax.management.j2ee.statistics**
   Specifies statistics provided by entity beans.

**EntityContext** - Interface in **javax.ejb**
   The EntityContext interface provides an instance with access to the
container-provided runtime context of an entity enterprise Bean
instance.

**EntityDeclaration** - Interface in **javax.xml.stream.events**
   An interface for handling Entity Declarations This interface is used to
record and report unparsed entity declarations.

**EntityExistsException** - Exception in **javax.persistence**
   Thrown by the persistence provider when
   EntityManager.persist(Object) is called and the entity already
   exists.

**EntityExistsException()** - Constructor for exception
java.persistence.**EntityExistsException**
   Constructs a new EntityExistsException exception with null as its
detail message.

**EntityExistsException(String)** - Constructor for exception
java.persistence.**EntityExistsException**
Constructs a new `EntityExistsException` exception with the specified detail message.

**EntityExistsException(String, Throwable)** - Constructor for exception

Constructs a new `EntityExistsException` exception with the specified detail message and cause.

**EntityExistsException(Throwabla** - Constructor for exception

Constructs a new `EntityExistsException` exception with the specified cause.

**EntityListeners** - Annotation Type in `javax.persistence`

Specifies the callback listener classes to be used for an entity or mapped superclass.

**EntityManager** - Interface in `javax.persistence`

Interface used to interact with the persistence context.

**EntityManagerFactory** - Interface in `javax.persistence`

The `EntityManagerFactory` interface is used by the application to obtain an application-managed entity manager.

**EntityNotFoundException** - Exception in `javax.persistence`

Thrown by the persistence provider when an entity reference obtained by `EntityManager.getReference(Class, Object)` is accessed but the entity does not exist.

**EntityNotFoundException()** - Constructor for exception

Constructs a new `EntityNotFoundException` exception with null as its detail message.

**EntityNotFoundException(String)** - Constructor for exception

Constructs a new `EntityNotFoundException` exception with the specified detail message.

**EntityReference** - Interface in `javax.xml.stream.events`

An interface for handling Entity events.

**EntityResult** - Annotation Type in `javax.persistence`

References an entity in the SELECT clause of a SQL query.

**EntityTransaction** - Interface in `javax.persistence`

The `EntityTransaction` interface is used to control resource transactions on resource-local entity managers.

**entries()** - Method in interface

`javax.enterprise.deploy.model.DeployableObject`
Returns an enumeration of the module file entries.

**ENUM_ID** - Static variable in class `javax.faces.convert.EnumConverter`

The message identifier of the `FacesMessage` to be created if the conversion to `Enum` fails.

**ENUM_NO_CLASS_ID** - Static variable in class `javax.faces.convert.EnumConverter`

The message identifier of the `FacesMessage` to be created if the conversion to `Enum` fails and no target class has been provided.

**EnumConverter** - Class in `javax.faces.convert` implementation for `java.lang.Enum` (and enum primitive) values.

**EnumConverter()** - Constructor for class `javax.faces.convert.EnumConverter`

**EnumConverter(Class)** - Constructor for class `javax.faces.convert.EnumConverter`

**Enumerated** - Annotation Type in `javax.persistence`

Specifies that a persistent property or field should be persisted as a enumerated type.

**EnumType** - Enum in `javax.persistence`

Defines mapping for the enumerated types.

**ENVELOPE** - Static variable in class `javax.mail.FetchProfile.Item`

This is the Envelope item.

**ENVELOPE_CHANGED** - Static variable in class `javax.mail.event.MessageChangedEvent`

The message's envelope (headers, but not body) changed.

**EOF** - Static variable in class `javax.mail.internet.HeaderTokenizer.Token`

Token type indicating end of input.

**EQ** - Static variable in class `javax.mail.search.ComparisonTerm`

**equals(DataFlavor)** - Method in class `javax.activation.ActivationDataFlavor`

Compares the DataFlavor passed in with this DataFlavor; calls the `isMimeTypeEqual` method.

**equals(Object)** - Method in class `javax.el.Expression`

Determines whether the specified object is equal to this `Expression`.

**equals(Object)** - Method in class `javax.faces.validator.DoubleRangeValidator`
equals(Object) - Method in class javax.faces.validator.LengthValidator

equals(Object) - Method in class javax.faces.validator.LongRangeValidator

equals(Object) - Method in class javax.mail.Address
The equality operator.

equals(Object) - Method in class javax.mail.Flags
Check whether the two Flags objects are equal.

equals(Object) - Method in class javax.mail.internet.InternetAddress
The equality operator.

equals(Object) - Method in class javax.mail.internet.NewsAddress
The equality operator.

equals(Object) - Method in class javax.mail.search.AddressStringTerm
Equality comparison.

equals(Object) - Method in class javax.mail.search.AddressTerm
Equality comparison.

equals(Object) - Method in class javax.mail.search.AndTerm
Equality comparison.

equals(Object) - Method in class javax.mail.search.BodyTerm
Equality comparison.

equals(Object) - Method in class javax.mail.search.ComparisonTerm
Equality comparison.

equals(Object) - Method in class javax.mail.search.DateTerm
Equality comparison.

equals(Object) - Method in class javax.mail.search.FlagTerm
Equality comparison.

equals(Object) - Method in class javax.mail.search.FromStringTerm
Equality comparison.

equals(Object) - Method in class javax.mail.search.FromTerm
Equality comparison.

equals(Object) - Method in class javax.mail.search.HeaderTerm
Equality comparison.

equals(Object) - Method in class javax.mail.search.IntegerComparisonTerm
Equality comparison.

equals(Object) - Method in class javax.mail.search.MessageIDTerm
Equality comparison.
equals(Object) - Method in class javax.mail.search.MessageNumberTerm
  Equality comparison.
equals(Object) - Method in class javax.mail.search.NotTerm
  Equality comparison.
equals(Object) - Method in class javax.mail.search.OrTerm
  Equality comparison.
equals(Object) - Method in class javax.mail.search.ReceivedDateTerm
  Equality comparison.
equals(Object) - Method in class javax.mail.search.RecipientStringTerm
  Equality comparison.
equals(Object) - Method in class javax.mail.search.RecipientTerm
  Equality comparison.
equals(Object) - Method in class javax.mail.search.SentDateTerm
  Equality comparison.
equals(Object) - Method in class javax.mail.search.SizeTerm
  Equality comparison.
equals(Object) - Method in class javax.mail.search.StringTerm
  Equality comparison.
equals(Object) - Method in class javax.mail.search.SubjectTerm
  Equality comparison.
equals(Object) - Method in class javax.mail.URLName
  Compares two URLNames.
equals(Object) - Method in class javax.resource.cci.Record
  Check if this instance is equal to another Record.
equals(Object) - Method in class javax.resource.spi.ConnectionRequestInfo
  Checks whether this instance is equal to another.
equals(Object) - Method in class javax.resource.spi.ManagedConnectionFactory
  Check if this ManagedConnectionFactory is equal to another ManagedConnectionFactory.
equals(Object) - Method in class javax.resource.spi.security.GenericCredential
  Deprecated. Tests if this GenericCredential instance refers to the same entity as the supplied object.
equals(Object) - Method in class javax.resource.spi.security.PasswordCredential
  Compares this PasswordCredential with the specified object for
equality.

**equals(Object)** - Method in class `javax.security.jacc.EJBMethodPermission`
Checks two EJBMethodPermission objects for equality.

**equals(Object)** - Method in class `javax.security.jacc.EJBRoleRefPermission`
Checks two EJBRoleRefPermission objects for equality.

**equals(Object)** - Method in class `javax.security.jacc.WebResourcePermission`
Checks two WebResourcePermission objects for equality.

**equals(Object)** - Method in class `javax.security.jacc.WebRoleRefPermission`
Checks two WebRoleRefPermission objects for equality.

**equals(Object)** - Method in class `javax.security.jacc.WebUserDataPermission`
Checks two WebUserDataPermission objects for equality.

**ERROR** - Static variable in interface `javax.xml.bind.ValidationEvent`
Conditions that correspond to the definition of "error" in section 1.2 of the W3C XML 1.0 Recommendation

**errorCode** - Variable in exception `javax.transaction.SystemException`
The error code with which to create the SystemException.

**errorCode** - Variable in exception `javax.transaction.xa.XAException`
The error code with which to create the SystemException.

**ErrorData** - Class in `javax.servlet.jsp`
Contains information about an error, for error pages.

**ErrorData(Throw, int, String, String)** - Constructor for class `javax.servlet.jsp.ErrorData`
Creates a new ErrorData object.

**EVAL_BODY_AGAIN** - Static variable in interface `javax.servlet.jsp.tagext.IterationTag`
Request the reevaluation of some body.

**EVAL_BODY_BUFFERED** - Static variable in interface `javax.servlet.jsp.tagext.BodyTag`
Request the creation of new buffer, a BodyContent on which to evaluate the body of this tag.

**EVAL_BODY_INCLUDE** - Static variable in interface `javax.servlet.jsp.tagext.Tag`
Evaluate body into existing out stream.

**EVAL_BODY_TAG** - Static variable in interface

javax.servlet.jsp.tagext.**BodyTag**

**Deprecated.** As of Java JSP API 1.2, use `BodyTag.EVAL_BODY_BUFFERED` or `IterationTag.EVAL_BODY_AGAIN`.

**EVAL_PAGE** - Static variable in interface `javax.servlet.jsp.tagext.Tag` Continue evaluating the page.

**evaluate(VariableResolver)** - Method in class `javax.servlet.jsp.el.Expression`

**Deprecated.** Evaluates an expression that was previously prepared.

**evaluate(String, Class, VariableResolver, FunctionMapper)** - Method in class `javax.servlet.jsp.el.ExpressionEvaluator`

**Deprecated.** Evaluates an expression.

**evaluateExpressionGet(FacesContext, String, Class)** - Method in class `javax.faces.application.Application`

Get a value by evaluating an expression.

**EvaluationException** - Exception in `javax.faces.el`

**Deprecated.** This has been replaced by `ELException`.

**EvaluationException()** - Constructor for exception `javax.faces.el.EvaluationException`

**Deprecated.** Construct a new exception with no detail message or root cause.

**EvaluationException(String)** - Constructor for exception `javax.faces.el.EvaluationException`

**Deprecated.** Construct a new exception with the specified detail message and no root cause.

**EvaluationException(Throwables)** - Constructor for exception `javax.faces.el.EvaluationException`

**Deprecated.** Construct a new exception with the specified root cause.

**EVENT_TYPE_CREATED** - Static variable in interface `javax.xml.registry.infomodel.AuditableEvent` An event where a RegistryObject is created.

**EVENT_TYPE_DELETED** - Static variable in interface `javax.xml.registry.infomodel.AuditableEvent` An event where a RegistryObject is deleted.
**EVENT_TYPE_DEPRECATED** - Static variable in interface javax.xml.registry.infomodel.AuditableEvent
   An event where a RegistryObject is deprecated.

**EVENT_TYPE_UNDEPRECATED** - Static variable in interface javax.xml.registry.infomodel.AuditableEvent
   An event where a RegistryObject isundeprecated.

**EVENT_TYPE_UPDATED** - Static variable in interface javax.xml.registry.infomodel.AuditableEvent
   An event where a RegistryObject is updated.

**EVENT_TYPE_VERSIONED** - Static variable in interface javax.xml.registry.infomodel.AuditableEvent
   An event where a RegistryObject is versioned.

**EventFilter** - Interface in javax.xml.stream
   This interface declares a simple filter interface that one can create to filter XMLEventReaders

**EventReaderDelegate** - Class in javax.xml.stream.util
   This is the base class for deriving an XMLEventReader filter.

**EventReaderDelegate()** - Constructor for class javax.xml.stream.util.EventReaderDelegate
   Construct an empty filter with no parent.

**EventReaderDelegate(XMLEventReader)** - Constructor for class javax.xml.stream.util.EventReaderDelegate
   Construct an filter with the specified parent.

**EXACT_NAME_MATCH** - Static variable in interface javax.xml.registry.FindQualifier

**examineAllHeaderElements()** - Method in interface javax.xml.soap.SOAPHeader
   Returns an Iterator over all the SOAPHeaderElement objects in this SOAPHeader object.

**examineHeaderElements(String)** - Method in interface javax.xml.soap.SOAPHeader
   Returns an Iterator over all the SOAPHeaderElement objects in this SOAPHeader object that have the specified actor.

**examineMustUnderstandHeaderElements(String)** - Method in interface javax.xml.soap.SOAPHeader
   Returns an Iterator over all the SOAPHeaderElement objects in this SOAPHeader object that have the specified actor and that have a MustUnderstand attribute whose value is equivalent to true.
**EXCEPTION** - Static variable in class `javax.servlet.jsp.PageContext`
Name used to store uncaught exception in ServletRequest attribute list and PageContext name table.

**ExceptionListener** - Interface in `javax.jms`
If a JMS provider detects a serious problem with a `Connection` object, it informs the `Connection` object's `ExceptionListener`, if one has been registered.

**ExcludeClassInterceptors** - Annotation Type in `javax.interceptor`
Used to exclude class-level interceptors for a business method.

**ExcludeDefaultInterceptors** - Annotation Type in `javax.interceptor`
Used to exclude default interceptors for a bean or a business method.

**ExcludeDefaultListeners** - Annotation Type in `javax.persistence`
Specifies that the invocation of default listeners is to be excluded for the entity class (or mapped superclass) and its subclasses.

**ExcludeSuperclassListeners** - Annotation Type in `javax.persistence`
Specifies that the invocation of superclass listeners is to be excluded for the entity class (or mapped superclass) and its subclasses.

**excludeUnlistedClasses()** - Method in interface `javax.persistence.spi.PersistenceUnitInfo`
Returns whether classes in the root of the persistence unit that have not been explicitly listed are to be included in the set of managed classes.

**EXECUTE** - Static variable in class `javax.enterprise.deploy.shared.ActionType`
The DeploymentManager action command is executing.

**execute()** - Method in interface `javax.enterprise.deploy.spi.status.ClientConfiguration`
This method performs an exec and starts the application client running in another process.

**execute(FacesContext)** - Method in class `javax.faces.lifecycle.Lifecycle`
Execute all of the phases of the request processing lifecycle, up to but not including the `Render Response` phase, as described in the JavaServer Faces Specification, in the specified order.

**execute(InteractionSpec, Record, Record)** - Method in interface `javax.resource.cci.Interaction`
Executes an interaction represented by the `InteractionSpec`.

**execute(InteractionSpec, Record)** - Method in interface `javax.resource.cci.Interaction`
Executes an interaction represented by the InteractionSpec.

**executeQuery(Query)** - Method in interface javax.xml.registry.DeclarativeQueryManager
Executes a query as specified by query parameter.

**executeUpdate()** - Method in interface javax.persistence.Query
Execute an update or delete statement.

**ExecutionContext** - Class in javax.resource.spi.work
This class models an execution context (transaction, security, etc) with which the Work instance must be executed.

**ExecutionContext()** - Constructor for class javax.resource.spi.work.ExecutionContext

**exists()** - Method in class javax.mail.Folder
Tests if this folder physically exists on the Store.

**Expression** - Class in javax.el
Base class for the expression subclasses ValueExpression and MethodExpression, implementing characteristics common to both.

**Expression()** - Constructor for class javax.el.Expression

**Expression** - Class in javax.servlet.jsp.el
Deprecated. As of JSP 2.1, replaced by ValueExpression

**Expression()** - Constructor for class javax.servlet.jsp.el.Expression
Deprecated.

**ExpressionEvaluator** - Class in javax.servlet.jsp.el
Deprecated. As of JSP 2.1, replaced by ExpressionFactory

**ExpressionEvaluator()** - Constructor for class javax.servlet.jsp.el.ExpressionEvaluator
Deprecated.

**ExpressionFactory** - Class in javax.el

**ExpressionFactory()** - Constructor for class javax.el.ExpressionFactory

**expunge()** - Method in class javax.mail.Folder
Expunge (permanently remove) messages marked DELETED.

**expunged** - Variable in class javax.mail.Message
True if this message has been expunged.

**ExtensibleObject** - Interface in javax.xml.registry.infomodel
An ExtensibleObject is one that allows itself to be extended by utilizing dynamically added Slots that add arbitrary attributes to the
object on a per instance basis.

**EXTERNAL_IDENTIFIER** - Static variable in interface
javax.xml.registry.LifeCycleManager

**EXTERNAL_LINK** - Static variable in interface
javax.xml.registry.LifeCycleManager

**ExternalContext** - Class in javax.faces.context
This class allows the Faces API to be unaware of the nature of its containing application environment.

**ExternalContext()** - Constructor for class
javax.faces.context.ExternalContext

**ExternalIdentifier** - Interface in javax.xml.registry.infomodel
ExternalIdentifier instances provide the additional identifier information to RegistryObjects such as DUNS number, Social Security Number, or an alias name of the organization.

**ExternalLink** - Interface in javax.xml.registry.infomodel
ExternalLink instances model a named URI to content that may reside outside the registry.

**extractAllHeaderElements()** - Method in interface
javax.xml.soap.SOAPHeader
Returns an Iterator over all the SOAPHeaderElement objects in this SOAPHeader object and detaches them from this SOAPHeader object.

**extractContentAsDocument()** - Method in interface
javax.xml.soap.SOAPBody
Creates a new DOM Document and sets the first child of this SOAPBody as its document element.

**extractHeaderElements(String)** - Method in interface
javax.xml.soap.SOAPHeader
Returns an Iterator over all the SOAPHeaderElement objects in this SOAPHeader object that have the specified actor and detaches them from this SOAPHeader object.

**EXTRINSIC_OBJECT** - Static variable in interface
javax.xml.registry.LifeCycleManager

**ExtrinsicObject** - Interface in javax.xml.registry.infomodel
ExtrinsicObjects provide metadata that describes submitted content whose type is not intrinsically known to the registry and therefore
must be described by means of additional attributes (e.g., mime type).
**FACES_CONTEXT_FACTORY** - Static variable in class `javax.faces.FactoryFinder`

The property name for the `FacesContextFactory` class name.

**FACES_MESSAGES** - Static variable in class `javax.faces.application.FacesMessage`

ResourceBundle identifier for messages whose message identifiers are defined in the JavaServer Faces specification.

**FacesContext** - Class in `javax.faces.context`

`FacesContext` contains all of the per-request state information related to the processing of a single JavaServer Faces request, and the rendering of the corresponding response.

**FacesContext()** - Constructor for class `javax.faces.context.FacesContext`

**FacesContextFactory** - Class in `javax.faces.context`

`FacesContextFactory` is a factory object that creates (if needed) and returns new `FacesContext` instances, initialized for the processing of the specified request and response objects.

**FacesContextFactory()** - Constructor for class `javax.faces.context.FacesContextFactory`

**FacesEvent** - Class in `javax.faces.event`

`FacesEvent` is the base class for user interface and application events that can be fired by `UIComponent`s.

**FacesEvent(UIComponent)** - Constructor for class `javax.faces.event.FacesEvent`

Construct a new event object from the specified source component.

**FacesException** - Exception in `javax.faces`

This class encapsulates general JavaServer Faces exceptions.

**FacesException()** - Constructor for exception `javax.faces.FacesException`

Construct a new exception with no detail message or root cause.

**FacesException(String)** - Constructor for exception `javax.faces.FacesException`

Construct a new exception with the specified detail message and no root cause.
**FacesException(Throwable)** - Constructor for exception
javax.faces.**FacesException**
   Construct a new exception with the specified root cause.

**FacesException(String, Throwable)** - Constructor for exception
javax.faces.**FacesException**
   Construct a new exception with the specified detail message and root cause.

**FacesListener** - Interface in **javax.faces.event**
   A generic base interface for event listeners for various types of FacesEventS.

**FacesMessage** - Class in **javax.faces.application**
   **FacesMessage** represents a single validation (or other) message, which is typically associated with a particular component in the view.

**FacesMessage()** - Constructor for class
class javax.faces.application.**FacesMessage**
   Construct a new **FacesMessage** with no initial values.

**FacesMessage(String)** - Constructor for class
class javax.faces.application.**FacesMessage**
   Construct a new **FacesMessage** with just a summary.

**FacesMessage(String, String)** - Constructor for class
class javax.faces.application.**FacesMessage**
   Construct a new **FacesMessage** with the specified initial values.

**FacesMessage(FacesMessage.Severity, String, String)** - Constructor for class
class javax.faces.application.**FacesMessage**
   Construct a new **FacesMessage** with the specified initial values.

**FacesMessage.Severity** - Class in **javax.faces.application**
   Class used to represent message severity levels in a typesafe enumeration.

**FacesServlet** - Class in **javax.faces.webapp**
   **FacesServlet** is a servlet that manages the request processing lifecycle for web applications that are utilizing JavaServer Faces to construct the user interface.

**FacesServlet()** - Constructor for class
class javax.faces.webapp.**FacesServlet**

**FacetTag** - Class in **javax.faces.webapp**
   **FacetTag** is the JSP mechanism for denoting a **UIComponent** is to be added as a **facet** to the component associated with its parent.

**FacetTag()** - Constructor for class
class javax.faces.webapp.**FacetTag**
**FactoryConfigurationError** - Error in `javax.xml.stream`
   An error class for reporting factory configuration errors.

**FactoryConfigurationError()** - Constructor for error
   `javax.xml.stream.FactoryConfigurationError`
   Default constructor

**FactoryConfigurationError( Exception )** - Constructor for error
   `javax.xml.stream.FactoryConfigurationError`
   Construct an exception with a nested inner exception

**FactoryConfigurationError( Exception, String )** - Constructor for error
   `javax.xml.stream.FactoryConfigurationError`
   Construct an exception with a nested inner exception and a message

**FactoryConfigurationError( String, Exception )** - Constructor for error
   `javax.xml.stream.FactoryConfigurationError`
   Construct an exception with a nested inner exception and a message

**FactoryConfigurationError( String )** - Constructor for error
   `javax.xml.stream.FactoryConfigurationError`
   Construct an exception with associated message

**FactoryFinder** - Class in `javax.faces`
   **FactoryFinder** implements the standard discovery algorithm for all factory objects specified in the JavaServer Faces APIs.

**FAILED** - Static variable in class
   `javax.enterprise.deploy.shared.StateType`
   The action operation has failed.

**FATAL_ERROR** - Static variable in interface
   `javax.xml.bind.ValidationEvent`
   Conditions that correspond to the definition of "fatal error" in section 1.2 of the W3C XML 1.0 Recommendation

**FederatedConnection** - Interface in `javax.xml.registry`
   Represents a single logical connection to a federation or group of registry providers.

**fetch( Message[], FetchProfile )** - Method in class `javax.mail.Folder`
   Prefetch the items specified in the FetchProfile for the given Messages.

**FetchProfile** - Class in `javax.mail`
   Clients use a FetchProfile to list the Message attributes that it wishes to prefetch from the server for a range of messages.

**FetchProfile()** - Constructor for class `javax.mail.FetchProfile`
Create an empty FetchProfile.

**FetchProfile.Item** - Class in [javax.mail](https://docs.oracle.com/javae/8/javamail/api/

This inner class is the base class of all items that can be requested in a FetchProfile.

**FetchProfile.Item(String)** - Constructor for class

This is a constructor for an item.

**FetchType** - Enum in [javax.persistence](https://docs.oracle.com/javae/8/persistence/

Defines strategies for fetching data from the database.

**FieldResult** - Annotation Type in [javax.persistence](https://docs.oracle.com/javae/8/persistence/

This is used to map the columns specified in the SELECT list of the query to the properties or fields of the entity class.

**FileDataSource** - Class in [javax.activation](https://docs.oracle.com/javae/8/activation/

This class implements a simple DataSource object that encapsulates a file.

**FileDataSource(File)** - Constructor for class

This is for creating a FileDataSource from a File object.

**FileDataSource(String)** - Constructor for class

This is for creating a FileDataSource from the specified path name.

**FileTypeMap** - Class in [javax.activation](https://docs.oracle.com/javae/8/activation/

This is an abstract class that provides a data typing interface for files.

**FileTypeMap()** - Constructor for class [javax.activation.FileTypeMap](https://docs.oracle.com/javae/8/activation/

This is the default constructor.

**Filter** - Interface in [javax.servlet](https://docs.oracle.com/javae/8/servlet/

This is an object that performs filtering tasks on either the request to a resource (a servlet or static content), or on the response from a resource, or both.

**FilterChain** - Interface in [javax.servlet](https://docs.oracle.com/javae/8/servlet/

This is an object provided by the servlet container to the developer giving a view into the invocation chain of a filtered request for a resource.

**FilterConfig** - Interface in [javax.servlet](https://docs.oracle.com/javae/8/servlet/

This is a filter configuration object used by a servlet container to pass information to a filter during initialization.

**finalize()** - Method in class [javax.mail.Folder](https://docs.oracle.com/javae/8/javamail/

**finalize()** - Method in class javax.mail.Service
Stop the event dispatcher thread so the queue can be garbage collected.

**finalize()** - Method in class javax.mail.util.SharedFileInputStream
Force this stream to close.

**find(Class<T>, Object)** - Method in interface javax.persistence.EntityManager
Find by primary key.

**findAncestorWithClass(JspTag, Class<?>)** - Static method in class javax.servlet.jsp.tagext.SimpleTagSupport
Find the instance of a given class type that is closest to a given instance.

**findAncestorWithClass(Tag, Class)** - Static method in class javax.servlet.jsp.tagext.TagSupport
Find the instance of a given class type that is closest to a given instance.

**findAssociations(Collection, String, String, Collection)** - Method in interface javax.xml.registry.BusinessQueryManager
Finds all Association objects that match all of the criteria specified by the parameters of this call.

**findAttribute(String)** - Method in class javax.servlet.jsp.JspContext
Searches for the named attribute in page, request, session (if valid), and application scope(s) in order and returns the value associated or null.

**findCallerAssociations(Collection, Boolean, Boolean, Collection)** - Method in interface javax.xml.registry.BusinessQueryManager
Finds all Association objects owned by the caller that match all of the criteria specified by the parameters of this call.

**findClassificationSchemeByName(Collection, String)** - Method in interface javax.xml.registry.BusinessQueryManager
Finds a ClassificationScheme by name based on the specified find qualifiers and name pattern.

**findClassificationSchemes(Collection, Collection, Collection, Collection)** - Method in interface javax.xml.registry.BusinessQueryManager
Finds all ClassificationScheme objects that match all of the criteria specified by the parameters of this call.

**findComponent(String)** - Method in class javax.faces.component.UIComponent
Search for and return the `UIComponent` with an id that matches the specified search expression (if any), according to the algorithm described below.

**findComponent(String)** - Method in class `javax.faces.component.UIComponentBase`

According to the algorithm described below.

**findComponent(FacesContext)** - Method in class `javax.faces.webapp.UIComponentClassicTagBase`

Find and return the `UIComponent`, from the component tree, that corresponds to this tag handler instance.

**findConceptByPath(String)** - Method in interface `javax.xml.registry.BusinessQueryManager`  
Finds a Concept based on the path specified.

**findConcepts(Collection, Collection, Collection, Collection, Collection)** - Method in interface `javax.xml.registry.BusinessQueryManager`  
Finds all Concept objects that match all of the criteria specified by the parameters of this call.

**FinderException** - Exception in `javax.ejb`

The FinderException exception must be included in the throws clause of every findMETHOD(...) method of an entity Bean's home interface.

**FinderException()** - Constructor for exception `javax.ejb.FinderException`

Constructs an FinderException with no detail message.

**FinderException(String)** - Constructor for exception `javax.ejb.FinderException`

Constructs an FinderException with the specified detail message.

**FindException** - Exception in `javax.xml.registry`

A RegistryException that occurs during a find action.

**FindException()** - Constructor for exception `javax.xml.registry.FindException`

Constructs a JAXRException object with no reason or embedded Throwable.

**FindException(String)** - Constructor for exception `javax.xml.registry.FindException`

Constructs a JAXRException object with the given String as the reason for the exception being thrown.

**FindException(String, Throwable)** - Constructor for exception `javax.xml.registry.FindException`

Constructs a JAXRException object with the specified detail message.
Constructs a JAXRException object with the given String as the reason for the exception being thrown and the given Throwable object as an embedded Throwable.

**FindException(Throwables)** - Constructor for exception
```
javax.xml.registry.FindException
```
Constructs a JAXRException object initialized with the given Throwable object.

**findOrganizations(Collection, Collection, Collection, Collection, Collection)** - Method in interface
```
javax.xml.registry.BusinessQueryManager
```
Finds all Organization objects that match all of the criteria specified by the parameters of this call.

**FindQualifier** - Interface in **javax.xml.registry**
```
FindQualifier provides various constants that identify options that effect find method behavior.
```

**findRegistryPackages(Collection, Collection, Collection, Collection)** - Method in interface **javax.xml.registry.BusinessQueryManager**
```
Finds all RegistryPackage objects that match all of the criteria specified by the parameters of this call.
```

**findServiceBindings(Key, Collection, Collection, Collection)** - Method in interface **javax.xml.registry.BusinessQueryManager**
```
Finds all ServiceBinding objects that match all of the criteria specified by the parameters of this call.
```

**findServices(Key, Collection, Collection, Collection, Collection)** - Method in interface **javax.xml.registry.BusinessQueryManager**
```
Finds all Service objects that match all of the criteria specified by the parameters of this call.
```

**fireXpathEvent(XpathEvent)** - Method in interface
```
javax.enterprise.deploy.model.XpathListener
```

**FLAGGED** - Static variable in class **javax.mail.Flags.Flag**
```
This message is flagged.
```

**FLAGS** - Static variable in class **javax.mail.FetchProfile.Item**
```
This is the Flags item.
```

**Flags** - Class in **javax.mail**
```
The Flags class represents the set of flags on a Message.
```

**Flags()** - Constructor for class **javax.mail.Flags**
```
Construct an empty Flags object.
```

**Flags(Flags)** - Constructor for class **javax.mail.Flags**
Construct a Flags object initialized with the given flags.

**Flags(Flags.Flag)** - Constructor for class `javax.mail.Flags`  
Construct a Flags object initialized with the given system flag.

**Flags(String)** - Constructor for class `javax.mail.Flags`  
Construct a Flags object initialized with the given user flag.

**flags** - Variable in class `javax.mail.internet.MimeMessage`  
The Flags for this message.

**flags** - Variable in class `javax.mail.search.FlagTerm`  
Flags object containing the flags to test.

**Flags.Flag** - Class in `javax.mail`  
This inner class represents an individual system flag.

**FLAGS_CHANGED** - Static variable in class `javax.mail.event.MessageChangedEvent`  
The message's flags changed.

**FlagTerm** - Class in `javax.mail.search`  
This class implements comparisons for Message Flags.

**FlagTerm(Flags, boolean)** - Constructor for class `javax.mail.search.FlagTerm`  
Constructor.

**FLOAT_ID** - Static variable in class `javax.faces.convert.FloatConverter`  
The message identifier of the `FacesMessage` to be created if the conversion to `Float` fails.

**FloatConverter** - Class in `javax.faces.convert`  
Converter implementation for `java.lang.Float` (and float primitive) values.

**FloatConverter()** - Constructor for class `javax.faces.convert.FloatConverter`

**FloatHolder** - Class in `javax.xml.rpc.holders`  

**FloatHolder()** - Constructor for class `javax.xml.rpc.holders.FloatHolder`

**FloatHolder(float)** - Constructor for class `javax.xml.rpc.holders.FloatHolder`

**FloatWrapperHolder** - Class in `javax.xml.rpc.holders`  

**FloatWrapperHolder()** - Constructor for class `javax.xml.rpc.holders.FloatWrapperHolder`
**FloatWrapperHolder(Float)** - Constructor for class javax.xml.rpc.holders.FloatWrapperHolder

**flush()** - Method in class javax.faces.context.ResponseWriter
Flush any output buffered by the output method to the underlying Writer or OutputStream.

**flush()** - Method in class javax.faces.context.ResponseWriterWrapper
The default behavior of this method is to call ResponseWriter.flush() on the wrapped ResponseWriter object.

**flush()** - Method in interface javax.persistence.EntityManager
Synchronize the persistence context to the underlying database.

**flush()** - Method in class javax.servlet.jsp.JspWriter
Flush the stream.

**flush()** - Method in class javax.servlet.jsp.tagext.BodyContent
Redefined flush() so it is not legal.

**flush()** - Method in interface javax.xml.stream.XMLEventWriter
Writes any cached events to the underlying output mechanism

**flush()** - Method in interface javax.xml.stream.XMLStreamWriter
Write any cached data to the underlying output mechanism.

**flushBuffer()** - Method in interface javax.servlet.ServletResponse
Forces any content in the buffer to be written to the client.

**flushBuffer()** - Method in class javax.servlet.ServletResponseWrapper
The default behavior of this method is to call flushBuffer() on the wrapped response object.

**FlushModeType** - Enum in javax.persistence
Flush mode setting.

**fold(int, String)** - Static method in class javax.mail.internet.MimeUtility
Fold a string at linear whitespace so that each line is no longer than 76 characters, if possible.

**folder** - Variable in class javax.mail.event.FolderEvent
The folder the event occurred on.

**Folder** - Class in javax.mail
Folder is an abstract class that represents a folder for mail messages.

**Folder(Store)** - Constructor for class javax.mail.Folder
Constructor that takes a Store object.

**folder** - Variable in class javax.mail.Message
The containing folder, if this message is obtained from a folder
**FolderAdapter** - Class in *javax.mail.event*
   The adapter which receives Folder events.

**FolderAdapter()** - Constructor for class *javax.mail.event.FolderAdapter*

**FolderClosedException** - Exception in *javax.mail*
   This exception is thrown when a method is invoked on a Messaging object and the Folder that owns that object has died due to some reason.

**FolderClosedException(Folder)** - Constructor for exception *javax.mail.FolderClosedException*
   Constructor

**FolderClosedException(Folder, String)** - Constructor for exception *javax.mail.FolderClosedException*
   Constructor

**folderCreated(FolderEvent)** - Method in class *javax.mail.event.FolderEvent*
   Invoked when a Folder is created.

**folderDeleted(FolderEvent)** - Method in class *javax.mail.event.FolderEvent*
   Invoked when a folder is deleted.

**FolderEvent** - Class in *javax.mail.event*
   This class models Folder existence events.

**FolderEvent(Object, Folder, int)** - Constructor for class *javax.mail.event.FolderEvent*
   Constructor.

**FolderEvent(Object, Folder, Folder, int)** - Constructor for class *javax.mail.event.FolderEvent*
   Constructor.

**FolderListener** - Interface in *javax.mail.event*
   This is the Listener interface for Folder events.

**FolderNotFoundException** - Exception in *javax.mail*
   This exception is thrown by Folder methods, when those methods are invoked on a non existent folder.
**FolderNotFoundException()** - Constructor for exception
javax.mail.FolderNotFoundException
   Constructs a MessagingException with no detail message.
**FolderNotFoundException(Folder)** - Constructor for exception
javax.mail.FolderNotFoundException
   Constructs a MessagingException with the specified folder.
**FolderNotFoundException(Folder, String)** - Constructor for exception
javax.mail.FolderNotFoundException
   Constructs a MessagingException with the specified folder and the specified detail message.
**FolderNotFoundException(String, Folder)** - Constructor for exception
javax.mail.FolderNotFoundException
   Constructs a MessagingException with the specified detail message and the specified folder.
**folderRenamed(FolderEvent)** - Method in class
javax.mail.event.FolderAdapter

**folderRenamed(FolderEvent)** - Method in interface
javax.mail.event.FolderListener
   Invoked when a folder is renamed.
**forget(Xid)** - Method in interface javax.resource.spi.XATerminator
   Tells the resource manager to forget about a heuristically completed transaction branch.
**forget(Xid)** - Method in interface javax.transaction.xa.XAResource
   Tells the resource manager to forget about a heuristically completed transaction branch.
**FORM_AUTH** - Static variable in class
javax.faces.context.ExternalContext
   String identifier for FORM authentication.
**FORM_AUTH** - Static variable in interface
javax.servlet.http.HttpServletRequest
   String identifier for Form authentication.
**format(Date, StringBuffer, FieldPosition)** - Method in class
javax.mail.internet.MailDateFormat
   Formats the given date in the format specified by draft-ietf-drums-msg-fmt-08 in the current TimeZone.
**forward(String)** - Method in class javax.servlet.jsp.PageContext
   This method is used to re-direct, or "forward" the current ServletRequest and ServletResponse to another active component.
in the application.

**forward(ServletRequest, ServletResponse)** - Method in interface javax.servlet.RequestDispatcher
  Forwards a request from a servlet to another resource (servlet, JSP file, or HTML file) on the server.

**FromStringTerm** - Class in javax.mail.search
  This class implements string comparisons for the From Address header.

**FromStringTerm(String)** - Constructor for class javax.mail.searchFromStringTerm Constructor.

**FromTerm** - Class in javax.mail.search
  This class implements comparisons for the From Address header.

**FromTerm(Address)** - Constructor for class javax.mail.search.FromTerm Constructor.

**fullURL** - Variable in class javax.mail.URLName
  The full version of the URL

**FunctionInfo** - Class in javax.servlet.jsp.tagext
  Information for a function in a Tag Library.

**FunctionInfo(String, String, String)** - Constructor for class javax.servlet.jsp.tagext.FunctionInfo Constructor for FunctionInfo.

**FunctionMapper** - Class in javax.el
  The interface to a map between EL function names and methods.

**FunctionMapper()** - Constructor for class javax.el.FunctionMapper

**FunctionMapper** - Interface in javax.servlet.jsp.el
  Deprecated. As of JSP 2.1, replaced by FunctionMapper

**functions** - Variable in class javax.servlet.jsp.tagext.TagLibraryInfo
  An array describing the functions that are defined in this tag library.
**GE** - Static variable in class javax.mail.search. *ComparisonTerm*

**Generated** - Annotation Type in *javax.annotation*

The Generated annotation is used to mark source code that has been generated.

**GeneratedValue** - Annotation Type in *javax.persistence*

Provides for the specification of generation strategies for the values of primary keys.

**generateSchema(SchemaOutputResolver)** - Method in class javax.xml.bind. *JAXBContext*

Generates the schema documents for this context.

**GenerationType** - Enum in *javax.persistence*

Defines the types of primary key generation.

**GenericCredential** - Interface in *javax.resource.spi.security*

*Deprecated.* The preferred way to represent generic credential information is via the org.ietf.jgss.GSSCredential interface in J2SE Version 1.4, which provides similar functionality.

**GenericHandler** - Class in *javax.xml.rpc.handler*

The javax.xml.rpc.handler.GenericHandler class implements the Handler interface.

**GenericHandler()** - Constructor for class javax.xml.rpc.handler. *GenericHandler*

Default constructor.

**GenericServlet** - Class in *javax.servlet*

Defines a generic, protocol-independent servlet.

**GenericServlet()** - Constructor for class javax.servlet. *GenericServlet*

Does nothing.

**get(String)** - Method in class javax.activation. *MimeTypeParameterList*

Retrieve the value associated with the given name, or null if there is no current association.

**get(String)** - Method in class javax.mail.internet. *ParameterList*

Returns the value of the specified parameter.

**get(Object)** - Method in class javax.xml.soap. *SOAPConnection*

Gets a message from a specific endpoint and blocks until it receives,

**getAccept()** - Method in class javax.faces.component.html. *HtmlForm*
Return the value of the accept property.

```java
getAcceptCharset() - Method in class
javax.faces.component.html.HtmlForm
```

Return the value of the acceptcharset property.

```java
getAccesskey() - Method in class
javax.faces.component.html.HtmlCommandButton
```

Return the value of the accesskey property.

```java
getAccesskey() - Method in class
javax.faces.component.html.HtmlCommandLink
```

Return the value of the accesskey property.

```java
getAccesskey() - Method in class
javax.faces.component.html.HtmlInputSecret
```

Return the value of the accesskey property.

```java
getAccesskey() - Method in class
javax.faces.component.html.HtmlInputText
```

Return the value of the accesskey property.

```java
getAccesskey() - Method in class
javax.faces.component.html.HtmlInputTextarea
```

Return the value of the accesskey property.

```java
getAccesskey() - Method in class
javax.faces.component.html.HtmlOutputLabel
```

Return the value of the accesskey property.

```java
getAccesskey() - Method in class
javax.faces.component.html.HtmlOutputLink
```

Return the value of the accesskey property.

```java
getAccesskey() - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
```

Return the value of the accesskey property.

```java
getAccesskey() - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
```

Return the value of the accesskey property.

```java
getAccesskey() - Method in class
javax.faces.component.html.HtmlSelectManyListbox
```

Return the value of the accesskey property.

```java
getAccesskey() - Method in class
javax.faces.component.html.HtmlSelectManyMenu
```

Return the value of the accesskey property.

```java
getAccesskey() - Method in class
javax.faces.component.html.HtmlSelectOneListbox
```
Return the value of the accesskey property.

**getAccesskey()** - Method in class
javax.faces.component.html.HtmlSelectOneMenu
Return the value of the accesskey property.

**getAccesskey()** - Method in class
javax.faces.component.html.HtmlSelectOneRadio
Return the value of the accesskey property.

**getAccessURI()** - Method in interface
javax.xml.registry.infomodel.ServiceBinding
Gets the URI that gives access to the service via this binding.

**getAcknowledgeMode()** - Method in interface javax.jms.Session
Returns the acknowledgement mode of the session.

**getAction()** - Method in interface
javax.enterprise.deploy.spi.status.DeploymentStatus
Retrieve the deployment ActionType for this event.

**getAction()** - Method in class javax.faces.component.ActionSource
Deprecated. This has been replaced by
ActionSource2.getActionExpression().

**getAction()** - Method in class javax.faces.component.UICommand
Deprecated. This has been replaced by
UICommand.getActionExpression().

**getActionExpression()** - Method in interface
javax.faces.component.ActionSource2
Return the MethodExpression pointing at the application action to be
invoked, if this UIComponent is activated by the user, during the Apply
Request Values or Invoke Application phase of the request
processing lifecycle, depending on the value of the immediate
property.

**getActionExpression()** - Method in class
javax.faces.component.UICommand

**getActionListener()** - Method in class javax.faces.application.Application
Return the default ActionListener to be registered for all
ActionSource components in this application.

**getActionListener()** - Method in interface
javax.faces.component.ActionSource
Deprecated. Use ActionSource.getActionListeners() instead.

**getActionListener()** - Method in class
javax.faces.component.UICommand
Deprecated. Use `UICommand.getActionListeners()` instead.

**getActionListeners()** - Method in interface
javax.faces.component.ActionSource
   Return the set of registered `ActionListener`s for this `ActionSource` instance.

**getActionListeners()** - Method in class
javax.faces.component.UICommand

**getActions()** - Method in class
javax.security.jacc.EJBMethodPermission
   Returns a String containing a canonical representation of the actions of this EJBMMethodPermission.

**getActions()** - Method in class
javax.security.jacc.EJBRoleRefPermission
   Returns a canonical String representation of the actions of this EJBRoleRefPermission.

**getActions()** - Method in class
javax.security.jacc.WebResourcePermission
   Returns a canonical String representation of the actions of this WebResourcePermission.

**getActions()** - Method in class
javax.security.jacc.WebRoleRefPermission
   Returns a canonical String representation of the actions of this WebRoleRefPermission.

**getActions()** - Method in class
javax.security.jacc.WebUserDataPermission
   Returns a canonical String representation of the actions of this WebUserDataPermission.

**getActionType(int)** - Static method in class
javax.enterprise.deploy.shared.ActionType
   Return an object of the specified value.

**getActionURL(FacesContext, String)** - Method in class
javax.faces.application.ViewHandler
   Return a URL suitable for rendering (after optional encoding performed by the `encodeActionURL()` method of `ExternalContext`) that selects the specified view identifier.

**getActionURL(FacesContext, String)** - Method in class
javax.faces.application.ViewHandlerWrapper
   The default behavior of this method is to call
   `ViewHandler.getActionURL(javax.faces.context.FacesContext,`
on the wrapped `ViewHandler` object.

**getActiveCount()** - Method in interface `javax.management.j2ee.statistics.JTASstats`
Number of active transactions.

**getActor()** - Method in interface `javax.xml.soap.SOAPHeaderElement`
Returns the uri of the `actor` attribute of this `SOAPHeaderElement`.

**getAdaptee()** - Method in class `javax.servlet.jsp.tagext.TagAdapter`
Gets the tag that is being adapted to the Tag interface.

**getAdapter(Class<A>)** - Method in class `javax.xml.bind.helpers.AbstractMarshallerImpl`
Gets the adapter associated with the specified type.

**getAdapter(Class<A>)** - Method in class `javax.xml.bind.helpers.AbstractUnmarshallerImpl`
Gets the adapter associated with the specified type.

**getAdapter(Class<A>)** - Method in interface `javax.xml.bind.Marshaller`
Gets the adapter associated with the specified type.

**getAdapter(Class<A>)** - Method in interface `javax.xml.bind.Unmarshaller`
Gets the adapter associated with the specified type.

**getAdapterName()** - Method in interface `javax.resource.cci.ResourceAdapterMetaData`
Gets a tool displayable name of the resource adapter.

**getAdapterShortDescription()** - Method in interface `javax.resource.cci.ResourceAdapterMetaData`
Gets a tool displayable short description of the resource adapter.

**getAdapterVendorName()** - Method in interface `javax.resource.cci.ResourceAdapterMetaData`
Gets the name of the vendor that has provided the resource adapter.

**getAdapterVersion()** - Method in interface `javax.resource.cci.ResourceAdapterMetaData`
Gets the version of the resource adapter.

**getAddress()** - Method in class `javax.mail.internet.InternetAddress`
Get the email address.

**getAddress()** - Method in class `javax.mail.search.AddressTerm`
Return the address to match with.

**getAddress()** - Method in interface `javax.xml.registry.infomodel.EmailAddress`
Returns the email address for this object.

**getAfterPhaseListener()** - Method in class
javax.faces.component.**UIViewRoot**

**getAllAttributes()** - Method in interface javax.xml.soap.**SOAPElement**
Returns an **Iterator** over all of the attribute **Name** objects in this **SOAPElement** object.

**getAllAttributesAsQNames()** - Method in interface javax.xml.soap.**SOAPElement**
Returns an **Iterator** over all of the attributes in this **SOAPElement** as QName objects.

**getAllCommands(String)** - Method in class javax.activation.**CommandMap**
Get all the available commands for this type.

**getAllCommands(String, DataSource)** - Method in class javax.activation.**CommandMap**
Get all the available commands for this type.

**getAllCommands()** - Method in class javax.activation.**DataHandler**
Return all the commands for this type of data.

**getAllCommands(String)** - Method in class javax.activation.**MailcapCommandMap**
Get all the available commands in all mailcap files known to this instance of MailcapCommandMap for this MIME type.

**getAllHeaderLines()** - Method in class javax.mail.internet.**InternetHeaders**
Return all the header lines as an Enumeration of Strings.

**getAllHeaderLines()** - Method in class javax.mail.internet.**MimeBodyPart**
Get all header lines as an Enumeration of Strings.

**getAllHeaderLines()** - Method in class javax.mail.internet.**MimeMessage**
Get all header lines as an Enumeration of Strings.

**getAllHeaderLines()** - Method in interface javax.mail.internet.**MimePart**
Get all header lines as an Enumeration of Strings.

**getAllHeaders()** - Method in class javax.mail.internet.**InternetHeaders**
Return all the headers as an Enumeration of Header objects.

**getAllHeaders()** - Method in class javax.mail.internet.**MimeBodyPart**
Return all the headers from this Message as an enumeration of Header objects.

**getAllHeaders()** - Method in class javax.mail.internet.**MimeMessage**
Return all the headers from this Message as an enumeration of Header objects.

**getAllHeaders()** - Method in interface javax.mail.**Part**
Return all the headers from this part as an Enumeration of Header objects.

**getAllHeaders()** - Method in class `javax.xml.soap.MimeHeaders`
Returns all the `MimeHeaders` in this `MimeHeaders` object.

**getAllMimeHeaders()** - Method in class `javax.xml.soap.AttachmentPart`
Retrieves all the headers for this `AttachmentPart` object as an iterator over the `MimeHeader` objects.

**getAllMimeHeaders()** - Method in class `javax.xml.soap.SOAPPart`
Retrieves all the headers for this `SOAPPart` object as an iterator over the `MimeHeader` objects.

**getAllRecipients()** - Method in class `javax.mail.internet.MimeMessage`
Get all the recipient addresses for the message.

**getAllRecipients()** - Method in class `javax.mail.Message`
Get all the recipient addresses for the message.

**getAlt()** - Method in class `javax.faces.component.html.HtmlCommandButton`
Return the value of the `alt` property.

**getAlt()** - Method in class `javax.faces.component.html.HtmlGraphicImage`
Return the value of the `alt` property.

**getAlt()** - Method in class `javax.faces.component.html.HtmlInputSecret`
Return the value of the `alt` property.

**getAlt()** - Method in class `javax.faces.component.html.HtmlInputText`
Return the value of the `alt` property.

**getApplication()** - Method in class `javax.faces.application.ApplicationFactory`
Create (if needed) and return an `Application` instance for this web application.

**getApplication()** - Method in class `javax.faces.context.FacesContext`
Return the `Application` instance associated with this web application.

**getApplicationMap()** - Method in class `javax.faces.context.ExternalContext`
Return a mutable `Map` representing the application scope attributes for the current application.

**getAreaCode()** - Method in interface `javax.xml.registry.infomodel.TelephoneNumber`
Gets the area code.

**getAsObject(FacesContext, UIComponent, String)** - Method in class
javax.faces.convert.BigDecimalConverter

getAsObject(FacesContext, UIComponent, String) - Method in class javax.faces.convert.BigIntegerConverter

getAsObject(FacesContext, UIComponent, String) - Method in class javax.faces.convert.BooleanConverter

getAsObject(FacesContext, UIComponent, String) - Method in class javax.faces.convert.ByteConverter

getAsObject(FacesContext, UIComponent, String) - Method in class javax.faces.convert.CharacterConverter

getAsObject(FacesContext, UIComponent, String) - Method in class javax.faces.convert.Converter
  Convert the specified string value, which is associated with the specified UIComponent, into a model data object that is appropriate for being stored during the Apply Request Values phase of the request processing lifecycle.

getAsObject(FacesContext, UIComponent, String) - Method in class javax.faces.convert.DateTimeConverter

getAsObject(FacesContext, UIComponent, String) - Method in class javax.faces.convert.DoubleConverter

getAsObject(FacesContext, UIComponent, String) - Method in class javax.faces.convert.EnumConverter
  Convert the value argument to one of the enum constants of the class provided in our constructor.

getAsObject(FacesContext, UIComponent, String) - Method in class javax.faces.convert.FloatConverter

getAsObject(FacesContext, UIComponent, String) - Method in class javax.faces.convert.IntegerConverter

getAsObject(FacesContext, UIComponent, String) - Method in class javax.faces.convert.LongConverter
getAsObject(FacesContext, UIComponent, String) - Method in class javax.faces.convert.NumberConverter

getAsObject(FacesContext, UIComponent, String) - Method in class javax.faces.convert.ShortConverter

getAssociatedObjects() - Method in interface javax.xml.registry.infomodel.RegistryObject

    Returns the collection of RegistryObject instances associated with this object.

getAssociations() - Method in interface javax.xml.registry.infomodel.RegistryObject

    Gets all Associations where this object is source.

getAssociationType() - Method in interface javax.xml.registry.infomodel.Association

    Gets the association type for this Association.

getAsString(FacesContext, UIComponent, Object) - Method in class javax.faces.convert.BigDecimalConverter

getAsString(FacesContext, UIComponent, Object) - Method in class javax.faces.convert.BigIntegerConverter

getAsString(FacesContext, UIComponent, Object) - Method in class javax.faces.convert.BooleanConverter

getAsString(FacesContext, UIComponent, Object) - Method in class javax.faces.convert.ByteConverter

getAsString(FacesContext, UIComponent, Object) - Method in class javax.faces.convert.CharacterConverter

getAsString(FacesContext, UIComponent, Object) - Method in interface javax.faces.convert.Converter

    Convert the specified model object value, which is associated with the specified UIComponent, into a String that is suitable for being included in the response generated during the Render Response phase of the request processing lifecycle.

getAsString(FacesContext, UIComponent, Object) - Method in class javax.faces.convert.DateTimeConverter
getAsString(FacesContext, UIComponent, Object) - Method in class javax.faces.convert.DoubleConverter

gAsString(FacesContext, UIComponent, Object) - Method in class javax.faces.convert.EnumConverter
   Convert the enum constant given by the value argument into a String.

gAsString(FacesContext, UIComponent, Object) - Method in class javax.faces.convert.FloatConverter

gAsString(FacesContext, UIComponent, Object) - Method in class javax.faces.convert.IntegerConverter

gAsString(FacesContext, UIComponent, Object) - Method in class javax.faces.convert.LongConverter

gAsString(FacesContext, UIComponent, Object) - Method in class javax.faces.convert.NumberConverter

gAsString(FacesContext, UIComponent, Object) - Method in class javax.faces.convert.ShortConverter

gGetAttachment(SOAPElement) - Method in class javax.xml.soap.SOAPMessage
   Returns an AttachmentPart object that is associated with an attachment that is referenced by this SOAPElement or null if no such attachment exists.

gGetAttachmentAsByteArray(String) - Method in class javax.xml.bind.attachment.AttachmentUnmarshaller
   Retrieve the attachment identified by content-id, cid, as a byte[].

gGetAttachmentAsDataHandler(String) - Method in class javax.xml.bind.attachment.AttachmentUnmarshaller
   Lookup MIME content by content-id, cid, and return as a DataHandler.

gGetAttachmentMarshaller() - Method in class javax.xml.bind.helpers.AbstractMarshallerImpl

gGetAttachmentMarshaller() - Method in class javax.xml.bind.helpers.AbstractMarshallerImpl
javax.xml.bind.**Marshaller**

**getAttachments()** - Method in class javax.xml.soap.SOAPMessage
Retrieves all the AttachmentPart objects that are part of this SOAPMessage object.

**getAttachments(MimeHeaders)** - Method in class javax.xml.soap.SOAPMessage
Retrieves all the AttachmentPart objects that have header entries that match the specified headers.

**getAttachmentUnmarshaller()** - Method in class javax.xml.bind.helpers.AbstractUnmarshallerImpl

**getAttachmentUnmarshaller()** - Method in interface javax.xml.bind.Unmarshaller

**getAttribute(ObjectName, String)** - Method in interface javax.management.j2ee.Management
Gets the value of a specific attribute of a named managed object.

**getAttribute(String)** - Method in interface javax.servlet.http.HttpSession
Returns the object bound with the specified name in this session, or null if no object is bound under the name.

**getAttribute(String)** - Method in class javax.servlet.jsp.JspContext
Returns the object associated with the name in the page scope or null if not found.

**getAttribute(String, int)** - Method in class javax.servlet.jsp.JspContext
Return the object associated with the name in the specified scope or null if not found.

**getAttribute(String)** - Method in class javax.servlet.jsp.tagext.TagData
The value of the attribute.

**getAttribute(String)** - Method in interface javax.servlet.ServletContext
Returns the servlet container attribute with the given name, or null if there is no attribute by that name.

**getAttribute(String)** - Method in interface javax.servlet.ServletRequest
Returns the value of the named attribute as an object, or null if no attribute of the given name exists.

**getAttribute(String)** - Method in class javax.servlet.ServletRequestWrapper
The default behavior of this method is to call getAttribute(String name) on the wrapped request object.
**getAttributeByQName(QName)** - Method in interface
javax.xml.stream.eventsStartElement
  Returns the attribute referred to by this name

**getAttributeCount()** - Method in class
javax.xml.stream.util.StreamReaderDelegate

**getAttributeCount()** - Method in interface
javax.xml.stream.XMLStreamReader
  Returns the count of attributes on this START_ELEMENT, this method is only valid on a START_ELEMENT or ATTRIBUTE.

**getAttributeLocalName(int)** - Method in class
javax.xml.stream.util.StreamReaderDelegate

**getAttributeLocalName(int)** - Method in interface
javax.xml.stream.XMLStreamReader
  Returns the localName of the attribute at the provided index

**getAttributeName(int)** - Method in class
javax.xml.stream.util.StreamReaderDelegate

**getAttributeName(int)** - Method in interface
javax.xml.stream.XMLStreamReader
  Returns the qname of the attribute at the provided index

**getAttributeNames()** - Method in interface
javax.enterprise.deploy.model.DDBean
  Returns the list of attribute names associated with the XML element.

**getAttributeNames()** - Method in interface javax.servlet.http.HttpSession
  Returns an Enumeration of String objects containing the names of all the objects bound to this session.

**getAttributeNames()** - Method in interface javax.servlet.ServletContext
  Returns an Enumeration containing the attribute names available within this servlet context.

**getAttributeNames()** - Method in interface javax.servlet.ServletRequest
  Returns an Enumeration containing the names of the attributes available to this request.

**getAttributeNames()** - Method in class
javax.servlet.ServletRequestWrapper
  The default behavior of this method is to return getAttributeNames() on the wrapped request object.

**getAttributeNamesInScope(int)** - Method in class
enumerate all the attributes in a given scope.

**getAttributeNamespace(int)** - Method in class
javax.xml.stream.util.StreamReaderDelegate

Returns the namespace of the attribute at the provided index

**getAttributePrefix(int)** - Method in class
javax.xml.stream.util.StreamReaderDelegate

Returns the prefix of this attribute at the provided index

**getAttributes()** - Method in class javax.faces.component.UIComponent

Return a mutable Map representing the attributes (and properties, see below) associated with this UIComponent, keyed by attribute name (which must be a String).

**getAttributes()** - Method in class
javax.faces.component.UIComponentBase

**getAttributes(ObjectName, String[])** - Method in interface
javax.management.j2ee.Management

Enables the values of several attributes of a named managed object.

**getAttributes()** - Method in class javax.servlet.jsp.tagext.TagData

Enumerates the attributes.

**getAttributes()** - Method in class javax.servlet.jsp.tagext.TagInfo

Attribute information (in the TLD) on this tag.

**getAttributes()** - Method in interface
javax.xml.stream.events.StartElement

Returns an Iterator of non-namespace declared attributes declared on this START_ELEMENT, returns an empty iterator if there are no attributes.

**getAttributesScope(String)** - Method in class
javax.servlet.jsp.JspContext

Get the scope where a given attribute is defined.

**getAttributeString(String)** - Method in class
javax.servlet.jsp.tagext.TagData

Get the value for a given attribute.
**getAttributeType(int)** - Method in class
javax.xml.stream.util.StreamReaderDelegate

g**etAttributeType(int)** - Method in interface
javax.xml.stream.XMLStreamReader
    Returns the XML type of the attribute at the provided index

**getAttributeValue(String)** - Method in interface
javax.enterprise.deploy.model.DDBean
    Returns the string value of the named attribute.

**getAttributeValue(Name)** - Method in interface
javax.xml.soap.SOAPElement
    Returns the value of the attribute with the specified name.

**getAttributeValue(QName)** - Method in interface
javax.xml.soap.SOAPElement
    Returns the value of the attribute with the specified qname.

**getAttributeValue(String, String)** - Method in class
javax.xml.stream.util.StreamReaderDelegate
    Returns the normalized attribute value of the attribute with the namespace and localName. If the namespaceURI is null the namespace is not checked for equality.

**getAttributeValue(int)** - Method in interface
javax.xml.stream.XMLStreamReader
    Returns the value of the attribute at the index

**getAuditTrail()** - Method in interface
javax.xml.registry.infomodel.RegistryObject
    Returns the complete audit trail of all requests that effected a state change in this object as an ordered Collection of AuditableEvent objects.

**getAuthType()** - Method in class
javax.faces.context.ExternalContext
    Return the name of the authentication scheme used to authenticate the current user, if any; otherwise, return null.

**getAuthType()** - Method in interface
javax.servlet.http.HttpServletRequest
Returns the name of the authentication scheme used to protect the servlet.

**getAuthType()** - Method in class
javax.servlet.http.HttpServletRequestWrapper

The default behavior of this method is to return getAuthType() on the wrapped request object.

**getAutocomplete()** - Method in class
javax.faces.component.html(HtmlInputSecret)

Return the value of the autocomplete property.

**getAutocomplete()** - Method in class
javax.faces.component.html.HtmlInputText

Return the value of the autocomplete property.

**getAvailableModules(ModuleType[], Target[])** - Method in interface
javax.enterprise.deploy.spi.DeploymentManager

Retrieve the list of all J2EE application modules running or not running on the identified targets.

**getBase64Content()** - Method in class javax.xml.soap.AttachmentPart

Returns an InputStream which can be used to obtain the content of AttachmentPart as Base64 encoded character data, this method would base64 encode the raw bytes of the attachment and return.

**getBaseType()** - Method in class javax.activation.MimeType

Return a String representation of this object without the parameter list.

**getBaseType()** - Method in class javax.mail.internet.ContentType

Return the MIME type string, without the parameters.

**getBaseURI()** - Method in interface
javax.xml.stream.events.EntityDeclaration

Get the base URI for this reference or null if this information is not available

**getBean(CommandInfo)** - Method in class javax.activation.DataHandler

A convenience method that takes a CommandInfo object and instantiates the corresponding command, usually a JavaBean component.

**getBean()** - Method in class javax.enterprise.deploy.model.XpathEvent

The bean being added/removed/changed.

**getBeanProperty(String)** - Method in class
javax.el.BeanELResolver.BeanProperties

**getBeforePhaseListener()** - Method in class
javax.faces.component.**UIViewRoot**

**getBgcolor()** - Method in class
javax.faces.component.html.**HtmlDataTable**
Return the value of the bgcolor property.
**getBgcolor()** - Method in class
javax.faces.component.html.**HtmlPanelGrid**
Return the value of the bgcolor property.

**getBinding()** - Method in interface javax.xml.ws.**BindingProvider**
Get the Binding for this binding provider.

**getBinding()** - Method in class javax.xml.ws.**Endpoint**
Returns the binding for this endpoint.

**getBindingID()** - Method in interface javax.xml.ws.handler.**PortInfo**
Gets the URI identifying the binding used by the port being accessed.

**getBody()** - Method in interface javax.xml.soap.**SOAPEnvelope**
Returns the SOAPBody object associated with this SOAPEnvelope object.

**getBodyContent()** - Method in class
javax.faces.webapp.**UIComponentClassicTagBase**
**getBodyContent()** - Method in class
javax.servlet.jsp.tagext.**BodyTagSupport**
Get current bodyContent.

**getBodyContent()** - Method in class
javax.servlet.jsp.tagext.**TagInfo**
The bodycontent information for this tag.

**getBodyLength()** - Method in interface javax.jms.**BytesMessage**
Gets the number of bytes of the message body when the message is in read-only mode.

**getBodyPart(int)** - Method in class javax.mail.internet.**MimeMultipart**
Get the specified BodyPart.

**getBodyPart(String)** - Method in class javax.mail.internet.**MimeMultipart**
Get the MimeBodyPart referred to by the given ContentID (CID).

**getBodyPart(int)** - Method in class javax.mail.**Multipart**
Get the specified Part.

**getBodyPart(int)** - Method in class javax.mail.**MultipartDataSource**
Get the specified Part.

**getBoolean(String)** - Method in interface javax.jms.**MapMessage**
Returns the boolean value with the specified name.

**getBooleanProperty(String)** - Method in interface javax.jms.**Message**
Returns the value of the boolean property with the specified name.

**getBorder()** - Method in class
javax.faces.component.html.HtmlDataTable
Return the value of the border property.

**getBorder()** - Method in class
javax.faces.component.html.HtmlPanelGrid
Return the value of the border property.

**getBorder()** - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
Return the value of the border property.

**getBorder()** - Method in class
javax.faces.component.html.HtmlSelectOneRadio
Return the value of the border property.

**getBranchQualifier()** - Method in interface javax.transaction.xa.Xid
Obtain the transaction branch identifier part of XID as an array of bytes.

**getBufferSize()** - Method in class javax.servlet.jsp.JspWriter
This method returns the size of the buffer used by the JspWriter.

**getBufferSize()** - Method in interface javax.servlet.ServletResponse
Returns the actual buffer size used for the response.

**getBufferSize()** - Method in class javax.servlet.ServletResponseWrapper
The default behavior of this method is to return getBufferSize() on the wrapped response object.

**getBuilder()** - Method in class
javax.xml.bind.annotation.W3CDomHandler

**getBulkResponse(String)** - Method in interface
javax.xml.registry.RegistryService
Returns the BulkResponse associated with specified requestId.

**getBusinessLifeCycleManager()** - Method in interface
javax.xml.registry.RegistryService
Returns the BusinessLifeCycleManager object implemented by the JAXR provider.

**getBusinessObject(Class<T>)** - Method in interface
javax.ejb.SessionContext
Obtain an object that can be used to invoke the current bean through the given business interface.

**getBusinessQueryManager()** - Method in interface
javax.xml.registry.RegistryService
Returns the BusinessQueryManager object implemented by the JAXR provider.

**getByte(String)** - Method in interface javax.jms.MapMessage

Returns the byte value with the specified name.

**getByteProperty(String)** - Method in interface javax.jms.Message

Returns the value of the byte property with the specified name.

**getBytes(String)** - Method in interface javax.jms.MapMessage

Returns the byte array value with the specified name.

**getCallerIdentity()** - Method in interface javax.ejb.EJBContext

*Deprecated. Use Principal getCallerPrincipal() instead.*

**getCallerPrincipal()** - Method in interface javax.ejb.EJBContext

Obtain the java.security.Principal that identifies the caller.

**getCalls(QName)** - Method in interface javax.xml.rpc.Service

Gets an array of preconfigured call objects for invoking operations on the specified port.

**getCapabilityLevel()** - Method in interface javax.xml.registry.CapabilityProfile

Gets the capability level supported by the JAXR provider.

**getCapabilityProfile()** - Method in interface javax.xml.registry.RegistryService

Returns the CapabilityProfile for the JAXR provider.

**getCaptionClass()** - Method in class javax.faces.component.html.HtmlDataTable

Return the value of the captionClass property.

**getCaptionClass()** - Method in class javax.faces.component.html.HtmlPanelGrid

Return the value of the captionClass property.

**getCaptionStyle()** - Method in class javax.faces.component.html.HtmlDataTable

Return the value of the captionStyle property.

**getCaptionStyle()** - Method in class javax.faces.component.html.HtmlPanelGrid

Return the value of the captionStyle property.

**getCause()** - Method in exception javax.faces.FacesException

Return the cause of this exception, or null if the cause is nonexistent or unknown.

**getCause()** - Method in exception javax.mail.MessagingException

Overrides the getCause method of Throwable to return the next exception in the chain of nested exceptions.
**get Cause()** - Method in exception javax.xml.bind.JAXBException

Returns the Throwable embedded in this JAXBException if there is one.

**get Cause()** - Method in exception javax.xml.registry.JAXRException

Returns the Throwable object embedded in this JAXRException if there is one.

**get Caused By Exception()** - Method in exception javax.ejb.EJBException

Obtain the exception that caused the EJBException being thrown.

**getCellpadding()** - Method in class javax.faces.component.html.HtmlDataTable

Return the value of the cellpadding property.

**getCellpadding()** - Method in class javax.faces.component.html.HtmlPanelGrid

Return the value of the cellpadding property.

**getCellspacing()** - Method in class javax.faces.component.html.HtmlDataTable

Return the value of the cellspacing property.

**getCellspacing()** - Method in class javax.faces.component.html.HtmlPanelGrid

Return the value of the cellspacing property.

**get Change Event()** - Method in class javax.enterprise.deploy.model.XpathEvent

**getChar(String)** - Method in interface javax.jms.MapMessage

Returns the Unicode character value with the specified name.

**get Character Encoding()** - Method in class javax.faces.context.ResponseWriter

Return the character encoding (such as "ISO-8859-1") for this ResponseWriter.

**get Character Encoding()** - Method in class javax.faces.context.ResponseWriterWrapper

The default behavior of this method is to call ResponseWriter.getCharacterEncoding() on the wrapped ResponseWriter object.

**get Character Encoding()** - Method in interface javax.servlet.ServletRequest

Returns the name of the character encoding used in the body of this
request.

The default behavior of this method is to return `getCharacterEncoding()` on the wrapped request object.

Returns the name of the character encoding (MIME charset) used for the body sent in this response.

The default behavior of this method is to return `getCharacterEncoding()` on the wrapped response object.

Returns the encoding style of the XML data.

**getCharacterEncodingScheme()** - Method in class [javax.xml.stream.utilStreamReaderDelegate](https://docs.oracle.com/en/java/javase/11/docs/api/java.xml/stream/javax/xml/stream/util/StreamReaderDelegate.html)

Returns the character encoding declared on the xml declaration
Returns null if none was declared.

**getCharacterOffset()** - Method in interface [javax.xml.stream.Location](https://docs.oracle.com/en/java/javase/11/docs/api/java.xml/stream/javax/xml/stream/Location.html)

Returns the byte or character offset into the input source this location is pointing to.

Return the value of the *charset* property.

Return the value of the *charset* property.

Gets the canonical name for the charset for this object.

**getChildBean(String)** - Method in interface [javax.enterprise.deploy.model/DDBean](https://docs.oracle.com/en/java/javase/11/docs/api/java.xml.registry.infomodel/javax/xml/registry/infomodel/DDBean.html)

Return a list of DDBeans based upon the XPath.
javax.enterprise.deploy.model.\texttt{DeployableObject}

Return an array of standard beans representing the XML content returned based upon the XPath.

\texttt{getChildBean(ModuleType, String)} - Method in interface javax.enterprise.deploy.model.\texttt{J2eeApplicationObject}

Return a list of \texttt{DDBean} based upon an XPath; all deployment descriptors of the specified type are searched.

\texttt{getChildConceptCount()} - Method in interface javax.xml.registry.infomodel.\texttt{ClassificationScheme}

Gets number of children.

\texttt{getChildConceptCount()} - Method in interface javax.xml.registry.infomodel.\texttt{Concept}

Gets number of children.

\texttt{getChildCount()} - Method in class javax.faces.component.\texttt{UIComponent}

Return the number of child \texttt{UIComponent}s that are associated with this \texttt{UIComponent}.

\texttt{getChildren()} - Method in class javax.faces.component.\texttt{UIComponentBase}

Return a mutable List representing the child \texttt{UIComponent}s associated with this component.
**getChildren()** - Method in class
javax.faces.component.UIComponentBase

**getChildrenConcepts()** - Method in interface
javax.xml.registry.infomodel.ClassificationScheme
   Gets all immediate children Concepts.

**getChildrenConcepts()** - Method in interface
javax.xml.registry.infomodel.Concept
   Gets all immediate children Concepts.

**getChildTargetModuleID()** - Method in interface
javax.enterprise.deploy.spi.TargetModuleID
   Retrieve a list of identifiers of the children of this deployed module.

**getCity()** - Method in interface
javax.xml.registry.infomodel.PostalAddress
   Returns the city.

**getClassFromScope(String)** - Method in interface
javax.enterprise.deploy.model.DeployableObject
   Retrieve the specified class from this deployable module.

**getClassifications()** - Method in interface
javax.xml.registry.infomodel.RegistryObject
   Gets the Classification instances that classify this object.

**getClassificationScheme()** - Method in interface
javax.xml.registry.infomodel.Classification
   Gets the ClassificationScheme that is used in classifying the object.

**getClassificationScheme()** - Method in interface
javax.xml.registry.infomodel.Concept
   Gets the ClassificationScheme that this Concept is a descendent of.

**getClassifiedObject()** - Method in interface
javax.xml.registry.infomodel.Classification
   Gets the Object that is being classified.

**getClassLoader()** - Method in interface
javax.persistence.spi.PersistenceUnitInfo
   Returns ClassLoader that the provider may use to load any classes, resources, or open URLs.

**getClassName()** - Method in class
javax.mail.Provider
   Returns name of the class that implements the protocol.

**getClassName()** - Method in class
javax.servlet.jsp.tagext.TagVariableInfo
   The body of the <variable-class> element.
**getClassName()** - Method in class `javax.servlet.jsp.tagext.VariableInfo`
Returns the type of this variable.

**getClientConfiguration(TargetModuleID)** - Method in interface `javax.enterprise.deploy.spi.status.ProgressObject`
Return the ClientConfiguration object associated with the TargetModuleID.

**getClientId(FacesContext)** - Method in class `javax.faces.component.UIComponent`
Return a client-side identifier for this component, generating one if necessary.

**getClientId(FacesContext)** - Method in class `javax.faces.component.UIComponentBase`

**getClientId(FacesContext)** - Method in class `javax.faces.component.UIData`
Return a client identifier for this component that includes the current value of the `rowIndex` property, if it is not set to -1.

**getClientID()** - Method in interface `javax.jms.Connection`
Gets the client identifier for this connection.

**getClientIdsWithMessages()** - Method in class `javax.faces.context.FacesContext`
Return an Iterator over the client identifiers for which at least one `FacesMessage` has been queued.

**getCloseCount()** - Method in interface `javax.management.j2ee.statistics.JCAConnectionPoolStats`
The number of connections closed

**getCloseCount()** - Method in interface `javax.management.j2ee.statistics.JDBCConnectionPoolStats`
Number of connections closed.

**getCollection()** - Method in interface `javax.xml.registry.BulkResponse`
Get the Collection of objects returned as a response of a bulk operation.

**getCols()** - Method in class `javax.faces.component.html.HtmlInputTextarea`
Return the value of the `cols` property.

**getColumnClasses()** - Method in class `javax.faces.component.html.HtmlDataTable`
Return the value of the `columnClasses` property.

**getColumnClasses()** - Method in class
javax.faces.component.html.HtmlPanelGrid
  Return the value of the columnClasses property.

getColumnNumber() - Method in class
gavax.xml.bind.helpers.ValidationEventLocatorImpl
  getColumnNumber() - Method in interface
gavax.xml.bindhelpers.ValidationEventLocator
    Return the column number if available

columnNumber() - Method in interface
gavax.xml.stream.Location
  Return the column number where the current event ends, returns -1 if none is available.

columns() - Method in class
gavax.faces.component.html.HtmlPanelGrid
  Get the value of the columns property.

getCommand(String, String) - Method in class
gavax.activation.CommandMap
  Get the default command corresponding to the MIME type.

getCommand(String, String, DataSource) - Method in class
gavax.activation.CommandMap
  Get the default command corresponding to the MIME type.

getCommand(String) - Method in class
gavax.activation.DataHandler
  Get the command cmdName.

getCommand(String, String) - Method in class
gavax.activation.MailcapCommandMap
  Get the command corresponding to cmdName for the MIME type.

getCommand() - Method in interface
gavax.enterprise.deploy.spi.status.DeploymentStatus
  Retrieve the deployment CommandType of this event.

getCommandClass() - Method in class
gavax.activation.CommandInfo
  Return the command's class name.

getCommandName() - Method in class
gavax.activation.CommandInfo
  Return the command verb.

getCommandObject(DataHandler, ClassLoader) - Method in class
gavax.activation.CommandInfo
  Return the instantiated JavaBean component.

getCommandType(int) - Static method in class
gavax.enterprise.deploy.shared.CommandType
  Return an object of the specified value.

getComment() - Method in class
gavax.servlet.http.Cookie
Returns the comment describing the purpose of this cookie, or null if the cookie has no comment.

`getCommittedCount()` - Method in interface `javax.management.j2ee.statistics.JTASstats`
Number of committed transactions.

`getCommonPropertyType(ELContext, Object)` - Method in class `javax.el.ArrayELResolver`
If the base object is a Java language array, returns the most general type that this resolver accepts for the property argument.

`getCommonPropertyType(ELContext, Object)` - Method in class `javax.el.BeanELResolver`
If the base object is not null, returns the most general type that this resolver accepts for the property argument.

`getCommonPropertyType(ELContext, Object)` - Method in class `javax.el.CompositeELResolver`
Returns the most general type that this resolver accepts for the property argument, given a base object.

`getCommonPropertyType(ELContext, Object)` - Method in class `javax.el.ELResolver`
Returns the most general type that this resolver accepts for the property argument, given a base object.

`getCommonPropertyType(ELContext, Object)` - Method in class `javax.el.ListELResolver`
If the base object is a list, returns the most general type that this resolver accepts for the property argument.

`getCommonPropertyType(ELContext, Object)` - Method in class `javax.el.MapELResolver`
If the base object is a map, returns the most general type that this resolver accepts for the property argument.

`getCommonPropertyType(ELContext, Object)` - Method in class `javax.el.ResourceBundleELResolver`
If the base object is a ResourceBundle, returns the most general type that this resolver accepts for the property argument.

`getCommonPropertyType(ELContext, Object)` - Method in class `javax.servlet.jsp.el.ImplicitObjectELResolver`
If the base object is null, returns String.class.

`getCommonPropertyType(ELContext, Object)` - Method in class `javax.servlet.jsp.el.ScopedAttributeELResolver`
If the base object is null, returns String.class.
**getComparison()** - Method in class `javax.mail.search.DateTerm`
  Return the type of comparison.

**getComparison()** - Method in class `javax.mail.search.IntegerComparisonTerm`
  Return the type of comparison.

**getComponent()** - Method in class `javax.faces.event.FacesEvent`
  Return the source `UIComponent` that sent this event.

**getComponentInstance()** - Method in class `javax.faces.webapp.UIComponentClassicTagBase`
  Return the `UIComponent` instance that is associated with this tag instance.

**getComponentInstance()** - Method in class `javax.faces.webapp.UIComponentTagBase`
  Return the `UIComponent` instance that is associated with this tag instance.

**getComponentStateToRestore(FacesContext)** - Method in class `javax.faces.render.ResponseStateManager`
  **Deprecated.** This method has been replaced by

**getComponentStateToSave(FacesContext)** - Method in class `javax.faces.application.StateManager`
  **Deprecated.** the distinction between tree structure and component state is now an implementation detail. The default implementation returns `null`.

**getComponentStateToSave(FacesContext)** - Method in class `javax.faces.applicationStateManagerWrapper`
  The default behavior of this method is to call
  `StateManager.getComponentStateToSave(javax.faces.context.FacesContext)` on the wrapped `StateManager` object.

**getComponentType()** - Method in class `javax.faces.webapp.UIComponentTagBase`
  Return the component type for the component that is or will be bound to this tag.

**getComponentTypes()** - Method in class `javax.faces.application.Application`
  Return an `Iterator` over the set of currently defined component types for this `Application`.

**getConcept()** - Method in interface
javax.xml.registry.infomodel.**Classification**

*Gets the Concept that is classifying the object.*

**getConnection()** - Method in interface
javax.resource.cci.**ConnectionFactory**

*Gets a connection to an EIS instance.*

**getConnection(ConnectionSpec)** - Method in interface
javax.resource.cci.**ConnectionFactory**

*Gets a connection to an EIS instance.*

**getConnection()** - Method in interface javax.resource.cci.**Interaction**

*Gets the Connection associated with the Interaction.*

**getConnection(Subject, ConnectionRequestInfo)** - Method in interface
javax.resource.spi.**ManagedConnection**

*Creates a new connection handle for the underlying physical connection represented by the ManagedConnection instance.*

**getConnectionFactory()** - Method in interface
javax.management.j2ee.statistics.**JCAConnectionStats**

*Returns the associated JCAConnectionFactory OBJECT_NAME*

**getConnectionHandle()** - Method in class
javax.resource.spi.**ConnectionEvent**

*Get the connection handle associated with the Managed Connection instance.*

**getConnectionPools()** - Method in interface
javax.management.j2ee.statistics.**JCAStats**

*Returns an array of JCAConnectionPool Stats that provide statistics about the connection pools associated with the referencing JCA resource statistics*

**getConnectionPools()** - Method in interface
javax.management.j2ee.statistics.**JDBCStats**

**getConnections()** - Method in interface
javax.management.j2ee.statistics.**JCAStats**

*Returns an array of JCAConnectionStats that provide statistics about the non-pooled connections associated with the referencing JCA resource statistics*

**getConnections()** - Method in interface
javax.management.j2ee.statistics.**JDBCStats**

**getConnections()** - Method in interface
javax.management.j2ee.statistics.**JMSStats**
Returns an array of JMSConnectionStats that provide statistics about the connections associated with the referencing JMS resource.

**getConsumers()** - Method in interface `javax.management.j2ee.statistics.JMSSessionStats`

Returns an array of JMSConsumerStats that provide statistics about the message consumers associated with the referencing JMS session statistics.

**getContainerClientId(FacesContext)** - Method in class `javax.faces.component.UIComponent`

Allow components that implement `NamingContainer` to selectively disable prepending their clientId to their descendent's clientIds by breaking the prepending logic into a separately callable method.

**getContainerClientId(FacesContext)** - Method in class `javax.faces.component.UIForm`

Override the `UIComponent.getContainerClientId(javax.faces.context.FacesContext)` to allow users to disable this form from prepending its clientId to its descendent's clientIds depending on the value of this form's `UIForm.isPrependId()` property.

**getContent(DataSource)** - Method in interface `javax.activation.DataContentHandler`

Return an object representing the data in its most preferred form.

**getContent()** - Method in class `javax.activation.DataHandler`

Return the data in its preferred Object form.

**getContent()** - Method in class `javax.mail.internet.MimeBodyPart`

Return the content as a Java object.

**getContent()** - Method in class `javax.mail.internet.MimeMessage`

Return the content as a Java object.

**getContent()** - Method in interface `javax.mail.Part`

Return the content as a Java object.

**getContent()** - Method in class `javax.xml.soap.AttachmentPart`

Gets the content of this `AttachmentPart` object as a Java object.

**getContent()** - Method in class `javax.xml.soap.SOAPPart`

Returns the content of the SOAPEnvelope as a JAXP `Source` object.

**getContentDescription()** - Method in class `javax.xml.soap.SOAPMessage`

Retrieves a description of this `SOAPMessage` object's content.

**getContentID()** - Method in class `javax.mail.internet.MimeBodyPart`
Returns the value of the "Content-ID" header field.

**getContentID()** - Method in class `javax.mail.internet.MimeMessage`
Returns the value of the "Content-ID" header field.

**getContentID()** - Method in interface `javax.mail.internet.MimePart`
Get the Content-ID of this part.

**getContentId()** - Method in class `javax.xml.soap.AttachmentPart`
Gets the value of the MIME header whose name is "Content-ID".

**getContentId()** - Method in class `javax.xml.soap.SOAPPart`
Retrieves the value of the MIME header whose name is "Content-Id".

**getContentLanguage()** - Method in class `javax.mail.internet.MimeBodyPart`
Get the languages specified in the Content-Language header of this MimePart.

**getContentLanguage()** - Method in class `javax.mail.internet.MimeMessage`
Get the languages specified in the "Content-Language" header field of this message.

**getContentLanguage()** - Method in interface `javax.mail.internet.MimePart`
Get the language tags specified in the Content-Language header of this MimePart.

**getContentLength()** - Method in interface `javax.servlet.ServletRequest`
Returns the length, in bytes, of the request body and made available by the input stream, or -1 if the length is not known.

**getContentLength()** - Method in class `javax.servlet.ServletRequestWrapper`
The default behavior of this method is to return getContentLength() on the wrapped request object.

**getContentLocation()** - Method in class `javax.xml.soap.AttachmentPart`
Gets the value of the MIME header whose name is "Content-Location".

**getContentLocation()** - Method in class `javax.xml.soap.SOAPPart`
Retrieves the value of the MIME header whose name is "Content-Location".

**getContentMD5()** - Method in class `javax.mail.internet.MimeBodyPart`
Return the value of the "Content-MD5" header field.

**getContentMD5()** - Method in class `javax.mail.internet.MimeMessage`
Return the value of the "Content-MD5" header field.

**getContentMD5()** - Method in interface `javax.mail.internet.MimePart`
Get the Content-MD5 digest of this part.

**getContentType()** - Method in class javax.mail.internet.MimeBodyPart
Produce the raw bytes of the content.

**getContentType()** - Method in class javax.mail.internet.MimeMessage
Produce the raw bytes of the content.

**getContentType()** - Method in class javax.activation.DataHandler
Return the MIME type of this object as retrieved from the source object.

**getContentType()** - Method in interface javax.activation.DataSource
This method returns the MIME type of the data in the form of a string.

**getContentType()** - Method in class javax.activation.FileDataSource
This method returns the MIME type of the data in the form of a string.

**getContentType(File)** - Method in class javax.activation.FileTypeMap
Return the type of the file object.

**getContentType(String)** - Method in class javax.activation.FileTypeMap
Return the type of the file passed in.

**getContentType(File)** - Method in class javax.activation.MimetypesFileTypeMap
Return the MIME type of the file object.

**getContentType(String)** - Method in class javax.activation.MimetypesFileTypeMap
Return the MIME type based on the specified file name.

**getContentType()** - Method in class javax.activation.URLDataSource
Returns the value of the URL content-type header field.

**getContentType()** - Method in class javax.faces.context.ResponseWriter
Return the content type (such as "text/html") for this ResponseWriter.

**getContentType()** - Method in class javax.faces.context.ResponseWriterWrapper
The default behavior of this method is to call
*ResponseWriter.getContentType()* on the wrapped *ResponseWriter* object.

**getContentType()** - Method in class javax.mail.internet.MimeBodyPart
Returns the value of the RFC 822 "Content-Type" header field.

**getContentType()** - Method in class javax.mail.internet.MimeMessage
Returns the value of the RFC 822 "Content-Type" header field.

**getContentType()** - Method in class javax.mail.internet.MimePartDataSource
Returns the content-type of this DataSource.

**getContentType()** - Method in class **javax.mail.Multipart**
Return the content-type of this Multipart.

**getContentType()** - Method in interface **javax.mail.Part**
Returns the Content-Type of the content of this part.

**getContentType()** - Method in class **javax.mail.util.BytesArrayDataSource**
Get the MIME content type of the data.

**getContentType()** - Method in interface **javax.servlet.ServletRequest**
Returns the MIME type of the body of the request, or null if the type is not known.

**getContentType()** - Method in class **javax.servlet.ServletRequestWrapper**
The default behavior of this method is to return getContentType() on the wrapped request object.

**getContentType()** - Method in interface **javax.servlet.ServletResponse**
Returns the content type used for the MIME body sent in this response.

**getContentType()** - Method in class **javax.servlet.ServletResponseWrapper**
The default behavior of this method is to return getContentType() on the wrapped response object.

**getContentType()** - Method in class **javax.xml.soap.AttachmentPart**
Gets the value of the MIME header whose name is "Content-Type".

**getContext(Class)** - Method in class **javax.el.ELContext**
Returns the context object associated with the given key.

**getContext()** - Method in class **javax.faces.context.ExternalContext**
Return the application environment object instance for the current application.

**getContext(String)** - Static method in class **javax.security.jacc.PolicyContext**
This method may be used by a Policy provider to activate the PolicyContextHandler registered to the context object key and cause it to return the corresponding policy context object from the container.

**getContext(String, Object)** - Method in interface **javax.security.jacc.PolicyContextHandler**
This public method is used by the PolicyContext class to activate the handler and obtain from it the context object identified by the (case-sensitive) key.
**getContext(String)** - Method in interface javax.servlet.**ServletContext**
Returns a **ServletContext** object that corresponds to a specified URL on the server.

**getContext()** - Method in interface javax.xml.ws.**Response**
Gets the contained response context.

**getContextData()** - Method in interface javax.interceptor.**InvocationContext**
Returns the context data associated with this invocation or lifecycle callback.

**getContextID()** - Method in interface javax.security.jacc.**PolicyConfiguration**
This method returns this object's policy context identifier.

**getContextID()** - Static method in class javax.security.jacc.**PolicyContext**
This static method returns the value of the policy context identifier associated with the thread on which the accessor is called.

**getContextPath()** - Method in interface javax.servlet.http.**HttpServletRequest**
Returns the portion of the request URI that indicates the context of the request.

**getContextPath()** - Method in class javax.servlet.http.**HttpServletRequestWrapper**
The default behavior of this method is to return getContextPath() on the wrapped request object.

**getContextPath()** - Method in interface javax.servlet.**ServletContext**
Returns the context path of the web application.

**getConvertedValue(FacesContext, Object)** - Method in class javax.faces.component.**UIInput**
Convert the submitted value into a "local value" of the appropriate data type, if necessary.

**getConvertedValue(FacesContext, UIComponent, Object)** - Method in class javax.faces.render.**Renderer**
Attempt to convert previously stored state information into an object of the type required for this component (optionally using the registered **Converter** for this component, if there is one).

**getConverter()** - Method in class javax.faces.component.**UIOutput**

**getConverter()** - Method in interface javax.faces.component.**ValueHolder**
Return the **Converter** (if any) that is registered for this **UIComponent**

**getConverterIds()** - Method in class javax.faces.application.**Application**
Return an iterator over the set of currently registered converter ids for this application.

`getConverterMessage()` - Method in class `javax.faces.component.UIInput`
If there has been a call to `UIInput.setConverterMessage(java.lang.String)` on this instance, return the message.

`getConverterTypes()` - Method in class `javax.faces.application.Application`
Return an iterator over the set of class instances for which Converter classes have been explicitly registered.

Returns an array containing all of the Cookie objects the client sent with this request.

`getCookies()` - Method in class `javax.servlet.http.HttpServletRequestWrapper`
The default behavior of this method is to return getCookies() on the wrapped request object.

`getCoords()` - Method in class `javax.faces.component.html.HtmlCommandLink`
Return the value of the `coords` property.

`getCoords()` - Method in class `javax.faces.component.html.HtmlOutputLink`
Return the value of the `coords` property.

`getCount()` - Method in class `javax.mail.internet.MimeMultipart`
Return the number of enclosed BodyPart objects.

`getCount()` - Method in class `javax.mail.Multipart`
Return the number of enclosed BodyPart objects.

`getCount()` - Method in interface `javax.mail.MultipartDataSource`
Return the number of enclosed BodyPart objects.

`getCount()` - Method in interface `javax.management.j2ee.statistics.CountStatistic`
The count since the last reset.

`getCount()` - Method in interface `javax.management.j2ee.statistics.TimeStatistic`
Number of times the operation was invoked since the beginning of this measurement.

`getCountry()` - Method in interface `javax.xml.registry.infomodel.PostalAddress`
Returns the country.

**getCountryCode()** - Method in interface javax.xml.registry.infomodel.**TelephoneNumber**  
Gets the country code.

**getCreateCount()** - Method in interface javax.management.j2ee.statistics.**EJBStats**  
Number of times create was called.

**getCreateCount()** - Method in interface javax.management.j2ee.statistics.**JCAConnectionPoolStats**  
The number of connections created

**getCreateCount()** - Method in interface javax.management.j2ee.statistics.**JDBCConnectionPoolStats**  
The number of connections created.

**getCreated()** - Method in class javax.faces.webapp.**UIComponentClassicTagBase**  
Return true if we dynamically created a new component instance during execution of this tag.

**getCreated()** - Method in class javax.faces.webapp.**UIComponentTagBase**  
Return true if we dynamically created a new component instance during execution of this tag.

**getCreatedComponents()** - Method in class javax.faces.webapp.**UIComponentClassicTagBase**  
Returns the List of **UIComponent** ids created or located by nested **UIComponentTag**s while processing the current request.

**getCreationTime()** - Method in interface javax.servlet.http.**HttpSession**  
Returns the time when this session was created, measured in milliseconds since midnight January 1, 1970 GMT.

**getCredentialData()** - Method in interface javax.resource.spi.security.**GenericCredential**  
*Deprecated.* Gets security data for a specific security mechanism represented by the GenericCredential.

**getCredentials()** - Method in interface javax.xml.registry.**Connection**  
Gets the credentials associated with this client.

**getCurrencyCode()** - Method in class javax.faces.convert.**NumberConverter**  
Return the ISO 4217 currency code used by getAsString() with a type of currency.

**getCurrencySymbol()** - Method in class
javax.faces.convert.NumberConverter

Return the currency symbol used by getAsString() with a type of currency.

**getCurrent()** - Method in interface
javax.management.j2ee.statistics.RangeStatistic

The current value of this attribute.

**getCurrentInstance()** - Static method in class
javax.faces.context.FacesContext

Return the FacesContext instance for the request that is being processed by the current thread, if any.

**getCurrentLocale()** - Method in interface
javax.enterprise.deploy.spi.DeploymentManager

Returns the active locale this implementation of javax.enterprise.deploy.spi subpackages is running.

**getData()** - Method in interface javax.xml.stream.events.Characters

Get the character data of this event.

**getData()** - Method in interface
javax.xml.stream.events.ProcessingInstruction

The data section of the processing instruction.

**getDataHandler()** - Method in class javax.mail.internet.MimeBodyPart

Return a DataHandler for this body part's content.

**getDataHandler()** - Method in class javax.mail.internet.MimeMessage

Return a DataHandler for this Message's content.

**getDataHandler()** - Method in interface javax.mail.Part

Return a DataHandler for the content within this part.

**getDataHandler()** - Method in class javax.xml.soap.AttachmentPart

Gets the DataHandler object for this AttachmentPart object.

**getDataModel()** - Method in class javax.faces.component.UIData

Return the internal DataModel object representing the data objects that we will iterate over in this component's rendering.

**getDataModel()** - Method in class javax.faces.model.DataModelEvent

Return the DataModel that fired this event.

**getDataModelListeners()** - Method in class
javax.faces.model.DataModel

Return the set of DataModelListeners interested in notifications from this DataModel.

**getSource()** - Method in class javax.activation.DataHandler

Return the DataSource associated with this instance of DataHandler.

**getDate()** - Method in class javax.mail.search.DateTerm
Return the Date to compare with.

**getDateHeader(String)** - Method in interface `javax.servlet.http.HttpServletRequest`  
Returns the value of the specified request header as a `long` value that represents a `Date` object.

**getDateHeader(String)** - Method in class `javax.servlet.http.HttpServletRequestWrapper`  
The default behavior of this method is to return `getDateHeader(String name)` on the wrapped request object.

**getDConfigBean(DDBean)** - Method in interface `javax.enterprise.deploy.spi.DConfigBean`  
Return the JavaBean containing the server-specific deployment configuration information based upon the XML data provided by the DBean.

**getDConfigBean(DDBeanRoot)** - Method in interface `javax.enterprise.deploy.spi.DConfigBeanRoot`  
Return a DConfigBean for a deployment descriptor that is not the module's primary deployment descriptor.

**getDConfigBeanRoot(DDBeanRoot)** - Method in interface `javax.enterprise.deploy.spi.DeploymentConfiguration`  
Returns the top level configuration bean, DConfigBeanRoot, associated with the deployment descriptor represented by the designated DBeanRoot bean.

**getDConfigBeanVersion()** - Method in interface `javax.enterprise.deploy.spi.DeploymentManager`  
Returns the J2EE platform version number for which the configuration beans are provided.

**getDConfigBeanVersionType(int)** - Static method in class `javax.enterprise.deploy.shared.DConfigBeanVersionType`  
Return an object of the specified value.

**getDDBean()** - Method in interface `javax.enterprise.deploy.spi.DConfigBean`  
Return the JavaBean containing the deployment descriptor XML text associated with this DConfigBean.

**getDDBeanRoot()** - Method in interface `javax.enterprise.deploy.model.DeployableObject`  
Return the top level standard bean representing the root of the
getDDBeanRoot(String) - Method in interface javax.enterprise.deploy.model.DeployableObject
  Returns a DDBeanRoot object for the XML instance document named.

getDDBeanRootVersion() - Method in interface javax.enterprise.deploy.model.DDBeanRoot
  Returns the version number of an XML instance document.

getDebug() - Method in class javax.mail.Session
  Get the debug setting for this Session.

getDebugOut() - Method in class javax.mail.Session
  Returns the stream to be used for debugging output.

getDeclaration() - Method in interface javax.xml.stream.events.EntityReference
  Return the declaration of this entity.

getDeclarativeQueryManager() - Method in interface javax.xml.registry.RegistryService
  Returns the DeclarativeQueryManager object implemented by the JAXR provider.

getDeclare() - Method in class javax.servlet.jsp.tagext.TagVariableInfo
  The body of the <declare> element.

getDeclare() - Method in class javax.servlet.jsp.tagext.VariableInfo
  Returns whether this is a new variable.

getDeclaredType() - Method in class javax.xml.bind.JAXBElement
  Returns the Java binding of the xml element declaration's type attribute.

getDefaultCommandMap() - Static method in class javax.activation.CommandMap
  Get the default CommandMap.

defaultDomain() - Method in interface javax.management.j2ee.Management
  Returns the default domain name of this MEJB.

defaultFactory() - Static method in class javax.servlet.jsp.JspFactory
  Returns the default factory for this implementation.

getDefaultFileTypeMap() - Static method in class javax.activation.FileTypeMap
  Return the default FileTypeMap for the system.

defaultFolder() - Method in class javax.mail.Store
  Returns a Folder object that represents the 'root' of the default
namespace presented to the user by the Store.

getDefaultInstance(Properties, Authenticator) - Static method in class javax.mail.Session
  Get the default Session object.

getDefaultJavaCharsetName - Static method in class javax.mail.Session
  Get the default Session object.

getDefaultJavaCharsetName - Static method in class javax.mail.internet.MimeUtility
  Get the default charset corresponding to the system's current default locale.

getDefaultLocale() - Method in interface javax.enterprise.deploy.spi.DeploymentManager
  Returns the default locale supported by this implementation of javax.enterprise.deploy.spi subpackages.

getDefaultLocale() - Method in class javax.faces.application.Application
  Return the default Locale for this application.

getDefaultPostalScheme() - Method in interface javax.xml.registry.RegistryService
  Gets the default user-defined postal scheme for codifying the attributes of PostalAddress.

getDefaultRenderKitId() - Method in class javax.faces.application.Application
  Return the renderKitId to be used for rendering this application.

getDefaultTypeMapping() - Method in interface javax.xml.rpc.encoding.TypeMappingRegistry
  Gets the registered default TypeMapping instance.

getDefaultUserName() - Method in class javax.mail.Authenticator

getDelegate() - Method in interface javax.persistence.EntityManager
  Return the underlying provider object for the EntityManager, if available.

getDeletedMessageCount() - Method in class javax.mail.Folder
  Get the number of deleted messages in this Folder.

getDeliveryMode() - Method in interface javax.jms.MessageProducer
  Gets the producer's default delivery mode.

getDeployableObject() - Method in interface javax.enterprise.deploy.model.DDBeanRoot
  Return the containing DeployableObject
**getDeployableObject(String)** - Method in interface
javax.enterprise.deploy.model.J2eeApplicationObject
   Return the DeployableObject of the specified URI designator.

**getDeployableObject()** - Method in interface
javax.enterprise.deploy.spi.DeploymentConfiguration
   Returns an object that provides access to the deployment descriptor
data and classes of a J2EE module.

**getDeployableObjects(ModuleType)** - Method in interface
javax.enterprise.deploy.model.J2eeApplicationObject
   Return the all DeployableObjects of the specified type.

**getDeployableObjects()** - Method in interface
javax.enterprise.deploy.model.J2eeApplicationObject
   Return the all DeployableObjects in this application.

**getDeploymentFactories()** - Method in class
javax.enterprise.deploy.sharedfactories.DeploymentFactoryManager
   Retrieve the lists of currently registered DeploymentFactories.

**getDeploymentManager(String, String, String)** - Method in class
javax.enterprise.deploy.sharedfactories.DeploymentFactoryManager
   Retrieves a DeploymentManager instance to use for deployment.

**getDeploymentManager(String, String, String)** - Method in interface
javax.enterprise.deploy.spi.factories.DeploymentFactory
   Return a connected DeploymentManager instance.

**getDeploymentStatus()** - Method in class
javax.enterprise.deploy.spi.status.ProgressEvent
   Retrieve the status information.

**getDeploymentStatus()** - Method in interface
javax.enterprise.deploy.spi.status.ProgressObject
   Retrieve the status of this activity.

**getDescendantConcepts()** - Method in interface
javax.xml.registry.infomodel.ClassificationScheme
   Gets all descendant Concepts.

**getDescendantConcepts()** - Method in interface
javax.xml.registry.infomodel.Concept
   Gets all descendant Concepts.

**getDescendantOrganizations()** - Method in interface
javax.xml.registry.infomodel.Organization
   Gets all descendant Organizations.

**getDescription()** - Method in interface
javax.enterprise.deploy.spi.Target
   Retrieve other descriptive information about the target.
**getDescription()** - Method in class `javax.faces.model.SelectItem`
   Return a description of this item, for use in development tools.

**getDescription()** - Method in class `javax.mail.internet.MimeBodyPart`
   Returns the "Content-Description" header field of this body part.

**getDescription()** - Method in class `javax.mail.internet.MimeMessage`
   Returns the "Content-Description" header field of this Message.

**getDescription()** - Method in interface `javax.mail.Part`
   Return a description String for this part.

**getDescription()** - Method in interface
   `javax.management.j2ee.statistics.Statistic`
   A human-readable description of the Statistic.

**getDescription()** - Method in class
   `javax.servlet.jsp.tagext.TagAttributeInfo`
   Gets the description string of this tag attribute.

**getDescription()** - Method in interface
   `javax.xml.registry.infomodel.RegistryObject`
   Gets the textual description for this object.

**getDeserializer(Class, QName)** - Method in interface
   `javax.xml.rpc.encoding.TypeMapping`
   Gets the DeserializerFactory registered for the specified pair of Java type and XML data type.

**getDeserializerAs(String)** - Method in interface
   `javax.xml.rpc.encoding.DeserializerFactory`
   Returns a Deserializer for the specified XML processing mechanism type.

**getDestination()** - Method in interface `javax.jms.MessageProducer`
   Gets the destination associated with this MessageProducer.

**getDestination()** - Method in interface
   `javax.management.j2ee.statistics.JMSProducerStats`
   Returns a string that encapsulates the identity of the message destination.

**getDetail()** - Method in class `javax.faces.application.FacesMessage`
   Return the localized detail text.

**getDetail()** - Method in exception
   `javax.xml.rpc.soap.SOAPFaultException`
   Gets the detail element.

**getDetail()** - Method in interface `javax.xml.soap.SOAPFault`
   Returns the optional detail element for this SOAPFault object.

**getDetailEntries()** - Method in interface `javax.xml.soap.Detail`
Gets an Iterator over all of the DetailEntry in this Detail object.

**getDir()** - Method in class
javax.faces.component.html.HtmlCommandButton
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlCommandLink
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlDataTable
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlForm
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlGraphicImage
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlInputSecret
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlInputText
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlInputTextarea
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlMessage
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlMessages
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlOutputFormat
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlOutputLabel
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlOutputLink
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlOutputText
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlPanelGrid
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
Return the value of the dir property.

**getDir()** - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
   Return the value of the dir property.
getDir() - Method in class
javax.faces.component.html.HtmlSelectManyListbox
   Return the value of the dir property.
getDir() - Method in class
javax.faces.component.html.HtmlSelectManyMenu
   Return the value of the dir property.
getDir() - Method in class
javax.faces.component.html.HtmlSelectOneListbox
   Return the value of the dir property.
getDir() - Method in class
javax.faces.component.html.HtmlSelectOneMenu
   Return the value of the dir property.
getDir() - Method in class
javax.faces.component.html.HtmlSelectOneRadio
   Return the value of the dir property.
getDisabledClass() - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
   Return the value of the disabledClass property.
getDisabledClass() - Method in class
javax.faces.component.html.HtmlSelectManyListbox
   Return the value of the disabledClass property.
getDisabledClass() - Method in class
javax.faces.component.html.HtmlSelectManyMenu
   Return the value of the disabledClass property.
getDisabledClass() - Method in class
javax.faces.component.html.HtmlSelectOneListbox
   Return the value of the disabledClass property.
getDisabledClass() - Method in class
javax.faces.component.html.HtmlSelectOneMenu
   Return the value of the disabledClass property.
getDisabledClass() - Method in class
javax.faces.component.html.HtmlSelectOneRadio
   Return the value of the disabledClass property.
getDisableMessageID() - Method in interface
javax.jms.MessageProducer
   Gets an indication of whether message IDs are disabled.
getDisableMessageTimestamp() - Method in interface
javax.jms.MessageProducer
  Gets an indication of whether message timestamps are disabled.

getDisconnectedDeploymentManager(String) - Method in class
javax.enterprise.deploy.shared.factories.DeploymentFactoryManager
  Return a disconnected DeploymentManager instance.

getDisconnectedDeploymentManager(String) - Method in interface
javax.enterprise.deploy.spi.factories.DeploymentFactory
  Return a disconnected DeploymentManager instance.

getDisplayName() - Method in interface
javax.enterprise.deploy.spi.factories.DeploymentFactory
  Provide a string with the name of this vendor's DeploymentManager.

getDisplayName() - Method in class javax.servlet.jsp.tagext.TagInfo
  Get the displayName.

getAddression() - Method in class javax.mail.internet.ContentDisposition
  Return the disposition value.

getAddression() - Method in class javax.mail.internet.MimeBodyPart
  Returns the value of the "Content-Disposition" header field.

getAddression() - Method in class javax.mail.internet.MimeMessage
  Returns the value of the "Content-Disposition" header field.

getAddression() - Method in interface javax.mail.Part
  Return the disposition of this part.

getAddression() - Method in class
javax.faces.webapp.UIComponentClassicTagBase
  Return the flag value that should be returned from the doAfterBody() method when it is called.

getAddression() - Method in interface
javax.xml.stream.events.DTD
  Returns the entire Document Type Declaration as a string, including the internal DTD subset.

getAddression() - Method in class
javax.faces.webapp.UIComponentClassicTagBase
  Return the flag value that should be returned from the doEnd() method when it is called.

getAddression() - Method in class
javax.servlet.http.Cookie
  Returns the domain name set for this cookie.

getAddression() - Method in class
javax.faces.webapp.UIComponentClassicTagBase
  Return the flag value that should be returned from the doStart() method when it is called.
**getDouble(String)** - Method in interface *javax.jms.MapMessage*

Returns the `double` value with the specified name.

**getDoubleProperty(String)** - Method in interface *javax.jms.Message*

Returns the value of the `double` property with the specified name.

**getDTDType()** - Method in interface *javax.xml.stream.events.Attribute*

Gets the type of this attribute, default is the String "CDATA"

**getDurableSubscriptionCount()** - Method in interface *javax.management.j2ee.statistics.JMSSessionStats*

Number of durable subscriptions.

**getEISProductName()** - Method in interface *javax.resource.cci.ConnectionMetaData*

Returns product name of the underlying EIS instance connected through the Connection that produced this metadata.

**getEISProductName()** - Method in interface *javax.resource.spi.ManagedConnectionMetaData*

Returns Product name of the underlying EIS instance connected through the ManagedConnection.

**getEISProductVersion()** - Method in interface *javax.resource.cci.ConnectionMetaData*

Returns product version of the underlying EIS instance.

**getEISProductVersion()** - Method in interface *javax.resource.spi.ManagedConnectionMetaData*

Returns product version of the underlying EIS instance connected through the ManagedConnection.

**getEJBHome()** - Method in interface *javax.ejb.EJBContext*

Obtain the enterprise bean's remote home interface.

**getEJBHome()** - Method in interface *javax.ejb.EJBMetaData*

Obtain the remote home interface of the enterprise Bean.

**getEJBHome()** - Method in interface *javax.ejb.EJBObject*

Obtain the enterprise Bean's remote home interface.

**getEJBHome()** - Method in interface *javax.ejb.HomeHandle*

Obtain the home object represented by this handle.

**getEJBLocalHome()** - Method in interface *javax.ejb.EJBContext*

Obtain the enterprise bean's local home interface.

**getEJBLocalHome()** - Method in interface *javax.ejb.EJBLocalObject*

Obtain the enterprise Bean's local home interface.

**getEJBLocalObject()** - Method in interface *javax.ejb.EntityContext*

Obtain a reference to the EJB local object that is currently associated with the instance.
**getEJBLocalObject()** - Method in interface javax.ejb.SessionContext
  Obtain a reference to the EJB local object that is associated with the instance.

**getEJBMetaData()** - Method in interface javax.ejb.EJBHome
  Obtain the EJBMetaData interface for the enterprise Bean.

**getEJBObject()** - Method in interface javax.ejb.EntityContext
  Obtain a reference to the EJB object that is currently associated with the instance.

**getEJBObject()** - Method in interface javax.ejb.Handle
  Obtain the EJB object reference represented by this handle.

**getEJBObject()** - Method in interface javax.ejb.SessionContext
  Obtain a reference to the EJB object that is currently associated with the instance.

**getELContext()** - Method in class javax.el.ELContextEvent
  Returns the ELContext that was created.

**getELContext()** - Method in class javax.faces.context.FacesContext
  Return the ELContext instance for this FacesContext instance.

**getELContext()** - Method in class javax.faces.webapp.UIComponentELTag
  Return the ELContext for the FacesContext for this request.

**getELContext()** - Method in class javax.faces.webapp.UIComponentTagBase
  Return the ELContext for the FacesContext for this request.

**getELContext()** - Method in class javax.servlet.jsp.JspContext
  Returns the ELContext associated with this JspContext.

**getELContextListeners()** - Method in class javax.faces.application.Application
  If no calls have been made to
    Application.addELContextListener(javax.el.ELContextListener),
  this method must return an empty array.

**getElement(ResultT)** - Method in interface javax.xml.bind.annotation.DomHandler
  Once the portion is sent to the Result.

**getElement(DOMResult)** - Method in class javax.xml.bind.annotation.W3CDomHandler

**getElementName(Object)** - Method in class javax.xml.bind.JAXBIntrospector
  Get xml element qname for jaxbElement.
**getElementName()** - Method in interface javax.xml.soap.SOAPElement

Returns the name of this SOAPElement object.

**getElementQName()** - Method in interface javax.xml.soap.SOAPElement

Returns the qname of this SOAPElement object.

**getElementText()** - Method in class javax.xml.stream.util.EventReaderDelegate

**getElementText()** - Method in class javax.xml.stream.util.StreamReaderDelegate

**getElementText()** - Method in interface javax.xml.stream.XMLEventReader

Reads the content of a text-only element.

**getElementText()** - Method in interface javax.xml.stream.XMLStreamReader

Reads the content of a text-only element, an exception is thrown if this is not a text-only element.

**getELResolver()** - Method in class javax.el.ELContext

Retrieves the ELResolver associated with this context.

**getELResolver()** - Method in class javax.faces.application.Application

Return the singleton ELResolver instance to be used for all EL resolution.

**getEmailAddresses()** - Method in interface javax.xml.registry.infomodel.User

Gets the email addresses for this User.

**getEnabledClass()** - Method in class javax.faces.component.html.HtmlSelectManyCheckbox

Return the value of the enabledClass property.

**getEnabledClass()** - Method in class javax.faces.component.html.HtmlSelectManyListbox

Return the value of the enabledClass property.

**getEnabledClass()** - Method in class javax.faces.component.html.HtmlSelectManyMenu

Return the value of the enabledClass property.

**getEnabledClass()** - Method in class javax.faces.component.html.HtmlSelectOneListbox

Return the value of the enabledClass property.
javax.faces.component.html.HtmlSelectOneMenu

Return the value of the enabledClass property.

**getEnabledClass()** - Method in class

javax.faces.component.html.HtmlSelectOneRadio

Return the value of the enabledClass property.

**getEnclosingWriter()** - Method in class

javax.servlet.jsp.tagext.BodyContent

Get the enclosing JspWriter.

**getEncoding()** - Method in class java.mail.internet.MimeBodyPart

Returns the content transfer encoding from the "Content-Transfer-Encoding" header field.

**getEncoding()** - Method in class java.mail.internet.MimeMessage

Returns the content transfer encoding from the "Content-Transfer-Encoding" header field.

**getEncoding()** - Method in interface java.mail.internet.MimePart

Get the transfer encoding of this part.

**getEncoding(DataSource)** - Static method in class

java.mail.internet.MimeUtility

Get the content-transfer-encoding that should be applied to the input stream of this datasource, to make it mailsafe.

**getEncoding(DataHandler)** - Static method in class

java.mail.internet.MimeUtility

Same as getEncoding(DataSource) except that instead of reading the data from an InputStream it uses the writeTo method to examine the data.

**getEncoding()** - Method in class

java.mail.internet.PreencodedMimeBodyPart

Returns the content transfer encoding specified when this object was created.

**getEncoding()** - Method in class

java.xml.bind.helpers.AbstractMarshallerImpl

Convenience method for getting the current output encoding.

**getEncoding()** - Method in class

java.xml.stream.util.StreamReaderDelegate

Return input encoding if known or null if unknown.

**getEncodingStyle()** - Method in interface java.xml.soap.SOAPElement
Returns the encoding style for this SOAPElement object.

**getEnctype()** - Method in class `javax.faces.component.html.HtmlForm`
Returns the value of the enctype property.

**getEngineInfo()** - Method in class `javax.servlet.jsp.JspFactory`
called to get implementation-specific information on the current JSP engine.

**getEntities()** - Method in interface `javax.xml.stream.events/DTD`
Return a List containing the general entities, both external and internal, declared in the DTD.

**getEntity()** - Method in exception `javax.persistence.OptimisticLockException`
Returns the entity that caused this exception.

**getEntry(String)** - Method in interface `javax.enterprise.deploy.model.DeployableObject`
Returns the InputStream for the given entry name The file name must be relative to the root of the module.

**getEnumeration()** - Method in interface `javax.jms.QueueBrowser`
Gets an enumeration for browsing the current queue messages in the order they would be received.

**getEnumValueTable()** - Method in class `javax.enterprise.deploy.shared.ActionType`
Returns the enumeration value table for class ActionType

**getEnumValueTable()** - Method in class `javax.enterprise.deploy.shared.CommandType`
Returns the enumeration value table for class CommandType

**getEnumValueTable()** - Method in class `javax.enterprise.deploy.shared.DConfigBeanVersionType`
Returns the enumeration value table for class DConfigBeanVersionType

**getEnumValueTable()** - Method in class `javax.enterprise.deploy.shared.ModuleType`
Returns the enumeration value table for class ModuleType

**getEnumValueTable()** - Method in class `javax.enterprise.deploy.shared.StateType`
Returns the enumeration value table for class StateType

**getEnvelope()** - Method in class `javax.xml.soap.SOAPPart`
Gets the SOAPEnvelope object associated with this SOAPPart object.

**getEnvironment()** - Method in interface `javax.ejb.EJBContext`
Deprecated. Use the JNDI naming context java:comp/env to access
enterprise bean's environment.

**getErrorClass()** - Method in class
javax.faces.component.html.HtmlMessage

Return the value of the errorClass property.

**getErrorClass()** - Method in class
javax.faces.component.html.HtmlMessages

Return the value of the errorClass property.

**getErrorCode()** - Method in exception javax.jms.JMSException

Gets the vendor-specific error code.

**getErrorCode()** - Method in exception
javax.resource.ResourceException

Get the error code.

**getErrorCode()** - Method in exception javax.xml.bind.JAXBException

Get the vendor specific error code

**getErrorCode()** - Method in exception
javax.xml.bind.TypeConstraintException

Get the vendor specific error code

**getErrorData()** - Method in class javax.servlet.jsp.PageContext

Provides convenient access to error information.

**getErrorObjectKey()** - Method in exception
javax.xml.registry.RegistryException

Gets the Key to the first object that encountered an error in the registry.

**getErrorCode()** - Method in class
javax.faces.component.html.HtmlMessage

Return the value of the errorStyle property.

**getErrorCode()** - Method in class
javax.faces.component.html.HtmlMessages

Return the value of the errorStyle property.

**getEventAllocator()** - Method in class
javax.xml.stream.XMLInputFactory

Gets the allocator used by streams created with this factory

**getEventHandler()** - Method in class javax.xml.bind.Binder

Return the current event handler or the default event handler if one hasn't been set.

**getEventHandler()** - Method in class
javax.xml.bind.helpers.AbstractMarshallerImpl

**getEventHandler()** - Method in class
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**
Return the current event handler or the default event handler if one hasn't been set.

**getEventHandler()** - Method in interface javax.xml.bind.**Marshaller**
Return the current event handler or the default event handler if one hasn't been set.

**getEventHandler()** - Method in interface javax.xml.bind.**Unmarshaller**
Return the current event handler or the default event handler if one hasn't been set.

**getEventHandler()** - Method in interface javax.xml.bind.**Validator**
**Deprecated. since JAXB2.0**

**getEvents()** - Method in class javax.xml.bind.util.**ValidationEventCollector**
Return an array of ValidationEvent objects containing a copy of each of the collected errors and warnings.

**getEventType()** - Method in interface javax.xml.registry.infomodel.**AuditableEvent**
Gets the type of this event.

**getEventType()** - Method in interface javax.xml.stream.events.**XMLEvent**
Returns an integer code for this event.

**getEventType()** - Method in class javax.xml.stream.util.**StreamReaderDelegate**
Returns an integer code that indicates the type of the event the cursor is pointing to.

**getException()** - Method in class javax.resource.spi.**ConnectionEvent**
Get the exception.

**getException()** - Method in class javax.resource.spi.work.**WorkEvent**
Return the WorkException.

**getException()** - Method in class javax.servlet.jsp.**PageContext**
The current value of the exception object (an Exception).

**getException()** - Method in error javax.xml.stream.**FactoryConfigurationError**
Return the nested exception (if any)

**getExceptionListener()** - Method in interface javax.jms.**Connection**
Gets the ExceptionListener object for this connection.

**getExceptions()** - Method in interface javax.xml.registry.**BulkResponse**
Get the Collection of RegistryException instances in case of partial commit.

**getExecutor()** - Method in class javax.xml.ws.**Endpoint**

Returns the executor for this **Endpoint** instance.

**getExecutor()** - Method in class javax.xml.ws.**Service**

Returns the executor for this **Service** instance.

**getExecutor()** - Method in class javax.xml.ws.spi.**ServiceDelegate**

Returns the executor for this **Service** instance.

**getExpectedType()** - Method in class javax.el.**ValueExpression**

Returns the type of the expression will be coerced to after evaluation.

**getExpectedTypeName()** - Method in class javax.servlet.jsp.tagext.**TagAttributeInfo**

Returns the name of the expected type (as a String) of this deferred value attribute.

**getExpiration()** - Method in interface javax.xml.registry.infomodel.**RegistryEntry**

Gets expirationDate attribute of the RegistryEntry within the Registry.

**getExpiredMessageCount()** - Method in interface javax.management.j2ee.statistics.**JMSEndpointStats**

Number of messages that expired before delivery.

**getExpiredMessageCount()** - Method in interface javax.management.j2ee.statistics.**JMSSessionStats**

Number of expired messages.

**getExpressionEvaluator()** - Method in class javax.servlet.jsp.**JspContext**

**Deprecated.** As of JSP 2.1, replaced by

*JspApplicationContext.getExpressionFactory()*

**getExpressionFactory()** - Method in class javax.faces.application.**Application**

Returns the **ExpressionFactory** instance for this application.

**getExpressionFactory()** - Method in interface javax.servlet.jsp.**JspApplicationContext**

Returns a factory used to create **ValueExpression**s and **MethodExpression**s so that EL expressions can be parsed and evaluated.

**getExpressionString()** - Method in class javax.el.**Expression**

Returns the original String used to create this **Expression**, unmodified.
**getExpressionString()** - Method in class **javax.faces.el.MethodBinding**

Deprecated. Return the (possibly **null**) expression String, with leading and trailing delimiters, from which this **MethodBinding** was built.

**getExpressionString()** - Method in class **javax.faces.el.ValueBinding**

Deprecated. Return the (possibly **null**) expression String, including the delimiters, from which this **ValueBinding** was built.

**getExtension()** - Method in interface **javax.xml.registry.infomodel.TelephoneNumber**

Gets the internal extension.

**getExternalContext()** - Method in class **javax.faces.context.FacesContext**

Return the **ExternalContext** instance for this **FacesContext** instance.

**getExternalIdentifiers()** - Method in interface **javax.xml.registry.infomodel.RegistryObject**

Returns the ExternalIdentifiers associated with this object that are external identifiers for this object.

**getExternalLinks()** - Method in interface **javax.xml.registry.infomodel.RegistryObject**

Returns the ExternalLinks associated with this object.

**getExternalURI()** - Method in interface **javax.xml.registry.infomodel.ExternalLink**

Gets URI to the an external resource.

**getFacesContext()** - Method in class **javax.faces.component.UIComponent**

Convenience method to return the **FacesContext** instance for the current request.

**getFacesContext()** - Method in class **javax.faces.component.UIComponentBase**

**getFacesContext(Object, Object, Object, Lifecycle)** - Method in class **javax.faces.context.FacesContextFactory**

Create (if needed) and return a **FacesContext** instance that is initialized for the processing of the specified request and response objects, utilizing the specified **Lifecycle** instance, for this web application.

**getFacesContext()** - Method in class **javax.faces.event.PhaseEvent**

Return the **FacesContext** for the request being processed.

**getFacesContext()** - Method in class
javax.faces.webapp.**UIComponentClassicTagBase**

**getFacesContext()** - Method in class
javax.faces.webapp.**UIComponentTagBase**

Return the **FacesContext** instance for the current request.

**getFacesJspId()** - Method in class
javax.faces.webapp.**UIComponentClassicTagBase**

If this method has been called before on this tag's useful lifetime (before **UIComponentClassicTagBase.release()** was called), return the previously returned value.

**getFacesListeners(Class)** - Method in class
javax.faces.component.**UIComponent**

Return an array of registered **FacesListener**s that are instances of the specified class.

**getFacesListeners(Class)** - Method in class
javax.faces.component.**UIComponentBase**

**getFacesMessage()** - Method in exception
javax.faces.convert.**ConverterException**

Returns the FacesMessage associated with this exception; this will only be available if the converter that threw this exception instance placed it there.

**getFacesMessage()** - Method in exception
javax.faces.validator.**ValidatorException**

Returns the FacesMessage associated with the exception.

**getFacet(String)** - Method in class
javax.faces.component.**UIComponent**

Convenience method to return the named facet, if it exists, or **null** otherwise.

**getFacet(String)** - Method in class
javax.faces.component.**UIComponentBase**

**getFacetCount()** - Method in class
javax.faces.component.**UIComponent**

Return the number of facet **UIComponent**s that are associated with this **UIComponent**.

**getFacetCount()** - Method in class
javax.faces.component.**UIComponentBase**

**getFacetName()** - Method in class
javax.faces.webapp.**UIComponentClassicTagBase**
Return the facet name that we should be stored under, if any; otherwise, return null (indicating that we will be a child component).

**getFacets()** - Method in class `javax.faces.component.UIComponent`  
Return a mutable `Map` representing the facet `UIComponent`s associated with this `UIComponent`, keyed by facet name (which must be a String).

**getFacets()** - Method in class `javax.faces.component.UIComponentBase`

**getFacetsAndChildren()** - Method in class `javax.faces.component.UIComponent`  
Return a mutable `Map` representing the facet `UIComponent`s associated with this `UIComponent`, keyed by facet name (which must be a String).

**getFacetsAndChildren()** - Method in class `javax.faces.component.UIComponentBase`

**getFactory(String)** - Static method in class `javax.faces.FactoryFinder`  
Create (if necessary) and return a per-web-application instance of the appropriate implementation class for the specified JavaServer Faces factory class, based on the discovery algorithm described in the class description.

**getFamily()** - Method in class `javax.faces.component.UIColumn`

**getFamily()** - Method in class `javax.faces.component.UIColumn`

**getFamily()** - Method in class `javax.faces.component.UIInput`

**getFamily()** - Method in class `javax.faces.component.UIMessage`

**getFamily()** - Method in class `javax.faces.component.UIMessages`

**getFamily()** - Method in class `javax.faces.component.UIData`

**getFamily()** - Method in class `javax.faces.component.UIForm`

**getFamily()** - Method in class `javax.faces.component.UIInput`

**getFamily()** - Method in class `javax.faces.component.UIInput`

**getFamily()** - Method in class `javax.faces.component.UIMessage`

**getFamily()** - Method in class `javax.faces.component.UIMessages`

**getFamily()** - Method in class
javax.faces.component.UiNamingContainer

getFamily() - Method in class javax.faces.component.UIOutput

getFamily() - Method in class javax.faces.component.UIPanel

getFamily() - Method in class javax.faces.component.UIParameter

getFamily() - Method in class javax.faces.component.UISelectBoolean

getFamily() - Method in class javax.faces.component.UISelectItem

getFamily() - Method in class javax.faces.component.UISelectItems

getFamily() - Method in class javax.faces.component.UISelectMany

getFamily() - Method in class javax.faces.component.UISelectOne

getFamily() - Method in class javax.faces.component.UIViewRoot

getFatalClass() - Method in class
javax.faces.component.html.HtmlMessage
    Return the value of the fatalClass property.

getFatalClass() - Method in class
javax.faces.component.html.HtmlMessages
    Return the value of the fatalClass property.

getFatalStyle() - Method in class
javax.faces.component.html.HtmlMessage
    Return the value of the fatalStyle property.

getFatalStyle() - Method in class
javax.faces.component.html.HtmlMessages
    Return the value of the fatalStyle property.

gFault() - Method in interface javax.xml.soap.SOAPBody
    Returns the SOAPFault object in this SOAPBody object.

gFault() - Method in exception javax.xml.ws.soap.SOAPFaultException
    Gets the embedded SOAPFault instance.

gFaultActor() - Method in exception
javax.xml.rpc.soap.SOAPFaultException
    Gets the faultactor element.
**getFaultActor()** - Method in interface `javax.xml.soap.SOAPFault`
  Gets the fault actor for this `SOAPFault` object.

**getFaultCode()** - Method in exception
`javax.xml.rpc.soap.SOAPFaultException`
  Gets the fault code element.

**getFaultCode()** - Method in interface `javax.xml.soap.SOAPFault`
  Gets the fault code for this `SOAPFault` object.

**getFaultCodeAsName()** - Method in interface
`javax.xml.soap.SOAPFault`
  Gets the mandatory SOAP 1.1 fault code for this `SOAPFault` object as a SAAJ `Name` object.

**getFaultCodeAsQName()** - Method in interface
`javax.xml.soap.SOAPFault`
  Gets the fault code for this `SOAPFault` object as a `QName` object.

**getFaultNode()** - Method in interface
`javax.xml.soap.SOAPFault`
  Returns the optional Node element value for this `SOAPFault` object.

**getFaultReasonLocales()** - Method in interface
`javax.xml.soap.SOAPFault`
  Returns an `Iterator` over a distinct sequence of `Locales` for which there are associated `Reason` `Text` items.

**getFaultReasonText(Locale)** - Method in interface
`javax.xml.soap.SOAPFault`
  Returns the `Reason` `Text` associated with the given `Locale`.

**getFaultReasonTexts()** - Method in interface `javax.xml.soap.SOAPFault`
  Returns an `Iterator` over a sequence of `String` objects containing all of the `Reason` `Text` items for this `SOAPFault`.

**getFaultRole()** - Method in interface `javax.xml.soap.SOAPFault`
  Returns the optional `Role` element value for this `SOAPFault` object.

**getFaultString()** - Method in exception
`javax.xml.rpc.soap.SOAPFaultException`
  Gets the `faultstring` element.

**getFaultString()** - Method in interface `javax.xml.soap.SOAPFault`
  Gets the fault string for this `SOAPFault` object.

**getFaultStringLocale()** - Method in interface `javax.xml.soap.SOAPFault`
  Gets the locale of the fault string for this `SOAPFault` object.

**getFaultSubcodes()** - Method in interface `javax.xml.soap.SOAPFault`
  Gets the Subcodes for this `SOAPFault` as an iterator over `QNames`.

**getFeatureDescriptors(ELContext, Object)** - Method in class
`javax.el.ArrayELResolver`
Always returns `null`, since there is no reason to iterate through set of all integers.

`getFeatureDescriptors(ELContext, Object)` - Method in class `javax.el.BeanELResolver`
If the base object is not `null`, returns an `Iterator` containing the set of JavaBeans properties available on the given object.

`getFeatureDescriptors(ELContext, Object)` - Method in class `javax.el.CompositeELResolver`
Returns information about the set of variables or properties that can be resolved for the given base object.

`getFeatureDescriptors(ELContext, Object)` - Method in class `javax.el.ELResolver`
Returns information about the set of variables or properties that can be resolved for the given base object.

`getFeatureDescriptors(ELContext, Object)` - Method in class `javax.el.ListELResolver`
Always returns `null`, since there is no reason to iterate through set of all integers.

`getFeatureDescriptors(ELContext, Object)` - Method in class `javax.el.MapELResolver`
If the base object is a map, returns an `Iterator` containing the set of keys available in the `Map`.

`getFeatureDescriptors(ELContext, Object)` - Method in class `javax.el.ResourceBundleELResolver`
If the base object is a `ResourceBundle`, returns an `Iterator` containing the set of keys available in the `ResourceBundle`.

`getFeatureDescriptors(ELContext, Object)` - Method in class `javax.servlet.jsp.el.ImplicitObjectELResolver`
If the base object is `null`, and the property matches the name of a JSP implicit object, returns an `Iterator` containing `FeatureDescriptor` objects with information about each JSP implicit object resolved by this resolver.

`getFeatureDescriptors(ELContext, Object)` - Method in class `javax.servlet.jsp.el.ScopedAttributeELResolver`
If the base object is `null`, returns an `Iterator` containing `FeatureDescriptor` objects with information about each scoped attribute resolved by this resolver.

`getFile()` - Method in class `javax.activation.FileDataSource`
Return the File object that corresponds to this FileDataSource.
**getFilename()** - Method in interface java.xs.engage.deployment.model.DDBeanRoot
Returns the filename relative to the root of the module of the XML instance document this DDBeanRoot represents.

**getFileName()** - Method in class javax.mail.internet.MimeBodyPart
Get the filename associated with this body part.

**getFileName()** - Method in class javax.mail.internet.MimeMessage
Get the filename associated with this Message.

**getFileName()** - Method in interface javax.mail.Part
Get the filename associated with this part, if possible.

**getFilterName()** - Method in interface javax.servlet.FilterConfig
Returns the filter-name of this filter as defined in the deployment descriptor.

**getFirst()** - Method in class javax.faces.component.UIData
Return the zero-relative row number of the first row to be displayed.

**getFirstName()** - Method in interface javax.xml.registry.infomodel.PersonName
Gets the first name for this Person.

**getFloat(String)** - Method in interface javax.jms.MapMessage
Returns the float value with the specified name.

**getFloatProperty(String)** - Method in interface javax.jms.Message
Returns the value of the float property with the specified name.

**getFlushMode()** - Method in interface javax.persistence.EntityManager
Get the flush mode that applies to all objects contained in the persistence context.

**getFolder()** - Method in class javax.mail.event.FolderEvent
Return the affected folder.

**getFolder(String)** - Method in class javax.mail.Folder
Return the Folder object corresponding to the given name.

**getFolder()** - Method in exception javax.mail.FolderClosedException
Returns the dead Folder object
getFolder() - Method in exception javax.mail.FolderNotFoundException
Returns the offending Folder object.

getFolder() - Method in class javax.mail.Message
Get the folder from which this message was obtained.

getFolder() - Method in exception javax.mail.ReadOnlyFolderException
Returns the dead Folder object.

getFolder(URLName) - Method in class javax.mail.Session
Get a closed Folder object for the given URLName.

getFolder(String) - Method in class javax.mail.Store
Return the Folder object corresponding to the given name.

getFolder(URLName) - Method in class javax.mail.Store
Return a closed Folder object, corresponding to the given URLName.

getFooter() - Method in class javax.faces.component.UIColumn
Return the footer facet of the column (if any).

getFooter() - Method in class javax.faces.component.UIData
Return the footer facet of this component (if any).

getFooterClass() - Method in class javax.faces.component.html.UIColumn
Return the value of the footerClass property.

getFooterClass() - Method in class javax.faces.component.html.HtmlColumn
Return the value of the footerClass property.

getFooterClass() - Method in class javax.faces.component.html.HtmlDataTable
Return the value of the footerClass property.

getFooterClass() - Method in class javax.faces.component.html.HtmlPanelGrid
Return the value of the footerClass property.

getFor() - Method in class javax.faces.component.html.HtmlOutputLabel
Return the value of the for property.

getFor() - Method in class javax.faces.component.UIMessage
Return the client identifier of the component for which this component represents associated message(s) (if any).

getFormatId() - Method in interface javax.transaction.xa.Xid
Obtain the format identifier part of the XID.

getFrame() - Method in class javax.faces.component.html.HtmlDataTable
Return the value of the frame property.

getFrame() - Method in class javax.faces.component.html.HtmlPanelGrid
Return the value of the frame property.

getFreePoolSize() - Method in interface javax.management.j2ee.statistics.JCACollectionPoolStats
The number of free connections in the pool

**getFreePoolSize()** - Method in interface
javax.management.j2ee.statistics.[JDBCConnectionPoolStats](https://java.specs.java.net/jmmt-api/jmmt-api-1.0.1-SNAPSHOT/docs/javadoc/)

Number of free connections in the pool.

**getFrom()** - Method in class javax.mail.internet.[MimeMessage](https://java.specs.java.net/jmmt-api/jmmt-api-1.0.1-SNAPSHOT/docs/javadoc/)
Returns the value of the RFC 822 "From" header fields.

**getFrom()** - Method in class javax.mail.[Message](https://java.specs.java.net/jmmt-api/jmmt-api-1.0.1-SNAPSHOT/docs/javadoc/)
Returns the "From" attribute.

**getFullName()** - Method in class javax.mail.[Folder](https://java.specs.java.net/jmmt-api/jmmt-api-1.0.1-SNAPSHOT/docs/javadoc/)
Returns the full name of this Folder.

**getFullName()** - Method in interface
javax.xml.registry.infomodel.[PersonName](https://java.specs.java.net/jmmt-api/jmmt-api-1.0.1-SNAPSHOT/docs/javadoc/)
Gets the fully formatted name for this person.

**getFunction(String)** - Method in class
javax.servlet.jsp.tagext.[TagLibraryInfo](https://java.specs.java.net/jmmt-api/jmmt-api-1.0.1-SNAPSHOT/docs/javadoc/)
Get the FunctionInfo for a given function name, looking through all the functions in this tag library.

**getFunctionClass()** - Method in class
javax.servlet.jsp.tagext.[FunctionInfo](https://java.specs.java.net/jmmt-api/jmmt-api-1.0.1-SNAPSHOT/docs/javadoc/)
The class of the function.

**getFunctionMapper()** - Method in class javax.el.[ELContext](https://java.specs.java.net/jmmt-api/jmmt-api-1.0.1-SNAPSHOT/docs/javadoc/)
Retrieves the FunctionMapper associated with this ELContext.

**getFunctions()** - Method in class javax.servlet.jsp.tagext.[TagLibraryInfo](https://java.specs.java.net/jmmt-api/jmmt-api-1.0.1-SNAPSHOT/docs/javadoc/)
An array describing the functions that are defined in this tag library.

**getFunctionSignature()** - Method in class
javax.servlet.jsp.tagext.[FunctionInfo](https://java.specs.java.net/jmmt-api/jmmt-api-1.0.1-SNAPSHOT/docs/javadoc/)
The signature of the function.

**getGlobalTransactionId()** - Method in interface javax.transaction.xa.[Xid](https://java.specs.java.net/jmmt-api/jmmt-api-1.0.1-SNAPSHOT/docs/javadoc/)
Obtain the global transaction identifier part of XID as an array of bytes.

**getGroup(boolean)** - Method in class javax.mail.internet.[InternetAddress](https://java.specs.java.net/jmmt-api/jmmt-api-1.0.1-SNAPSHOT/docs/javadoc/)
Return the members of a group address.

**getHandle()** - Method in interface javax.ejb.[EJBObject](https://java.specs.java.net/jmmt-api/jmmt-api-1.0.1-SNAPSHOT/docs/javadoc/)
Obtain a handle for the EJB object.

**getHandle()** - Method in interface javax.ejb.[Timer](https://java.specs.java.net/jmmt-api/jmmt-api-1.0.1-SNAPSHOT/docs/javadoc/)
Get a serializable handle to the timer.

**getHandlerChain(QName)** - Method in interface
javax.xml.rpc.handler.[HandlerRegistry](https://java.specs.java.net/jmmt-api/jmmt-api-1.0.1-SNAPSHOT/docs/javadoc/)
Gets the handler chain for the specified service endpoint.
**getHandlerChain()** - Method in interface javax.xml.ws.Binding
Gets a copy of the handler chain for a protocol binding instance.

**getHandlerChain(PortInfo)** - Method in interface javax.xml.ws.handler.HandlerResolver
Gets the handler chain for the specified port.

**getHandlerClass()** - Method in class javax.xml.rpc.handler.HandlerInfo
Gets the Handler class.

**getHandlerConfig()** - Method in class javax.xml.rpc.handler.HandlerInfo
Gets the Handler configuration.

**getHandlerKeys()** - Static method in class javax.security.jacc.PolicyContext
This method may be used to obtain the keys that identify the container specific context handlers registered by the container.

**getHandlerRegistry()** - Method in interface javax.xml.rpc.Service
Returns the configured HandlerRegistry instance for this Service instance.

**getHandlerResolver()** - Method in class javax.xml.ws.Service
Returns the configured handler resolver.

**getHandlerResolver()** - Method in class javax.xml.ws.spi.ServiceDelegate
Returns the configured handler resolver.

**getHeader()** - Method in class javax.faces.component.UIColumn
Return the header facet of the column (if any).

**getHeader()** - Method in class javax.faces.component.UIData
Return the header facet of this component (if any).

**getHeader(String)** - Method in class javax.mail.internet.InternetHeaders
Get all the headers for this header_name, returned as a single String, with headers separated by the delimiter.

**getHeader(String)** - Method in class javax.mail.internet.MimeBodyPart
Get all the headers for this header_name.

**getHeader(String, String)** - Method in class javax.mail.internet.MimeBodyPart
Get all the headers for this header_name, returned as a single String, with headers separated by the delimiter.

**getHeader(String)** - Method in class javax.mail.internet.MimeMessage
Get all the headers for this header_name.
getHeader(String, String) - Method in class javax.mail.internet.MimeMessage
    Get all the headers for this header name, returned as a single String, with headers separated by the delimiter.
getHeader(String, String) - Method in interface javax.mail.internet.MimePart
    Get the values of all header fields available for this header, returned as a single String, with the values separated by the delimiter.
getHeader(String) - Method in interface javax.mail.Part
    Get all the headers for this header name.
getHeader(String) - Method in interface javax.mail.internet.MimePart
    Get the values of all header fields available for this header, returned as a single String, with the values separated by the delimiter.
getHeader(String) - Method in class javax.servlet.http.HttpServletRequest
    Returns the value of the specified request header as a String.
getHeader(String) - Method in class javax.servlet.http.HttpServletRequestWrapper
    The default behavior of this method is to return getHeader(String name) on the wrapped request object.
getHeader(String) - Method in class javax.xml.soap.MimeHeaders
    Returns all of the values for the specified header as an array of String objects.
getHeader() - Method in interface javax.xml.soap.SOAPEnvelope
    Returns the SOAPHeader object for this SOAPEnvelope object.
getHeaderClass() - Method in class javax.faces.component.html.HtmlColumn
    Return the value of the headerClass property.
getHeaderClass() - Method in class javax.faces.component.html.HtmlDataTable
    Return the value of the headerClass property.
getHeaderClass() - Method in class javax.faces.component.html.HtmlPanelGrid
    Return the value of the headerClass property.
getHeaderName() - Method in class javax.mail.search.HeaderTerm
    Return the name of the header to compare with.
getHeaderNames() - Method in class javax.mail.FetchProfile
    Get the names of the header-fields set in this profile.
    Returns an enumeration of all the header names this request contains.
**getHeaderNames()** - Method in class
javax.servlet.http.HttpServletRequestWrapper
The default behavior of this method is to return getHeaderNames() on the wrapped request object.

**getHeaders(String)** - Method in interface
javax.servlet.http.HttpServletRequest
Returns all the values of the specified request header as an Enumeration of String objects.

**getHeaders(String)** - Method in class
javax.servlet.http.HttpServletRequestWrapper
The default behavior of this method is to return getHeaders(String name) on the wrapped request object.

**getHeaders()** - Method in class
javax.xml.rpc.handler.GenericHandler
Gets the header blocks processed by this Handler instance.

**getHeaders()** - Method in interface
javax.xml.rpc.handler.Handler
Gets the header blocks that can be processed by this Handler instance.

**getHeaders()** - Method in class
javax.xml.rpc.handler.HandlerInfo
Gets the header blocks processed by this Handler.

**getHeaders()** - Method in interface
javax.xml.ws.handler.soap.SOAPHandler
Gets the header blocks that can be processed by this Handler instance.

**getHeaders(QName, JAXBContext, boolean)** - Method in interface
javax.xml.ws.handler.soap.SOAPMessageContext
Gets headers that have a particular qualified name from the message in the message context.

**getHeapSize()** - Method in interface
javax.management.j2ee.statistics.JVMStats
Size of the JVM's heap.

**getHeight()** - Method in class
javax.faces.component.html.HtmlGraphicImage
Return the value of the height property.

**getHighWaterMark()** - Method in interface
javax.management.j2ee.statistics.RangeStatistic
The highest value this attribute has held since the beginning of the measurement.

**getHomeHandle()** - Method in interface javax.ejb.EJBHome
Obtain a handle for the remote home object.
**getHomeInterfaceClass()** - Method in interface `javax.ejb.EJBMetaData`
  Obtain the Class object for the enterprise Bean's remote home interface.

**getHost()** - Method in class `javax.mail.internet.NewsAddress`
  Get the host.

**getHost()** - Method in class `javax.mail.URLName`
  Returns the host of this URLName.

**getHreflang()** - Method in class `javax.faces.component.html.HtmlCommandLink`
  Return the value of the `hreflang` property.

**getHreflang()** - Method in class `javax.faces.component.html.HtmlOutputLink`
  Return the value of the `hreflang` property.

**getHttpSession()** - Method in interface `javax.xml.rpc.server.ServletEndpointContext`
  The `getHttpSession` method returns the current HTTP session (as a `javax.servlet.http.HttpSession`).

**getHumanPresentableName()** - Method in class `javax.activation.ActivationDataFlavor`
  Return the Human Presentable name.

**getId()** - Method in interface `javax.enterprise.deploy.model.DDBean`
  Returns a tool-specific reference for attribute ID on an element in the deployment descriptor.

**getId()** - Method in class `javax.faces.component.UICOMPONENT UICOMPONENT`
  Return the component identifier of this `UICOMPONENT`.

**getId()** - Method in class `javax.faces.component.UICOMPONENTBase`

**getId()** - Method in class `javax.faces.webapp.UICOMPONENT ClassicTagBase`
  Return the `id` value assigned by the page author.

**getId()** - Method in class `javax.resource.spi.ConnectionEvent`
  Get the type of event

**getId()** - Method in interface `javax.servlet.http.HttpServletRequest`
  Returns a string containing the unique identifier assigned to this session.

**getId()** - Method in class `javax.servlet.jsp.tagext.TagData`
  The value of the tag's `id` attribute.

**getId()** - Method in class `javax.servlet.jsp.tagext.TagSupport`
  The value of the `id` attribute of this tag; or null.
**getld()** - Method in class javax.servlet.jsp.tagext.**ValidationMessage**
Get the jsp:id.

**getld()** - Method in interface javax.xml.registry.infomodel.**Key**
Returns the unique Id of this key.

**getIdAttribute(TagAttributeInfo[])** - Static method in class javax.servlet.jsp.tagext.**TagAttributeInfo**
Convenience static method that goes through an array of TagAttributeInfo objects and looks for "id".

**getIdentificationScheme()** - Method in interface javax.xml.registry.infomodel.**ExternalIdentifier**
Gets the ClassificationScheme that is used as the identification scheme for identifying this object.

**getld()** - Method in interface javax.servlet.http.**HttpSessionContext**
**Deprecated. As of Java Servlet API 2.1 with no replacement. This method must return an empty Enumeration and will be removed in a future version of this API.**

**getIgnoreCase()** - Method in class javax.mail.search.**StringTerm**
Return true if we should ignore case when matching.

**getImage()** - Method in class javax.faces.component.html.**HtmlCommandButton**
Return the value of the image property.

**getImplementor()** - Method in class javax.xml.ws.**Endpoint**
Returns the implementation object for this endpoint.

**getIndexOfNextChildTag()** - Method in class javax.faces.webapp.**UIComponentClassicTagBase**
Return the index of the next child to be added as a child of this tag.

**getInfo()** - Method in interface javax.ejb.**Timer**
Get the information associated with the timer at the time of creation.

**getInfo()** - Method in class javax.faces.component.html.**HtmlMessage**
Return the value of the infoClass property.

**getInfo()** - Method in class javax.faces.component.html.**HtmlMessages**
Return the value of the infoClass property.

**getInfoString()** - Method in class javax.servlet.jsp.tagext.**TagInfo**
The information string for the tag.
**getInfoString()** - Method in class `javax.servlet.jsp.tagext.TagLibraryInfo`
Information (documentation) for this TLD.

**getInfoStyle()** - Method in class `javax.faces.component.html.HtmlMessage`
Return the value of the `infoStyle` property.

**getInfoStyle()** - Method in class `javax.faces.component.html.HtmlMessages`
Return the value of the `infoStyle` property.

**getInitParameter(String)** - Method in class `javax.faces.context.ExternalContext`
Return the value of the specified application initialization parameter (if any).

**getInitParameter(String)** - Method in interface `javax.servlet.FilterConfig`
Returns a `String` containing the value of the named initialization parameter, or `null` if the parameter does not exist.

**getInitParameter(String)** - Method in class `javax.servlet.GenericServlet`
Returns a `String` containing the value of the named initialization parameter, or `null` if the parameter does not exist.

**getInitParameter(String)** - Method in interface `javax.servlet.ServletConfig`
Returns a `String` containing the value of the named initialization parameter, or `null` if the parameter does not exist.

**getInitParameter(String)** - Method in interface `javax.servlet.ServletContext`
Returns a `String` containing the value of the named context-wide initialization parameter, or `null` if the parameter does not exist.

**getInitParameterMap()** - Method in class `javax.faces.context.ExternalContext`
Return an immutable `Map` whose keys are the set of application initialization parameter names configured for this application, and whose values are the corresponding parameter values.

**getInitParameterNames()** - Method in interface `javax.servlet.FilterConfig`
Returns the names of the filter's initialization parameters as an `Enumeration` of `String` objects, or an empty `Enumeration` if the filter has no initialization parameters.

**getInitParameterNames()** - Method in class `javax.servlet.GenericServlet`
Returns the names of the servlet's initialization parameters as an `Enumeration` of `String` objects, or an empty `Enumeration` if the servlet has no initialization parameters.
**getInitParameterNames()** - Method in interface `javax.servlet.ServletConfig`
Returns the names of the servlet's initialization parameters as an `Enumeration` of `String` objects, or an empty `Enumeration` if the servlet has no initialization parameters.

**getInitParameterNames()** - Method in interface `javax.servlet.ServletContext`
Returns the names of the context's initialization parameters as an `Enumeration` of `String` objects, or an empty `Enumeration` if the context has no initialization parameters.

**getInitParameters()** - Method in class `javax.servlet.jsp.tagext.TagLibraryValidator`
Get the init parameters data as an immutable Map.

**getInputStream()** - Method in class `javax.activation.DataHandler`
Get the InputStream for this object.

**getInputStream()** - Method in interface `javax.activation.DataSource`
This method returns an `InputStream` representing the data and throws the appropriate exception if it can not do so.

**getInputStream()** - Method in class `javax.activation.FileDataSource`
This method will return an `InputStream` representing the the data and will throw an `IOException` if it can not do so.

**getInputStream()** - Method in class `javax.activation.URLDataSource`
The `getInputStream` method from the URL.

**getInputStream()** - Method in class `javax.mail.internet.MimeBodyPart`
Return a decoded input stream for this body part's "content".

**getInputStream()** - Method in class `javax.mail.internet.MimeMessage`
Return a decoded input stream for this Message's "content".

**getInputStream()** - Method in class `javax.mail.internet.MimePartDataSource`
Returns an input stream from this MimePart.

**getInputStream()** - Method in interface `javax.mail.Part`
Return an input stream for this part's "content".

**getInputStream()** - Method in class `javax.mail.util.ByteArrayDataSource`
Return an `InputStream` for the data.

**getInputStream()** - Method in class `javax.servlet.jsp.tagext.PageData`
Returns an input stream on the XML view of a JSP page.

**getInputStream()** - Method in interface `javax.servlet.ServletRequest`
Retrieves the body of the request as binary data using a `ServletInputStream`. 
**getInputStream()** - Method in class `javax.servlet.ServletRequestWrapper`

The default behavior of this method is to return `getInputStream()` on the wrapped request object.

**getInstance()** - Static method in class `javax.enterprise.deploy.shared.factories.DeploymentFactoryManager`

Retrieve the Singleton `DeploymentFactoryManager` `getInstance(Properties, Authenticator)`.

**getInstance(Properties, Authenticator)** - Static method in class `javax.mail.Session`

Get a new `Session` object.

**getInstance(Properties)** - Static method in class `javax.mail.Session`

Get a new `Session` object.

**getInt(String)** - Method in interface `javax.jms.MapMessage`

Returns the int value with the specified name.

**getIntHeader(String)** - Method in interface `javax.servlet.http.HttpServletRequest`

Returns the value of the specified request header as an int.

**getIntHeader(String)** - Method in class `javax.servlet.http.HttpServletRequestWrapper`

The default behavior of this method is to return `getIntHeader(String name)` on the wrapped request object.

**getIntProperty(String)** - Method in interface `javax.jms.Message`

Returns the value of the int property with the specified name.

**getInvalidAddresses()** - Method in class `javax.mail.event.TransportEvent`

Return the addresses to which this message could not be sent.

**getInvalidAddresses()** - Method in exception `javax.mail.SendFailedException`

Return the addresses to which this message could not be sent.

**getInvalidConnections(Set)** - Method in interface `javax.resource.spi.ValidatingManagedConnectionFactory`

This method returns a set of invalid `ManagedConnection` objects chosen from a specified set of `ManagedConnection` objects.

**getInvalidPropertyDescriptor()** - Method in exception `javax.resource.spi.InvalidPropertyException`
Get the list of invalid properties.

**getInvokedBusinessInterface()** - Method in interface javax.ejb.SessionContext
- Obtain the business interface through which the current business method invocation was made.

**getItemDescription()** - Method in class javax.faces.component.UISelectItem
- Return the description for this selection item.

**getItemLabel()** - Method in class javax.faces.component.UISelectItem
- Return the localized label for this selection item.

**getItems()** - Method in class javax.mail.FetchProfile
- Get the items set in this profile.

**getItemValue()** - Method in class javax.faces.component.UISelectItem
- Return the server value for this selection item.

**getJarFileUrls()** - Method in interface javax.persistence.spi.PersistenceUnitInfo
- Returns a list of URLs for the jar files or exploded jar file directories that the persistence provider must examine for managed classes of the persistence unit.

**getJavaEncoding(String)** - Method in class javax.xml.bind.helpers.AbstractMarshallerImpl
- Gets the corresponding Java encoding name from an IANA name.

**getJAXBNode(XmlNode)** - Method in class javax.xml.bind.Binder
- Gets the JAXB object associated with the given XML element.

**getJdbcDataSource()** - Method in interface javax.management.j2ee.statistics.JDBCConnectionStats
- Identifies the JDBC driver for the corresponding JDBCConnection.

**getJMSCorrelationID()** - Method in interface javax.jms.Message
- Gets the correlation ID for the message.

**getJMSCorrelationIDAsBytes()** - Method in interface javax.jms.Message
- Gets the correlation ID as an array of bytes for the message.

**getJMSDeliveryMode()** - Method in interface javax.jms.Message
- Gets the DeliveryMode value specified for this message.

**getJMSDestination()** - Method in interface javax.jms.Message
- Gets the Destination object for this message.

**getJMSExpiration()** - Method in interface javax.jms.Message
- Gets the message's expiration value.

**getJMSMajorVersion()** - Method in interface
javax.jms.ConnectionMetaData
  Gets the JMS major version number.
**getJMSMessageID()** - Method in interface javax.jms.Message
  Gets the message ID.
**getJMSMinorVersion()** - Method in interface javax.jms.ConnectionMetaData
  Gets the JMS minor version number.
**getJMSPriority()** - Method in interface javax.jms.Message
  Gets the message priority level.
**getJMSProviderName()** - Method in interface javax.jms.ConnectionMetaData
  Gets the JMS provider name.
**getJMSRedelivered()** - Method in interface javax.jms.Message
  Gets an indication of whether this message is being redelivered.
**getJMSReplyTo()** - Method in interface javax.jms.Message
  Gets the Destination object to which a reply to this message should be sent.
**getJMSTimestamp()** - Method in interface javax.jms.Message
  Gets the message timestamp.
**getJMSType()** - Method in interface javax.jms.Message
  Gets the message type identifier supplied by the client when the message was sent.
**getJMSVersion()** - Method in interface javax.jms.ConnectionMetaData
  Gets the JMS API version.
**getJMSXPropertyNames()** - Method in interface javax.jms.ConnectionMetaData
  Gets an enumeration of the JMSX property names.
**getJspApplicationContext(ServletContext)** - Method in class javax.servlet.jsp.JspFactory
  Obtains the JspApplicationContext instance associated with the web application for the given ServletContext.
**getJspBody()** - Method in class javax.servlet.jsp.tagext.SimpleTagSupport
  Returns the body passed in by the container via setJspBody.
**getJspContext()** - Method in class javax.servlet.jsp.tagext.JspFragment
  Returns the JspContext that is bound to this JspFragment.
**getJspContext()** - Method in class javax.servlet.jsp.tagext.SimpleTagSupport
  Returns the page context passed in by the container via
setJspContext.

**getJspId()** - Method in class

`javax.faces.webapp.UIComponentClassicTagBase`

**getJtaDataSource()** - Method in interface

`javax.persistence.spi.PersistenceUnitInfo`

Returns the JTA-enabled data source to be used by the persistence provider.

**getJtaDataSource()** - Method in interface

`javax.xml.registry.infomodel.RegistryObject`

Gets the key representing the universally unique ID (UUID) for this object.

**getKey()** - Method in interface

`javax.security.jacc.PolicyContextHandler`

This public method returns the keys identifying the context objects supported by the handler.

**getLabel()** - Method in class

`javax.faces.component.html.HtmlCommandButton`

Return the value of the label property.

**getLabel()** - Method in class

`javax.faces.component.html.HtmlInputSecret`

Return the value of the label property.

**getLabel()** - Method in class

`javax.faces.component.html.HtmlInputText`

Return the value of the label property.

**getLabel()** - Method in class

`javax.faces.component.html.HtmlInputTextarea`

Return the value of the label property.

**getLabel()** - Method in class

`javax.faces.component.html.HtmlSelectBooleanCheckbox`

Return the value of the label property.

**getLabel()** - Method in class

`javax.faces.component.html.HtmlSelectManyCheckbox`

Return the value of the label property.

**getLabel()** - Method in class

`javax.faces.component.html.HtmlSelectManyListbox`

Return the value of the label property.

**getLabel()** - Method in class

`javax.faces.component.html.HtmlSelectManyMenu`

Return the value of the label property.

**getLabel()** - Method in class
javax.faces.component.html.HtmlSelectOneListbox
  Return the value of the label property.
  **getLabel()** - Method in class
javax.faces.component.html.HtmlSelectOneMenu
  Return the value of the label property.
  **getLabel()** - Method in class
javax.faces.component.html.HtmlSelectOneRadio
  Return the value of the label property.
  **getLabel()** - Method in class
javax.faces.model.SelectItem
  Return the label of this item, to be rendered visibly for the user.
  **getLang()** - Method in class
javax.faces.component.html.HtmlCommandButton
  Return the value of the lang property.
  **getLang()** - Method in class
javax.faces.component.html.HtmlCommandLink
  Return the value of the lang property.
  **getLang()** - Method in class
javax.faces.component.html.HtmlDataTable
  Return the value of the lang property.
  **getLang()** - Method in class
javax.faces.component.html.HtmlForm
  Return the value of the lang property.
  **getLang()** - Method in class
javax.faces.component.html.HtmlGraphicImage
  Return the value of the lang property.
  **getLang()** - Method in class
javax.faces.component.html.HtmlInputSecret
  Return the value of the lang property.
  **getLang()** - Method in class
javax.faces.component.html.HtmlInputText
  Return the value of the lang property.
  **getLang()** - Method in class
javax.faces.component.html.HtmlInputTextarea
  Return the value of the lang property.
  **getLang()** - Method in class
javax.faces.component.html.HtmlMessage
  Return the value of the lang property.
  **getLang()** - Method in class
javax.faces.component.html.HtmlMessages
  Return the value of the lang property.
  **getLang()** - Method in class
javax.faces.component.html.HtmlOutputFormat
  Return the value of the lang property.
  **getLang()** - Method in class
javax.faces.component.html.HtmlOutputLabel
Return the value of the `lang` property.

**getLang()** - Method in class `javax.faces.component.html.HtmlOutputLink`
Return the value of the `lang` property.

**getLang()** - Method in class `javax.faces.component.html.HtmlOutputText`
Return the value of the `lang` property.

**getLang()** - Method in class `javax.faces.component.html.HtmlPanelGrid`
Return the value of the `lang` property.

**getLang()** - Method in class `javax.faces.component.html.HtmlSelectBooleanCheckbox`
Return the value of the `lang` property.

**getLang()** - Method in class `javax.faces.component.html.HtmlSelectManyCheckbox`
Return the value of the `lang` property.

**getLang()** - Method in class `javax.faces.component.html.HtmlSelectManyListbox`
Return the value of the `lang` property.

**getLang()** - Method in class `javax.faces.component.html.HtmlSelectManyMenu`
Return the value of the `lang` property.

**getLang()** - Method in class `javax.faces.component.html.HtmlSelectOneListbox`
Return the value of the `lang` property.

**getLang()** - Method in class `javax.faces.component.html.HtmlSelectOneMenu`
Return the value of the `lang` property.

**getLang()** - Method in class `javax.faces.component.html.HtmlSelectOneRadio`
Return the value of the `lang` property.

**getLargeIcon()** - Method in class `javax.servlet.jsp.tagext.TagInfo`
Get the path to the large icon.

Returns the last time the client sent a request associated with this session, as the number of milliseconds since midnight January 1, 1970 GMT, and marked by the time the container received the request.

**getLastModified(HttpServletRequest)** - Method in class `javax.servlet.http.HttpServlet`
Returns the time the `HttpServletRequest` object was last modified, in
milliseconds since midnight January 1, 1970 GMT.

**getLastName()** - Method in interface
javax.xml.registry.infomodel.PersonName
  Gets the last name (surname) for this Person.

**getLastSampleTime()** - Method in interface
javax.management.j2ee.statistics.Statistic
  The time of the last measurement represented as a long, whose value is the number of milliseconds since January 1, 1970, 00:00:00.

**getLayout()** - Method in class
javax.faces.component.html.HtmlMessages
  Return the value of the layout property.

**getLayout()** - Method in class
javax.faces.component.html.HtmlPanelGroup
  Return the value of the layout property.

**getLayout()** - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
  Return the value of the layout property.

**getLayout()** - Method in class
javax.faces.component.html.HtmlSelectOneRadio
  Return the value of the layout property.

**getLifecycle(String)** - Method in class
javax.faces.lifecycle.LifecycleFactory
  Create (if needed) and return a Lifecycle instance for the specified lifecycle identifier.

**getLifecycleIds()** - Method in class
javax.faces.lifecycle.LifecycleFactory
  Return an Iterator over the set of lifecycle identifiers supported by this factory.

**getLifeCycleManager()** - Method in interface
javax.xml.registry.infomodel.RegistryObject
  Returns the LifeCycleManager that created this object.

**getLineCount()** - Method in class
javax.mail.internet.MimeBodyPart
  Return the number of lines for the content of this Part.

**getLineCount()** - Method in class
javax.mail.internet.MimeMessage
  Return the number of lines for the content of this message.

**getLineCount()** - Method in interface
javax.mail.Part
  Return the number of lines in the content of this part.

**getLineNumber()** - Method in class
javax.xml.bind.helpers.ValidationEventLocatorImpl
**getLineNumber()** - Method in interface javax.xml.bind.**ValidationEventLocator**
   Return the line number if available

**getLineNumber()** - Method in interface javax.xml.stream.**Location**
   Return the line number where the current event ends, returns -1 if none is available.

**getLinkedCause()** - Method in exception javax.xml.rpc.**JAXRPCException**
   Gets the Linked cause

**getLinkedCause()** - Method in exception javax.xml.rpc.**ServiceException**
   Gets the Linked cause

**getLinkedException()** - Method in exception javax.jms.**JMSException**
   Gets the exception linked to this one.

**getLinkedException()** - Method in exception javax.resource.**ResourceException**
   Deprecated. J2SE release 1.4 supports a chained exception facility that allows any throwable to know about another throwable, if any, that caused it to get thrown. Refer to `getCause` and `initCause` methods of the java.lang.Throwable class..

**getLinkedException()** - Method in exception javax.xml.bind.**JAXBException**

**getLinkedException()** - Method in interface javax.xml.bind.**ValidationEvent**
   Retrieve the linked exception for this warning/error.

**getLinkedObjects()** - Method in interface javax.xml.registry.infomodel.**ExternalLink**
   Gets the collection of RegistryObjects that are annotated by this ExternalLink.

**getLinkedWarning()** - Method in exception javax.resource.cci.**ResourceWarning**
   Deprecated. J2SE release 1.4 supports a chained exception facility that allows any throwable to know about another throwable, if any,
that caused it to get thrown. Refer to `getCause` and `initCause` methods of the `java.lang.Throwable` class.

**getListener()** - Method in class
javax.xml.bind.helpers.Abs
t getListener() - Method in class
javax.xml.bind.helpers.AbstractMarshallerImpl

getListener() - Method in class
getListener() - Method in interface javax.xml.bind.Marshaller
Return `Marshaler.Listener` registered with this `Marshaler`.
getListener() - Method in interface javax.xml.bind.Unmarshaler
Return `Unmarshaler.Listener` registered with this `Unmarshaler`.

**getListenerRegistry()** - Method in interface
javax.management.j2ee.Management
Returns the listener registry implementation for this MEJB.

**getLocalAddr()** - Method in interface javax.servlet.ServletRequest
Returns the Internet Protocol (IP) address of the interface on which the request was received.

**getLocalAddr()** - Method in class javax.servlet.ServletRequestWrapper
The default behavior of this method is to return `getLocalAddr()` on the wrapped request object.

**getLocalAddress(Session)** - Static method in class
javax.mail.internet.InternetAddress
Return an `InternetAddress` object representing the current user.

**getLocale()** - Method in class javax.el.ELContext
Get the `Locale` stored by a previous invocation to `ELContext.setLocale(java.util.Locale)`.

**getLocale()** - Method in class javax.faces.component.UIViewRoot
Return the `Locale` to be used in localizing the response being created for this view.

**getLocale()** - Method in class javax.faces.convert.DateTimeConverter
Return the `Locale` to be used when parsing or formatting dates and times.

**getLocale()** - Method in class javax.faces.convert.NumberConverter
Return the `Locale` to be used when parsing numbers.

**getLocale()** - Method in interface javax.servlet.ServletRequest
Returns the preferred `Locale` that the client will accept content in, based on the Accept-Language header.

**getLocale()** - Method in class javax.servlet.ServletRequestWrapper
The default behavior of this method is to return `getLocale()` on the wrapped request object.

**getLocale()** - Method in interface `javax.servlet.ServletResponse`  
Returns the locale specified for this response using the `ServletResponse.setLocale(java.util.Locale)` method.

**getLocale()** - Method in class `javax.servlet.ServletResponseWrapper`  
The default behavior of this method is to return `getLocale()` on the wrapped response object.

**getLocale()** - Method in interface `javax.xml.registry.infomodelLocalizedString`  
Get the Locale for this object.

**getLocales()** - Method in interface `javax.servlet.ServletRequest`  
Returns an `Enumeration` of `Locale` objects indicating, in decreasing order starting with the preferred locale, the locales that are acceptable to the client based on the Accept-Language header.

**getLocales()** - Method in class `javax.servlet.ServletRequestWrapper`  
The default behavior of this method is to return `getLocales()` on the wrapped request object.

**getLocaleString(Locale, String)** - Method in interface `javax.xml.registry.infomodelInternationalString`  
Gets the `LocalizedString` for the specified Locale and charsetName.

**getLocalizedStrings()** - Method in interface `javax.xml.registry.infomodelInternationalString`  
Returns the `LocalizedStrings` associated with this object.

**getLocalName()** - Method in interface `javax.servlet.ServletRequest`  
Returns the host name of the Internet Protocol (IP) interface on which the request was received.

**getLocalName()** - Method in class `javax.servlet.ServletRequestWrapper`  
The default behavior of this method is to return `getLocalName()` on the wrapped request object.

**getLocalName()** - Method in interface `javax.xml.soap.Name`  
Gets the local name part of the XML name that this `Name` object represents.

**getLocalName()** - Method in class  
`javax.xml.stream.util.StreamReaderDelegate`  
_Returns the (local) name of the current event.
**getLocalPort()** - Method in interface javax.servlet.ServletRequest
Returns the Internet Protocol (IP) port number of the interface on which the request was received.

**getLocalPort()** - Method in class javax.servlet.ServletRequestWrapper
The default behavior of this method is to return getLocalPort() on the wrapped request object.

**getLocalTransaction()** - Method in interface javax.resource.cci.Connection
Returns a LocalTransaction instance that enables a component to demarcate resource manager local transactions on the Connection.

**getLocalTransaction()** - Method in interface javax.resource.spi.ManagedConnection
Returns a javax.resource.spi.LocalTransaction instance.

**getLocalValue()** - Method in class javax.faces.component.UIOutput
**getLocalValue()** - Method in interface javax.faces.component.ValueHolder
Return the local value of this UIComponent (if any), without evaluating any associated ValueExpression.

**getLocation()** - Method in interface javax.xml.stream.events.XMLEvent
Return the location of this event.

**getLocation()** - Method in class javax.xml.stream.util.StreamReaderDelegate

**getLocation()** - Method in exception javax.xml.stream.XMLStreamException
Gets the location of the exception

**getLocation()** - Method in interface javax.xml.stream.XMLStreamReader
Return the current location of the processor.

**getLocator()** - Method in class javax.xml.bind.helpers.ValidationEventImpl
Retrieve the locator for this warning/error.

**getLogWriter()** - Method in interface javax.resource.spi.ManagedConnection
Gets the log writer for this ManagedConnection instance.

**getLogWriter()** - Method in interface javax.resource.spi.ManagedConnectionFactory
Get the log writer for this ManagedConnectionFactory instance.

**getLog(String)** - Method in interface javax.jms.MapMessage
- Returns the `long` value with the specified name.

**getLongdesc()** - Method in class javax.faces.component.html.HtmlGraphicImage
- Return the value of the `longdesc` property.

**getLongProperty(String)** - Method in interface javax.jms.Message
- Returns the value of the `long` property with the specified name.

**getLowerBound()** - Method in interface javax.management.j2ee.statistics.BoundaryStatistic
- The lower limit of the value of this attribute. The upper limit of the value of this attribute.

**getLowWaterMark()** - Method in interface javax.management.j2ee.statistics.RangeStatistic
- The lowest value this attribute has held since the beginning of the measurement.

**getMajorVersion()** - Method in interface javax.servlet.ServletContext
- Returns the major version of the Java Servlet API that this servlet container supports.

**getMajorVersion()** - Method in interface javax.xml.registry.infomodel.Versionable
- Gets the major revision number for this version of the Versionable object.

**getManagedClassNames()** - Method in interface javax.persistence.spi.PersistenceUnitInfo
- Returns the list of the names of the classes that the persistence provider must add it to its set of managed classes.

**getManagedConnectionFactory()** - Method in interface javax.management.j2ee.statistics.JCAConnectionStats
- Returns the associated JCAManagedConnectionFactory

**getManagedConnectionFactory()** - Method in class javax.resource.spi.security.PasswordCredential
- Gets the target ManagedConnectionFactory for which the user name and password has been set by the application server.

**getMapNames()** - Method in interface javax.jms.MapMessage
- Returns an Enumeration of all the names in the MapMessage object.

**getMappingFileNames()** - Method in interface javax.persistence.spi.PersistenceUnitInfo
Returns the list of mapping file names that the persistence provider
must load to determine the mappings for the entity classes.

**getMatchingHeaderLines(String[])** - Method in class
javax.mail.internet.InternetHeaders
Return all matching header lines as an Enumeration of Strings.

**getMatchingHeaderLines(String[])** - Method in class
javax.mail.internet.MimeBodyPart
Get matching header lines as an Enumeration of Strings.

**getMatchingHeaderLines(String[])** - Method in class
javax.mail.internet.MimeMessage
Get matching header lines as an Enumeration of Strings.

**getMatchingHeaderLines(String[])** - Method in interface
javax.mail.internet.MimePart
Get matching header lines as an Enumeration of Strings.

**getMatchingHeaders(String[])** - Method in class
javax.mail.internet.InternetHeaders
Return all matching Header objects.

**getMatchingHeaders(String[])** - Method in class
javax.mail.internet.MimeBodyPart
Return matching headers from this Message as an Enumeration of
Header objects.

**getMatchingHeaders(String[])** - Method in class
javax.mail.internet.MimeMessage
Return matching headers from this Message as an Enumeration of
Header objects.

**getMatchingHeaders(String[])** - Method in interface
javax.mail.Part
Return matching headers from this part as an Enumeration of
Header objects.

**getMatchingHeaders(String[])** - Method in class
javax.xml.soap.MimeHeaders
Returns all the MimeHeader objects whose name matches a name in
the given array of names.

**getMatchingMimeHeaders(String[])** - Method in class
javax.xml.soap.AttachmentPart
Retrieves all MimeHeader objects that match a name in the given
array.

**getMatchingMimeHeaders(String[])** - Method in class
javax.xml.soap.SOAPPart
Retrieves all MimeHeader objects that match a name in the given
array.

**getMaxAge()** - Method in class `javax.servlet.http.Cookie`  
Retrieves the maximum age of the cookie, specified in seconds. By default, -1 indicating the cookie will persist until browser shutdown.

**getMaxConnections()** - Method in interface `javax.resource.spi.ManagedConnectionMetaData`  
Returns the maximum limit on number of active concurrent connections that an EIS instance can support across client processes.

**getMaxFractionDigits()** - Method in class `javax.faces.convert.NumberConverter`  
Returns the maximum number of digits `getAsString()` should render in the fraction portion of the result.

**getMaximum()** - Method in class `javax.faces.validator.DoubleRangeValidator`  
Returns the maximum value to be enforced by this `Validator` or `Double.MAX_VALUE` if it has not been set.

**getMaximum()** - Method in class `javax.faces.validator.LengthValidator`  
Returns the maximum length to be enforced by this `Validator`, or 0 if the maximum has not been set.

**getMaximum()** - Method in class `javax.faces.validator.LongRangeValidator`  
Returns the maximum value to be enforced by this `Validator`.

**getMaximumSeverity()** - Method in class `javax.faces.context.FacesContext`  
Returns the maximum severity level recorded on any `FacesMessage` that has been queued, whether or not they are associated with any specific `UIComponent`.

**getMaxInactiveInterval()** - Method in interface `javax.servlet.http.HttpSession`  
Returns the maximum time interval, in seconds, that the servlet container will keep this session open between client accesses.

**getMaxIntegerDigits()** - Method in class `javax.faces.convert.NumberConverter`  
Returns the maximum number of digits `getAsString()` should render in the integer portion of the result.

**getMaxLength()** - Method in class `javax.faces.component.html.HtmlInputSecret`  
Returns the value of the `maxLength` property.

**getMaxLength()** - Method in class
javax.faces.component.html.HtmlInputText
Return the value of the maxLength property.

getMaxTime() - Method in interface
javax.management.j2ee.statistics.TimeStatistic
The maximum amount of time taken to complete one invocation of this operation since the beginning of this measurement.

getMBeanCount() - Method in interface
javax.management.j2ee.Management
Returns the number of managed objects registered in the MEJB.

getMBeanInfo(ObjectName) - Method in interface
javax.management.j2ee.Management
This method discovers the attributes and operations that a managed object exposes for management.

getMechanismType() - Method in interface
javax.xml.rpc.encoding.Deserializer
Gets the type of the XML processing mechanism and representation used by this Deserializer.

getMechanismType() - Method in interface
javax.xml.rpc.encoding.Serializer
Gets the type of the XML processing mechanism and representation used by this Serializer.

getMechType() - Method in interface
javax.resource.spi.security.GenericCredential
Deprecated. Returns the mechanism type for the GenericCredential instance.

getMessage() - Method in exception javax.ejb.EJBException
Returns the detail message, including the message from the nested exception if there is one.

getMessage() - Method in interface
javax.enterprise.deploy.spi.status.DeploymentStatus
Retrieve any additional information about the status of this event.

getMessage() - Method in exception
javax.faces.application.ViewExpiredException
Return the message for this exception prepended with the view identifier if the view identifier is not null, otherwise, return the message.

getMessage() - Method in class
javax.mail.event.MessageChangedEvent
Return the changed Message.
**getMessage()** - Method in class *javax.mail.event.StoreEvent*
Get the message from the Store.

**getMessage()** - Method in class *javax.mail.event.TransportEvent*
Get the Message object associated with this Transport Event.

**getMessage(int)** - Method in class *javax.mail.Folder*
Get the Message object corresponding to the given message number.

**getMessage()** - Method in class *javax.mail.MessageContext*
Return the Message that contains the content.

**getMessage()** - Method in exception *javax.resource.ResourceException*
Returns a detailed message string describing this exception.

**getMessage()** - Method in class *javax.servlet.jsp.tagext.ValidationMessage*
Get the localized validation message.

**getMessage()** - Method in class *javax.xml.bind.helpers.ValidationEventImpl*

**getMessage()** - Method in interface *javax.xml.bind.ValidationEvent*
Retrieve the text message for this warning/error.

**getMessage()** - Method in exception *javax.xml.registry.JAXRException*
Returns the detail message for this JAXRException object.

**getMessage()** - Method in interface *javax.xml.rpc.handler.soap.SOAPMessageContext*
Gets the SOAPMessage from this message context.

**getMessage()** - Method in interface *javax.xml.ws.handler.soap.SOAPMessageContext*
Gets the SOAPMessage from this message context.

**getMessage()** - Method in interface *javax.xml.ws.handler.soap.SOAPMessageContext*
Gets the SOAPMessage from this message context.

**getLocalizedMessage()** - Method in class *javax.faces.application.Application*
Return the fully qualified class name of the ResourceBundle to be used for JavaServer Faces messages for this application.
**getMessageByUID(long)** - Method in interface `javax.mail.UIDFolder`
Get the Message corresponding to the given UID.

**getMessageChangeType()** - Method in class `javax.mail.event.MessageChangedEvent`
Return the type of this event.

**getMessageContext()** - Method in interface `javax.ejb.SessionContext`
Obtain a reference to the JAX-RPC MessageContext.

**getMessageContext()** - Method in class `javax.mail.internet.MimePartDataSource`
Return the MessageContext for the current part.

**getMessageContext()** - Method in interface `javax.mail.MessageAware`
Return the message context.

**getMessageContext()** - Method in interface `javax.xml.rpc.server.ServletEndpointContext`
The method `getMessageContext` returns the MessageContext targeted for this endpoint instance.

Returns the MessageContext for the request being served at the time this method is called.

**getMessageCount()** - Method in class `javax.mail.Folder`
Get total number of messages in this Folder.

**getMessageCount()** - Method in interface `javax.management.j2ee.statistics.JMSEndpointStats`
Number of messages sent or received.

**getMessageCount()** - Method in interface `javax.management.j2ee.statistics.JMSSessionStats`
Number of messages exchanged.

**getMessageCount()** - Method in interface `javax.management.j2ee.statistics.MessageDrivenBeanStats`
Number of messages received.

**getMessageFactory()** - Method in interface `javax.xml.ws.soap.SOAPBinding`
Gets the SAAJ MessageFactory instance used by this SOAP binding.

**getMessageID()** - Method in class `javax.mail.internet.MimeMessage`
Returns the value of the "Message-ID" header field.

**getMessageListener()** - Method in interface `javax.jms.MessageConsumer`
Gets the message consumer's MessageListener.
**getMessagListener()** - Method in interface `javax.jms.Session`  
Returns the session's distinguished message listener (optional).

**getMessagNumber()** - Method in class `javax.mail.Message`  
Get the Message number for this Message.

**getMessagss()** - Method in class `javax.faces.context.FacesContext`  
Return an Iterator over the FacesMessage that have been queued, whether or not they are associated with any specific client identifier.

**getMessagss(String)** - Method in class `javax.faces.context.FacesContext`  
Return an Iterator over the FacesMessage that have been queued that are associated with the specified client identifier (if clientId is not null), or over the FacesMessage that have been queued that are not associated with any specific client identifier (if clientId is null).

**getMessagss()** - Method in class `javax.mail.event.MessageCountEvent`  
Return the array of messages added or removed.

**getMessagss(int, int)** - Method in class `javax.mail.Folder`  
Get the Message objects for message numbers ranging from start through end, both start and end inclusive.

**getMessagss(int[])** - Method in class `javax.mail.Folder`  
Get the Message objects for message numbers specified in the array.

**getMessagss()** - Method in class `javax.mail.Folder`  
Get all Message objects from this Folder.

**getMessagssByUID(long, long)** - Method in interface `javax.mail.UIDFolder`  
Get the Messages specified by the given range.

**getMessagssByUID(long[])** - Method in interface `javax.mail.UIDFolder`  
Get the Messages specified by the given array of UIDs.

**getMessageSelector()** - Method in interface `javax.jms.MessageConsumer`  
Gets this message consumer's message selector expression.

**getMessageSelector()** - Method in interface `javax.jms.QueueBrowser`  
Gets this queue browser's message selector expression.

**getMessageType()** - Method in class `javax.mail.event.StoreEvent`  
Return the type of this event.

**getMessageWaitTime()** - Method in interface `javax.management.j2ee.statistics.JMSEndpointStats`  
Time spent by a message before being delivered.
javax.management.j2ee.statistics.JMSSessionStats
Time spent by a message before being delivered.

**getMetaData()** - Method in interface javax.jms.Connection
Gets the metadata for this connection.

**getMetaData()** - Method in interface javax.resource.cci.Connection
Gets the information on the underlying EIS instance represented through an active connection.

**getMetaData()** - Method in interface javax.resource.cci.ConnectionFactory
Gets metadata for the Resource Adapter.

**getMetaData()** - Method in interface javax.resource.spi.ManagedConnection
Gets the metadata information for this connection's underlying EIS resource manager instance.

**getMetadata()** - Method in class javax.xml.ws.Endpoint
Returns a list of metadata documents for the service.

**getMethod()** - Method in interface javax.interceptor.InvocationContext
Returns the method of the bean class for which the interceptor was invoked.

Returns the name of the HTTP method with which this request was made, for example, GET, POST, or PUT.

**getMethod()** - Method in class javax.servlet.http.HttpServletRequestWrapper
The default behavior of this method is to return getMethod() on the wrapped request object.

**getMethodInfo(ELContext)** - Method in class javax.el.MethodExpression
Evaluates the expression relative to the provided context, and returns information about the actual referenced method.

**getMethodReadyCount()** - Method in interface javax.management.j2ee.statistics.SessionBeanStats
Number of beans in the method-ready state.

**getMethodSignature()** - Method in class javax.servlet.jsp.tagext.TagAttributeInfo
Returns the expected method signature of this deferred method attribute.

**getMiddleName()** - Method in interface javax.xml.registry.infomodel.PersonName
Gets the middle name for this Person.

**getMimeHeader(String)** - Method in class \(\text{javax.xml.soap.AttachmentPart}\)

- Gets all the values of the header identified by the given String.

**getMimeHeader(String)** - Method in class \(\text{javax.xml.soap.SOAPPart}\)

- Gets all the values of the MimeHeader object in this SOAPPart object that is identified by the given String.

**getMimeHeaders()** - Method in class \(\text{javax.xml.soap.SOAPMessage}\)

- Returns all the transport-specific MIME headers for this SOAPMessage object in a transport-independent fashion.

**getMimeType()** - Method in class \(\text{javax.activation.ActivationDataFlavor}\)

- Return the MIME type for this DataFlavor.

**getMimeType(String)** - Method in interface \(\text{javax.servlet.ServletContext}\)

- Returns the MIME type of the specified file, or \text{null} if the MIME type is not known.

**getMimeType()** - Method in interface \(\text{javax.xml.registry.infomodel.ExtrinsicObject}\)

- Gets the mime type associated with this object.

**getMimeType()** - Method in class \(\text{javax.activation.MailcapCommandMap}\)

- Get all the MIME types known to this command map.

**getMinFractionDigits()** - Method in class \(\text{javax.faces.convert.NumberConverter}\)

- Return the minimum number of digits \text{getAsString()} should render in the fraction portion of the result.

**getMinimum()** - Method in class \(\text{javax.faces.validator.DoubleRangeValidator}\)

- Return the minimum value to be enforced by this \text{validator}, or \text{Double.MIN_VALUE} if it has not been set.

**getMinimum()** - Method in class \(\text{javax.faces.validator.LengthValidator}\)

- Return the minimum length to be enforced by this \text{validator}, or \text{0} if the minimum has not been set.

**getMinimum()** - Method in class \(\text{javax.faces.validator.LongRangeValidator}\)

- Return the minimum value to be enforced by this \text{validator}.

**getMinIntegerDigits()** - Method in class \(\text{javax.faces.convert.NumberConverter}\)
Return the minimum number of digits `getAsString()` should render in the integer portion of the result.

`getMinorVersion()` - Method in interface `javax.servlet.ServletContext`

Returns the minor version of the Servlet API that this servlet container supports.

`getMinorVersion()` - Method in interface `javax.xml.registry.infomodel.Versionable`

 Gets the minor revision number for this version of the Versionable object.

`getMinTime()` - Method in interface `javax.management.j2ee.statistics.TimeStatistic`

 The minimum amount of time taken to complete one invocation of this operation since the beginning of this measurement.

`getMode()` - Method in class `javax.mail.Folder`

 Return the open mode of this folder.

`getModuleDTDVersion()` - Method in interface `javax.enterprise.deploy.model.DDBeanRoot`

  *Deprecated.* As of version 1.1 replaced by
`DDBeanRoot.getDDBeanRootVersion()`

`getModuleDTDVersion()` - Method in interface `javax.enterprise.deploy.model.DeployableObject`

  *Deprecated.* As of version 1.1 replaced by
`DDBeanRoot.getDDBeanRootVersion()`

`getModuleExtension()` - Method in class `javax.enterprise.deploy.shared.ModuleType`

 Return the file extension string for this enumeration.

`getModuleID()` - Method in interface `javax.enterprise.deploy.spi.TargetModuleID`

 Retrieve the id assigned to represent the deployed module.

`getModuleType(int)` - Static method in class `javax.enterprise.deploy.shared.ModuleType`

 Return an object of the specified value.

`getModuleUris(ModuleType)` - Method in interface `javax.enterprise.deploy.model.J2eeApplicationObject`

 Return the list of URIs of the designated module type.

`getModuleUris()` - Method in interface `javax.enterprise.deploy.model.J2eeApplicationObject`

 Return the list of URIs for all modules in the application.

`getMustUnderstand()` - Method in interface
javax.xml.soap.SOAPHeaderElement
Returns the boolean value of the mustUnderstand attribute for this SOAPHeaderElement.

**getName()** - Method in class javax.activation.DataHandler
Return the name of the data object.

**getName()** - Method in interface javax.activation.DataSource
Return the *name* of this object where the name of the object is dependant on the nature of the underlying objects.

**getName()** - Method in class javax.activation.FileDataSource
Return the *name* of this object.

**getName()** - Method in class javax.activation.URLDataSource
Calls the getFile method on the URL used to instantiate the object.

**getName()** - Method in class javax.el.MethodInfo
Returns the name of the method

**getName()** - Method in interface javax.enterprise.deploy.spi.Target
Retrieve the name of the target server.

**getName()** - Method in class javax.faces.component.UIParameter
Return the optional parameter name for this parameter.

**getName()** - Method in class javax.faces.webapp.FacetTag
Return the name to be assigned to this facet.

**getName()** - Method in class javax.mail.Folder
Returns the name of this Folder.

**getName()** - Method in class javax.mail.Header
Returns the name of this header.

**getName()** - Method in class javax.mail.internet.MimePartDataSource
DataSource method to return a name.

**getName()** - Method in class javax.mail.util.ByteArrayDataSource
Get the name of the data.

**getName()** - Method in interface javax.management.j2ee.statistics.Statistic
The name of this Statistic.

**getName()** - Method in interface javax.resource.spi.security.GenericCredential
**Deprecated.** Returns the name of the resource principal associated with a GenericCredential instance.

**getName()** - Method in class javax.servlet.http.Cookie
Returns the name of the cookie.

**getName()** - Method in class javax.servlet.http.HttpSessionBindingEvent
Returns the name with which the attribute is bound to or unbound
from the session.

**getName()** - Method in class `javax.servlet.jsp.tagext.FunctionInfo`
The name of the function.

**getName()** - Method in class `javax.servlet.jsp.tagext.TagAttributeInfo`
The name of this attribute.

**getName()** - Method in class `javax.servlet.jsp.tagext.TagFileInfo`
The unique action name of this tag.

**getName()** - Method in class `javax.servlet.ServletContextAttributeEvent`
Return the name of the attribute that changed on the ServletContext.

**getName()** - Method in class `javax.servlet.ServletRequestAttributeEvent`
Return the name of the attribute that changed on the ServletRequest.

**getName()** - Method in class `javax.xml.bind.JAXBElement`
Returns the xml element tag name.

**getName()** - Method in interface
`javax.xml.registry.infomodel.RegistryObject`
Gets the user-friendly name of this object.

**getName()** - Method in interface `javax.xml.registry.infomodel.Slot`
Gets the name for this Slot.

**getName()** - Method in class `javax.xml.soap.MimeHeader`
Returns the name of this MimeHeader object.

**getName()** - Method in interface `javax.xml.stream.events.Attribute`
Returns the QName for this attribute.

**getName()** - Method in interface `javax.xml.stream.events.EndElement`
Get the name of this event.

**getName()** - Method in interface `javax.xml.stream.events.EntityDeclaration`
The entity's name.

**getName()** - Method in interface `javax.xml.stream.events.EntityReference`
The name of the entity.

**getName()** - Method in interface `javax.xml.stream.events.NotationTokenDeclaration`
The notation name.

**getName()** - Method in interface `javax.xml.stream.eventsStartElement`
Get the name of this event.

**getName()** - Method in class `javax.xml.stream.util.StreamReaderDelegate`
**getName()** - Method in interface javax.xml.stream.XMLStreamReader
   Returns a QName for the current START_ELEMENT or END_ELEMENT event

**getNamedDispatcher(String)** - Method in interface javax.servlet.ServletContext
   Returns a RequestDispatcher object that acts as a wrapper for the named servlet.

**getNameFromAttribute()** - Method in class javax.servlet.jsp.tagext.TagVariableInfo
   The body of the <name-from-attribute> element.

**getNameGiven()** - Method in class javax.servlet.jsp.tagext.TagVariableInfo
   The body of the <name-given> element.

**getNames()** - Method in class javax.activation.MimeTypeParameterList
   Retrieve an enumeration of all the names in this list.

**getNames()** - Method in class javax.mail.internet.ParameterList
   Return an enumeration of the names of all parameters in this list.

**getNamespaceContext()** - Method in interface javax.xml.stream.eventsStartElement
   Gets a read-only namespace context.

**getNamespaceContext()** - Method in class javax.xml.stream.util.StreamReaderDelegate

**getNamespaceContext()** - Method in interface javax.xml.stream.XMLEventWriter
   Returns the current namespace context.

**getNamespaceContext()** - Method in interface javax.xml.stream.XMLStreamReader
   Returns a read only namespace context for the current position.

**getNamespaceContext()** - Method in interface javax.xml.stream.XMLStreamWriter
   Returns the current namespace context.

**getNamespaceCount()** - Method in class javax.xml.stream.util.StreamReaderDelegate
   Returns the count of namespaces declared on this START_ELEMENT or END_ELEMENT, this method is only valid on
getNamespacePrefix(int) - Method in class
javax.xml.stream.util.StreamReaderDelegate

getNamespacePrefix(int) - Method in interface
javax.xml.stream.XMLStreamReader

  Returns the prefix for the namespace declared at the index.

getNamespacePrefixes() - Method in interface
javax.xml.soap.SOAPElement

  Returns an Iterator over the namespace prefix Strings declared by
  this element.

getNamespaces() - Method in interface
javax.xml.stream.events.EndElement

  Returns an Iterator of namespaces that have gone out of scope.

getNamespaces() - Method in interface
javax.xml.stream.events.StartElement

  Returns an Iterator of namespaces declared on this element.

getNamespaceURI(String) - Method in interface
javax.xml.soap.SOAPElement

  Returns the URI of the namespace that has the given prefix.

getNamespaceURI() - Method in interface
javax.xml.stream.events.Namespace

  Gets the uri bound to the prefix of this namespace

getNamespaceURI(String) - Method in interface
javax.xml.stream.events.StartElement

  Gets the value that the prefix is bound to in the context of this
  element.

getNamespaceURI(String) - Method in class
javax.xml.stream.util.StreamReaderDelegate

getNamespaceURI(int) - Method in class
javax.xml.stream.util.StreamReaderDelegate

getNamespaceURI() - Method in class
javax.xml.stream.util.StreamReaderDelegate

getNamespaceURI(String) - Method in interface
javax.xml.stream.XMLStreamReader

  Return the uri for the given prefix.
**getNamespaceURI(int)** - Method in interface javax.xml.stream.XMLStreamReader
Returns the uri for the namespace declared at the index.

**getNamespaceURI()** - Method in interface javax.xml.stream.XMLStreamReader
If the current event is a START_ELEMENT or END_ELEMENT this method returns the URI of the prefix or the default namespace.

**getNativeCommands(String)** - Method in class javax.activation.MailcapCommandMap
Get the native commands for the given MIME type.

**getNavigationHandler()** - Method in class javax.faces.application.Application
Return the NavigationHandler instance that will be passed the outcome returned by any invoked application action for this web application.

**getNestedException()** - Method in exception javax.xml.stream.XMLStreamException
Gets the nested exception.

**getNewFolder()** - Method in class javax.mail.event.FolderEvent
If this event indicates that a folder is renamed, (i.e, the event type is RENAMED), then this method returns the Folder object representing the new name.

**getNewMessageCount()** - Method in class javax.mail.Folder
Get the number of new messages in this Folder.

**getNewsgroup()** - Method in class javax.mail.internet.NewsAddress
Get the newsgroup.

**getNewTempClassLoader()** - Method in interface javax.persistence.spi.PERSISTENCEUNITINFO
Return a new instance of a ClassLoader that the provider may use to temporarily load any classes, resources, or open URLs.

**getNewValue()** - Method in class javax.faces.event.ValueChangeEvent
Return the current local value of the source UIComponent.

**getNextException()** - Method in exception javax.mail.MessagingException
Get the next exception chained to this one.

**getNextTimeout()** - Method in interface javax.ejb.Timer
Get the point in time at which the next timer expiration is scheduled to occur.

**getNode(Object)** - Method in class
By default, the getNode method is unsupported and throw a
UnsupportedOperationException.

**getNode()** - Method in class
javax.xml.bind.helpers.**ValidationEventLocatorImpl**

**getNode(Object)** - Method in interface javax.xml.bind.**Marshaller**
Get a DOM tree view of the content tree(Optional).

**getNode()** - Method in interface javax.xml.bind.**ValidationEventLocator**
Return a reference to the DOM Node if available

**getNoLocal()** - Method in interface javax.jms.**TopicSubscriber**
Gets the NoLocal attribute for this subscriber.

**getNonJtaDataSource()** - Method in interface
javax.persistence.spi.**PersistenceUnitInfo**
Returns the non-JTA-enabled data source to be used by the persistence provider for accessing data outside a JTA transaction.

**getNonMatchingHeaderLines(String[])** - Method in class
javax.mail.internet.**InternetHeaders**
Return all non-matching header lines

**getNonMatchingHeaderLines(String[])** - Method in class
javax.mail.internet.**MimeBodyPart**
Get non-matching header lines as an Enumeration of Strings.

**getNonMatchingHeaderLines(String[])** - Method in class
javax.mail.internet.**MimeMessage**
Get non-matching header lines as an Enumeration of Strings.

**getNonMatchingHeaderLines(String[])** - Method in interface
javax.mail.internet.**MimePart**
Get non-matching header lines as an Enumeration of Strings.

**getNonMatchingHeaders(String[])** - Method in class
javax.mail.internet.**InternetHeaders**
Return all non-matching Header objects.

**getNonMatchingHeaders(String[])** - Method in class
javax.mail.internet.**MimeBodyPart**
Return non-matching headers from this Message as an Enumeration of Header objects.

**getNonMatchingHeaders(String[])** - Method in class
javax.mail.internet.**MimeMessage**
Return non-matching headers from this Message as an Enumeration of Header objects.
**getNonMatchingHeaders(String[])**  - Method in interface javax.mail.Part
- Return non-matching headers from this envelope as an Enumeration of Header objects.

**getNonMatchingHeaders(String[])**  - Method in class javax.xml.soap.MimeHeaders
- Returns all of the MimeHeaders objects whose name does not match a name in the given array of names.

**getNonMatchingMimeHeaders(String[])**  - Method in class javax.xml.soap.AttachmentPart
- Retrieves all MimeHeader objects whose name does not match a name in the given array.

**getNonMatchingMimeHeaders(String[])**  - Method in class javax.xml.soap.SOAPPart
- Retrieves all MimeHeader objects whose name does not match a name in the given array.

**getNonRunningModules(ModuleType, Target[])**  - Method in interface javax.enterprise.deploy.spi.DeploymentManager
- Retrieve the list of J2EE application modules distributed to the identified targets and that are currently not running on the associated server or servers.

**getNoNSSchemaLocation()**  - Method in class javax.xml.bind.helpers.AbstractMarshallerImpl
- Convenience method for getting the current noNamespaceSchemaLocation.

**getNotationName()**  - Method in interface javax.xml.stream.events.EntityDeclaration
- The name of the associated notation.

**getNotations()**  - Method in interface javax.xml.stream.events/DTD
- Return a List containing the notations declared in the DTD.

**getNumber()**  - Method in class javax.mail.search.IntegerComparisonTerm
- Return the number to compare with.

**getNumber()**  - Method in interface javax.xml.registry.infomodel.TelphoneNumber
- Gets the telephone number suffix, not including the country or area code.

**getObject(String)**  - Method in interface javax.jms.MapMessage
- Returns the value of the object with the specified name.

**getObject()**  - Method in interface javax.jms.ObjectMessage
Gets the serializable object containing this message's data.

**getObject()** - Method in class
javax.xml.bind.helpers.**ValidationEventLocatorImpl**

**getObject()** - Method in interface javax.xml.bind.**ValidationEventLocator**
Return a reference to the object in the Java content tree if available

**getableObjectProperty(String)** - Method in interface javax.jms.**Message**
Returns the value of the Java object property with the specified name.

**getObjectType()** - Method in interface
javax.xml.registry.infomodel.**RegistryObject**
Gets the object type that best describes the RegistryObject.

**getOffset()** - Method in class
javax.enterprise.deploy.shared.**ActionType**
Returns the lowest integer value used by this enumeration value's enumeration class.

**getOffset()** - Method in class
javax.enterprise.deploy.shared.**CommandType**
Returns the lowest integer value used by this enumeration value's enumeration class.

**getOffset()** - Method in class
javax.enterprise.deploy.shared.**DConfigBeanVersionType**
Returns the lowest integer value used by this enumeration value's enumeration class.

**getOffset()** - Method in class
javax.enterprise.deploy.shared.**ModuleType**
Returns the lowest integer value used by this enumeration value's enumeration class.

**getOffset()** - Method in class
javax.enterprise.deploy.shared.**StateType**
Returns the lowest integer value used by this enumeration value's enumeration class.

**getOffset()** - Method in class
javax.xml.bind.helpers.**ValidationEventLocatorImpl**

**getOffset()** - Method in interface javax.xml.bind.**ValidationEventLocator**
Return the byte offset if available

**getOldValue()** - Method in class javax.faces.event.**ValueChangeEvent**
Return the previous local value of the source **UIComponent**.

**getOnblur()** - Method in class
javax.faces.component.html.**HtmlCommandButton**
Return the value of the onblur property.
**getOnblur** - Method in class javax.faces.component.html.HtmlCommandLink
Return the value of the onblur property.

**getOnblur** - Method in class javax.faces.component.html.HtmlInputSecret
Return the value of the onblur property.

**getOnblur** - Method in class javax.faces.component.html.HtmlInputText
Return the value of the onblur property.

**getOnblur** - Method in class javax.faces.component.html.HtmlInputTextarea
Return the value of the onblur property.

**getOnblur** - Method in class javax.faces.component.html.HtmlOutputLabel
Return the value of the onblur property.

**getOnblur** - Method in class javax.faces.component.html.HtmlOutputLink
Return the value of the onblur property.

**getOnblur** - Method in class javax.faces.component.html.HtmlSelectBooleanCheckbox
Return the value of the onblur property.

**getOnblur** - Method in class javax.faces.component.html.HtmlSelectManyCheckbox
Return the value of the onblur property.

**getOnblur** - Method in class javax.faces.component.html.HtmlSelectManyListbox
Return the value of the onblur property.

**getOnblur** - Method in class javax.faces.component.html.HtmlSelectManyMenu
Return the value of the onblur property.

**getOnblur** - Method in class javax.faces.component.html.HtmlSelectOneListbox
Return the value of the onblur property.

**getOnblur** - Method in class javax.faces.component.html.HtmlSelectOneMenu
Return the value of the onblur property.

**getOnblur** - Method in class javax.faces.component.html.HtmlSelectOneRadio
Return the value of the onblur property.

**getOnchange** - Method in class
getOnchange() - Method in class
javax.faces.component.html.HtmlCommandButton
Return the value of the onchange property.

getOnchange() - Method in class
javax.faces.component.html.HtmlInputSecret
Return the value of the onchange property.

getOnchange() - Method in class
javax.faces.component.html.HtmlInputText
Return the value of the onchange property.

getOnchange() - Method in class
javax.faces.component.html.HtmlInputTextarea
Return the value of the onchange property.

getOnchange() - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
Return the value of the onchange property.

getOnchange() - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
Return the value of the onchange property.

getOnchange() - Method in class
javax.faces.component.html.HtmlSelectManyListbox
Return the value of the onchange property.

getOnchange() - Method in class
javax.faces.component.html.HtmlSelectManyMenu
Return the value of the onchange property.

getOnchange() - Method in class
javax.faces.component.html.HtmlSelectOneListbox
Return the value of the onchange property.

getOnchange() - Method in class
javax.faces.component.html.HtmlSelectOneMenu
Return the value of the onchange property.

getOnchange() - Method in class
javax.faces.component.html.HtmlSelectOneRadio
Return the value of the onchange property.

getOnclick() - Method in class
javax.faces.component.html.HtmlCommandButton
Return the value of the onclick property.

getOnclick() - Method in class
javax.faces.component.html.HtmlCommandLink
Return the value of the onclick property.

getOnclick() - Method in class
javax.faces.component.html.HtmlDataTable
Return the value of the onclick property.

getOnclick() - Method in class javax.faces.component.html.HtmlForm
Return the value of the onclick property.

getOnclick() - Method in class
javax.faces.component.html.HtmlGraphicImage
Return the value of the onclick property.

getOnclick() - Method in class
javax.faces.component.html.HtmlInputSecret
Return the value of the onclick property.

getOnclick() - Method in class
javax.faces.component.html.HtmlInputText
Return the value of the onclick property.

getOnclick() - Method in class
javax.faces.component.html.HtmlInputTextarea
Return the value of the onclick property.

getOnclick() - Method in class
javax.faces.component.html.HtmlOutputLabel
Return the value of the onclick property.

getOnclick() - Method in class
javax.faces.component.html.HtmlOutputLink
Return the value of the onclick property.

getOnclick() - Method in class
javax.faces.component.html.HtmlPanelGrid
Return the value of the onclick property.

getOnclick() - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
Return the value of the onclick property.

getOnclick() - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
Return the value of the onclick property.

getOnclick() - Method in class
javax.faces.component.html.HtmlSelectManyListbox
Return the value of the onclick property.

getOnclick() - Method in class
javax.faces.component.html.HtmlSelectManyMenu
Return the value of the onclick property.

getOnclick() - Method in class
javax.faces.component.html.HtmlSelectOneListbox
Return the value of the onclick property.

**getOnclick()** - Method in class
javax.faces.component.html.HttpSelectOneMenu
   Return the value of the onclick property.

**getOnclick()** - Method in class
javax.faces.component.html.HttpSelectOneRadio
   Return the value of the onclick property.

**getOndblclick()** - Method in class
javax.faces.component.html.HttpCommandButton
   Return the value of the ondblclick property.

**getOndblclick()** - Method in class
javax.faces.component.html.HttpCommandLink
   Return the value of the ondblclick property.

**getOndblclick()** - Method in class
javax.faces.component.html.HtmlDataTable
   Return the value of the ondblclick property.

**getOndblclick()** - Method in class
javax.faces.component.html.HtmlForm
   Return the value of the ondblclick property.

**getOndblclick()** - Method in class
javax.faces.component.html.HtmlGraphicImage
   Return the value of the ondblclick property.

**getOndblclick()** - Method in class
javax.faces.component.html.HtmlInputSecret
   Return the value of the ondblclick property.

**getOndblclick()** - Method in class
javax.faces.component.html.HtmlInputText
   Return the value of the ondblclick property.

**getOndblclick()** - Method in class
javax.faces.component.html.HtmlInputTextarea
   Return the value of the ondblclick property.

**getOndblclick()** - Method in class
javax.faces.component.html.HtmlOutputLabel
   Return the value of the ondblclick property.

**getOndblclick()** - Method in class
javax.faces.component.html.HtmlOutputLink
   Return the value of the ondblclick property.

**getOndblclick()** - Method in class
javax.faces.component.html.HtmlPanelGrid
   Return the value of the ondblclick property.
getOndblclick() - Method in class javax.faces.component.html.HtmlSelectBooleanCheckbox
    Return the value of the ondblclick property.
getOndblclick() - Method in class javax.faces.component.html.HtmlSelectManyCheckbox
    Return the value of the ondblclick property.
getOndblclick() - Method in class javax.faces.component.html.HtmlSelectManyListbox
    Return the value of the ondblclick property.
getOndblclick() - Method in class javax.faces.component.html.HtmlSelectManyMenu
    Return the value of the ondblclick property.
getOndblclick() - Method in class javax.faces.component.html.HtmlSelectOneListbox
    Return the value of the ondblclick property.
getOndblclick() - Method in class javax.faces.component.html.HtmlSelectOneMenu
    Return the value of the ondblclick property.
getOndblclick() - Method in class javax.faces.component.html.HtmlSelectOneRadio
    Return the value of the ondblclick property.
getOnfocus() - Method in class javax.faces.component.html.HtmCommandButton
    Return the value of the onfocus property.
getOnfocus() - Method in class javax.faces.component.html.HtmCommandLink
    Return the value of the onfocus property.
getOnfocus() - Method in class javax.faces.component.html.HtmInputSecret
    Return the value of the onfocus property.
getOnfocus() - Method in class javax.faces.component.html.HtmInputText
    Return the value of the onfocus property.
getOnfocus() - Method in class javax.faces.component.html.HtmInputTextarea
    Return the value of the onfocus property.
getOnfocus() - Method in class javax.faces.component.html.HtmOutputLabel
    Return the value of the onfocus property.
**getOnfocus()** - Method in class
javax.faces.component.html.HtmlOutputLink
Return the value of the onfocus property.

**getOnfocus()** - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
Return the value of the onfocus property.

**getOnfocus()** - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
Return the value of the onfocus property.

**getOnfocus()** - Method in class
javax.faces.component.html.HtmlSelectManyListbox
Return the value of the onfocus property.

**getOnfocus()** - Method in class
javax.faces.component.html.HtmlSelectManyMenu
Return the value of the onfocus property.

**getOnfocus()** - Method in class
javax.faces.component.html.HtmlSelectOneListbox
Return the value of the onfocus property.

**getOnfocus()** - Method in class
javax.faces.component.html.HtmlSelectOneMenu
Return the value of the onfocus property.

**getOnfocus()** - Method in class
javax.faces.component.html.HtmlSelectOneRadio
Return the value of the onfocus property.

**getOnkeydown()** - Method in class
javax.faces.component.html.HtmlCommandButton
Return the value of the onkeydown property.

**getOnkeydown()** - Method in class
javax.faces.component.html.HtmlCommandLink
Return the value of the onkeydown property.

**getOnkeydown()** - Method in class
javax.faces.component.html.HtmlDataTable
Return the value of the onkeydown property.

**getOnkeydown()** - Method in class
javax.faces.component.html.HtmlForm
Return the value of the onkeydown property.

**getOnkeydown()** - Method in class
javax.faces.component.html.HtmlGraphicImage
Return the value of the onkeydown property.
`getOnkeydown()` - Method in class `javax.faces.component.html.HtmlInputSecret`
Return the value of the `onkeydown` property.

`getOnkeydown()` - Method in class `javax.faces.component.html.HtmlInputText`
Return the value of the `onkeydown` property.

`getOnkeydown()` - Method in class `javax.faces.component.html.HtmlInputTextarea`
Return the value of the `onkeydown` property.

`getOnkeydown()` - Method in class `javax.faces.component.html.HtmlOutputLabel`
Return the value of the `onkeydown` property.

`getOnkeydown()` - Method in class `javax.faces.component.html.HtmlOutputLink`
Return the value of the `onkeydown` property.

`getOnkeydown()` - Method in class `javax.faces.component.html.HtmlPanelGrid`
Return the value of the `onkeydown` property.

`getOnkeydown()` - Method in class `javax.faces.component.html.HtmlSelectBooleanCheckbox`
Return the value of the `onkeydown` property.

`getOnkeydown()` - Method in class `javax.faces.component.html.HtmlSelectManyCheckbox`
Return the value of the `onkeydown` property.

`getOnkeydown()` - Method in class `javax.faces.component.html.HtmlSelectManyListbox`
Return the value of the `onkeydown` property.

`getOnkeydown()` - Method in class `javax.faces.component.html.HtmlSelectManyMenu`
Return the value of the `onkeydown` property.

`getOnkeydown()` - Method in class `javax.faces.component.html.HtmlSelectOneListbox`
Return the value of the `onkeydown` property.

`getOnkeydown()` - Method in class `javax.faces.component.html.HtmlSelectOneMenu`
Return the value of the `onkeydown` property.

`getOnkeydown()` - Method in class `javax.faces.component.html.HtmlSelectOneRadio`
Return the value of the `onkeydown` property.
**getOnkeypress()** - Method in class
javafx.faces.component.html.HtmCommandButton
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class
javafx.faces.component.html.HtmCommandLink
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class
javafx.faces.component.html.HtmDataTable
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class
javafx.faces.component.html.HtmForm
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class
javafx.faces.component.html.HtmGraphicImage
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class
javafx.faces.component.html.HtmInputSecret
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class
javafx.faces.component.html.HtmInputText
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class
javafx.faces.component.html.HtmInputTextarea
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class
javafx.faces.component.html.HtmOutputLabel
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class
javafx.faces.component.html.HtmOutputLink
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class
javafx.faces.component.html.HtmPanelGrid
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class
javafx.faces.component.html.HtmSelectBooleanCheckbox
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class
javafx.faces.component.html.HtmSelectManyCheckbox
Return the value of the onkeypress property.
**getOnkeypress()** - Method in class `javax.faces.component.html.HtmlSelectManyListbox`
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class `javax.faces.component.html.HtmlSelectManyMenu`
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class `javax.faces.component.html.HtmlSelectOneListbox`
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class `javax.faces.component.html.HtmlSelectOneMenu`
Return the value of the onkeypress property.

**getOnkeypress()** - Method in class `javax.faces.component.html.HtmlSelectOneRadio`
Return the value of the onkeypress property.

**getOnkeyup()** - Method in class `javax.faces.component.html.HtmlCommandButton`
Return the value of the onkeyup property.

**getOnkeyup()** - Method in class `javax.faces.component.html.HtmlCommandLink`
Return the value of the onkeyup property.

**getOnkeyup()** - Method in class `javax.faces.component.html.HtmlDataTable`
Return the value of the onkeyup property.

**getOnkeyup()** - Method in class `javax.faces.component.html.HtmlForm`
Return the value of the onkeyup property.

**getOnkeyup()** - Method in class `javax.faces.component.html.HtmlGraphicImage`
Return the value of the onkeyup property.

**getOnkeyup()** - Method in class `javax.faces.component.html.HtmlInputSecret`
Return the value of the onkeyup property.

**getOnkeyup()** - Method in class `javax.faces.component.html.HtmlInputText`
Return the value of the onkeyup property.

**getOnkeyup()** - Method in class `javax.faces.component.html.HtmlInputTextarea`
Return the value of the onkeyup property.
javax.faces.component.html.HtmlOutputLabel
Return the value of the onkeyup property.

getOnkeyup() - Method in class
javax.faces.component.html.HtmlOutputLink
Return the value of the onkeyup property.

getOnkeyup() - Method in class
javax.faces.component.html.HtmlPanelGrid
Return the value of the onkeyup property.

getOnkeyup() - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
Return the value of the onkeyup property.

getOnkeyup() - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
Return the value of the onkeyup property.

getOnkeyup() - Method in class
javax.faces.component.html.HtmlSelectManyListbox
Return the value of the onkeyup property.

getOnkeyup() - Method in class
javax.faces.component.html.HtmlSelectManyMenu
Return the value of the onkeyup property.

getOnkeyup() - Method in class
javax.faces.component.html.HtmlSelectOneListbox
Return the value of the onkeyup property.

getOnkeyup() - Method in class
javax.faces.component.html.HtmlSelectOneMenu
Return the value of the onkeyup property.

getOnkeyup() - Method in class
javax.faces.component.html.HtmlSelectOneRadio
Return the value of the onkeyup property.

getOnmousedown() - Method in class
javax.faces.component.html.HtmlCommandButton
Return the value of the onmousedown property.

getOnmousedown() - Method in class
javax.faces.component.html.HtmlCommandLink
Return the value of the onmousedown property.

getOnmousedown() - Method in class
javax.faces.component.html.HtmlDataTable
Return the value of the onmousedown property.

getOnmousedown() - Method in class
javax.faces.component.html.HtmlForm

Return the value of the onmousedown property.

getOnmousedown() - Method in class

javax.faces.component.html.HtmlGraphicImage

Return the value of the onmousedown property.

getOnmousedown() - Method in class

javax.faces.component.html.HtmlInputSecret

Return the value of the onmousedown property.

getOnmousedown() - Method in class

javax.faces.component.html.HtmlInputText

Return the value of the onmousedown property.

getOnmousedown() - Method in class

javax.faces.component.html.HtmlInputTextarea

Return the value of the onmousedown property.

getOnmousedown() - Method in class

javax.faces.component.html.HtmlOutputLabel

Return the value of the onmousedown property.

getOnmousedown() - Method in class

javax.faces.component.html.HtmlOutputLink

Return the value of the onmousedown property.

getOnmousedown() - Method in class

javax.faces.component.html.HtmlPanelGrid

Return the value of the onmousedown property.

getOnmousedown() - Method in class

javax.faces.component.html.HtmlSelectBooleanCheckbox

Return the value of the onmousedown property.

getOnmousedown() - Method in class

javax.faces.component.html.HtmlSelectManyCheckbox

Return the value of the onmousedown property.

getOnmousedown() - Method in class

javax.faces.component.html.HtmlSelectManyListbox

Return the value of the onmousedown property.

getOnmousedown() - Method in class

javax.faces.component.html.HtmlSelectManyMenu

Return the value of the onmousedown property.

getOnmousedown() - Method in class

javax.faces.component.html.HtmlSelectOneListbox

Return the value of the onmousedown property.

getOnmousedown() - Method in class
javax.faces.component.html.HtmlSelectOneMenu
Return the value of the onmousedown property.
**getOnmousedown()** - Method in class
javax.faces.component.html.HtmlSelectOneRadio
Return the value of the onmousedown property.
**getOnmousedown()** - Method in class
javax.faces.component.html.HtmlCommandButton
Return the value of the onmousemove property.
**getOnmousemove()** - Method in class
javax.faces.component.html.HtmlCommandLink
Return the value of the onmousemove property.
**getOnmousemove()** - Method in class
javax.faces.component.html.HtmlDataTable
Return the value of the onmousemove property.
**getOnmousemove()** - Method in class
javax.faces.component.html.HtmlForm
Return the value of the onmousemove property.
**getOnmousemove()** - Method in class
javax.faces.component.html.HtmlGraphicImage
Return the value of the onmousemove property.
**getOnmousemove()** - Method in class
javax.faces.component.html.HtmlInputSecret
Return the value of the onmousemove property.
**getOnmousemove()** - Method in class
javax.faces.component.html.HtmlInputText
Return the value of the onmousemove property.
**getOnmousemove()** - Method in class
javax.faces.component.html.HtmlInputTextarea
Return the value of the onmousemove property.
**getOnmousemove()** - Method in class
javax.faces.component.html.HtmlOutputLabel
Return the value of the onmousemove property.
**getOnmousemove()** - Method in class
javax.faces.component.html.HtmlOutputLink
Return the value of the onmousemove property.
**getOnmousemove()** - Method in class
javax.faces.component.html.HtmlPanelGrid
Return the value of the onmousemove property.
javax.faces.component.html.HtmlSelectBooleanCheckbox
Return the value of the onmousemove property.

getOnmousemove() - Method in class

javax.faces.component.html.HtmlSelectManyCheckbox
Return the value of the onmousemove property.

getOnmousemove() - Method in class

javax.faces.component.html.HtmlSelectManyListbox
Return the value of the onmousemove property.

getOnmousemove() - Method in class

javax.faces.component.html.HtmlSelectManyMenu
Return the value of the onmousemove property.

getOnmousemove() - Method in class

javax.faces.component.html.HtmlSelectOneListbox
Return the value of the onmousemove property.

getOnmousemove() - Method in class

javax.faces.component.html.HtmlSelectOneMenu
Return the value of the onmousemove property.

getOnmousemove() - Method in class

javax.faces.component.html.HtmlSelectOneRadio
Return the value of the onmousemove property.

getOnmouseout() - Method in class

javax.faces.component.html.HtmlCommandButton
Return the value of the onmouseout property.

getOnmouseout() - Method in class

javax.faces.component.html.HtmlCommandLink
Return the value of the onmouseout property.

getOnmouseout() - Method in class

javax.faces.component.html.HtmlDataTable
Return the value of the onmouseout property.

getOnmouseout() - Method in class

javax.faces.component.html.HtmlForm
Return the value of the onmouseout property.

getOnmouseout() - Method in class

javax.faces.component.html.HtmlGraphicImage
Return the value of the onmouseout property.

getOnmouseout() - Method in class

javax.faces.component.html.HtmlInputSecret
Return the value of the onmouseout property.

getOnmouseout() - Method in class
javax.faces.component.html.HtmlInputText
Return the value of the onmouseout property.

getOnmouseout() - Method in class
javax.faces.component.html.HtmlInputTextarea
Return the value of the onmouseout property.

getOnmouseout() - Method in class
javax.faces.component.html.HtmlOutputLabel
Return the value of the onmouseout property.

getOnmouseout() - Method in class
javax.faces.component.html.HtmlOutputLink
Return the value of the onmouseout property.

getOnmouseout() - Method in class
javax.faces.component.html.HtmlPanelGrid
Return the value of the onmouseout property.

getOnmouseout() - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
Return the value of the onmouseout property.

getOnmouseout() - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
Return the value of the onmouseout property.

getOnmouseout() - Method in class
javax.faces.component.html.HtmlSelectManyListbox
Return the value of the onmouseout property.

getOnmouseout() - Method in class
javax.faces.component.html.HtmlSelectManyMenu
Return the value of the onmouseout property.

getOnmouseout() - Method in class
javax.faces.component.html.HtmlSelectOneListbox
Return the value of the onmouseout property.

getOnmouseout() - Method in class
javax.faces.component.html.HtmlSelectOneMenu
Return the value of the onmouseout property.

getOnmouseout() - Method in class
javax.faces.component.html.HtmlSelectOneRadio
Return the value of the onmouseout property.

getOnmouseover() - Method in class
javax.faces.component.html.HtmlCommandButton
Return the value of the onmouseover property.

getOnmouseover() - Method in class
javax.faces.component.html.HtmlCommandButton
Return the value of the onmouseover property.
javax.faces.component.html.HtmlCommandLink
  Return the value of the onmouseover property.
getOnmouseover() - Method in class
javax.faces.component.html.HtmlDataTable
  Return the value of the onmouseover property.
getOnmouseover() - Method in class
javax.faces.component.html.HtmlForm
  Return the value of the onmouseover property.
getOnmouseover() - Method in class
javax.faces.component.html.HtmlGraphicImage
  Return the value of the onmouseover property.
getOnmouseover() - Method in class
javax.faces.component.html.HtmlInputSecret
  Return the value of the onmouseover property.
getOnmouseover() - Method in class
javax.faces.component.html.HtmlInputText
  Return the value of the onmouseover property.
getOnmouseover() - Method in class
javax.faces.component.html.HtmlInputTextarea
  Return the value of the onmouseover property.
getOnmouseover() - Method in class
javax.faces.component.html.HtmlOutputLabel
  Return the value of the onmouseover property.
getOnmouseover() - Method in class
javax.faces.component.html.HtmlOutputLink
  Return the value of the onmouseover property.
getOnmouseover() - Method in class
javax.faces.component.html.HtmlPanelGrid
  Return the value of the onmouseover property.
getOnmouseover() - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
  Return the value of the onmouseover property.
getOnmouseover() - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
  Return the value of the onmouseover property.
getOnmouseover() - Method in class
javax.faces.component.html.HtmlSelectManyListbox
  Return the value of the onmouseover property.
javax.faces.component.html.HtmlSelectManyMenu
Return the value of the onmouseover property.

getOnmouseover() - Method in class
javax.faces.component.html.HtmlSelectOneListbox
Return the value of the onmouseover property.

getOnmouseover() - Method in class
javax.faces.component.html.HtmlSelectOneMenu
Return the value of the onmouseover property.

getOnmouseover() - Method in class
javax.faces.component.html.HtmlSelectOneRadio
Return the value of the onmouseover property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlCommandButton
Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlCommandLink
Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlDataTable
Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlForm
Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlGraphicImage
Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlInputSecret
Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlInputText
Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlInputTextarea
Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlOutputLabel
javax.faces.component.html.HtmlOutputLink
   Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlPanelGrid
   Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
   Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
   Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlSelectManyListbox
   Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlSelectManyMenu
   Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlSelectOneListbox
   Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlSelectOneMenu
   Return the value of the onmouseup property.

getOnmouseup() - Method in class
javax.faces.component.html.HtmlSelectOneRadio
   Return the value of the onmouseup property.

getOnreset() - Method in class javax.faces.component.html.HtmlForm
   Return the value of the onreset property.

getOnselect() - Method in class
javax.faces.component.html.HtmlCommandButton
   Return the value of the onselect property.

getOnselect() - Method in class
javax.faces.component.html.HtmlInputSecret
   Return the value of the onselect property.

getOnselect() - Method in class
javax.faces.component.html.HtmlInputText
   Return the value of the onselect property.

getOnselect() - Method in class
javax.faces.component.html.HtmlInputTextarea
Return the value of the `onselect` property.

`getOnselect()` - Method in class `javax.faces.component.html.HtmlSelectBooleanCheckbox`  
Return the value of the `onselect` property.

`getOnselect()` - Method in class `javax.faces.component.html.HtmlSelectManyCheckbox`  
Return the value of the `onselect` property.

`getOnselect()` - Method in class `javax.faces.component.html.HtmlSelectManyListbox`  
Return the value of the `onselect` property.

`getOnselect()` - Method in class `javax.faces.component.html.HtmlSelectManyMenu`  
Return the value of the `onselect` property.

`getOnselect()` - Method in class `javax.faces.component.html.HtmlSelectOneListbox`  
Return the value of the `onselect` property.

`getOnselect()` - Method in class `javax.faces.component.html.HtmlSelectOneMenu`  
Return the value of the `onselect` property.

`getOnselect()` - Method in class `javax.faces.component.html.HtmlSelectOneRadio`  
Return the value of the `onselect` property.

`getOnsubmit()` - Method in class `javax.faces.component.html.HtmlForm`  
Return the value of the `onsubmit` property.

`getOperationName()` - Method in interface `javax.xml.rpc.Call`  
Gets the name of the operation to be invoked using this `Call` instance.

`getOrdinal()` - Method in class `javax.faces.application.FacesMessage.Severity`  
Return the ordinal value of this `FacesMessage.Severity` instance.

`getOrdinal()` - Method in class `javax.faces.event.PhaseId`  
Return the ordinal value of this `PhaseId` instance.

`getOrganization()` - Method in interface `javax.xml.registry.infomodel.User`  
Gets the Organization that this User is affiliated with.

`getOrigin()` - Method in interface `javax.management.j2ee.statistics.JMSSConsumerStats`  
Returns a string that encapsulates the identity of a message origin.

`getOut()` - Method in class `javax.servlet.jsp.JspContext`
The current value of the `out` object (a `JspWriter`).

**`getOutputParams()`** - Method in interface `javax.xml.rpc.Call`
Returns a Map of `{name, value}` for the output parameters of the last invoked operation.

**`getOutputStream()`** - Method in class `javax.activation.DataHandler`
Get an OutputStream for this DataHandler to allow overwriting the underlying data.

**`getOutputStream()`** - Method in interface `javax.activation.DataSource`
This method returns an `OutputStream` where the data can be written and throws the appropriate exception if it cannot do so.

**`getOutputStream()`** - Method in class `javax.activation.FileDataSources`
This method will return an `OutputStream` representing the data and will throw an IOException if it cannot do so.

**`getOutputStream()`** - Method in class `javax.activation.URLDataSource`
The `getOutputStream` method from the URL.

**`getOutputStream()`** - Method in class `javax.mail.internet.MimePartDataSource`
DataSource method to return an output stream.

**`getOutputStream()`** - Method in class `javax.mail.util.ByteArrayDataSource`
Return an `OutputStream` for the data.

**`getOutputValues()`** - Method in interface `javax.xml.rpc.Call`
Returns a List values for the output parameters of the last invoked operation.

**`getPage()`** - Method in class `javax.servlet.jsp.PageContext`
The current value of the page object (In a Servlet environment, this is an instance of `javax.servlet.Servlet`).

**`getPageContext(Servlet, ServletRequest, ServletResponse, String, boolean, int, boolean)`** - Method in class `javax.servlet.jsp.JspFactory`
Obtains an instance of an implementation dependent `javax.servlet.jsp.PageContext` abstract class for the calling Servlet and currently pending request and response.
**getParameter(String)** - Method in class `javax.activation.MimeType`  
Retrieve the value associated with the given name, or null if there is no current association.

**getParameter(String)** - Method in class `javax.mail.internet.ContentDisposition`  
Return the specified parameter value.

**getParameter(String)** - Method in class `javax.mail.internet.ContentType`  
Return the specified parameter value.

**getParameter(String)** - Method in interface `javax.servletServletRequest`  
Returns the value of a request parameter as a String, or null if the parameter does not exist.

**getParameter(String)** - Method in class `javax.servlet.ServletRequestWrapper`  
The default behavior of this method is to return `getParameter(String name)` on the wrapped request object.

**getParameterList()** - Method in class `javax.mail.internet.ContentDisposition`  
Return a ParameterList object that holds all the available parameters.

**getParameterList()** - Method in class `javax.mail.internet.ContentType`  
Return a ParameterList object that holds all the available parameters.

**getParameterMap()** - Method in interface `javax.servletServletRequest`  
Returns a java.util.Map of the parameters of this request.

**getParameterMap()** - Method in class `javax.servletServletRequestWrapper`  
The default behavior of this method is to return `getParameterMap()` on the wrapped request object.

**getParameterNames()** - Method in interface `javax.servletServletRequest`  
Returns an Enumeration of String objects containing the names of the parameters contained in this request.

**getParameterNames()** - Method in class `javax.servletServletRequestWrapper`  
The default behavior of this method is to return `getParameterNames()` on the wrapped request object.

**getParameters()** - Method in class `javax.activation.MimeType`  
Retrieve this object's parameter list.

**getParameters()** - Method in interface
javax.interceptor.**InvocationContext**
   Returns the parameters that will be used to invoke the business method.

**getParameterTypeByName(String)** - Method in interface javax.xml.rpc.**Call**
   Gets the XML type of a parameter by name

**getParameterValues(String)** - Method in interface javax.servlet.**ServletRequest**
   Returns an array of String objects containing all of the values the
given request parameter has, or null if the parameter does not exist.

**getParameterValues(String)** - Method in class javax.servlet.**ServletRequestWrapper**
   The default behavior of this method is to return
   getParameterValues(String name) on the wrapped request object.

**getParamTypes()** - Method in class javax.el.**MethodInfo**
   Returns the parameter types of the method

**getParent()** - Method in class javax.faces.component.**UIComponent**
   Return the parent **UIComponent** of this UIComponent, if any.

**getParent()** - Method in class javax.faces.component.**UIComponentBase**

**getParent()** - Method in class javax.faces.webapp.**UIComponentClassicTagBase**
   Return the Tag that is the parent of this instance.

**getParent()** - Method in class javax.mail.**BodyPart**
   Return the containing Multipart object, or null if not known.

**getParent()** - Method in class javax.mail.**Folder**
   Returns the parent folder of this folder.

**getParent()** - Method in class javax.mail.**Multipart**
   Return the Part that contains this Multipart object, or null if not known.

**getParent()** - Method in interface javax.servlet.jsp.tagext.**SimpleTag**
   Returns the parent of this tag, for collaboration purposes.

**getParent()** - Method in class javax.servlet.jsp.tagext.**SimpleTagSupport**
   Returns the parent of this tag, for collaboration purposes.

**getParent()** - Method in interface javax.servlet.jsp.tagext.**Tag**
   Get the parent (closest enclosing tag handler) for this tag handler.

**getParent()** - Method in class javax.servlet.jsp.tagext.**TagAdapter**
   Returns the parent of this tag, which is always
   getAdaptee().getParent().
**getParent()** - Method in class `javax.servlet.jsp.tagext.TagSupport`
The Tag instance most closely enclosing this tag instance.

**getParent()** - Method in interface `javax.xml.registry.infomodel.Concat` or `javax.xml.registry.infomodel.ClassificationScheme`
Gets the parent Concept or ClassificationScheme for this object.

**getParent()** - Method in class `javax.xml.stream.util.EventReaderDelegate`
Get the parent of this instance.

**getParent()** - Method in class `javax.xml.stream.util.StreamReaderDelegate`
Get the parent of this instance.

**getParentConcept()** - Method in interface `javax.xml.registry.infomodel.Concat` or `javax.xml.registry.infomodel.ClassificationScheme`
Gets the parent Concept or null if parent is a ClassificationScheme.

**getParentElement()** - Method in interface `javax.xml.soap.Node`
Returns the parent element of this `Node` object.

**getParentOrganization()** - Method in interface `javax.xml.registry.infomodel.Organization`
Gets the parent (container) organization.

**getParentTargetModuleID()** - Method in interface `javax.enterprise.deploy.spi.TargetModuleID`
Retrieve the identifier of the parent object of this deployed module.

**getParentUIComponentClassicTagBase(PageContext)** - Static method in class `javax.faces.webapp.UIComponentClassicTagBase`
Locate and return the nearest enclosing `UIComponentClassicTagBase` if any; otherwise, return `null`.

**getParentUIComponentTag(PageContext)** - Static method in class `javax.faces.webapp.UIComponentTag`
Deprecated. Locate and return the nearest enclosing `UIComponentTag` if any; otherwise, return `null`.

**getPart()** - Method in class `javax.mail.MessageContext`
Return the Part that contains the content.

**getPassiveCount()** - Method in interface `javax.management.j2ee.statistics.StatefulSessionBeanStats`
Number of beans that are in the passive state.

**getPassword()** - Method in class `javax.mail.PasswordAuthentication`
Returns the password of this `PasswordAuthentication`.

**getPassword()** - Method in class `javax.mail.URLName`
Returns the password of this `URLName`.

**getPassword()** - Method in class `java.util.DriverManager`
javax.resource.spi.security.PasswordCredential
   Returns the user password.
**getPasswordAuthentication()** - Method in class javax.mail.Authenticator
   Called when password authentication is needed.
**getPasswordAuthentication(URLName)** - Method in class javax.mail.Session
   Return any saved PasswordAuthentication for this (store or transport) URLName.
**getPath()** - Method in class javax.servlet.http.Cookie
   Returns the path on the server to which the browser returns this cookie.
**getPath()** - Method in class javax.servlet.jsp.tagext.TagFileInfo
   Where to find the .tag file implementing this action.
**getPath()** - Method in interface javax.xml.registry.infomodel.Concept
   Gets the canonical path representation for this Concept.
   Returns any extra path information associated with the URL the client sent when it made this request.
**getPathInfo()** - Method in class javax.servlet.http.HttpServletRequestWrapper
   The default behavior of this method is to return getPathInfo() on the wrapped request object.
**getPathTranslated()** - Method in interface javax.servlet.http.HttpServletRequest
   Returns any extra path information after the servlet name but before the query string, and translates it to a real path.
**getPathTranslated()** - Method in class javax.servlet.http.HttpServletRequestWrapper
   The default behavior of this method is to return getPathTranslated() on the wrapped request object.
**getPattern()** - Method in class javax.faces.convert.DateTimeConverter
   Return the format pattern to be used when formatting and parsing dates and times.
**getPattern()** - Method in class javax.faces.convert.NumberConverter
   Return the format pattern to be used when formatting and parsing numbers.
**getPattern()** - Method in class javax.mail.search.StringTerm
   Return the string to match with.
**getPayload()** - Method in interface `javax.xml.ws.LogicalMessage`

Gets the message payload as an XML source, may be called multiple times on the same `LogicalMessage` instance, always returns a new Source that may be used to retrieve the entire message payload.

**getPayload(JAXBContext)** - Method in interface `javax.xml.ws.LogicalMessage`

 Gets the message payload as a JAXB object.

**getPendingMessageCount()** - Method in interface `javax.management.j2ee.statistics.JMSEndpointStats`

Number of pending messages.

**getPendingMessageCount()** - Method in interface `javax.management.j2ee.statistics.JMSSessionStats`

Number of pending messages.

**getPermanentFlags()** - Method in class `javax.mail.Folder`

Get the permanent flags supported by this Folder.

**getPersistenceProviderClassName()** - Method in interface `javax.persistence.spi.PersistenceUnitInfo`

Returns the fully qualified name of the persistence provider implementation class.

**getPersistenceUnitName()** - Method in interface `javax.persistence.spi.PersistenceUnitInfo`

Returns the name of the persistence unit.

**getPersistenceUnitRootUrl()** - Method in interface `javax.persistence.spi.PersistenceUnitInfo`

Returns the URL for the jar file or directory that is the root of the persistence unit.

**getPersonal()** - Method in class `javax.mail.internet.InternetAddress`

Get the personal name.

**getPersonalNamespaces()** - Method in class `javax.mail.Store`

Return a set of folders representing the *personal* namespaces for the current user.

**getPersonName()** - Method in interface `javax.xml.registry.infomodel.User`

Returns the name of this User.

**getPhaseId()** - Method in class `javax.faces.event.FacesEvent`

Return the identifier of the request processing phase during which this event should be delivered.

**getPhaseId()** - Method in class `javax.faces.event.PhaseEvent`
Return the PhaseId representing the current request processing lifecycle phase.

**getPhaseId()** - Method in interface javax.faces.event.PhaseListener

Return the identifier of the request processing phase during which this listener is interested in processing PhaseEvent events.

**getPhaseListeners()** - Method in class javax.faces.lifecycle.Lifecycle

Return the set of registered PhaseListener for this Lifecycle instance.

**getPIData()** - Method in class javax.xml.stream.util.StreamReaderDelegate

**getPIData()** - Method in interface javax.xml.stream.XMLStreamReader

Get the data section of a processing instruction

**getPITarget()** - Method in class javax.xml.stream.util.StreamReaderDelegate

**getPITarget()** - Method in interface javax.xml.stream.XMLStreamReader

Get the target of a processing instruction

**getPolicyConfiguration(String, boolean)** - Method in class javax.security.jacc.PolicyConfigurationFactory

This method is used to obtain an instance of the provider specific class that implements the PolicyConfiguration interface that corresponds to the identified policy context within the provider.

**getPolicyConfigurationFactory()** - Static method in class javax.security.jacc.PolicyConfigurationFactory

This static method uses a system property to find and instantiate (via a public constructor) a provider specific factory implementation class.

**getPooledCount()** - Method in interface javax.management.j2ee.statistics.EntityBeanStats

Number of beans in the pooled state.

**getPoolSize()** - Method in interface javax.management.j2ee.statistics.JCACredentialPoolStats

The size of the connection pool

**getPoolSize()** - Method in interface javax.management.j2ee.statistics.JDBCConnectionPoolStats

Size of the connection pool.

**getPort()** - Method in class javax.mail.URLName

Returns the port number of this URLName.

**getPort(QName, Class)** - Method in interface javax.xml.rpc.Service
The `getPort` method returns either an instance of a generated stub implementation class or a dynamic proxy.

**getPort(Class) - Method in interface javax.xml.rpc.Service**
- The `getPort` method returns either an instance of a generated stub implementation class or a dynamic proxy.

**getPort(QName, Class<T>) - Method in class javax.xml.ws.Service**
- The `getPort` method returns a stub.

**getPort(Class<T>) - Method in class javax.xml.ws.Service**
- The `getPort` method returns a stub.

**getPort(QName, Class<T>) - Method in class javax.xml.ws.spi.ServiceDelegate**
- The `getPort` method returns a stub.

**getPort(Class<T>) - Method in class javax.xml.ws.spi.ServiceDelegate**
- The `getPort` method returns a stub.

**getPortName() - Method in interface javax.xml.ws.handler.PortInfo**
- Gets the qualified name of the WSDL port being accessed.

**getPorts() - Method in interface javax.xml.rpc.Service**
- Returns an Iterator for the list of QNameS of service endpoints grouped by this service.

**getPorts() - Method in class javax.xml.ws.Service**
- Returns an Iterator for the list of QNameS of service endpoints grouped by this service.

**getPorts() - Method in class javax.xml.ws.spi.ServiceDelegate**
- Returns an Iterator for the list of QNameS of service endpoints grouped by this service.

**getPortTypeName() - Method in interface javax.xml.rpc.Call**
- Gets the qualified name of the port type.

**getPos() - Method in exception javax.mail.internet.AddressException**
- Get the position with the reference string where the error was detected (-1 if not relevant).

**getPosition() - Method in interface javax.mail.internet.SharedInputStream**
- Return the current position in the InputStream, as an offset from the beginning of the InputStream.

**getPosition() - Method in class javax.mail.util.SharedByteArrayInputStream**
- Return the current position in the InputStream, as an offset from the beginning of the InputStream.

**getPosition() - Method in class javax.mail.util.SharedFileInputStream**
Return the current position in the InputStream, as an offset from the beginning of the InputStream.

**getPostalAddress()** - Method in interface
javax.xml.registry.infomodel.**Organization**
Gets the Address for this Organization.

**getPostalAddresses()** - Method in interface
javax.xml.registry.infomodel.**User**
Gets the postal address for this User.

**getPostalCode()** - Method in interface
javax.xml.registry.infomodel.**PostalAddress**
Returns the postal or zip code.

**getPostalScheme()** - Method in interface
javax.xml.registry.infomodel.**PostalAddress**
Returns a user-defined postal scheme for codifying the attributes of PostalAddress.

**getPreamble()** - Method in class javax.mail.internet.**MimeMultipart**
Get the preamble text, if any, that appears before the first body part of this multipart.

**getPreferredCommands(String)** - Method in class
javax.activation.**CommandMap**
Get the preferred command list from a MIME Type.

**getPreferredCommands(String, DataSource)** - Method in class
javax.activation.**CommandMap**
Get the preferred command list from a MIME Type.

**getPreferredCommands()** - Method in class
javax.activation.**DataHandler**
Return the preferred commands for this type of data.

**getPreferredCommands(String)** - Method in class
javax.activation.**MailcapCommandMap**
Get the preferred command list for a MIME Type.

**getPrefix()** - Method in interface javax.xml.soap.**Name**
Returns the prefix that was specified when this Name object was initialized.

**getPrefix()** - Method in interface javax.xml.stream.events.**Namespace**
Gets the prefix, returns "" if this is a default namespace declaration.

**getPrefix()** - Method in class
javax.xml.stream.util.**StreamReaderDelegate**

**getPrefix(String)** - Method in interface
javax.xml.stream.**XMLEventWriter**

Gets the prefix the uri is bound to

**getPrefix()** - Method in interface javax.xml.stream.**XMLStreamReader**

Returns the prefix of the current event or null if the event does not have a prefix

**getPrefix(String)** - Method in interface javax.xml.stream.**XMLStreamWriter**

Gets the prefix the uri is bound to

**getPrefixString()** - Method in class javax.servlet.jsp.tagext.**TagLibraryInfo**

The prefix assigned to this taglib from the taglib directive

**getPreviousOut()** - Method in class javax.faces.webapp.**UIComponentClassicTagBase**

Get the JspWriter from our BodyContent.

**getPreviousOut()** - Method in class javax.servlet.jsp.tagext.**BodyTagSupport**

Get surrounding out JspWriter.

**getPrimaryContact()** - Method in interface javax.xml.registry.infomodel.**Organization**

Gets the primary Contact for this Organization.

**getPrimaryKey()** - Method in interface javax.ejb.**EJBLocalObject**

Obtain the primary key of the EJB local object.

**getPrimaryKey()** - Method in interface javax.ejb.**EJBObject**

Obtain the primary key of the EJB object.

**getPrimaryKey()** - Method in interface javax.ejb.**EntityContext**

Obtain the primary key of the EJB object that is currently associated with this instance.

**getPrimaryKeyClass()** - Method in interface javax.ejb.**EJBMetaData**

Obtain the Class object for the enterprise Bean's primary key class.

**getPrimaryType()** - Method in class javax.activation.**MimeType**

Retrieve the primary type of this object.

**getPrimaryType()** - Method in class javax.mail.internet.**ContentType**

Return the primary type.

**getPriority()** - Method in interface javax.jms.**MessageProducer**

Gets the producer's default priority.

**getProcessedDTD()** - Method in interface javax.xml.stream.events.**DTD**

Returns an implementation defined representation of the DTD.

**getProducers()** - Method in interface javax.management.j2ee.statistics.**JMSSessionStats**
Returns an array of JMSProducerStats that provide statistics about the message producers associated with the referencing JMS session statistics.

**getProductVersion()** - Method in interface
javax.enterprise.deploy.spi.factories.**DeploymentFactory**
Provide a string identifying version of this vendor's DeploymentManager.

**getProperties()** - Method in class javax.mail.**Session**
Returns the Properties object associated with this Session

**getProperties()** - Method in interface
javax.persistence.spi.**PersistenceUnitInfo**
Returns properties object.

**getProperties()** - Method in class javax.xml.registry.**ConnectionFactory**
Gets the Properties used during createConnection and createFederatedConnection calls.

**getProperties()** - Method in class javax.xml.ws.**Endpoint**
Returns the property bag for this Endpoint instance.

**getProperty(String)** - Method in class javax.mail.**Session**
Returns the value of the specified property.

**getProperty(String)** - Method in class javax.xml.bind.**Binder**
Get the particular property in the underlying implementation of Binder.

**getProperty(String)** - Method in class
javax.xml.bind.helpers.**AbstractMarshallerImpl**
Default implementation of the getProperty method handles the four defined properties in Marshaller.

**getProperty(String)** - Method in class
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**
Default implementation of the getProperty method always throws PropertyException since there are no required properties.

**getProperty(String)** - Method in interface javax.xml.bind.**Marshaller**
Get the particular property in the underlying implementation of Marshaller.

**getProperty(String)** - Method in interface javax.xml.bind.**Unmarshaller**
Get the particular property in the underlying implementation of Unmarshaller.

**getProperty(String)** - Method in interface javax.xml.bind.**Validator**
*Deprecated. since JAXB2.0*

**getProperty(String)** - Method in interface javax.xml.rpc.**Call**
Gets the value of a named property.

**`getProperty(String)` - Method in interface javax.xml.rpc.handler.MessageContext**
- Gets the value of a specific property from the MessageContext

**`getProperty(String)` - Method in class javax.xml.soap.SOAPMessage**
- Retrieves value of the specified property.

**`getProperty(String)` - Method in class javax.xml.stream.util.EventReaderDelegate**

**`getProperty(String)` - Method in class javax.xml.stream.util.StreamReaderDelegate**

**`getProperty(String)` - Method in interface javax.xml.stream.XMLEventReader**
- Get the value of a feature/property from the underlying implementation

**`getProperty(String)` - Method in class javax.xml.stream.XMLInputFactory**
- Get the value of a feature/property from the underlying implementation

**`getProperty(String)` - Method in class javax.xml.stream.XMLOutputFactory**
- Get a feature/property on the underlying implementation

**`getProperty(String)` - Method in interface javax.xml.stream.XMLStreamReader**
- Get the value of a feature/property from the underlying implementation

**`getProperty(String)` - Method in interface javax.xml.stream.XMLStreamWriter**
- Get the value of a feature/property from the underlying implementation

**`getPropertyNames()` - Method in interface javax.jms.Message**
- Returns an Enumeration of all the property names.

**`getPropertyNames()` - Method in interface javax.xml.rpc.Call**
- Gets the names of configurable properties supported by this Call object.

**`getPropertyNames()` - Method in interface javax.xml.rpc.handler.MessageContext**
- Returns an Iterator view of the names of the properties in this
**MessageContext**

**getPropertyResolver()** - Method in class javax.faces.application.Application

*Deprecated.* This has been replaced by Application.getELResolver().

**getPropertyType()** - Method in class javax.el.BeanELResolver.BeanProperty

**getProtocol()** - Method in class javax.mail.Provider

Returns the protocol supported by this Provider.

**getProtocol()** - Method in class javax.mail.URLName

Returns the protocol of this URLName.

**getProtocol()** - Method in interface javax.mail.URLName

Returns the name and version of the protocol the request uses in the form protocol/majorVersion.minorVersion, for example, HTTP/1.1.

**getProtocol()** - Method in class javax.servlet.HttpServletRequest

The default behavior of this method is to return getProtocol() on the wrapped request object.

**getProvider(String)** - Method in class javax.mail.Session

Returns the default Provider for the protocol specified.

**getProviderMajorVersion()** - Method in interface javax.jms.ConnectionMetaData

Gets the JMS provider major version number.

**getProviderMinorVersion()** - Method in interface javax.jms.ConnectionMetaData

Gets the JMS provider minor version number.

**getProviders()** - Method in class javax.mail.Session

This method returns an array of all the implementations installed via the javamail.

**getProviderVersion()** - Method in interface javax.jms.ConnectionMetaData

Gets the JMS provider version.

**getProvidingOrganization()** - Method in interface javax.xml.registry.infomodel.Service

Gets the Organization that provides this service.

**getPublicId()** - Method in interface javax.xml.stream.events.EntityDeclaration

The entity’s public identifier, or null if none was given.

**getPublicId()** - Method in interface
javax.xml.stream.events.\texttt{NotationDeclaration}

The notation's public identifier, or null if none was given.

\texttt{getPublicId()} - Method in interface javax.xml.stream.\texttt{Location}

Returns the public ID of the XML

\texttt{getQualifiedName()} - Method in interface javax.xml.soap.\texttt{Name}

Gets the namespace-qualified name of the XML name that this \texttt{Name}
object represents.

\texttt{getQueryString()} - Method in interface
javax.servlet.http.\texttt{HttpServletRequest}

Returns the query string that is contained in the request URL after
the path.

\texttt{getQueryString()} - Method in class
javax.servlet.http.\texttt{HttpServletRequestWrapper}

The default behavior of this method is to return \texttt{getQueryString()} on
the wrapped request object.

\texttt{getQueue()} - Method in interface javax.jms.\texttt{QueueBrowser}

Gets the queue associated with this queue browser.

\texttt{getQueue()} - Method in interface javax.jms.\texttt{QueueReceiver}

Gets the queue associated with this queue receiver.

\texttt{getQueue()} - Method in interface javax.jms.\texttt{QueueSender}

Gets the queue associated with this \texttt{QueueSender}.

\texttt{getQueueName()} - Method in interface javax.jms.\texttt{Queue}

Gets the name of this queue.

\texttt{getQueueSession()} - Method in interface javax.jms.\texttt{XAQueueSession}

Gets the queue session associated with this \texttt{XAQueueSession}.

\texttt{getQuota(String)} - Method in interface javax.mail.\texttt{QuotaAwareStore}

Get the quotas for the named quota root.

\texttt{getRawContent()} - Method in class javax.xml.soap.\texttt{AttachmentPart}

Gets the content of this \texttt{AttachmentPart} object as an InputStream as
if a call had been made to \texttt{getContent} and no \texttt{DataContentHandler}
had been registered for the \texttt{content-type} of this \texttt{AttachmentPart}.

\texttt{getRawContentBytes()} - Method in class
javax.xml.soap.\texttt{AttachmentPart}

Gets the content of this \texttt{AttachmentPart} object as a byte[] array as if
a call had been made to \texttt{getContent} and no \texttt{DataContentHandler}
had been registered for the \texttt{content-type} of this \texttt{AttachmentPart}.

\texttt{getRawInputStream()} - Method in class
javax.mail.internet.\texttt{MimeBodyPart}

Return an InputStream to the raw data with any Content-Transfer-
getRawInputStream() - Method in class javax.mail.internet.MimeMessage
Return an InputStream to the raw data with any Content-Transfer-Encoding intact.

getReader() - Method in class javax.servlet.jsp.tagext.BodyContent
Return the value of this BodyContent as a Reader.

getReader() - Method in interface javax.servlet.ServletRequest
Retrieves the body of the request as character data using a BufferedReader.

getReader() - Method in class javax.servlet.ServletRequestWrapper
The default behavior of this method is to return getReader() on the wrapped request object.

getReadMethod() - Method in class javax.el.BeanELResolver.BeanProperty

getReadyCount() - Method in interface javax.management.j2ee.statistics.EntityBeanStats
Number of beans in the ready state.

getRealPath(String) - Method in interface javax.servlet.ServletContext
Returns a String containing the real path for a given virtual path.

getRealPath(String) - Method in interface javax.servlet.ServletRequest
 Deprecated. As of Version 2.1 of the Java Servlet API, use ServletContext.getRealPath(java.lang.String) instead.

getRealPath(String) - Method in class javax.servlet.ServletRequestWrapper
The default behavior of this method is to return getRealPath(String path) on the wrapped request object.

getReceivedDate() - Method in class javax.mail.internet.MimeMessage
Returns the Date on this message was received.

getReceivedDate() - Method in class javax.mail.Message
Get the date this message was received.

getRecipients(Message.RecipientType) - Method in class javax.mail.internet.MimeMessage
Returns the recipients specified by the type.

getRecipients(Message.RecipientType) - Method in class javax.mail.Message
Get all the recipient addresses of the given type.

getRecipientType() - Method in class
javax.mail.search.**RecipientStringTerm**
   Return the type of recipient to match with.

**getRecipientType()** - Method in class javax.mail.search.**RecipientTerm**
   Return the type of recipient to match with.

**getRecordFactory()** - Method in interface javax.resource.cci.**ConnectionFactory**
   Gets a RecordFactory instance.

**getRecordName()** - Method in interface javax.resource.cci.**Record**
   Gets the name of the Record.

**getRecordShortDescription()** - Method in interface javax.resource.cci.**Record**
   Gets a short description string for the Record.

**getRef()** - Method in exception javax.mail.internet.**AddressException**
   Get the string that was being parsed when the error was detected (null if not relevant).

**getRef()** - Method in class javax.mail.**URLName**
   Returns the reference of this URLName.

**getReference(Class<T>, Object)** - Method in interface javax.persistence.**EntityManager**
   Get an instance, whose state may be lazily fetched.

**getRegisteredEncodingStyleURIs()** - Method in interface javax.xml.rpc.encoding.**TypeMappingRegistry**
   Returns a list of registered encodingStyle URIs in this TypeMappingRegistry instance.

**getRegistryObject()** - Method in interface javax.xml.registry.infomodel.**AuditableEvent**
   Gets the RegistryObject associated with this AuditableEvent.

**getRegistryObject()** - Method in interface javax.xml.registry.infomodel.**ExternalIdentifier**
   Gets the parent RegistryObject for this ExternalIdentifier.

**getRegistryObject(String, String)** - Method in interface javax.xml.registry.**QueryManager**
   Gets the RegistryObject specified by the Id and type of object.

**getRegistryObject(String)** - Method in interface javax.xml.registry.**QueryManager**
   Gets the RegistryObject specified by the Id.

**getRegistryObjects()** - Method in interface javax.xml.registry.infomodel.**RegistryPackage**
   Gets the collection of member RegistryObjects of this
RegistryPackage.

**getRegistryObjects(Collection)** - Method in interface javax.xml.registry.**QueryManager**
- Gets the specified RegistryObjects.

**getRegistryObjects(Collection, String)** - Method in interface javax.xml.registry.**QueryManager**
- Gets the specified RegistryObjects.

**getRegistryObjects()** - Method in interface javax.xml.registry.**QueryManager**
- Gets the RegistryObjects owned by the caller.

**getRegistryObjects(String)** - Method in interface javax.xml.registry.**QueryManager**
- Gets the RegistryObjects owned by the caller, that are of the specified type.

**getRegistryPackages()** - Method in interface javax.xml.registry.infomodel.**RegistryObject**
- Returns the Package associated with this object.

**getRegistryService()** - Method in interface javax.xml.registry.**Connection**
- Gets the RegistryService interface associated with the Connection.

**getRegistryService()** - Method in interface javax.xml.registry.**LifeCycleManager**
- Returns the parent RegistryService that created this object.

**getRegistryService()** - Method in interface javax.xml.registry.**QueryManager**
- Returns the parent RegistryService that created this object.

**getRel()** - Method in class javax.faces.component.html.**HtmlCommandLink**
- Return the value of the rel property.

**getRel()** - Method in class javax.faces.component.html.**HtmlOutputLink**
- Return the value of the rel property.

**getRelay()** - Method in interface javax.xml.soap.**SOAPHeaderElement**
- Returns the boolean value of the relay attribute for this SOAPHeaderElement

**getReliableURN()** - Method in class javax.servlet.jsp.tagext.**TagLibraryInfo**
- The "reliable" URN indicated in the TLD (the uri element).

**getRemainder()** - Method in class javax.mail.internet.**HeaderTokenizer**
- Return the rest of the Header.

**getRemaining()** - Method in class javax.servlet.jsp.**JspWriter**
This method returns the number of unused bytes in the buffer.

**getRemoteAddr()** - Method in interface `javax.servlet.ServletRequest` Returns the Internet Protocol (IP) address of the client or last proxy that sent the request.

**getRemoteAddr()** - Method in class `javax.servlet.ServletRequestWrapper` The default behavior of this method is to return getRemoteAddr() on the wrapped request object.

**getRemoteHost()** - Method in interface `javax.servlet.ServletRequest` Returns the fully qualified name of the client or the last proxy that sent the request.

**getRemoteHost()** - Method in class `javax.servlet.ServletRequestWrapper` The default behavior of this method is to return getRemoteHost() on the wrapped request object.

**getRemoteInterfaceClass()** - Method in interface `javax.ejb.EJBMetaData` Obtain the Class object for the enterprise Bean's remote interface.

**getRemotePort()** - Method in interface `javax.servlet.ServletRequest` Returns the Internet Protocol (IP) source port of the client or last proxy that sent the request.

**getRemotePort()** - Method in class `javax.servlet.ServletRequestWrapper` The default behavior of this method is to return getRemotePort() on the wrapped request object.

**getRemoteUser()** - Method in class `javax.faces.context.ExternalContext` Return the login name of the user making the current request if any; otherwise, return `null`.

**getRemoteUser()** - Method in interface `javax.servlet.http.HttpServletRequest` Returns the login of the user making this request, if the user has been authenticated, or `null` if the user has not been authenticated.

**getRemoteUser()** - Method in class `javax.servlet.http.HttpServletRequestWrapper` The default behavior of this method is to return getRemoteUser() on the wrapped request object.

**getRemoveCount()** - Method in interface `javax.management.j2ee.statistics.EJBStats` Number of times remove was called.

**getRenderer(FacesContext)** - Method in class...
javax.faces.component.*.UIComponent
Convenience method to return the Renderer instance associated with this component, if any; otherwise, return null.

**getRenderer(FacesContext)** - Method in class
javax.faces.component.*.UIComponentBase

**getRenderer(String, String)** - Method in class
javax.faces.render.*.RenderKit
Return the Renderer instance most recently registered for the specified component family and rendererType, if any; otherwise, return null.

**getRendererType()** - Method in class
javax.faces.component.*.UIComponent
Return the Renderer type for this UIComponent (if any).

**getRendererType()** - Method in class
javax.faces.component.*.UIComponentBase

**getRendererType()** - Method in class
javax.faces.webapp.*.UIComponentTagBase
Return the rendererType property that selects the Renderer to be used for encoding this component, or null to ask the component to render itself directly.

**getRenderKit()** - Method in class
javax.faces.context.*.FacesContext
Return the RenderKit instance for the render kit identifier specified on our UIViewRoot, if there is one.

**getRenderKit(FacesContext, String)** - Method in class
javax.faces.render.*.RenderKitFactory
Return a RenderKit instance for the specified render kit identifier, possibly customized based on dynamic characteristics of the specified FacesContext, if non-null.

**getRenderKitId()** - Method in class
javax.faces.component.*.UIViewRoot
Return the render kit identifier of the RenderKit associated with this view.

**getRenderKitIds()** - Method in class
javax.faces.render.*.RenderKitFactory
Return an Iterator over the set of render kit identifiers registered with this factory.

**getRenderResponse()** - Method in class
javax.faces.context.*.FacesContext
Return true if the `renderResponse()` method has been called for the current request.

**getRendersChildren()** - Method in class `javax.faces.component.UIComponent`

Return a flag indicating whether this component is responsible for rendering its child components.

**getRendersChildren()** - Method in class `javax.faces.component.UIComponentBase`

**getRendersChildren()** - Method in class `javax.faces.render.Renderer`

Return a flag indicating whether this `Renderer` is responsible for rendering the children the component it is asked to render.

**getReplacementText()** - Method in interface `javax.xml.stream.events.EntityDeclaration`

The replacement text of the entity.

**getReplyTo()** - Method in class `javax.mail.internet.MimeMessage`

Return the value of the RFC 822 "Reply-To" header field.

**getReplyTo()** - Method in class `javax.mail.Message`

Get the addresses to which replies should be directed.

**getRepositoryItem()** - Method in interface `javax.xml.registry.infomodel.ExtrinsicObject`

Gets the repository item for this object.

**getRepresentationClass()** - Method in class `javax.activation.ActivationDataFlavor`

Return the representation class.

**getRequest()** - Method in class `javax.faces.context.ExternalContext`

Return the environment-specific object instance for the current request.

**getRequest()** - Method in class `javax.servlet.jsp.PageContext`

The current value of the request object (a ServletRequest).

**getRequest()** - Method in class `javax.servlet.ServletRequestWrapper`

Return the wrapped request object.

**getRequestCharacterEncoding()** - Method in class `javax.faces.context.ExternalContext`

Return the character encoding currently being used to interpret this request.

**getRequestContentType()** - Method in class `javax.faces.context.ExternalContext`

Return the MIME Content-Type for this request.
**getRequestContext()** - Method in interface javax.xml.ws.BindingProvider
Get the context that is used to initialize the message context for request messages.

**getRequestContextPath()** - Method in class javax.faces.context.ExternalContext
Return the portion of the request URI that identifies the web application context for this request.

**getRequestCookieMap()** - Method in class javax.faces.context.ExternalContext
Return an immutable map whose keys are the set of cookie names included in the current request, and whose values (of type javax.servlet.http.Cookie) are the first (or only) cookie for each cookie name returned by the underlying request.

**getRequestDispatcher(String)** - Method in interface javax.servlet.ServletContext
Returns a RequestDispatcher object that acts as a wrapper for the resource located at the given path.

**getRequestDispatcher(String)** - Method in interface javax.servletServletRequest
Returns a RequestDispatcher object that acts as a wrapper for the resource located at the given path.

**getRequestDispatcher(String)** - Method in class javax.servlet.ServletRequestWrapper
The default behavior of this method is to return getRequestDispatcher(String path) on the wrapped request object.

**getRequestedSessionId()** - Method in interface javax.servlet.HttpServletRequest
Returns the session ID specified by the client.

**getRequestedSessionId()** - Method in class javax.servlet.HttpServletRequestWrapper
The default behavior of this method is to return getRequestedSessionId() on the wrapped request object.

**getRequestHeaderMap()** - Method in class javax.faces.context.ExternalContext
Return an immutable map whose keys are the set of request header names included in the current request, and whose values (of type String) are the first (or only) value for each header name returned by the underlying request.

**getRequestHeaderValueMap()** - Method in class
javax.faces.context.ExternalContext
Return an immutable Map whose keys are the set of request header names included in the current request, and whose values (of type String[]) are all of the value for each header name returned by the underlying request.

getRequestId() - Method in exception javax.xml.registry.JAXRException
getRequestId() - Method in interface javax.xml.registry.JAXRResponse
Returns the unique id for the request that generated this response.

getRequestingPort() - Method in class javax.mail.Authenticator

getRequestingPrompt() - Method in class javax.mail.Authenticator

getRequestingProtocol() - Method in class javax.mail.Authenticator
Give the protocol that’s requesting the connection.

getRequestingSite() - Method in class javax.mail.Authenticator

getRequestLocale() - Method in class javax.faces.context.ExternalContext
Return the preferred Locale in which the client will accept content.

getRequestLocales() - Method in class javax.faces.context.ExternalContext
Return an Iterator over the preferred Locales specified in the request, in decreasing order of preference.

getRequestMap() - Method in class javax.faces.context.ExternalContext
Return a mutable Map representing the request scope attributes for the current application.

getRequestParameterMap() - Method in class javax.faces.context.ExternalContext
Return an immutable Map whose keys are the set of request parameters names included in the current request, and whose values (of type String) are the first (or only) value for each parameter name returned by the underlying request.

getRequestParameterNames() - Method in class javax.faces.context.ExternalContext
Return an Iterator over the names of all request parameters included in the current request.

getRequestParameterValuesMap() - Method in class javax.faces.context.ExternalContext
Return an immutable map whose keys are the set of request parameters names included in the current request, and whose values (of type String[]) are all of the values for each parameter name returned by the underlying request.

getRequestParamInfo() - Method in class javax.faces.context.ExternalContext
Return the extra path information (if any) included in the request URI; otherwise, return null.

getRequestParamServletPath() - Method in class javax.faces.context.ExternalContext
Return the servlet path information (if any) included in the request URI; otherwise, return null.

getRequestParamURI() - Method in class javax.servlet.http.HttpServletRequest
Returns the part of this request's URL from the protocol name up to the query string in the first line of the HTTP request.

getRequestParamURI() - Method in class javax.servlet.http.HttpServletRequestWrapper
The default behavior of this method is to return getRequestParamURI() on the wrapped request object.

getRequestParamURI() - Method in class javax.servlet.jsp>ErrorData
Returns the request URI.

Reconstructs the URL the client used to make the request.

getRequestParamURL() - Method in class javax.servlet.http.HttpServletRequestWrapper
The default behavior of this method is to return getRequestParamURL() on the wrapped request object.

getRequestParamURL(HttpServletRequest) - Static method in class javax.servlet.http.HttpUtil
Deprecated. Reconstructs the URL the client used to make the request, using information in the HttpServletRequest object.

getRequiredMessage() - Method in class javax.faces.component.UIInput
If there has been a call to UIInput.setRequiredMessage(java.lang.String) on this instance, return the message.

getRequiredVersion() - Method in class
javax.servlet.jsp.tagext.\TagLibraryInfo

A string describing the required version of the JSP container.

**getResource(String)** - Method in class
javax.faces.context.\ExternalContext

Return a URL for the application resource mapped to the specified path, if it exists; otherwise, return null.

**getResource(String)** - Method in interface javax.servlet.\ServletContext

Returns a URL to the resource that is mapped to a specified path.

**getResource(Object)** - Method in interface
javax.transaction.\TransactionSynchronizationRegistry

Get an object from the Map of resources being managed for the transaction bound to the current thread at the time this method is called.

**getResourceAdapter()** - Method in interface
javax.resource.spl.\ResourceAdapterAssociation

Get the associated ResourceAdapter object.

**getResourceAsStream(String)** - Method in class
javax.faces.context.\ExternalContext

Return an InputStream for an application resource mapped to the specified path, if it exists; otherwise, return null.

**getResourceAsStream(String)** - Method in interface
javax.servlet.\ServletContext

Returns a directory-like listing of all the paths to resources within the web application whose longest sub-path matches the supplied path argument.

**getResourceURL(FacesContext, String)** - Method in class
javax.faces.application.\ViewHandler
Return a URL suitable for rendering (after optional encoding perfomed by the encodeResourceURL() method of ExternalContext) that selects the specified web application resource.

**getResourceURL(FacesContext, String)** - Method in class javax.faces.application.ViewHandlerWrapper
The default behavior of this method is to call ViewHandler.getResourceURL(javax.faces.context.FacesContext, String) on the wrapped ViewHandler object.

**getResponse()** - Method in class javax.faces.context.ExternalContext
Return the environment-specific object instance for the current response.

**getResponse()** - Method in class javax.servlet.jsp.PageContext
The current value of the response object (a ServletResponse).

**getResponse()** - Method in class javax.servlet.ServletResponseWrapper
Return the wrapped ServletResponse object.

**getResponseCharacterEncoding()** - Method in class javax.faces.context.ExternalContext
Returns the name of the character encoding (MIME charset) used for the body sent in this response.

**getResponseComplete()** - Method in class javax.faces.context.FacesContext
Return true if the responseComplete() method has been called for the current request.

**getResponseContentType()** - Method in class javax.faces.context.ExternalContext
Return the MIME Content-Type for this response.

**getResponseContext()** - Method in interface javax.xml.ws.BindingProvider
Get the context that resulted from processing a response message.

**getResponseStateManager()** - Method in class javax.faces.render.RenderKit
Return an instance of ResponseStateManager to handle rendering technology specific state management decisions.

**getResponseStream()** - Method in class javax.faces.context.FacesContext
Return the ResponseStream to which components should direct their binary output.

**getResponseWriter()** - Method in class javax.faces.context.FacesContext
Return the `ResponseWriter` to which components should direct their character-based output.

`getResult()` - Method in interface `javax.xml.bind.UnmarshallerHandler`
Obtains the unmarshalled result.

`getResult()` - Method in class `javax.xml.bind.util.JAXBResult`
Gets the unmarshalled object created by the transformation.

`getResult()` - Method in class `javax.xml.soap.SAAJResult`

`getResultList()` - Method in interface `javax.persistence.Query`
Execute a SELECT query and return the query results as a List.

`getResultSetInfo()` - Method in interface `javax.resource.cci.Connection`
Gets the information on the ResultSet functionality supported by a connected EIS instance.

`getResultTargetModuleIDs()` - Method in interface `javax.enterprise.deploy.spi.status.ProgressObject`
Retrieve the list of TargetModuleIDs successfully processed or created by the associated DeploymentManager operation.

`getReturnType()` - Method in class `javax.el.MethodInfo`
Returns the return type of the method

`getReturnType()` - Method in interface `javax.xml.rpc.Call`
Gets the return type for a specific operation

`getRev()` - Method in class `javax.faces.component.html.HtmlCommandLink`
Return the value of the `rev` property.

`getRev()` - Method in class `javax.faces.component.html.HtmlOutputLink`
Return the value of the `rev` property.

`getRole()` - Method in interface `javax.xml.soap.SOAPHeaderElement`
Returns the value of the `Role` attribute of this `SOAPHeaderElement`.

`getRoles()` - Method in interface `javax.xml.rpc.handler.HandlerChain`
Gets SOAP actor roles registered for this HandlerChain at this SOAP node.

`getRoles()` - Method in interface `javax.xml.ws.handler.soap.SOAPMessageContext`
Gets the SOAP actor roles associated with an execution of the HandlerChain and its contained Handler instances.

`getRoles()` - Method in interface `javax.xml.ws.handler.soap.SOAPMessageContext`
Gets the SOAP actor roles associated with an execution of the handler chain.
**getRoles()** - Method in interface `javax.xml.ws.soap.SOAPBinding`
  Gets the roles played by the SOAP binding instance.

**getRollbackOnly()** - Method in interface `javax.ejb.EJBContext`
  Test if the transaction has been marked for rollback only.

**getRollbackOnly()** - Method in interface `javax.persistence.EntityTransaction`
  Determine whether the current transaction has been marked for rollback.

**getRollbackOnly()** - Method in interface `javax.transaction.TransactionSynchronizationRegistry`
  Get the rollbackOnly status of the transaction bound to the current thread at the time this method is called.

**getRolledbackCount()** - Method in interface `javax.management.j2ee.statistics.JTASstats`
  Number of rolled-back transactions.

**getRoot()** - Method in interface `javax.enterprise.deploy.model.DDBean`
  Return the root element for this DDBean.

**getRootCause()** - Method in exception `javax.servlet.jsp.el.ELException`
  Deprecated. Returns the root cause.

**getRootCause()** - Method in exception `javax.servlet.jsp.JspException`
  Deprecated. As of JSP 2.1, replaced by `Throwable.getCause()`

**getRootCause()** - Method in exception `javax.servlet.ServletException`
  Returns the exception that caused this servlet exception.

**getRootOrganization()** - Method in interface `javax.xml.registry.infomodel.Organization`
  Gets the root organization.

**getRowClasses()** - Method in class `javax.faces.component.html.HtmlDataTable`
  Return the value of the rowClasses property.

**getRowClasses()** - Method in class `javax.faces.component.html.HtmlPanelGrid`
  Return the value of the rowClasses property.

**getRowCount()** - Method in class `javax.faces.component.UIData`
  Return the number of rows in the underlying data model.

**getRowCount()** - Method in class `javax.faces.model.ArrayDataModel`
  If there is wrappedData available, return the length of the array.

**getRowCount()** - Method in class `javax.faces.model.DataModel`
  Return the number of rows of data objects represented by this DataModel.
**getRowCount()** - Method in class `javax.faces.model.ListDataModel`

If there is wrappedData available, return the length of the list.

**getRowCount()** - Method in class `javax.faces.model.ResultSetDataModel`

If there is wrappedData available, return the length of the array returned by calling `getRows()` on the underlying Result.

**getRowCount()** - Method in class `javax.faces.model.ResultSetDataModel`

Return -1, since ResultSet does not provide a standard way to determine the number of available rows without scrolling through the entire ResultSet, and this can be very expensive if the number of rows is large.

**getRowCount()** - Method in class `javax.faces.model.ScalarDataModel`

If there is wrappedData available, return 1.

**getRowData()** - Method in class `javax.faces.component.UIData`

Return the data object representing the data for the currently selected row index, if any.

**getRowData()** - Method in class `javax.faces.model.ArrayDataModel`

If row data is available, return the array element at the index specified by rowIndex.

**getRowData()** - Method in class `javax.faces.model.DataModel`

Return an object representing the data for the currently selected row index.

**getRowData()** - Method in class `javax.faces.model.DataModelEvent`

Return the object representing the data for the specified row index, or null for no associated row data.

**getRowData()** - Method in class `javax.faces.model.ListDataModel`

If row data is available, return the array element at the index specified by rowIndex.

**getRowData()** - Method in class `javax.faces.model.ResultSetDataModel`

If row data is available, return the `SortedMap` array element at the index specified by rowIndex of the array returned by calling `getRows()` on the underlying Result.

**getRowData()** - Method in class `javax.faces.model.ResultSetDataModel`

If row data is available, return a `Map` representing the values of the columns for the row specified by rowIndex, keyed by the corresponding column names.

**getRowData()** - Method in class `javax.faces.model.ScalarDataModel`

If wrapped data is available, return the wrapped data instance.

**getRowIndex()** - Method in class `javax.faces.component.UIData`
Return the zero-relative index of the currently selected row.

**getRowIndex()** - Method in class `javax.faces.model.ArrayDataModel`

**getRowIndex()** - Method in class `javax.faces.model.DataModel`
Return the zero-relative index of the currently selected row.

**getRowIndex()** - Method in class `javax.faces.model.DataModelEvent`
Return the row index for this event, or -1 for no specific row.

**getRowIndex()** - Method in class `javax.faces.model.ListDataModel`

**getRowIndex()** - Method in class `javax.faces.model.ResultSetDataModel`

**getRowIndex()** - Method in class `javax.faces.model.ScalarDataModel`

**getRows()** - Method in class `javax.faces.component.html.HtmlInputTextarea`
Return the value of the `rows` property.

**getRows()** - Method in class `javax.faces.component.UIViewData`
Return the number of rows to be displayed, or zero for all remaining rows in the table.

**getRules()** - Method in class `javax.faces.component.html.HtmlDataTable`
Return the value of the `rules` property.

**getRules()** - Method in class `javax.faces.component.html.HtmlPanelGrid`
Return the value of the `rules` property.

**getRunningModules(ModuleType, Target[])** - Method in interface `javax.enterprise.deploy.spi.DeploymentManager`
Retrieve the list of J2EE application modules distributed to the identified targets and that are currently running on the associated server or servers.

**getSchema()** - Method in class `javax.xml.bind.Binder`
Gets the last `Schema` object (including null) set by the `Binder.setSchema(Schema)` method.

**getSchema()** - Method in class `javax.xml.bind.helpers.AbstractMarshallerImpl`

**getSchema()** - Method in class `javax.xml.bind.helpers.AbstractUnmarshallerImpl`
**getSchema()** - Method in interface javax.xml.bind.Marshaller
Get the JAXP 1.3 **Schema** object being used to perform marshal-time validation.

**getSchema()** - Method in interface javax.xml.bind.Unmarshaller
Get the JAXP 1.3 **Schema** object being used to perform unmarshal-time validation.

**getSchemaLocation()** - Method in class javax.xml.bind.helpers.AbstractUnmarshallerImpl
Convenience method for getting the current schemaLocation.

**getSchemaType()** - Method in interface javax.xml.stream.events.XMLEvent
This method is provided for implementations to provide optional type information about the associated event.

**getScheme()** - Method in interface javax.servlet.ServletRequest
Returns the name of the scheme used to make this request, for example, http, https, or ftp.

**getScheme()** - Method in class javax.servlet.ServletRequestWrapper
The default behavior of this method is to return getScheme() on the wrapped request object.

**getScope()** - Method in class javax.servlet.jsp.tagext.TagVariableInfo
The body of the <scope> element.

**getScope()** - Method in class javax.servlet.jsp.tagext.VariableInfo
Returns the lexical scope of the variable.

**getScope()** - Method in class javax.xml.bind.JAXBElement
Returns scope of xml element declaration.

**getScope(String)** - Method in interface javax.xml.ws.handler.MessageContext
Gets the scope of a property.

**getSecure()** - Method in class javax.servlet.http.Cookie
Returns true if the browser is sending cookies only over a secure protocol, or false if the browser can send cookies using any protocol.

**getSelectedValues()** - Method in class javax.faces.component.UISelectMany
Return the currently selected values, or null if there are no currently selected values.

**getSelectItems()** - Method in class javax.faces.model.SelectItemGroup
Return the set of subordinate SelectItems for this group.

**getSender()** - Method in class javax.mail.internet.MimeMessage
Returns the value of the RFC 822 "Sender" header field.

**getSentDate()** - Method in class javax.mail.internet.MimeMessage
Returns the value of the RFC 822 "Date" field.

**getSentDate()** - Method in class javax.mail.Message
Get the date this message was sent.

**getSentMailCount()** - Method in interface javax.management.j2ee.statistics.JavaMailStats
The number of mail messages sent.

**getSeparator()** - Method in class javax.mail.Folder
Return the delimiter character that separates this Folder's pathname from the names of immediate subfolders.

**getSerializer(Class, QName)** - Method in interface javax.xml.rpc.encoding.TypeMapping
Gets the SerializerFactory registered for the specified pair of Java type and XML data type.

**getSerializerAs(String)** - Method in interface javax.xml.rpc.encoding.SerializerFactory
Returns a Serializer for the specified XML processing mechanism type.

**getServerInfo()** - Method in interface javax.servlet.ServletContext
Returns the name and version of the servlet container on which the servlet is running.

**getServerName()** - Method in interface javax.servlet.ServletRequest
Returns the host name of the server to which the request was sent.

**getServerName()** - Method in class javax.servletServletRequestWrapper
The default behavior of this method is to return getServerName() on the wrapped request object.

**getServerPort()** - Method in interface javax.servlet.ServletRequest
Returns the port number to which the request was sent.

**getServerPort()** - Method in class javax.servletServletRequestWrapper
The default behavior of this method is to return getServerPort() on the wrapped request object.

**getServerSession()** - Method in interface javax.jms.ServerSessionPool
Return a server session from the pool.

**getServerSessionPool()** - Method in interface javax.jms.ConnectionConsumer
Gets the server session pool associated with this connection consumer.
**getService()** - Method in interface `javax.xml.registry.infomodel.ServiceBinding`  
Gets the parent service for which this is a binding.

**getServiceBinding()** - Method in interface `javax.xml.registry.infomodel.SpecificationLink`  
Gets the parent ServiceBinding for this SpecificationLink.

**getServiceBindings()** - Method in interface `javax.xml.registry.infomodel.Service`  
Gets all children ServiceBindings.

**getServiceName()** - Method in interface `javax.xml.rpc.Service`  
Gets the name of this service.

**getServiceName()** - Method in interface `javax.xml.ws.handler.PortInfo`  
Gets the qualified name of the WSDL service name containing the port being accessed.

**getServiceName()** - Method in class `javax.xml.ws.Service`  
Gets the name of this service.

**getServiceName()** - Method in class `javax.xml.ws.spi.ServiceDelegate`  
Gets the name of this service.

**getServices()** - Method in interface `javax.xml.registry.infomodel.Organization`  
Gets all children Services.

**getServiceTime()** - Method in interface `javax.management.j2ee.statistics.ServletStats`  
Execution times for the methods.

**getServlet(String)** - Method in interface `javax.servlet.ServletContext`  
*Deprecated.* As of Java Servlet API 2.1, with no direct replacement.

This method was originally defined to retrieve a servlet from a ServletContext. In this version, this method always returns `null` and remains only to preserve binary compatibility. This method will be permanently removed in a future version of the Java Servlet API.

In lieu of this method, servlets can share information using the ServletContext class and can perform shared business logic by invoking methods on common non-servlet classes.

**getServlet()** - Method in exception `javax.servlet.UnavailableException`  
*Deprecated.* As of Java Servlet API 2.2, with no replacement.  
*Returns the servlet that is reporting its unavailability.*
**getServletConfig()** - Method in class `javax.faces.webapp.FacesServlet`
  Return the ServletConfig instance for this servlet.

**getServletConfig()** - Method in class `javax.servlet.GenericServlet`
  Returns this servlet's `ServletConfig` object.

**getServletConfig()** - Method in class `javax.servlet.jsp.PageContext`
  The ServletConfig instance.

**getServletConfig()** - Method in interface `javax.servlet.Servlet`
  Returns a `ServletConfig` object, which contains initialization and startup parameters for this servlet.

**getServletContext()** - Method in interface `javax.servlet.FilterConfig`
  Returns a reference to the `ServletContext` in which the caller is executing.

**getServletContext()** - Method in class `javax.servlet.GenericServlet`
  Returns a reference to the `ServletContext` in which this servlet is running.

  Returns the ServletContext to which this session belongs.

**getServletContext()** - Method in class `javax.servlet.jsp.PageContext`
  The ServletContext instance.

**getServletContext()** - Method in interface `javax.servlet.ServletConfig`
  Returns a reference to the `ServletContext` in which this Servlet is running.

**getServletContext()** - Method in class `javax.servlet.ServletContextEvent`
  Return the ServletContext that changed.

**getServletContext()** - Method in class `javax.servlet.ServletRequestEvent`
  Returns the ServletContext of this web application.

**getServletContext()** - Method in interface `javax.xml.rpc.server.ServletEndpointContext`
  The method `getServletContext` returns the ServletContext associated with the web application that contain this endpoint.

**getServletContextName()** - Method in interface `javax.servlet.ServletContext`
  Returns the name of this web application corresponding to this ServletContext as specified in the deployment descriptor for this web application by the display-name element.

**getServletInfo()** - Method in class `javax.faces.webapp.FacesServlet`
  Return information about this Servlet.

**getServletInfo()** - Method in class `javax.servlet.GenericServlet`
Returns information about the servlet, such as author, version, and copyright.

**getServletInfo()** - Method in interface javax.servlet.Servlet

Returns information about the servlet, such as author, version, and copyright.

**getServletName()** - Method in class javax.servlet.GenericServlet

Returns the name of this servlet instance.

**getServletName()** - Method in class javax.servlet.jsp.ErrorData

Returns the name of the servlet invoked.

**getServletName()** - Method in interface javax.servlet.ServletConfig

Returns the name of this servlet instance.

**getServletNames()** - Method in interface javax.servlet.ServletContext

Deprecated. As of Java Servlet API 2.1, with no replacement.

This method was originally defined to return an Enumeration of all the servlet names known to this context. In this version, this method always returns an empty Enumeration and remains only to preserve binary compatibility. This method will be permanently removed in a future version of the Java Servlet API.

Returns the part of this request's URL that calls the servlet.

**getServletPath()** - Method in class javax.servlet.http.HttpServletRequestWrapper

The default behavior of this method is to return getServletPath() on the wrapped request object.

**getServletRequest()** - Method in class javax.servlet.ServletRequestEvent

Returns the ServletRequest that is changing.

**getServlets()** - Method in interface javax.servlet.ServletContext

Deprecated. As of Java Servlet API 2.0, with no replacement.

This method was originally defined to return an Enumeration of all the servlets known to this servlet context. In this version, this method always returns an empty enumeration and remains only to preserve binary compatibility. This method will be permanently removed in a future version of the Java Servlet API.
**getSession(boolean)** - Method in class `javax.faces.context.ExternalContext`
   If the `create` parameter is true, create (if necessary) and return a session instance associated with the current request.

**getSession()** - Method in interface `javax.jms.ServerSession`
   Return the ServerSession's Session.

**getSession()** - Method in interface `javax.jms.XASession`
   Gets the session associated with this XASession.

**getSession()** - Method in class `javax.mail.MessageContext`
   Return the Session we're operating in.

**getSession(boolean)** - Method in interface `javax.servlet.http.HttpServletRequest`
   Returns the current HttpSession associated with this request or, if there is no current session and `create` is true, returns a new session.

**getSession()** - Method in interface `javax.servlet.http.HttpServletRequest`
   Returns the current session associated with this request, or if the request does not have a session, creates one.

**getSession(boolean)** - Method in class `javax.servlet.http.HttpServletRequestWrapper`
   The default behavior of this method is to return `getSession(boolean create)` on the wrapped request object.

**getSession()** - Method in class `javax.servlet.http.HttpServletRequestWrapper`
   The default behavior of this method is to return `getSession()` on the wrapped request object.

**getSession()** - Method in class `javax.servlet.http.HttpServletResponseWrapper`
   Return the session that changed.

**getSession(String)** - Method in interface `javax.servlet.http.HttpServletResponseContext`
   Deprecated. As of Java Servlet API 2.1 with no replacement. This method must return null and will be removed in a future version of this API.

**getSession()** - Method in class `javax.servlet.http.HttpServletResponse`
   Return the session that changed.

**getSession()** - Method in class `javax.servlet.jsp.PageContext`
   The current value of the session object (an HttpSession).

**Deprecated.** As of Version 2.1, this method is deprecated and has no replacement. It will be removed in a future version of the Java Servlet API.

**getSessions()** - Method in interface javax.management.j2ee.statistics.JMSConnectionStats

Returns an array of JMSSessionStats that provide statistics about the sessions associated with the referencing JMSConnectionStats.

**getSeverity()** - Method in class javax.faces.application.FacesMessage

Return the severity level.

**getSeverity()** - Method in class javax.xml.bind.helpers.ValidationEventImpl

Retrieve the severity code for this warning/error.

**getShape()** - Method in class javax.faces.component.html.HtmlCommandLink

Return the value of the shape property.

**getShape()** - Method in class javax.faces.component.html.HtmlOutputLink

Return the value of the shape property.

**getSharedNamespaces()** - Method in class javax.mail.Store

Return a set of folders representing the shared namespaces.

**getShort(String)** - Method in interface javax.jms.MapMessage

Returns the short value with the specified name.

**getShortName()** - Method in class javax.servlet.jsp.tagext.TagLibraryInfo

The preferred short name (prefix) as indicated in the TLD.

**getShortProperty(String)** - Method in interface javax.jms.Message

Returns the value of the short property with the specified name.

**getSingleResult()** - Method in interface javax.persistence.Query

Execute a SELECT query that returns a single result.

**getSize()** - Method in class javax.faces.component.html.HtmlInputSecret

Return the value of the size property.

**getSize()** - Method in class javax.faces.component.html.HtmlInputText

Return the value of the size property.

**getSize()** - Method in class javax.faces.component.html.HtmlSelectManyListbox
Return the value of the size property.

**getSize()** - Method in class javax.faces.component.html.HtmlSelectOneListbox

Return the value of the size property.

**getSize()** - Method in class javax.mail.internet.MimeBodyPart

Return the size of the content of this body part in bytes.

**getSize()** - Method in class javax.mail.internet.MimeMessage

Return the size of the content of this message in bytes.

**getSize()** - Method in interface javax.mail.Part

Return the size of the content of this part in bytes.

**getSize()** - Method in class javax.xml.soap.AttachmentPart

Returns the number of bytes in this AttachmentPart object.

**getSlot(String)** - Method in interface javax.xml.registry.infomodel.ExtensibleObject

Gets the slot specified by slotName.

**getSlots()** - Method in interface javax.xml.registry.infomodel.ExtensibleObject

Returns the Slots associated with this object.

**getSlotType()** - Method in interface javax.xml.registry.infomodel.Slot

Gets the slotType for this Slot.

**getSmallIcon()** - Method in class javax.servlet.jsp.tagext.TagInfo

Get the path to the small icon.

**getSOAPBody()** - Method in class javax.xml.soap.SOAPMessage

Gets the SOAP Body contained in this SOAPMessage object.

**getSOAPFactory()** - Method in interface javax.xml.ws.soap.SOAPBinding

Gets the SAAJ SOAPFactory instance used by this SOAP binding.

**getSOAPHeader()** - Method in class javax.xml.soap.SOAPMessage

Gets the SOAP Header contained in this SOAPMessage object.

**getSOAPPart()** - Method in class javax.xml.soap.SOAPMessage

Gets the SOAP part of this SOAPMessage object.

**getSourceObject()** - Method in interface javax.xml.registry.infomodel.Association

Gets the Object that is the source of this Association.

**getSpecificationLinks()** - Method in interface javax.xml.registry.infomodel.ServiceBinding

Gets all children SpecificationLinks.

**getSpecificationObject()** - Method in interface javax.xml.registry.infomodelSpecificationLink
Gets the specification object for this object.

**getSpecificationVersion()** - Method in class
javax.servlet.jsp.JspEngineInfo
Return the version number of the JSP specification that is supported
by this JSP engine.

**getSpecVersion()** - Method in interface
javax.resource.cci.ResourceAdapterMetaData
Returns a string representation of the version of the connector
architecture specification that is supported by the resource adapter.

**getStability()** - Method in interface
javax.xml.registry.infomodel.RegistryEntry
Gets the stability indicator for the RegistryEntry within the Registry.

**getStartDuration()** - Method in class
javax.resource.spi.work.WorkEvent
Return the start interval duration.

**getStartTime()** - Method in interface
javax.management.j2ee.statistics.Statistic
The time of the first measurement represented as a long, whose
value is the number of milliseconds since January 1, 1970, 00:00:00.

**getState()** - Method in interface
javax.enterprise.deploy.spi.status.DeploymentStatus
Retrieve the StateType value.

**getState()** - Method in class
javax.faces.application.StateManager.SerializedView
Deprecated.

**getState(FacesContext, String)** - Method in class
javax.faces.render.ResponseStateManager
The implementation must inspect the current request and return an
Object representing the tree structure and component state passed
in to a previous invocation of
ResponseStateManager.writeState(javax.faces.context.FacesContext,java.lang.Object)

**getStateManager()** - Method in class
javax.faces.application.Application
Return the StateManager instance that will be utilized during the
Restore View and Render Response phases of the request
processing lifecycle.

**getStateOrProvince()** - Method in interface
javax.xml.registry.infomodel.PostalAddress
Returns the state or province.

**getStateType(int)** - Static method in class
javax.enterprise.deploy.shared.StateType
Return an object of the specified value.

**getStatistic(String)** - Method in interface javax.management.j2ee.statistics.Stats
Get a Statistic by name.

**getStatisticNames()** - Method in interface javax.management.j2ee.statistics.Stats
Returns an array of Strings which are the names of the attributes from the specific Stats submodel that this object supports.

**getStatistics()** - Method in interface javax.management.j2ee.statistics.Stats
Returns an array containing all of the Statistic objects supported by this Stats object.

**getStatus()** - Method in interface javax.transaction.Transaction
Obtain the status of the transaction associated with the target Transaction object.

**getStatus()** - Method in interface javax.transaction.TransactionManager
Obtain the status of the transaction associated with the current thread.

**getStatus()** - Method in interface javax.transaction.UserTransaction
Obtain the status of the transaction associated with the current thread.

**getStatus()** - Method in interface javax.xml.registry.infomodel.RegistryEntry
Gets the life cycle status of the RegistryEntry within the registry.

**getStatus()** - Method in exception javax.xml.registry.JAXRException
Returns the status for this response.

**getStatusCode()** - Method in class javax.servlet.jsp>ErrorData
Returns the status code of the error.

**getStatusCode()** - Method in exception javax.xml.ws.http.HTTPException
Gets the HTTP status code.

**getStore()** - Method in class javax.mail.Folder
Returns the Store that owns this Folder object.

**getStore()** - Method in class javax.mail.Session
Get a Store object that implements this user's desired Store protocol.

**getStore(String)** - Method in class javax.mail.Session
Get a Store object that implements the specified protocol.
**getStore(URLName)** - Method in class `javax.mail.Session`
Get a Store object for the given URLName.

**getStore(Provider)** - Method in class `javax.mail.Session`
Get an instance of the store specified by Provider.

**getStore()** - Method in exception `javax.mail.StoreClosedException`
Returns the dead Store object

**getStreet()** - Method in interface `javax.xml.registry.infomodel.PostalAddress`
Returns the street name.

**getStreetNumber()** - Method in interface `javax.xml.registry.infomodel.PostalAddress`
Returns the street number.

**getString(String)** - Method in interface `javax.jms.MapMessage`
Returns the String value with the specified name.

**getString()** - Method in class `javax.servlet.jsp.tagext.BodyContent`
Return the value of the BodyContent as a String.

**getStringProperty(String)** - Method in interface `javax.jms.Message`
Returns the value of the String property with the specified name.

**getStringTable()** - Method in class `javax.enterprise.deploy.shared.ActionType`
Returns the string table for class ActionType

**getStringTable()** - Method in class `javax.enterprise.deploy.shared.CommandType`
Returns the string table for class CommandType

**getStringTable()** - Method in class `javax.enterprise.deploy.shared.DConfigBeanVersionType`
Returns the string table for class DConfigBeanVersionType

**getStringTable()** - Method in class `javax.enterprise.deploy.shared.ModuleType`
Returns the string table for class ModuleType

**getStringTable()** - Method in class `javax.enterprise.deploy.shared.StateType`
Returns the string table for class StateType

**getStructure()** - Method in class `javax.faces.application.StateManager.SerializedView`
Deprecated.

**getStyle()** - Method in class `javax.faces.component.html.HtmlCommandButton`
Return the value of the style property.
**getStyle()** - Method in class
javax.faces.component.html.HtmlCommandLink
    Return the value of the style property.
**getStyle()** - Method in class javax.faces.component.html.HtmlDataTable
    Return the value of the style property.
**getStyle()** - Method in class javax.faces.component.html.HtmlForm
    Return the value of the style property.
**getStyle()** - Method in class javax.faces.component.html.HtmlGraphicImage
    Return the value of the style property.
**getStyle()** - Method in class javax.faces.component.html.HtmlInputSecret
    Return the value of the style property.
**getStyle()** - Method in class javax.faces.component.html.HtmlInputText
    Return the value of the style property.
**getStyle()** - Method in class javax.faces.component.html.HtmlInputTextarea
    Return the value of the style property.
**getStyle()** - Method in class javax.faces.component.html.HtmlMessage
    Return the value of the style property.
**getStyle()** - Method in class javax.faces.component.html.HtmlMessages
    Return the value of the style property.
**getStyle()** - Method in class javax.faces.component.html.HtmlOutputFormat
    Return the value of the style property.
**getStyle()** - Method in class javax.faces.component.html.HtmlOutputLabel
    Return the value of the style property.
**getStyle()** - Method in class javax.faces.component.html.HtmlOutputLink
    Return the value of the style property.
**getStyle()** - Method in class javax.faces.component.html.HtmlOutputText
    Return the value of the style property.
**getStyle()** - Method in class javax.faces.component.html.HtmlPanelGrid
    Return the value of the style property.
**getStyle()** - Method in class javax.faces.component.html.HtmlPanelGroup
    Return the value of the style property.
**getStyle()** - Method in class javax.faces.component.html.HtmlSelectBooleanCheckbox
    Return the value of the style property.
**getStyle()** - Method in class `javax.faces.component.html.HtmlSelectManyCheckbox`

Return the value of the style property.

**getStyle()** - Method in class `javax.faces.component.html.HtmlSelectManyListbox`

Return the value of the style property.

**getStyle()** - Method in class `javax.faces.component.html.HtmlSelectManyMenu`

Return the value of the style property.

**getStyle()** - Method in class `javax.faces.component.html.HtmlSelectOneListbox`

Return the value of the style property.

**getStyle()** - Method in class `javax.faces.component.html.HtmlSelectOneMenu`

Return the value of the style property.

**getStyle()** - Method in class `javax.faces.component.html.HtmlSelectOneRadio`

Return the value of the style property.

**getStyleClass()** - Method in class `javax.faces.component.html.HtmlCommandButton`

Return the value of the styleClass property.

**getStyleClass()** - Method in class `javax.faces.component.html.HtmlCommandLink`

Return the value of the styleClass property.

**getStyleClass()** - Method in class `javax.faces.component.html.HtmlDataTable`

Return the value of the styleClass property.

**getStyleClass()** - Method in class `javax.faces.component.html.HtmlForm`

Return the value of the styleClass property.

**getStyleClass()** - Method in class `javax.faces.component.html.HtmlGraphicImage`

Return the value of the styleClass property.

**getStyleClass()** - Method in class `javax.faces.component.html.HtmlInputSecret`

Return the value of the styleClass property.

**getStyleClass()** - Method in class `javax.faces.component.html.HtmlInputText`

Return the value of the styleClass property.
javax.faces.component.html.HtmlInputTextarea
Return the value of the styleClass property.

getStyleClass() - Method in class
javax.faces.component.html.HtmlMessage
Return the value of the styleClass property.

getStyleClass() - Method in class
javax.faces.component.html.HtmlMessages
Return the value of the styleClass property.

getStyleClass() - Method in class
javax.faces.component.html.HtmlOutputFormat
Return the value of the styleClass property.

getStyleClass() - Method in class
javax.faces.component.html.HtmlOutputLabel
Return the value of the styleClass property.

getStyleClass() - Method in class
javax.faces.component.html.HtmlOutputLink
Return the value of the styleClass property.

getStyleClass() - Method in class
javax.faces.component.html.HtmlOutputText
Return the value of the styleClass property.

getStyleClass() - Method in class
javax.faces.component.html.HtmlPanelGrid
Return the value of the styleClass property.

getStyleClass() - Method in class
javax.faces.component.html.HtmlPanelGroup
Return the value of the styleClass property.

getStyleClass() - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
Return the value of the styleClass property.

getStyleClass() - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
Return the value of the styleClass property.

getStyleClass() - Method in class
javax.faces.component.html.HtmlSelectManyListbox
Return the value of the styleClass property.

getStyleClass() - Method in class
javax.faces.component.html.HtmlSelectManyMenu
Return the value of the styleClass property.

getStyleClass() - Method in class
javax.faces.component.html.HtmlSelectOneListbox
Return the value of the styleClass property.

**getStyleClass()** - Method in class

javax.faces.component.html.HtmlSelectOneMenu
Return the value of the styleClass property.

**getStyleClass()** - Method in class

javax.faces.component.html.HtmlSelectOneRadio
Return the value of the styleClass property.

**getSubject()** - Method in class javax.mail.internet.MimeMessage
Returns the value of the "Subject" header field.

**getSubject()** - Method in class javax.mail.Message
Get the subject of this message.

**getSubmittedValue()** - Method in interface
javax.faces.component.EditableValueHolder
Return the submittedValue value of this component.

**getSubmittedValue()** - Method in class javax.faces.component.UIInput
Return the submittedValue value of this UIInput component.

**getSubmittingOrganization()** - Method in interface
javax.xml.registry.infomodel.RegistryObject
Gets the Organization that submitted this RegistryObject.

**getSubType()** - Method in class javax.activation.MimeType
Retrieve the subtype of this object.

**getSubType()** - Method in class javax.mail.internet.ContentType
Return the subType.

**getSummary()** - Method in class javax.faces.application.FacesMessage
Return the localized summary text.

**getSummary()** - Method in class
javax.faces.component.html.HtmlDataTable
Return the value of the summary property.

**getSummary()** - Method in class
javax.faces.component.html.HtmlPanelGrid
Return the value of the summary property.

**getSupportedEncodings()** - Method in interface
javax.xml.rpc.encoding.TypeMapping
Returns the encodingStyle URIs (as String[]) supported by this TypeMapping instance.

**getSupportedLocales()** - Method in interface
javax.enterprise.deploy.spi.DeploymentManager
Returns an array of supported locales for this implementation.
**getSupportedLocales()** - Method in class javax.faces.application.Application
   Return an Iterator over the supported Locales for this application.

**getSupportedMechanismTypes()** - Method in interface javax.xml.rpc.encoding.DeserializerFactory
   Returns a list of all XML processing mechanism types supported by this DeserializerFactory.

**getSupportedMechanismTypes()** - Method in interface javax.xml.rpc.encoding.SerializerFactory
   Returns a list of all XML processing mechanism types supported by this SerializerFactory.

**getSystemFlags()** - Method in class javax.mail.Flags
   Return all the system flags in this Flags object.

**getSystemId()** - Method in interface javax.xml.stream.events.EntityDeclaration
   The entity’s system identifier.

**getSystemId()** - Method in interface javax.xml.stream.events.NotationDeclaration
   The notation's system identifier, or null if none was given.

**getSystemId()** - Method in interface javax.xml.stream.events.StartDocument
   Returns the system ID of the XML data

**getSystemId()** - Method in interface javax.xml.stream.Location
   Returns the system ID of the XML

**getTabindex()** - Method in class javax.faces.component.html.HtmlCommandButton
   Return the value of the tabindex property.

**getTabindex()** - Method in class javax.faces.component.html.HtmlCommandLink
   Return the value of the tabindex property.

**getTabindex()** - Method in class javax.faces.component.html.HtmlInputSecret
   Return the value of the tabindex property.

**getTabindex()** - Method in class javax.faces.component.html.HtmlInputText
   Return the value of the tabindex property.

**getTabindex()** - Method in class javax.faces.component.html.HtmlInputTextarea
   Return the value of the tabindex property.
**getTabindex()** - Method in class javax.faces.component.html.HtmlOutputLabel
- Return the value of the `tabindex` property.

**getTabindex()** - Method in class javax.faces.component.html.HtmlOutputLink
- Return the value of the `tabindex` property.

**getTabindex()** - Method in class javax.faces.component.html.HtmlSelectBooleanCheckbox
- Return the value of the `tabindex` property.

**getTabindex()** - Method in class javax.faces.component.html.HtmlSelectManyCheckbox
- Return the value of the `tabindex` property.

**getTabindex()** - Method in class javax.faces.component.html.HtmlSelectManyListbox
- Return the value of the `tabindex` property.

**getTabindex()** - Method in class javax.faces.component.html.HtmlSelectManyMenu
- Return the value of the `tabindex` property.

**getTabindex()** - Method in class javax.faces.component.html.HtmlSelectOneListbox
- Return the value of the `tabindex` property.

**getTabindex()** - Method in class javax.faces.component.html.HtmlSelectOneMenu
- Return the value of the `tabindex` property.

**getTabindex()** - Method in class javax.faces.component.html.HtmlSelectOneRadio
- Return the value of the `tabindex` property.

**getTag(String)** - Method in class javax.servlet.jsp.tagext.TagLibraryInfo
- Get the TagInfo for a given tag name, looking through all the tags in this tag library.

**getTagName()** - Method in class javax.servlet.jsp.tagext.TagInfo
- Name of the class that provides the handler for this tag.

**getTagExtraInfo()** - Method in class javax.servlet.jsp.tagext.TagInfo
- The instance (if any) for extra tag information.

**getTagFile(String)** - Method in class javax.servlet.jsp.tagext.TagLibraryInfo
- Get the TagFileInfo for a given tag name, looking through all the tag files in this tag library.

**getTagFiles()** - Method in class javax.servlet.jsp.tagext.TagLibraryInfo
An array describing the tag files that are defined in this tag library.

`getTagInfo()` - Method in class `javax.servlet.jsp.tagext.TagExtraInfo`
Get the TagInfo for this class.

`getTagInfo()` - Method in class `javax.servlet.jsp.tagext.TagFileInfo`
Returns information about this tag, parsed from the directives in the tag file.

`getTagLibrary()` - Method in class `javax.servlet.jsp.tagext.TagInfo`
The instance of TagLibraryInfo we belong to.

`getTagLibraryInfos()` - Method in class `javax.servlet.jsp.tagext.TagLibraryInfo`
Returns an array of TagLibraryInfo objects representing the entire set of tag libraries (including this TagLibraryInfo) imported by taglib directives in the translation unit that references this TagLibraryInfo.

`getTagName()` - Method in class `javax.servlet.jsp.tagext.TagInfo`
The name of the Tag.

`getTags()` - Method in class `javax.servlet.jsp.tagext.TagLibraryInfo`
An array describing the tags that are defined in this tag library.

`getTagVariableInfos()` - Method in class `javax.servlet.jsp.tagext.TagInfo`
Get TagVariableInfo objects associated with this TagInfo.

`getTarget()` - Method in interface `javax.enterprise.deploy.spi.TargetModuleID`
Retrieve the name of the target server.

`getTarget()` - Method in class `javax.faces.component.html.HtmlCommandLink`
Return the value of the target property.

`getTarget()` - Method in class `javax.faces.component.html.HtmlForm`
Return the value of the target property.

`getTarget()` - Method in class `javax.faces.component.html.HtmlOutputLink`
Return the value of the target property.

`getTarget()` - Method in interface `javax.interceptor.InvocationContext`
Returns the target instance.

`getTargetBinding()` - Method in interface `javax.xml.registry.infomodel.ServiceBinding`
Gets the next ServiceBinding in case there is a redirection from one service provider to another service provider.
**getTargetEndpointAddress()** - Method in interface javax.xml.rpc.Call
- Gets the address of a target service endpoint.

**getTargetModuleID()** - Method in class javax.enterprise.deploy.spi.status.ProgressEvent
- Retrieve the TargetModuleID for this event

**getTargetObject()** - Method in interface javax.xml.registry.infomodel.Association
- Gets the Object that is the target of this Association.

**getTargets()** - Method in interface javax.enterprise.deploy.spi.DeploymentManager
- Retrieve the list of deployment targets supported by this DeploymentManager.

**getTelephoneNumbers(String)** - Method in interface javax.xml.registry.infomodel.Organization
- Gets the telephone numbers for this User that match the specified telephone number type.

**getTelephoneNumbers(String)** - Method in interface javax.xml.registry.infomodel.User
- Gets the telephone numbers for this User that match the specified telephone number type.

**getTerm()** - Method in class javax.mail.search.NotTerm
- Return the term to negate.

**getTerms()** - Method in class javax.mail.search.AndTerm
- Return the search terms.

**getTerms()** - Method in class javax.mail.search.OrTerm
- Return the search terms.

**getTestSet()** - Method in class javax.mail.search.FlagTerm
- Return true if testing whether the flags are set.

**getText()** - Method in interface javax.enterprise.deploy.model.DDBean
- Returns the XML text for by this bean.

**getText(String)** - Method in interface javax.enterprise.deploy.model.DDBean
- Return a list of text values for a given XPath in the deployment descriptor.

**getText(String)** - Method in interface javax.enterprise.deploy.model.DeployableObject
- Return the XML content associated with the XPath from a deployment descriptor.

**getText(ModuleType, String)** - Method in interface
javax.enterprise.deploy.model.\texttt{J2eeApplicationObject}

Return the text value from the XPath; search only the deployment descriptors of the specified type.

\texttt{getText()} - Method in interface \texttt{javax.jms.TextMessage}

Gets the string containing this message's data.

\texttt{getText()} - Method in interface \texttt{javax.xml.stream.events.Comment}

Return the string data of the comment, returns empty string if it does not exist

\texttt{getText()} - Method in class \texttt{javax.xml.stream.util.StreamReaderDelegate}

\texttt{getText()} - Method in interface \texttt{javax.xml.stream.XMLStreamReader}

Returns the current value of the parse event as a string, this returns the string value of a CHARACTERS event, returns the value of a COMMENT, the replacement value for an ENTITY\_REFERENCE, the string value of a CDATA section, the string value for a SPACE event, or the String value of the internal subset of the DTD.

\texttt{getTextCharacters(int, char[], int, int)} - Method in class \texttt{javax.xml.stream.util.StreamReaderDelegate}

\texttt{getTextCharacters()} - Method in class \texttt{javax.xml.stream.util.StreamReaderDelegate}

\texttt{getTextCharacters()} - Method in interface \texttt{javax.xml.stream.XMLStreamReader}

Returns an array which contains the characters from this event.

\texttt{getTextCharacters(int, char[], int, int)} - Method in interface \texttt{javax.xml.stream.XMLStreamReader}

Gets the the text associated with a CHARACTERS, SPACE or CDATA event.

\texttt{getTextLength()} - Method in class \texttt{javax.xml.stream.util.StreamReaderDelegate}

\texttt{getTextLength()} - Method in interface \texttt{javax.xml.stream.XMLStreamReader}

Returns the length of the sequence of characters for this Text event within the text character array.

\texttt{getTextStart()} - Method in class \texttt{javax.xml.stream.util.StreamReaderDelegate}
**getTextStart()** - Method in interface javax.xml.stream.XMLStreamReader
  Returns the offset into the text character array where the first character (of this text event) is stored.

**getThrowable()** - Method in class javax.servlet.jsp>ErrorData
  Returns the Throwable that caused the error.

**getTimer()** - Method in interface javax.ejb.TimerHandle
  Obtain a reference to the timer represented by this handle.

**getTimeRemaining()** - Method in interface javax.ejb.Timer
  Get the number of milliseconds that will elapse before the next scheduled timer expiration.

**getTimers()** - Method in interface javax.ejb.TimerService
  Get all the active timers associated with this bean.

**getTimerService()** - Method in interface javax.ejb.EJBContext
  Get access to the EJB Timer Service.

**getTimestamp()** - Method in interface javax.xml.registry.infomodel.AuditableEvent
  Gets the Timestamp for when this event occurred.

**getTimeStyle()** - Method in class javax.faces.convert.DateTimeConverter
  Return the style to be used to format or parse times.

**getTimeToLive()** - Method in interface javax.jms.MessageProducer
  Gets the default length of time in milliseconds from its dispatch time that a produced message should be retained by the message system.

**getTimeZone()** - Method in class javax.faces.convert.DateTimeConverter
  Return the TimeZone used to interpret a time value.

**getTitle()** - Method in class javax.faces.component.html.HtmlCommandButton
  Return the value of the title property.

**getTitle()** - Method in class javax.faces.component.html.HtmlCommandLink
  Return the value of the title property.

**getTitle()** - Method in class javax.faces.component.html.HtmlDataTable
  Return the value of the title property.

**getTitle()** - Method in class javax.faces.component.html.HtmlForm
  Return the value of the title property.

**getTitle()** - Method in class javax.faces.component.html.HtmlGraphicImage
  Return the value of the title property.

**getTitle()** - Method in class javax.faces.component.html.HtmlInputSecret
Return the value of the title property.

**getTitle()** - Method in class `javax.faces.component.html.HtmlInputText`
- Return the value of the title property.

**getTitle()** - Method in class `javax.faces.component.html.HtmlInputTextarea`
- Return the value of the title property.

**getTitle()** - Method in class `javax.faces.component.html.HtmlMessage`
- Return the value of the title property.

**getTitle()** - Method in class `javax.faces.component.html.HtmlMessages`
- Return the value of the title property.

**getTitle()** - Method in class `javax.faces.component.html.HtmlOutputFormat`
- Return the value of the title property.

**getTitle()** - Method in class `javax.faces.component.html.HtmlOutputLabel`
- Return the value of the title property.

**getTitle()** - Method in class `javax.faces.component.html.HtmlOutputLink`
- Return the value of the title property.

**getTitle()** - Method in class `javax.faces.component.html.HtmlOutputText`
- Return the value of the title property.

**getTitle()** - Method in class `javax.faces.component.html.HtmlPanelGrid`
- Return the value of the title property.

**getTitle()** - Method in class `javax.faces.component.html.HtmlSelectBooleanCheckbox`
- Return the value of the title property.

**getTitle()** - Method in class `javax.faces.component.html.HtmlSelectManyCheckbox`
- Return the value of the title property.

**getTitle()** - Method in class `javax.faces.component.html.HtmlSelectManyListbox`
- Return the value of the title property.

**getTitle()** - Method in class `javax.faces.component.html.HtmlSelectManyMenu`
- Return the value of the title property.

**getTitle()** - Method in class `javax.faces.component.html.HtmlSelectOneListbox`
- Return the value of the title property.

**getTitle()** - Method in class `javax.faces.component.html.HtmlSelectOneMenu`
- Return the value of the title property.
getTitle() - Method in class javax.faces.component.html.HtmlSelectOneRadio
  Return the value of the title property.

getTopic() - Method in interface javax.jms.TopicPublisher
  Gets the topic associated with this TopicPublisher.

getTopic() - Method in interface javax.jms.TopicSubscriber
  Gets the Topic associated with this subscriber.

getTopicName() - Method in interface javax.jms.Topic
  Gets the name of this topic.

getTopicSession() - Method in interface javax.jms.XATopicSession
  Gets the topic session associated with this XATopicSession.

g getTotalTime() - Method in interface javax.management.j2ee.statistics.TimeStatistic
  This is the sum total of time taken to complete every invocation of
  this operation since the beginning of this measurement.

getTransacted() - Method in interface javax.jms.Session
  Indicates whether the session is in transacted mode.

getTransacted() - Method in interface javax.jms.XASession
  Indicates whether the session is in transacted mode.

getTransaction() - Method in interface javax.persistence.EntityManager
  Returns the resource-level transaction object.

getTransaction() - Method in interface javax.transaction.TransactionManager
  Get the transaction object that represents the transaction context of
  the calling thread.

getTransactionKey() - Method in interface javax.transaction.TransactionSynchronizationRegistry
  Return an opaque object to represent the transaction bound to the
  current thread at the time this method is called.

gett ransactionStatus() - Method in interface javax.transaction.TransactionSynchronizationRegistry
  Return the status of the transaction bound to the current thread at
  the time this method is called.

getTransactionTimeout() - Method in class javax.resource.spi.work.ExecutionContext
  Get the transaction timeout value for a imported transaction.

getTransactionTimeout() - Method in interface javax.transaction.xa.XAResource
  Obtains the current transaction timeout value set for this
XAResource instance.

**getTransactionType()** - Method in interface javax.persistence.spi.PersistenceUnitInfo
- Returns the transaction type of the entity managers created by the EntityManagerFactory.

**getTransferData(DataFlavor, DataSource)** - Method in interface javax.activation.DataContentHandler
- Returns an object which represents the data to be transferred.

**getTransferData(DataFlavor)** - Method in class javax.activation.DataHandler
- Returns an object that represents the data to be transferred.

**getTransferDataFlavors()** - Method in interface javax.activation.DataContentHandler
- Returns an array of DataFlavor objects indicating the flavors the data can be provided in.

**getTransferDataFlavors()** - Method in class javax.activation.DataHandler
- Return the DataFlavors in which this data is available.

**getTransport()** - Method in class javax.mail.Session
- Get a Transport object that implements this user's desired Transport protocol.

**getTransport(String)** - Method in class javax.mail.Session
- Get a Transport object that implements the specified protocol.

**getTransport(URLName)** - Method in class javax.mail.Session
- Get a Transport object for the given URLName.

**getTransport(Provider)** - Method in class javax.mail.Session
- Get an instance of the transport specified in the Provider.

**getTransport(Address)** - Method in class javax.mail.Session
- Get a Transport object that can transport a Message to the specified address type.

**getTreeStructureToRestore(FacesContext, String)** - Method in class javax.faces.render.ResponseStateManager
- Deprecated. This method has been replaced by ResponseStateManager.getState(javax.faces.context.FacesContext, java.lang.String). The default implementation returns null.

**getTreeStructureToSave(FacesContext)** - Method in class javax.faces.application.StateManager
- Deprecated. the distinction between tree structure and component state is now an implementation detail. The default implementation
returns null.

**getTreeStructureToSave(FacesContext)** - Method in class javax.faces.application.StateManagerWrapper
The default behavior of this method is to call StateManager.getTreeStructureToSave(javax.faces.context.FacesContext) on the wrapped StateManager object.

**getType(ELContext, Object, Object)** - Method in class javax.el.ArrayELResolver
If the base object is an array, returns the most general acceptable type for a value in this array.

**getType(ELContext, Object, Object)** - Method in class javax.el.BeanELResolver
If the base object is not null, returns the most general acceptable type that can be set on this bean property.

**getType(ELContext, Object, Object)** - Method in class javax.el.CompositeELResolver
For a given base and property, attempts to identify the most general type that is acceptable for an object to be passed as the value parameter in a future call to the CompositeELResolver.setValue(javax.el.ELContext, java.lang.Object, java.lang.Object, java.lang.Object) method.

**getType(ELContext, Object, Object)** - Method in class javax.el.ELResolver
For a given base and property, attempts to identify the most general type that is acceptable for an object to be passed as the value parameter in a future call to the ELResolver.setValue(javax.el.ELContext, java.lang.Object, java.lang.Object, java.lang.Object) method.

**getType(ELContext, Object, Object)** - Method in class javax.el.MapELResolver
If the base object is a list, returns the most general acceptable type for a value in this list.

**getType(ELContext, Object, Object)** - Method in class javax.el.MapELResolver
If the base object is a map, returns the most general acceptable type for a value in this map.

**getType(ELContext, Object, Object)** - Method in class javax.el.ResourceBundleELResolver
If the base object is an instance of ResourceBundle, return null, since
the resolver is read only.

**`getType(ELContext)`** - Method in class `javax.el.ValueExpression`  
Evaluates the expression relative to the provided context, and returns the most general type that is acceptable for an object to be passed as the *value* parameter in a future call to the `ValueExpression.setValue(javax.el.ELContext, java.lang.Object)` method.

**`getType()`** - Method in interface  
`javax.enterprise.deploy.model.DDBeanRoot`  
Return the ModuleType of deployment descriptor.

**`getType()`** - Method in interface  
`javax.enterprise.deploy.model.DeployableObject`  
Return the ModuleType of deployment descriptor (i.e., EAR, JAR, WAR, RAR) this deployable object represents.

**`getType()`** - Method in class  
`javax.faces.component.html.HtmlCommandButton`  
Return the value of the *type* property.

**`getType()`** - Method in class  
`javax.faces.component.html.HtmlCommandLink`  
Return the value of the *type* property.

**`getType()`** - Method in class  
`javax.faces.component.html.HtmlOutputLink`  
Return the type of value to be formatted or parsed.

**`getType()`** - Method in class  
`javax.faces.convert.DateTimeConverter`  
Return the type to be used when formatting and parsing numbers.

**`getType(FacesContext)`** - Method in class `javax.faces.el.MethodBinding`  
Deprecated. Return the Java class representing the return type from the method identified by this method binding expression.

**`getType(Object, Object)`** - Method in class  
`javax.faces.el.PropertyResolver`  
Deprecated. Return the `java.lang.Class` representing the type of the specified property.

**`getType(Object, int)`** - Method in class `javax.faces.el.PropertyResolver`  
Deprecated. Return the `java.lang.Class` representing the type of the specified index.

**`getType(FacesContext)`** - Method in class `javax.faces.el.ValueBinding`  
Deprecated. Return the type of the property represented by this
ValueBinding, relative to the specified FacesContext.

**getType()** - Method in class javax.mail.Address
Return a type string that identifies this address type.

**getType()** - Method in class javax.mail.event.ConnectionEvent
Return the type of this event.

**getType()** - Method in class javax.mail.event.FolderEvent
Return the type of this event.

**getType()** - Method in class javax.mail.event.MessageCountEvent
Return the type of this event.

**getType()** - Method in class javax.mail.event.TransportEvent
Return the type of this event.

**getType()** - Method in class javax.mail.Folder
Returns the type of this Folder, that is, whether this folder can hold messages or subfolders or both.

**getType()** - Method in class javax.mail.internet.HeaderTokenizer.Token
Return the type of the token.

**getType()** - Method in class javax.mail.internet.InternetAddress
Return the type of this address.

**getType()** - Method in class javax.mail.internet.NewsAddress
Return the type of this address.

**getType()** - Method in class javax.mail.Provider
Returns the type of this Provider

**getType()** - Method in class javax.mail.resource.spi.work.WorkEvent
Return the type of this event.

**getType(ELContext, Object, Object)** - Method in class javax.servlet.jsp.el.ImplicitObjectELResolver
If the base object is null, and the property matches the name of a JSP implicit object, returns null to indicate that no types are ever accepted to setValue().

**getType(ELContext, Object, Object)** - Method in class javax.servlet.jsp.el ScopedAttributeELResolver
If the base object is null, returns Object.class to indicate that any type is valid to set for a scoped attribute.

**getType()** - Method in interface javax.xml.registry.infomodel.EmailAddress
Gets the type for this object.

**getType()** - Method in interface javax.xml.registry.infomodel.PostalAddress
Returns the type of address (for example, "headquarters") as a
String.

**getType()** - Method in interface javax.xml.registry.infomodel.**TelephoneNumber**
The type of telephone number (for example, "fax").

**getType()** - Method in interface javax.xml.registry.infomodel.**User**
Gets the type for this User.

**getType()** - Method in interface javax.xml.registry.infomodel.**Query**
Gets the type of Query (for example, QUERY_TYPE_SQL).

**getTypeMapping(String)** - Method in interface javax.xml.rpc.encoding.**TypeMappingRegistry**
Returns the registered TypeMapping for the specified encodingStyle URI.

**getTypeMappingRegistry()** - Method in interface javax.xml.rpc.**Service**
Gets the TypeMappingRegistry for this Service object.

**getTypeName()** - Method in class javax.servlet.jsp.tagext.**TagAttributeInfo**
The type (as a String) of this attribute.

**getUID(Message)** - Method in interface javax.mail.**UIDFolder**
Get the UID for the specified message.

**getUIDValidity()** - Method in interface javax.mail.**UIDFolder**
Returns the UIDValidity value associated with this folder.

**getUnreadMessageCount()** - Method in exception javax.mail.**Folder**
Get the total number of unread messages in this Folder.

**getUnavailableSeconds()** - Method in exception javax.servlet.**UnavailableException**
Returns the number of seconds the servlet expects to be temporarily unavailable.

**getUnit()** - Method in interface javax.management.j2ee.statistics.**Statistic**
The unit of measurement for this Statistic.

**getUnmarshallerHandler()** - Method in interface javax.xml.bind.**Unmarshaller**
Get an unmarshaller handler object that can be used as a component in an XML pipeline.

**getUnreadMessageCount()** - Method in class javax.mail.**Folder**
Get the total number of unread messages in this Folder.

**getUpperBound()** - Method in interface javax.management.j2ee.statistics.**BoundaryStatistic**
The upper limit of the value of this attribute.

**getUpTime()** - Method in interface javax.management.j2ee.statistics.**JVMStats**
Amount of time the JVM has been running.
**getURI()** - Method in class `javax.servlet.jsp.tagext.TagLibraryInfo`
The value of the uri attribute from the taglib directive for this library.

**getURI()** - Method in interface `javax.xml.soap.Name`
Returns the URI of the namespace for the XML name that this `Name` object represents.

**getURL()** - Method in class `javax.activation.URLDataSource`
Return the URL used to create this DataSource.

**getURL()** - Method in class `javax.faces.component.UIGraphic`
Return the image URL for this `UIGraphic`.

**getURL()** - Method in class `javax.mail.URLName`
Constructs a URL from the URLName.

**getURL()** - Method in class `javax.xml.bind.helpers.ValidationEventLocatorImpl`

**getURL()** - Method in interface `javax.xml.bind.ValidationEventLocator`
Return the name of the XML source as a URL if available

**getUrl()** - Method in interface `javax.xml.registry.infomodel.TelephoneNumber`
Gets the URL that can dial this number electronically.

**getUrl()** - Method in interface `javax.xml.registry.infomodel.User`
Gets the URL to the web page for this User.

**getURLName()** - Method in class `javax.mail.Folder`
Return a URLName representing this folder.

**getURLName()** - Method in class `javax.mail.Service`
Return a URLName representing this service.

**getUsageDescription()** - Method in interface `javax.xml.registry.infomodel.SpecificationLink`
Gets the description of usage parameters.

**getUsageParameters()** - Method in interface `javax.xml.registry.infomodel.SpecificationLink`
Gets any usage parameters.

**getUsemap()** - Method in class `javax.faces.component.html.HtmlGraphicImage`
Return the value of the `usemap` property.

**getUser()** - Method in interface `javax.xml.registry.infomodel.AuditableEvent`
Gets the User associated with this object.

**getUserFlags()** - Method in class `javax.mail.Flags`
Return all the user flags in this Flags object.
**getUserName()** - Method in class `javax.mail.PasswordAuthentication`

**getUsername()** - Method in class `javax.mail.URLName`
Returns the user name of this URLName.

**getUserName()** - Method in interface `javax.resource.cci.ConnectionMetaData`
Returns the user name for an active connection as known to the underlying EIS instance.

**getUserName()** - Method in interface `javax.resource.spi.ManagedConnectionMetaData`
Returns name of the user associated with the ManagedConnection instance.

**getUserName()** - Method in class `javax.resource.spi.security.PasswordCredential`
Returns the user name.

**getUserNamespaces(String)** - Method in class `javax.mail.Store`
Return a set of folders representing the namespaces for user.

**getUserPrincipal()** - Method in class `javax.faces.context.ExternalContext`
Return the Principal object containing the name of the current authenticated user, if any; otherwise, return null.

**getUserPrincipal()** - Method in interface `javax.servlet.http.HttpServletRequest`
Returns a java.security.Principal object containing the name of the current authenticated user.

**getUserPrincipal()** - Method in class `javax.servlet.http.HttpServletRequestWrapper`
The default behavior of this method is to return getUserPrincipal() on the wrapped request object.

**getUserPrincipal()** - Method in interface `javax.xml.rpc.server.ServletEndpointContext`
Returns a java.security.Principal instance that contains the name of the authenticated user for the current method invocation on the endpoint instance.

**getUserPrincipal()** - Method in interface `javax.xml.ws.WebServiceContext`
Returns the Principal that identifies the sender of the request currently being serviced.

**getUsers()** - Method in interface
javax.xml.registry.infomodel.**Organization**
- Gets the Collection of Users affiliated with this Organization.

**getUserTransaction()** - Method in interface **javax.ejb.EJBContext**
- Obtain the transaction demarcation interface.

**getUserVersion()** - Method in interface **javax.xml.registry.infomodel.Versionable**
- Gets the user-specified revision number for this version of the Versionable object.

**getUseTime()** - Method in interface **javax.management.j2ee.statistics.JCAConnectionStats**
- Returns the time spent using a connection

**getUseTime()** - Method in interface **javax.management.j2ee.statistics.JDBCConnectionStats**
- Time spent using a connection.

**getValidateURI()** - Method in interface **javax.xml.registry.infomodel.URIValidator**
- Gets whether to do URI validation for this object.

**getValidator()** - Method in interface **javax.faces.component.EditableValueHolder**
- Deprecated. **EditableValueHolder.getValidators()** should be used instead.

**getValidator()** - Method in class **javax.faces.component.UIInput**
- Deprecated. **UIInput.getValidators()** should be used instead.

**getValidatorIds()** - Method in class **javax.faces.application.Application**
- Return an Iterator over the set of currently registered validator ids for this Application.

**getValidatorMessage()** - Method in class **javax.faces.component.UIInput**
- If there has been a call to **UIInput.setRequiredMessage(java.lang.String)** on this instance, return the message.

**getValidators()** - Method in interface **javax.faces.component.EditableValueHolder**
- Return the set of registered **Validators** for this component instance.

**getValidators()** - Method in class **javax.faces.component.UIInput**
- Return the set of registered **Validators** for this **UIInput** instance.

**getValidSentAddresses()** - Method in class **javax.mail.event.TransportEvent**
- Return the addresses to which this message was sent succesfully.

**getValidSentAddresses()** - Method in exception
javax.mail.SendFailedException
Return the addresses to which this message was sent succesfully.

getValidUnsentAddresses() - Method in class javax.mail.event.TransportEvent
Return the addresses that are valid but to which this message was not sent.

getValidUnsentAddresses() - Method in exception javax.mail.SendFailedException
Return the addresses that are valid but to which this message was not sent.

getValue(ELContext, Object, Object) - Method in class javax.el.ArrayELResolver
If the base object is a Java language array, returns the value at the given index.

getValue(ELContext, Object, Object) - Method in class javax.el.BeanELResolver
If the base object is not null, returns the current value of the given property on this bean.

getValue(ELContext, Object, Object) - Method in class javax.el.CompositeELResolver
Attempts to resolve the given property object on the given base object by querying all component resolvers.

getValue(ELContext, Object, Object) - Method in class javax.el.ELResolver
Attempts to resolve the given property object on the given base object.

getValue(ELContext, Object, Object) - Method in class javax.el.ListELResolver
If the base object is a list, returns the value at the given index.

getValue(ELContext, Object, Object) - Method in class javax.el.MapELResolver
If the base object is a map, returns the value associated with the given key, as specified by the property argument.

getValue(ELContext, Object, Object) - Method in class javax.el.ResourceBundleELResolver
If the base object is an instance of ResourceBundle, the provided property will first be coerced to a String.

getValue(ELContext) - Method in class javax.el.ValueExpression
Evaluates the expression relative to the provided context, and
returns the resulting value.

**getValue()** - Method in class `javax.enterprise.deploy.shared.ActionType`
  Returns this enumeration value's integer value.

**getValue()** - Method in class `javax.enterprise.deploy.shared.CommandType`
  Returns this enumeration value's integer value.

**getValue()** - Method in class `javax.enterprise.deploy.shared.DConfigBeanVersionType`
  Returns this enumeration value's integer value.

**getValue()** - Method in class `javax.enterprise.deploy.shared.ModuleType`
  Returns this enumeration value's integer value.

**getValue()** - Method in class `javax.enterprise.deploy.shared.StateType`
  Returns this enumeration value's integer value.

**getValue()** - Method in class `javax.faces.component.UICommand`
  Returns the `value` property of the `UICommand`.  

**getValue()** - Method in class `javax.faces.component.UIData`
  Return the value of the `UIData`.  

**getValue()** - Method in class `javax.faces.component.UIGraphic`
  Returns the `value` property of the `UIGraphic`.  

**getValue()** - Method in class `javax.faces.component.UIOutput`

**getValue()** - Method in class `javax.faces.component.UIParameter`
  Returns the `value` property of the `UIParameter`.  

**getValue()** - Method in class `javax.faces.component.UISelectItem`
  Returns the `value` property of the `UISelectItem`.  

**getValue()** - Method in class `javax.faces.component.UISelectItems`
  Returns the `value` property of the `UISelectItems`.  

**getValue(Object, Object)** - Method in class `javax.faces.el.PropertyResolver`
  Deprecated. Return the value of the specified property from the specified base object.

**getValue(Object, int)** - Method in class `javax.faces.el.PropertyResolver`
  Deprecated. Return the value at the specified index of the specified base object.

**getValue(FacesContext)** - Method in class `javax.faces.el.ValueBinding`
  Deprecated. Return the value of the property represented by this `ValueBinding`, relative to the specified `FacesContext`.  

**getValue()** - Method in class *javax.faces.model.SelectItem*
Return the value of this item, to be delivered to the model if this item is selected by the user.

**getValue()** - Method in class *javax.mail.Header*
Returns the value of this header.

**getValue()** - Method in class *javax.mail.internet.HeaderTokenizer.Token*
Returns the value of the token just read.

**getValue()** - Method in class
javax.mail.internet.InternetHeaders.InternetHeader
Return the "value" part of the header line.

**getValue()** - Method in class *javax.servlet.http.Cookie*
Returns the value of the cookie.

**getValue(String)** - Method in interface *javax.servlet.http.HttpSession*
*Deprecated. As of Version 2.2, this method is replaced by HttpSession.getAttribute(java.lang.String).*

**getValue()** - Method in class *javax.servlet.http.HttpSessionBindingEvent*
Returns the value of the attribute that has been added, removed or replaced.

**getValue(ELContext, Object, Object)** - Method in class
javax.servlet.jsp.el.ImplicitObjectELResolver
If the base object is null, and the property matches the name of a JSP implicit object, returns the implicit object.

**getValue(ELContext, Object, Object)** - Method in class
javax.servlet.jsp.el.ScopedAttributeELResolver
If the base object is null, searches the page, request, session and application scopes for an attribute with the given name and returns it, or null if no attribute exists with the current name.

**getValue(String)** - Method in class *javax.servlet.jsp.tagext.TagSupport*
Get a the value associated with a key.

**getValue()** - Method in class *javax.servlet.ServletContextAttributeEvent*
Returns the value of the attribute that has been added, removed, or replaced.

**getValue()** - Method in class *javax.servlet.ServletRequestAttributeEvent*
Returns the value of the attribute that has been added, removed or replaced.

**getValue()** - Method in class *javax.xml.bind.JAXBElement*
Return the content model and attribute values for this element.

**getValue(Object)** - Static method in class
javax.xml.bind.JAXBIntrospector
Get the element value of a JAXB element.

**getValue()** - Method in interface
javax.xml.registry.infomodel.[Classification]

  Gets the taxonomy value for this Classification.

**getValue()** - Method in interface javax.xml.registry.infomodel.[Concept]

  Gets the value (usually a code in a taxonomy) associated with this Concept.

**getValue()** - Method in interface
javax.xml.registry.infomodel.[ExternalIdentifier]

  Gets the value of an ExternalIdentifier.

**getValue()** - Method in interface
javax.xml.registry.infomodel.[InternationalString]

  Gets the String value for the Locale returned by Locale.getDefault().

**getValue(Locale)** - Method in interface
javax.xml.registry.infomodel.[InternationalString]

  Gets the String value for the specified Locale.

**getValue()** - Method in interface
javax.xml.registry.infomodel.[LocalizedString]

  Get the String value for this object.

**getValue()** - Method in class javax.xml.soap.[MimeHeader]

  Returns the value of this MimeHeader object.

**getValue()** - Method in interface javax.xml.soap.[Node]

  Returns the value of this node if this is a Text node or the value of the immediate child of this node otherwise.

**getValue()** - Method in interface javax.xml.stream.events.[Attribute]

  Gets the normalized value of this attribute

**getValueBinding(String)** - Method in class
javax.faces.component.[UIComponent]

  Deprecated. This has been replaced by
  [UIComponent.getValueExpression(java.lang.String)].

**getValueBinding(String)** - Method in class
javax.faces.component.[UIComponentBase]

  Deprecated. This has been replaced by
  [UIComponent.getValueExpression(java.lang.String)].

**getValueBinding(String)** - Method in class
javax.faces.component.[UIGraphic]

  Deprecated. This has been replaced by
  [UIGraphic.getValueExpression(java.lang.String)].

**getValueBinding(String)** - Method in class
javax.faces.component.UISelectBoolean
   **Deprecated.** This has been replaced by
   UISelectBoolean.getValueExpression(java.lang.String).

**getValuExpression(String)** - Method in class
javax.faces.component.UISelectMany
   **Deprecated.** This has been replaced by
   UISelectMany.getValueExpression(java.lang.String).

**getValueChangeListener()** - Method in interface
javax.faces.component.EditableValueHolder
   **Deprecated.** Use EditableValueHolder.getValueChangeListeners() instead.

**getValueChangeListener()** - Method in class
javax.faces.component.UIInput

**getValueChangeListeners()** - Method in interface
javax.faces.component.EditableValueHolder
   Return the set of registered ValueChangeListener for this component instance.

**getValueChangeListeners()** - Method in class
javax.faces.component.UIInput
   Return the set of registered ValueChangeListeners for this UIInput instance.

**getValueExpression(String)** - Method in class
javax.faces.component.UIComponent
   Return the ValueExpression used to calculate the value for the specified attribute or property name, if any.

**getValueExpression(String)** - Method in class
javax.faces.component.UIGraphic
   Return any ValueExpression set for value if a ValueExpression for url is requested; otherwise, perform the default superclass processing for this method.

**getValueExpression(String)** - Method in class
javax.faces.component.UISelectBoolean
   Return any ValueExpression set for value if a ValueExpression for selected is requested; otherwise, perform the default superclass processing for this method.

**getValueExpression(String)** - Method in class
javax.faces.component.UISelectMany
   Return any ValueExpression set for value if a ValueExpression for
selectedIndex is requested; otherwise, perform the default superclass processing for this method.

**getValueNames()** - Method in interface javax.servlet.http.HttpSession

*Deprecated. As of Version 2.2, this method is replaced by HttpSession.getAttributeNames()*

**getValues()** - Method in class javax.servlet.jsp.tagext.TagSupport

Enumerate the keys for the values kept by this tag handler.

**getValues()** - Method in interface javax.xml.registry.infomodel.Slot

Gets the values for this Slot.

**getValueType()** - Method in interface javax.xml.registry.infomodel.ClassificationScheme

Gets the value type for this object.

**getVar()** - Method in class javax.faces.component.UIData

Return the request-scope attribute under which the data object for the current row will be exposed when iterating.

**getVariableInfo(TagData)** - Method in class javax.servlet.jsp.tagext.TagExtraInfo

Information on scripting variables defined by the tag associated with this TagExtraInfo instance.

**getVariableInfo(TagData)** - Method in class javax.servlet.jsp.tagext.TagInfo

Information on the scripting objects created by this tag at runtime.

**getVariableMapper()** - Method in class javax.el.ELContext

Retrieves the VariableMapper associated with this ELContext.

**getVariableResolver()** - Method in class javax.servlet.jsp.JspContext

*Deprecated. This has been replaced by Application.getELResolver().*

**getVariableResolver()** - Method in class javax.servlet.jsp.tagext.VariableInfo

*Deprecated. As of JSP 2.1, replaced by ELContext.getELResolver(), which can be obtained by jspContext.getELContext().getELResolver().*

**getVarName()** - Method in class javax.servlet.jsp.tagext.VariableInfo

Returns the name of the scripting variable.

**getVendor()** - Method in class javax.mail.Provider

Returns name of vendor associated with this implementation or null

** getVersion()** - Method in class javax.mail.Provider

Returns version of this implementation or null if no version

Returns the version of the protocol this cookie complies with.

getVersion() - Method in interface javax.xml.registry.CapabilityProfile
   Gets the JAXR specification version supported by the JAXR provider.

getVersion() - Method in interface
   javax.xml.stream.events.StartDocument
   Gets the version of XML of this XML stream

getVersion() - Method in class
   javax.xml.stream.util.StreamReaderDelegate

getVersion() - Method in interface javax.xml.stream.XMLStreamReader
   Get the xml version declared on the xml declaration Returns null if none was declared

getViewHandler() - Method in class javax.faces.application.Application
   Return the ViewHandler instance that will be utilized during the Restore View and Render Response phases of the request processing lifecycle.

getViewId() - Method in exception
   javax.faces.application.ViewExpiredException
   Return the view identifier of this exception, or null if the view identifier is nonexistent or unknown.

getViewId() - Method in class javax.faces.component.UIViewRoot
   Return the view identifier for this view.

getViewRoot() - Method in class javax.faces.context.FacesContext
   Return the root component that is associated with the this request.

getVisibleNamespacePrefixes() - Method in interface
   javax.xml.soap.SOAPElement
   Returns an Iterator over the namespace prefix Strings visible to this element.

getWaitingThreadCount() - Method in interface
   javax.management.j2ee.statistics.JCACollectionPoolStats
   The number of threads waiting for a connection

getWaitingThreadCount() - Method in interface
   javax.management.j2ee.statistics.JDBCCollectionPoolStats
   Number of threads waiting for a connection.

getWaitTime() - Method in interface
   javax.management.j2ee.statistics.JCAConnectionStats
   Returns the time spent waiting for a connection to be available
javax.management.j2ee.statistics.JDBCConnectionStats
Time spent waiting for a connection to be available.

getWarnClass() - Method in class
javax.faces.component.html.HtmlMessage
Return the value of the warnClass property.

getWarnClass() - Method in class
javax.faces.component.html.HtmlMessages
Return the value of the warnClass property.

getWarnings() - Method in interface javax.resource.cci.Interaction
Gets the first ResourceWarning from the chain of warnings associated with this Interaction instance.

getWarnStyle() - Method in class
javax.faces.component.html.HtmlMessage
Return the value of the warnStyle property.

getWarnStyle() - Method in class
javax.faces.component.html.HtmlMessages
Return the value of the warnStyle property.

getWebURL() - Method in interface
javax.enterprise.deploy.spi.TargetModuleID
If this TargetModuleID represents a web module retrieve the URL for it.

getWidth() - Method in class javax.faces.component.html.HtmlDataTable
Return the value of the width property.

getWidth() - Method in class
javax.faces.component.html.HtmlGraphicImage
Return the value of the width property.

getWidth() - Method in class
javax.faces.component.html.HtmlPanelGrid
Return the value of the width property.

getWork() - Method in class javax.resource.spi.work.WorkEvent
Return the work instance which is the cause of the event.

getWorkManager() - Method in interface
javax.resource.spi.BootstrapContext
Provides a handle to a WorkManager instance.

getWrapped() - Method in class
javax.faces.application.StateManagerWrapper

getWrapped() - Method in class
javax.faces.application.ViewHandlerWrapper
**getWrapped()** - Method in class `javax.faces.context.ResponseWriterWrapper`
javax.resource.spi.**ManagedConnection**
  Returns an `javax.transaction.xa.XAresource` instance.

**getXAResources(ActivationSpec[])** - Method in interface `javax.resource.spi. ResourceAdapter`
  This method is called by the application server during crash recovery.

**getXATerminator()** - Method in interface `javax.resource.spi. BootstrapContext`
  Provides a handle to a `XATerminator` instance.

**getXid()** - Method in class `javax.resource.spi.work. ExecutionContext`

**getXMLNode(Object)** - Method in class `javax.xml.bind. Binder`
  Gets the XML element associated with the given JAXB object.

**getXMLReader()** - Method in class `javax.xml.bind.helpers. AbstractUnmarshallerImpl`
  Obtains a configured XMLReader.

**getXMLReporter()** - Method in class `javax.xml.stream. XMLInputFactory`
  The reporter that will be set on any XMLStreamReader or XMLEventReader created by this factory instance.

**getXMLResolver()** - Method in class `javax.xml.stream. XMLInputFactory`
  The resolver that will be set on any XMLStreamReader or XMLEventReader created by this factory instance.

**getXpath()** - Method in interface `javax.enterprise.deploy.model. DDBean`
  Returns the original xpath string provided by the DConfigBean.

**getXpath()** - Method in interface `javax.enterprise.deploy.model. DDBeanRoot`
  Return the XPath for this standard bean.

**getXpaths()** - Method in interface `javax.enterprise.deploy.spi. DConfigBean`
  Return a list of XPaths designating the deployment descriptor information this DConfigBean requires.

**GT** - Static variable in class `javax.mail.search. ComparisonTerm`
**Handle** - Interface in *javax.ejb*
   The Handle interface is implemented by all EJB object handles.

**HandleDelegate** - Interface in *javax.ejb.spi*
   The HandleDelegate interface is implemented by the EJB container.

**handleEvent(ValidationEvent)** - Method in class *javax.xml.bind.helpers.DefaultValidationEventHandler*

**handleEvent(ValidationEvent)** - Method in class *javax.xml.bind.util.ValidationEventCollector*

**handleEvent(ValidationEvent)** - Method in interface *javax.xml.bind.ValidationEventHandler*
   Receive notification of a validation warning or error.

**handleFault(MessageContext)** - Method in class *javax.xml.rpc.handler.GenericHandler*
   The handleFault method processes the SOAP faults based on the SOAP message processing model.

**handleFault(MessageContext)** - Method in interface *javax.xml.rpc.handler.Handler*
   The handleFault method processes the SOAP faults based on the SOAP message processing model.

**handleFault(MessageContext)** - Method in interface *javax.xml.rpc.handler.HandlerChain*
   The handleFault method initiates the SOAP fault processing for this handler chain.

**handleFault(C)** - Method in interface *javax.xml.ws.handler.Handler*
   The handleFault method is invoked for fault message processing.

**handleMessage(C)** - Method in interface *javax.xml.ws.handler.Handler*
   The handleMessage method is invoked for normal processing of inbound and outbound messages.

**handleNavigation(FacesContext, String, String)** - Method in class *javax.faces.application.NavigationHandler*
   Perform navigation processing based on the state information in the specified FacesContext, plus the outcome string returned by an executed application action.
**handlePageException(Exception)** - Method in class javax.servlet.jsp.PageContext
   This method is intended to process an unhandled 'page' level exception by forwarding the exception to the specified error page for this JSP.

**handlePageException(Throwable)** - Method in class javax.servlet.jsp.PageContext
   This method is intended to process an unhandled 'page' level exception by forwarding the exception to the specified error page for this JSP.

**handleProgressEvent(ProgressEvent)** - Method in interface javax.enterprise.deploy.spi.status.ProgressListener
   Invoked when a deployment progress event occurs.

**Handler** - Interface in javax.xml.rpc.handler
   The javax.xml.rpc.handler.Handler interface is required to be implemented by a SOAP message handler.

**Handler<C extends MessageContext>** - Interface in javax.xml.ws.handler
   The Handler interface is the base interface for JAX-WS handlers.

**HandlerChain** - Annotation Type in javax.jws
   Associates the Web Service with an externally defined handler chain.

**HandlerChain** - Interface in javax.xml.rpc.handler
   The javax.xml.rpc.handler.HandlerChain interface represents a list of handlers.

**handleRequest(MessageContext)** - Method in class javax.xml.rpc.handler.GenericHandler
   The handleRequest method processes the request SOAP message.

**handleRequest(MessageContext)** - Method in interface javax.xml.rpc.handler.Handler
   The handleRequest method processes the request message.

**handleRequest(MessageContext)** - Method in interface javax.xml.rpc.handler.HandlerChain
   The handleRequest method initiates the request processing for this handler chain.

**handleResponse(MessageContext)** - Method in class javax.xml.rpc.handler.GenericHandler
   The handleResponse method processes the response message.
The handleResponse method processes the response SOAP message.

**handleResponse(MessageContext)** - Method in interface javax.xml.rpc.handler.HandlerChain
The handleResponse method initiates the response processing for this handler chain.

**handleResponse(Response<T>)** - Method in interface javax.xml.ws.AsyncHandler
Called when the response to an asynchronous operation is available.

**HandlerInfo** - Class in javax.xml.rpc.handler
The javax.xml.rpc.handler.HandlerInfo represents information about a handler in the HandlerChain.

**HandlerInfo()** - Constructor for class javax.xml.rpc.handler.HandlerInfo
Default constructor

**HandlerInfo(Class, Map, QName[])** - Constructor for class javax.xml.rpc.handler.HandlerInfo
Constructor for HandlerInfo

**HandlerRegistry** - Interface in javax.xml.rpc.handler
The javax.xml.rpc.handler.HandlerRegistry provides support for the programmatic configuration of handlers in a HandlerRegistry.

**HandlerResolver** - Interface in javax.xml.ws.handler
HandlerResolver is an interface implemented by an application to get control over the handler chain set on proxy/dispatch objects at the time of their creation.

**handlesURI(String)** - Method in interface javax.enterprise.deploy.spi.factories.DeploymentFactory
Tests whether this factory can create a DeploymentManager object based on the specified URI.

**hasBinding()** - Method in class javax.faces.webapp.UIClassicTagBase
Return true if this component has a non-null binding attribute.

**hasBinding()** - Method in class javax.faces.webapp.UIClassicTag
Deprecated.

**hasDetail()** - Method in interface javax.xml.soap.SOAPFault
Returns true if this SOAPFault has a Detail subelement and false otherwise.
**hasDynamicAttributes()** - Method in class javax.servlet.jsp.tagext.TagInfo
Get dynamicAttributes associated with this TagInfo.

**hasEvents()** - Method in class javax.xml.bind.util.ValidationEventCollector
Returns true if this event collector contains at least one ValidationEvent.

**hasFault()** - Method in interface javax.xml.soap.SOAPBody
Indicates whether a SOAPFault object exists in this SOAPBody object.

**hashCode()** - Method in class javax.el.Expression
Returns the hash code for this Expression.

**hashCode()** - Method in class javax.faces.validator.DoubleRangeValidator

**hashCode()** - Method in class javax.faces.validator.LengthValidator

**hashCode()** - Method in class javax.faces.validator.LongRangeValidator

**hashCode()** - Method in class javax.mail.Flags
Compute a hash code for this Flags object.

**hashCode()** - Method in class javax.mail.internet.InternetAddress
Compute a hash code for the address.

**hashCode()** - Method in class javax.mail.internet.NewsAddress
Compute a hash code for the address.

**hashCode()** - Method in class javax.mail.search.AddressTerm
Compute a hash code for this object.

**hashCode()** - Method in class javax.mail.search.AndTerm
Compute a hash code for this object.

**hashCode()** - Method in class javax.mail.search.ComparisonTerm
Compute a hash code for this object.

**hashCode()** - Method in class javax.mail.search.DateTerm
Compute a hash code for this object.

**hashCode()** - Method in class javax.mail.search.FlagTerm
Compute a hash code for this object.

**hashCode()** - Method in class javax.mail.search.HeaderTerm
Compute a hash code for this object.

**hashCode()** - Method in class javax.mail.search.IntegerComparisonTerm
Compute a hash code for this object.

**hashCode()** - Method in class javax.mail.search.NotTerm

Compute a hashCode for this object.

**hashCode()** - Method in class `javax.mail.search.OrTerm`
Compute a hashCode for this object.

**hashCode()** - Method in class `javax.mail.search.RecipientStringTerm`
Compute a hashCode for this object.

**hashCode()** - Method in class `javax.mail.search.RecipientTerm`
Compute a hashCode for this object.

**hashCode()** - Method in class `javax.mail.search.StringTerm`
Compute a hashCode for this object.

**hashCode()** - Method in class `javax.mail.URLName`
Compute the hash code for this URLName.

**hashCode()** - Method in interface `javax.resource.cci.Record`
Returns the hash code for the Record instance.

**hashCode()** - Method in interface
`javax.resource.spi.ConnectionRequestInfo`.
Returns the hash code of the ConnectionRequestInfo.

**hashCode()** - Method in interface
`javax.resource.spi.ManagedConnectionFactory`.
Returns the hash code for the ManagedConnectionFactory.

**hashCode()** - Method in interface
`javax.resource.spi.security_GENERICCREDENTIAL`.
**Deprecated.** Returns the hash code for this GenericCredential

**hashCode()** - Method in class
`javax.resource.spi.security.PasswordCredential`.
Returns the hash code for this PasswordCredential.

**hashCode()** - Method in class
`javax.security.jacc.EJBMethodPermission`
Returns the hash code value for this EJBMethodPermission.

**hashCode()** - Method in class
`javax.security.jacc.EJBRoleRefPermission`
Returns the hash code value for this EJBRoleRefPermission.

**hashCode()** - Method in class
`javax.security.jacc.WebResourcePermission`
Returns the hash code value for this WebResourcePermission.

**hashCode()** - Method in class
`javax.security.jacc.WebRoleRefPermission`
Returns the hash code value for this WebRoleRefPermission.

**hashCode()** - Method in class
`javax.security.jacc.WebUserDataPermission`
Returns the hash code value for this WebUserDataPermission.

**hasName()** - Method in class
`javax.xml.stream.util.StreamReaderDelegate`
**hasName()** - Method in interface [javax.xml.stream.XMLStreamReader](https://docs.oracle.com/javase/8/docs/api/java/xml/stream/(XMLStreamReader))
returns true if the current event has a name (is a `START_ELEMENT` or `END_ELEMENT`) returns false otherwise

**hasNewMessages()** - Method in class [javax.mail.Folder](https://docs.oracle.com/javase/8/docs/api/javax/mail/Folder)
Returns true if this Folder has new messages since the last time this indication was reset.

**hasNext()** - Method in class [javax.xml.stream.util.EventReaderDelegate](https://docs.oracle.com/javase/8/docs/api/javax/xml/stream/util/EventReaderDelegate)

**hasText()** - Method in class [javax.xml.stream.util.StreamReaderDelegate](https://docs.oracle.com/javase/8/docs/api/javax/xml/stream/util/StreamReaderDelegate)

**hasText()** - Method in interface [javax.xml.stream.XMLStreamReader](https://docs.oracle.com/javase/8/docs/api/java/xml/stream/XMLStreamReader)
Check if there are more events.

**hasNext()** - Method in interface [javax.xml.stream.XMLStreamReader](https://docs.oracle.com/javase/8/docs/api/java/xml/stream/XMLStreamReader)
Returns true if there are more parsing events and false if there are no more events.

**hasNext()** - Method in class [javax.xml.stream.util.StreamReaderDelegate](https://docs.oracle.com/javase/8/docs/api/javax/xml/stream/util/StreamReaderDelegate)

**hasNext()** - Method in interface [javax.xml.stream.XMLEventReader](https://docs.oracle.com/javase/8/docs/api/javax/xml/stream/XMLEventReader)
Check if there are more events.

**hasText()** - Method in interface [javax.xml.stream.XMLStreamReader](https://docs.oracle.com/javase/8/docs/api/java/xml/stream/XMLStreamReader)
Return true if the current event has text, false otherwise.
The following events have text: `CHARACTERS`, `DTD`, `ENTITY_REFERENCE`, `COMMENT`, `SPACE`

**Header** - Class in [javax.mail](https://docs.oracle.com/javase/8/docs/api/javax/mail)
The Header class stores a name/value pair to represent headers.

**Header(String, String)** - Constructor for class [javax.mail.Header](https://docs.oracle.com/javase/8/docs/api/javax/mail/Header)
Construct a Header object.

**headerName** - Variable in class [javax.mail.search.HeaderTerm](https://docs.oracle.com/javase/8/docs/api/javax/mail/search/HeaderTerm)
The name of the header.

**headers** - Variable in class [javax.mail.internet.InternetHeaders](https://docs.oracle.com/javase/8/docs/api/javax/mail/internet/InternetHeaders)
The actual list of Headers, including placeholder entries.

**headers** - Variable in class [javax.mail.internet.MimeBodyPart](https://docs.oracle.com/javase/8/docs/api/javax/mail/internet/MimeBodyPart)
The InternetHeaders object that stores all the headers of this body part.

**headers** - Variable in class [javax.mail.internet.MimeMessage](https://docs.oracle.com/javase/8/docs/api/javax/mail/internet/MimeMessage)
The InternetHeaders object that stores the header of this message.

**HeaderTerm** - Class in [javax.mail.search](https://docs.oracle.com/javase/8/docs/api/javax/mail/search)
This class implements comparisons for Message headers.

**HeaderTerm(String, String)** - Constructor for class [javax.mail.search.HeaderTerm](https://docs.oracle.com/javase/8/docs/api/javax/mail/search/HeaderTerm)
HeaderTokenizer - Class in javax.mail.internet
This class tokenizes RFC822 and MIME headers into the basic symbols specified by RFC822 and MIME.

HeaderTokenizer(String, String, boolean) - Constructor for class javax.mail.internet. HeaderTokenizer
Constructor that takes a rfc822 style header.

HeaderTokenizer(String, String) - Constructor for class javax.mail.internet. HeaderTokenizer
Constructor.

HeaderTokenizer(String) - Constructor for class javax.mail.internet. HeaderTokenizer
Constructor.

HeaderTokenizer.Token - Class in javax.mail.internet
The Token class represents tokens returned by the HeaderTokenizer.

HeaderTokenizer.Token(int, String) - Constructor for class javax.mail.internet. HeaderTokenizer.Token
Constructor.

HeuristicCommitException - Exception in javax.transaction
This exception is thrown by the rollback operation on a resource to report that a heuristic decision was made and that all relevant updates have been committed.

HeuristicCommitException() - Constructor for exception javax.transaction.HeuristicCommitException

HeuristicCommitException(String) - Constructor for exception javax.transaction.HeuristicCommitException

HeuristicMixedException - Exception in javax.transaction
This exception is thrown to report that a heuristic decision was made and that some relevant updates have been committed and others have been rolled back.

HeuristicMixedException() - Constructor for exception javax.transaction.HeuristicMixedException

HeuristicMixedException(String) - Constructor for exception javax.transaction.HeuristicMixedException

HeuristicRollbackException - Exception in javax.transaction
This exception is thrown by the commit operation to report that a heuristic decision was made and that all relevant updates have been rolled back.

**HeuristicRollbackException()** - Constructor for exception `javax.transaction.HeuristicRollbackException`

**HeuristicRollbackException(String)** - Constructor for exception `javax.transaction.HeuristicRollbackException`

**HexBinaryAdapter** - Class in `javax.xml.bind.annotation.adapters.XmlAdapter` for `xs:hexBinary`.

**HexBinaryAdapter()** - Constructor for class `javax.xml.bind.annotation.adapters.HexBinaryAdapter`

**Holder** - Interface in `javax.xml.rpc.holders`. The `javax.xml.rpc.holders.Holder` interface represents the base interface for both standard and generated `Holder` classes.

**Holder<T>** - Class in `javax.xml.ws`. Holds a value of type `T`.

**Holder()** - Constructor for class `javax.xml.ws.Holder`. Creates a new holder with a `null` value.

**Holder(T)** - Constructor for class `javax.xml.ws.Holder`. Create a new holder with the specified value.

**HOLDS_FOLDERS** - Static variable in class `javax.mail.Folder`. This folder can contain other folders.

**HOLDS_MESSAGES** - Static variable in class `javax.mail.Folder`. This folder can contain messages.

**HomeHandle** - Interface in `javax.ejb`. The `HomeHandle` interface is implemented by all home object handles.

**host** - Variable in class `javax.mail.internet.NewsAddress`.

**HTML_BASIC_RENDER_KIT** - Static variable in class `javax.faces.render.RenderKitFactory`. The render kit identifier of the default `RenderKit` instance for this JavaServer Faces implementation.

**HtmlColumn** - Class in `javax.faces.component.html`. Represents a column that will be rendered in an HTML table element.
**HtmlColumn()** - Constructor for class javax.faces.component.html.HtmlColumn

**HtmlCommandButton** - Class in javax.faces.component.html

  Represents an HTML input element for a button of type submit or reset.

**HtmlCommandButton()** - Constructor for class javax.faces.component.html.HtmlCommandButton

**HtmlCommandLink** - Class in javax.faces.component.html

  Represents an HTML a element for a hyperlink that acts like a submit button.

**HtmlCommandLink()** - Constructor for class javax.faces.component.html.HtmlCommandLink

**HtmlDataTable** - Class in javax.faces.component.html

  Represents a set of repeating data (segregated into columns by child UIColumn components) that will be rendered in an HTML table element.

**HtmlDataTable()** - Constructor for class javax.faces.component.html.HtmlDataTable

**HtmlForm** - Class in javax.faces.component.html

  Represents an HTML form element.

**HtmlForm()** - Constructor for class javax.faces.component.html.HtmlForm

**HtmlGraphicImage** - Class in javax.faces.component.html

  Represents an HTML img element, used to retrieve and render a graphical image.

**HtmlGraphicImage()** - Constructor for class javax.faces.component.html.HtmlGraphicImage

**HtmlInputHidden** - Class in javax.faces.component.html

  Represents an HTML input element of type hidden.

**HtmlInputHidden()** - Constructor for class javax.faces.component.html.HtmlInputHidden

**HtmlInputSecret** - Class in javax.faces.component.html
Represents an HTML input element of type password.

**HtmlInputSecret()** - Constructor for class javax.faces.component.html.HtmlInputSecret

**HtmlInputText** - Class in javax.faces.component.html

Represents an HTML input element of type text.

**HtmlInputText()** - Constructor for class javax.faces.component.html.HtmlInputText

**HtmlInputTextarea** - Class in javax.faces.component.html

Represents an HTML textarea element.

**HtmlInputTextarea()** - Constructor for class javax.faces.component.html.HtmlInputTextarea

**HtmlMessage** - Class in javax.faces.component.html

By default, the `rendererType` property must be set to "javax.faces.Message".

**HtmlMessage()** - Constructor for class javax.faces.component.html.HtmlMessage

**HtmlMessages** - Class in javax.faces.component.html

By default, the `rendererType` property must be set to "javax.faces.Messages".

**HtmlMessages()** - Constructor for class javax.faces.component.html.HtmlMessages

**HtmlOutputFormat** - Class in javax.faces.component.html

Represents a component that looks up a localized message in a resource bundle, optionally uses it as a `MessageFormat` pattern string and substitutes in parameter values from nested `UIParameter` components, and renders the result.

**HtmlOutputFormat()** - Constructor for class javax.faces.component.html.HtmlOutputFormat

**HtmlOutputLabel** - Class in javax.faces.component.html

Represents an HTML label element, used to define an accessible label for a corresponding input element.

**HtmlOutputLabel()** - Constructor for class javax.faces.component.html.HtmlOutputLabel
HtmlOutputLink - Class in javax.faces.component.html
Represents an HTML a (hyperlink) element that may be used to link to an arbitrary URL defined by the value property.
HtmlOutputLink() - Constructor for class
javax.faces.component.html.HtmlOutputLink

HtmlOutputText - Class in javax.faces.component.html
Renders the component value as text, optionally wrapping in a span element if I18N attributes, CSS styles or style classes are specified.
HtmlOutputText() - Constructor for class
javax.faces.component.html.HtmlOutputText

HtmlPanelGrid - Class in javax.faces.component.html
Renders child components in a table, starting a new row after the specified number of columns.
HtmlPanelGrid() - Constructor for class
javax.faces.component.html.HtmlPanelGrid

HtmlPanelGroup - Class in javax.faces.component.html
Causes all child components of this component to be rendered.
HtmlPanelGroup() - Constructor for class
javax.faces.component.html.HtmlPanelGroup

HtmlSelectBooleanCheckbox - Class in javax.faces.component.html
Represents an HTML input element of type checkbox.
HtmlSelectBooleanCheckbox() - Constructor for class
javax.faces.component.html.HtmlSelectBooleanCheckbox

HtmlSelectManyCheckbox - Class in javax.faces.component.html
Represents a multiple-selection component that is rendered as a set of HTML input elements of type checkbox.
HtmlSelectManyCheckbox() - Constructor for class
javax.faces.component.html.HtmlSelectManyCheckbox

HtmlSelectManyListbox - Class in javax.faces.component.html
Represents a multiple-selection component that is rendered as an HTML select element, showing either all available options or the specified number of options.
**HtmlSelectManyListbox()** - Constructor for class javax.faces.component.html.HtmlSelectManyListbox

**HtmlSelectManyMenu** - Class in javax.faces.component.html
Represents a multiple-selection component that is rendered as an HTML select element, showing a single available option at a time.

**HtmlSelectManyMenu()** - Constructor for class javax.faces.component.html.HtmlSelectManyMenu

**HtmlSelectOneListbox** - Class in javax.faces.component.html
Represents a single-selection component that is rendered as an HTML select element, showing either all available options or the specified number of options.

**HtmlSelectOneListbox()** - Constructor for class javax.faces.component.html.HtmlSelectOneListbox

**HtmlSelectOneMenu** - Class in javax.faces.component.html
Represents a single-selection component that is rendered as an HTML select element, showing a single available option at a time.

**HtmlSelectOneMenu()** - Constructor for class javax.faces.component.html.HtmlSelectOneMenu

**HtmlSelectOneRadio** - Class in javax.faces.component.html
Represents a single-selection component that is rendered as a set of HTML input elements of type radio.

**HtmlSelectOneRadio()** - Constructor for class javax.faces.component.html.HtmlSelectOneRadio

**HTTP_BINDING** - Static variable in interface javax.xml.ws.http.HTTPBinding
A constant representing the identity of the XML/HTTP binding.

**HTTP_REQUEST_HEADERS** - Static variable in interface javax.xml.ws.handler.MessageContext
Standard property: HTTP request headers.

**HTTP_REQUEST_METHOD** - Static variable in interface javax.xml.ws.handler.MessageContext
Standard property: HTTP request method.

**HTTP_RESPONSE_CODE** - Static variable in interface javax.xml.ws.handler.MessageContext
Standard property: HTTP response status code.

**HTTP RESPONSE_HEADERS** - Static variable in interface javax.xml.ws.handler.MessageContext

  Standard property: HTTP response headers.

**HTTPBinding** - Interface in javax.xml.ws.http

  The HTTPBinding interface is an abstraction for the XML/HTTP binding.

**HTTPException** - Exception in javax.xml.ws.http

  The HTTPException exception represents a XML/HTTP fault.

**HTTPException(int)** - Constructor for exception javax.xml.ws.http.HttpException

  Constructor for the HTTPException

**HttpJspPage** - Interface in javax.servlet.jsp

  The HttpJspPage interface describes the interaction that a JSP Page Implementation Class must satisfy when using the HTTP protocol.

**HttpServlet** - Class in javax.servlet.http

  Provides an abstract class to be subclassed to create an HTTP servlet suitable for a Web site.

**HttpServlet()** - Constructor for class javax.servlet.http.HttpServlet

  Does nothing, because this is an abstract class.

**HttpServletRequest** - Interface in javax.servlet.http

  Extends the ServletRequest interface to provide request information for HTTP servlets.

**HttpServletRequestWrapper** - Class in javax.servlet.http

  Provides a convenient implementation of the HttpServletRequest interface that can be subclassed by developers wishing to adapt the request to a Servlet.

**HttpServletRequestWrapper(HttpServletRequest)** - Constructor for class javax.servlet.http.HttpServletRequestWrapper

  Constructs a request object wrapping the given request.

**HttpServletRequestWrapper(HttpServletRequest)** - Interface in javax.servlet.http

  Extends the ServletResponse interface to provide HTTP-specific functionality in sending a response.

**HttpServletResponse** - Interface in javax.servlet.http

  Provides a convenient implementation of the HttpServletResponse interface that can be subclassed by developers wishing to adapt the response from a Servlet.

**HttpServletResponseWrapper** - Class in javax.servlet.http

  Provides a convenient implementation of the HttpServletResponse interface that can be subclassed by developers wishing to adapt the response from a Servlet.
Constructs a response adaptor wrapping the given response.

**HttpSession** - Interface in **javax.servlet.http**
Provides a way to identify a user across more than one page request or visit to a Web site and to store information about that user.

**HttpSessionActivationListener** - Interface in **javax.servlet.http**
Objects that are bound to a session may listen to container events notifying them that sessions will be passivated and that session will be activated.

**HttpSessionAttributeListener** - Interface in **javax.servlet.http**
This listener interface can be implemented in order to get notifications of changes to the attribute lists of sessions within this web application.

**HttpSessionBindingEvent** - Class in **javax.servlet.http**
Events of this type are either sent to an object that implements **HttpSessionBindingListener** when it is bound or unbound from a session, or to a **HttpSessionAttributeListener** that has been configured in the deployment descriptor when any attribute is bound, unbound or replaced in a session.

**HttpSessionBindingEvent(HttpSession, String)** - Constructor for class **javax.servlet.http.HttpSessionBindingEvent**
Constructs an event that notifies an object that it has been bound to or unbound from a session.

**HttpSessionBindingEvent(HttpSession, String, Object)** - Constructor for class **javax.servlet.http.HttpSessionBindingEvent**
Constructs an event that notifies an object that it has been bound to or unbound from a session.

**HttpSessionBindingListener** - Interface in **javax.servlet.http**
Causes an object to be notified when it is bound to or unbound from a session.

**HttpSessionContext** - Interface in **javax.servlet.http**
Deprecated. As of Java(tm) Servlet API 2.1 for security reasons, with no replacement. This interface will be removed in a future version of this API.

**HttpSessionEvent** - Class in **javax.servlet.http**
This is the class representing event notifications for changes to sessions within a web application.

**HttpSessionEvent(HttpSession)** - Constructor for class **javax.servlet.http.HttpSessionEvent**
Construct a session event from the given source.
**HttpSessionListener** - Interface in [javax.servlet.http](https://docs.oracle.com/javaee/7/api/javax/servlet/http/HttpSessionListener.html)
Implementations of this interface are notified of changes to the list of active sessions in a web application.

**HttpUtils** - Class in [javax.servlet.http](https://docs.oracle.com/javaee/7/api/javax/servlet/http/HttpUtils.html)
**Deprecated.** As of Java(tm) Servlet API 2.3. These methods were only useful with the default encoding and have been moved to the request interfaces.

**Deprecated.** Constructs an empty `HttpUtils` object.
Id - Annotation Type in javax.persistence
  Specifies the primary key property or field of an entity.

id - Variable in class javax.resource.spi.ConnectionEvent
  Type of the event

ID - Static variable in class javax.servlet.jsp.tagext.TagAttributeInfo
  "id" is wired in to be ID.

id - Variable in class javax.servlet.jsp.tagext.TagSupport
  The value of the id attribute of this tag; or null.

IdClass - Annotation Type in javax.persistence
  Specifies a composite primary key class that is mapped to multiple fields or properties of the entity.

ignoreCase - Variable in class javax.mail.search.StringTerm
  Ignore case when comparing?

IllegalStateException - Exception in javax.jms
  This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.

IllegalStateException(String, String) - Constructor for exception javax.jms.IllegalStateException
  Constructs an IllegalStateException with the specified reason and error code.

IllegalStateException(String) - Constructor for exception javax.jms.IllegalStateException
  Constructs a new instance with the specified reason.

IllegalStateException(throwable) - Constructor for exception javax.resource.spi.IllegalStateException
  Constructs a new instance with null as its detail message.
javax.resource.spi.**IllegalStateException**

Constructs a new throwable with the specified cause.

**IllegalStateException(String, Throwable)** - Constructor for exception

Constructs a new throwable with the specified detail message and cause.

**IllegalStateException(String, String)** - Constructor for exception

Constructs a new throwable with the specified detail message and an error code.

**IllegalWriteException** - Exception in **javax.mail**

The exception thrown when a write is attempted on a read-only attribute of any Messaging object.

**IllegalWriteException()** - Constructor for exception

Constructs a IllegalWriteException with no detail message.

**IllegalWriteException(String)** - Constructor for exception

Constructs a IllegalWriteException with the specified detail message.

**IMMEDIATE** - Static variable in interface

javax.resource.spi.work.**WorkManager**

A constant to indicate timeout duration.

**ImplicitObjectELResolver** - Class in **javax.servlet.jsp.el**

Defines variable resolution behavior for the EL implicit objects defined in the JSP specification.

**ImplicitObjectELResolver()** - Constructor for class

javax.servlet.jsp.el.**ImplicitObjectELResolver**

**implies(Permission)** - Method in class

javax.security.jacc.**EJBMethodPermission**

Determines if the argument Permission is "implied by" this EJBMethodPermission.

**implies(Permission)** - Method in class

javax.security.jacc.**EJBRoleRefPermission**

Determines if the argument Permission is "implied by" this EJBRoleRefPermission.

**implies(Permission)** - Method in class

javax.security.jacc.**WebResourcePermission**

Determines if the argument Permission is "implied by" this
WebResourcePermission.

**implies(Permission)** - Method in class javax.security.jacc.WebRoleRefPermission

Determine if the argument Permission is "implied by" this WebRoleRefPermission.

**implies(Permission)** - Method in class javax.security.jacc.WebUserDataPermission

Determine if the argument Permission is "implied by" this WebUserDataPermission.

**in** - Variable in class javax.mail.util.SharedFileInputStream

The file containing the data.

**IN** - Static variable in class javax.xml.rpc.ParameterMode

IN mode for parameter passing.

**INBOUND_MESSAGE_ATTACHMENTS** - Static variable in interface javax.xml.ws.handler.MessageContext

Standard property: Map of attachments to a message for the inbound message, key is the MIME Content-ID, value is a DataHandler.

**include(String)** - Method in class javax.servlet.jsp.PageContext

Causes the resource specified to be processed as part of the current ServletRequest and ServletResponse being processed by the calling Thread.

**include(String, boolean)** - Method in class javax.servlet.jsp.PageContext

Causes the resource specified to be processed as part of the current ServletRequest and ServletResponse being processed by the calling Thread.

**include(ServletRequest, ServletResponse)** - Method in interface javax.servlet.RequestDispatcher

Includes the content of a resource (servlet, JSP page, HTML file) in the response.

**INDEFINITE** - Static variable in interface javax.resource.spi.work.WorkManager

A constant to indicate timeout duration.

**IndexedRecord** - Interface in javax.resource.cci

IndexedRecord represents an ordered collection of record elements based on the java.util.List interface.

**info** - Variable in class javax.servlet.jsp.tagext.TagLibraryInfo

Information (documentation) for this TLD.
**Inheritance** - Annotation Type in `javax.persistence`  
Defines the inheritance strategy to be used for an entity class hierarchy.

**InheritanceType** - Enum in `javax.persistence`  
Defines inheritance strategy options.

**Init** - Annotation Type in `javax.ejb`  
Designates a method of a session bean that corresponds to the create method of an adapted Home interface or an adapted Local Home interface.

**init(ServletConfig)** - Method in class `javax.faces.webapp.FacesServlet`  
Acquire the factory instances we will require.

**init(FilterConfig)** - Method in interface `javax.servlet.Filter`  
Called by the web container to indicate to a filter that it is being placed into service.

**init(ServletConfig)** - Method in class `javax.servlet.GenericServlet`  
Called by the servlet container to indicate to a servlet that the servlet is being placed into service.

**init()** - Method in class `javax.servlet.GenericServlet`  
A convenience method which can be overridden so that there's no need to call `super.init(config)`.

**init(ServletConfig)** - Method in interface `javax.servlet.Servlet`  
Called by the servlet container to indicate to a servlet that the servlet is being placed into service.

**init(HandlerInfo)** - Method in class `javax.xml.rpc.handler.GenericHandler`  
The `init` method to enable the Handler instance to initialize itself.

**init(HandlerInfo)** - Method in interface `javax.xml.rpc.handler.Handler`  
The `init` method enables the Handler instance to initialize itself.

**init(Map)** - Method in interface `javax.xml.rpc.handler.HandlerChain`  
Initializes the configuration for a HandlerChain.

**init(Object)** - Method in interface `javax.xml.rpc.server.ServiceLifecycle`  
Used for initialization of a service endpoint.

**initCause(Throwable)** - Method in exception `javax.xml.registry.JAXRException`  
Initializes the `cause` of this throwable to the specified value.

**initCause(Throwable)** - Method in exception `javax.xml.soap.SOAPException`  
Initializes the `cause` field of this SOAPException object with the given Throwable object.

**initialize(Servlet, ServletRequest, ServletResponse, String, boolean,}
int, boolean) - Method in class javax.servlet.jsp.PageContext
   The initialize method is called to initialize an uninitialized PageContext so that it may be used by a JSP Implementation class to service an incoming request and response within it's _jspService() method.

InitParam - Annotation Type in javax.jws.soap
   Deprecated. As of JSR-181 2.0 with no replacement.

initView(FacesContext) - Method in class javax.faces.application.ViewHandler
   Initialize the view for the request processing lifecycle.

initView(FacesContext) - Method in class javax.faces.application.ViewHandlerWrapper
   The default behavior of this method is to call
   ViewHandler.initView(javax.faces.context.FacesContext) on the wrapped ViewHandler object.

INLINE - Static variable in interface javax.mail.Part
   This part should be presented inline.

INOUT - Static variable in class javax.xml.rpc.ParameterMode
   INOUT mode for parameter passing

insertsAreDetected(int) - Method in interface javax.resource.cci.ResultSetInfo
   Indicates whether or not a visible row insert can be detected by calling ResultSet.rowInserted.

inService() - Method in interface javax.security.jacc.PolicyConfiguration
   This method is used to determine if the policy context whose interface is this PolicyConfiguration Object is in the "inService" state.

inService(String) - Method in class javax.security.jacc.PolicyConfigurationFactory
   This method determines if the identified policy context exists with state "inService" in the Policy provider associated with the factory.

INTEGER_ID - Static variable in class javax.faces.convert.IntegerConverter
   The message identifier of the FacesMessage to be created if the conversion to Integer fails.

IntegerComparisonTerm - Class in javax.mail.search
   This class implements comparisons for integers.

IntegerComparisonTerm(int, int) - Constructor for class javax.mail.search.IntegerComparisonTerm
**IntegerConverter** - Class in `javax.faces.convert` Converter implementation for `java.lang.Integer` (and int primitive) values.

**IntegerConverter()** - Constructor for class `javax.faces.convert.IntegerConverter`

**IntegerWrapperHolder** - Class in `javax.xml.rpc.holders`

**IntegerWrapperHolder()** - Constructor for class `javax.xml.rpc.holders.IntegerWrapperHolder`

**IntegerWrapperHolder(Integer)** - Constructor for class `javax.xml.rpc.holders.IntegerWrapperHolder`

**Interaction** - Interface in `javax.resource.cci` The `javax.resource.cci.Interaction` enables a component to execute EIS functions.

**InteractionSpec** - Interface in `javax.resource.cci` An `InteractionSpec` holds properties for driving an Interaction with an EIS instance.

**Interceptors** - Annotation Type in `javax.interceptor` Declares an ordered list of interceptors for a class or method.

**INTERNAL** - Static variable in exception `javax.resource.spi.work.WorkException` Indicates an internal error condition.

**INTERNATIONAL_STRING** - Static variable in interface `javax.xml.registry.LifeCycleManager` This interface represents a String that has been internationalized into several Locales.

**InternationalString** - Interface in `javax.xml.registry.infomodel` This interface represents a String that has been internationalized into several Locales.

**InternetAddress** - Class in `javax.mail.internet` This class represents an Internet email address using the syntax of `RFC822`.

**InternetAddress()** - Constructor for class `javax.mail.internet.InternetAddress` Default constructor.

**InternetAddress(String)** - Constructor for class `javax.mail.internet.InternetAddress`
Constructor.

**InternetAddress(String, boolean)** - Constructor for class `javax.mail.internet.InternetAddress`  
Parse the given string and create an InternetAddress.

**InternetAddress(String, String)** - Constructor for class `javax.mail.internet.InternetAddress`  
Construct an InternetAddress given the address and personal name.

**InternetAddress(String, String, String)** - Constructor for class `javax.mail.internet.InternetAddress`  
Construct an InternetAddress given the address and personal name.

**InternetHeaders** - Class in `javax.mail.internet`  
InternetHeaders is a utility class that manages RFC822 style headers.

**InternetHeaders()** - Constructor for class `javax.mail.internet.InternetHeaders`  
Create an empty InternetHeaders object.

**InternetHeaders(InputStream)** - Constructor for class `javax.mail.internet.InternetHeaders`  
Read and parse the given RFC822 message stream till the blank line separating the header from the body.

**InternetHeaders.InternetHeader** - Class in `javax.mail.internet`  
An individual internet header.

**InternetHeaders.InternetHeader(String)** - Constructor for class `javax.mail.internet.InternetHeaders.InternetHeader`  
Constructor that takes a line and splits out the header name.

**InternetHeaders.InternetHeader(String, String)** - Constructor for class `javax.mail.internet.InternetHeaders.InternetHeader`  
Constructor that takes a header name and value.

**IntHolder** - Class in `javax.xml.rpc.holders`  

**IntHolder()** - Constructor for class `javax.xml.rpc.holders.IntHolder`

**IntHolder(int)** - Constructor for class `javax.xml.rpc.holders.IntHolder`

**invalid** - Variable in class `javax.mail.event.TransportEvent`

**invalid** - Variable in exception `javax.mail.SendFailedException`

**INVALID_MESSAGE_ID** - Static variable in class
javax.faces.component.UISelectMany
The message identifier of the FacesMessage to be created if a value not matching the available options is specified.

INVALID_MESSAGE_ID - Static variable in class javax.faces.component.UISelectOne
The message identifier of the FacesMessage to be created if a value not matching the available options is specified.

invalidate() - Method in interface javax.servlet.http.HttpSession
Invalidates this session then unbinds any objects bound to it.

InvalidClientIDException - Exception in javax.jms
This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

InvalidClientIDException(String, String) - Constructor for exception javax.jms.InvalidClientIDException
Constructs an InvalidClientIDException with the specified reason and error code.

InvalidClientIDException(String) - Constructor for exception javax.jms.InvalidClientIDException
Constructs an InvalidClientIDException with the specified reason.

InvalidDestinationException - Exception in javax.jms
This exception must be thrown when a destination either is not understood by a provider or is no longer valid.

InvalidDestinationException(String, String) - Constructor for exception javax.jms.InvalidDestinationException
Constructs an InvalidDestinationException with the specified reason and error code.

InvalidDestinationException(String) - Constructor for exception javax.jms.InvalidDestinationException
Constructs an InvalidDestinationException with the specified reason.

InvalidModuleException - Exception in javax.enterprise.deploy.spi.exceptions
This exception is to report an invalid J2EE deployment module type.

InvalidModuleException(String) - Constructor for exception javax.enterprise.deploy.spi.exceptions.InvalidModuleException
Creates a new InvalidModuleException object.

InvalidPropertyException - Exception in javax.resource.spi
This exception is thrown to indicate invalid configuration property settings.
InvalidPropertyException() - Constructor for exception
javax.resource.spi.InvalidPropertyException
Create a InvalidPropertyException.
InvalidPropertyException(String) - Constructor for exception
javax.resource.spi.InvalidPropertyException
Create a InvalidPropertyException.
InvalidPropertyException(Throwables) - Constructor for exception
javax.resource.spi.InvalidPropertyException
Constructs a new Throwable with the specified cause.
InvalidPropertyException(String, Throwable) - Constructor for exception
javax.resource.spi.InvalidPropertyException
Constructs a new Throwable with the specified detail message and cause.
InvalidPropertyException(String, String) - Constructor for exception
javax.resource.spi.InvalidPropertyException
Constructs a new Throwable with the specified detail message and an error code.
InvalidRequestException - Exception in javax.xml.registry
This exception is thrown when a JAXR client attempts to invoke an API method that is not valid for some reason.
InvalidRequestException() - Constructor for exception
javax.xml.registry.InvalidRequestException
Constructs a JAXRException object with no reason or embedded Throwable.
InvalidRequestException(String) - Constructor for exception
javax.xml.registry.InvalidRequestException
Constructs a JAXRException object with the given String as the reason for the exception being thrown.
InvalidRequestException(String, Throwable) - Constructor for exception
javax.xml.registry.InvalidRequestException
Constructs a JAXRException object with the given String as the reason for the exception being thrown and the given Throwable object as an embedded Throwable.
InvalidRequestException(Throwables) - Constructor for exception
javax.xml.registry.InvalidRequestException
Constructs a JAXRException object initialized with the given Throwable object.
InvalidSelectorException - Exception in javax.jms
This exception must be thrown when a JMS client attempts to give a
provider a message selector with invalid syntax.

**InvalidSelectorException(String, String)** - Constructor for exception

```java
javax.jms.InvalidSelectorException
```

**InvalidSelectorException** - Constructor for exception

```java
javax.jms.InvalidSelectorException
```

This exception indicates that the request carried an invalid transaction context.

**InvalidTransactionException()** - Constructor for exception

```java
javax.transaction.InvalidTransactionException
```

**InvalidTransactionException(String)** - Constructor for exception

```java
javax.transaction.InvalidTransactionException
```

**InvocationContext** - Interface in `javax.interceptor`

Context information passed to AroundInvoke and Interceptor-class lifecycle callback methods.

**invoke(ELContext, Object[])** - Method in class

```java
javax.el.MethodExpression
```

If a String literal is specified as the expression, returns the String literal coerced to the expected return type of the method signature.

**invoke(FacesContext, Object[])** - Method in class

```java
javax.faces.el.MethodBinding
```

Deprecated. Return the return value (if any) resulting from a call to the method identified by this method binding expression, passing it the specified parameters, relative to the specified `FacesContext`.

**invoke(ObjectName, String, Object[], String[])** - Method in interface

```java
javax.management.j2ee.Management
```

Invokes an operation on a managed object.

**invoke(Writer)** - Method in class `javax.servlet.jsp.tagext.JspFragment`

Executes the fragment and directs all output to the given Writer, or the JspWriter returned by the getOut() method of the JspContext associated with the fragment if out is null.

**invoke(Object[])** - Method in interface `javax.xml.rpc.Call`

Invokes a specific operation using a synchronous request-response interaction mode.
**invoke(QName, Object[])** - Method in interface javax.xml.rpc.Call
Invokes a specific operation using a synchronous request-response interaction mode.

**invoke(T)** - Method in interface javax.xml.ws.Dispatch
Invoke a service operation synchronously.

**invoke(T)** - Method in interface javax.xml.ws.Provider
Invokes an operation according to the contents of the request message.

**INVOKE_APPLICATION** - Static variable in class javax.faces.event.PhaseId
Identifier that indicates an interest in events queued for the Invoke Application phase of the request processing lifecycle.

**invokeAsync(T)** - Method in interface javax.xml.ws.Dispatch
Invoke a service operation asynchronously.

**invokeAsync(T, AsyncHandler<T>)** - Method in interface javax.xml.ws.Dispatch
 invoke a service operation asynchronously.

**invokeContextCallback(FacesContext, UIComponent)** - Method in interface javax.faces.component.ContextCallback
This method will be called by an implementation of
UIComponent.invokeOnComponent(javax.faces.context.FacesContext, java.lang.String, javax.faces.component.ContextCallback) and must be passed the component with the clientId given as an argument to invokeOnComponent.

**invokeOnComponent(FacesContext, String, ContextCallback)** - Method in class javax.faces.component.UICOMPONENT
Starting at this component in the View hierarchy, search for a component with a clientId equal to the argument clientId and, if found, call the
ContextCallback.invokeContextCallback(javax.faces.context.FacesContext, javax.faces.component.UICOMPONENT) method on the argument callback, passing the current FacesContext and the found component as arguments.

**invokeOnComponent(FacesContext, String, ContextCallback)** - Method in class javax.faces.component.UICOMPONENTBase
Starting at this component in the View hierarchy, search for a component with a clientId equal to the argument clientId and, if found, call the
ContextCallback.invokeContextCallback(javax.faces.context.FacesContext, javax.faces.component.UIComponent) method on the argument callback, passing the current FacesContext and the found component as arguments.

invokeOnComponent(FacesContext, String, ContextCallback) - Method in class javax.faces.component.UIData
Override behavior from UIComponentBase.invokeOnComponent(javax.faces.context.FacesContext, java.lang.String, javax.faces.component.ContextCallback) to provide special care for positioning the data properly before finding the component and invoking the callback on it.

invokeOneWay(Object[]) - Method in interface javax.xml.rpc.Call
Invokes a remote method using the one-way interaction mode.

invokeOneWay(T) - Method in interface javax.xml.ws.Dispatch
Invokes a service operation using the one-way interaction mode.

IS_COALEScing - Static variable in class javax.xml.stream.XMLInputFactory
The property that requires the parser to coalesce adjacent character data sections

IS_NAMESPACE_AWARE - Static variable in class javax.xml.stream.XMLInputFactory
The property used to turn on/off namespace support, this is to support XML 1.0 documents, only the true setting must be supported

IS_REPAIRING_NAMESPACES - Static variable in class javax.xml.stream.XMLOutputFactory
Property used to set prefix defaulting on the output side

IS_REPLACING_ENTITY_REFERENCES - Static variable in class javax.xml.stream.XMLInputFactory
Requires the parser to replace internal entity references with their replacement text and report them as characters

IS_SUPPORTING_EXTERNAL_ENTITIES - Static variable in class javax.xml.stream.XMLInputFactory
The property that requires the parser to resolve external parsed entities

IS_VALIDATING - Static variable in class javax.xml.stream.XMLInputFactory
The property used to turn on/off implementation specific validation

isActive() - Method in interface javax.persistence.EntityTransaction
Indicate whether a transaction is in progress.

**isAddEvent()** - Method in class javax.enterprise.deploy.model.XPathEvent

Is this an add event?

**isAppropriateListener(FacesListener)** - Method in class javax.faces.event.ActionEvent

**isAppropriateListener(FacesListener)** - Method in class javax.faces.event.FacesEvent

Return true if this FacesListener is an instance of a listener class that this event supports.

**isAppropriateListener(FacesListener)** - Method in class javax.faces.event.ValueChangeEvent

**isAttribute()** - Method in interface javax.xml.stream.events.XMLEvent

A utility function to check if this event is an Attribute.

**isAttributeSpecified(int)** - Method in class javax.xml.stream.util.StreamReaderDelegate

Returns a boolean which indicates if this attribute was created by default.

**isAutoFlush()** - Method in class javax.servlet.jsp.JspWriter

This method indicates whether the JspWriter is autoFlushing.

**isAvailable()** - Method in exception javax.xml.registry.JAXRException

Returns true if a response is available, false otherwise.

**isAvailable()** - Method in interface javax.xml.registry.JAXRResponse

Returns true if a response is available, false otherwise.

**isCallerInRole(Identity)** - Method in interface javax.ejb.EJBContext

Deprecated. Use boolean isCallerInRole(String roleName) instead.

**isCallerInRole(String)** - Method in interface javax.ejb.EJBContext

Test if the caller has a given security role.

**isCancelSupported()** - Method in interface javax.enterprise.deploy.spi.status.ProgressObject

Tests whether the vendor supports a cancel operation for deployment activities.

**isCData()** - Method in interface javax.xml.stream.events.Characters

Returns true if this is a CData section.
**isChangeEvent()** - Method in class javax.enterprise.deploy.model.XpathEvent
Is this a change event?

**isCharacters()** - Method in interface javax.xml.stream.events.XMLEvent
A utility function to check if this event is Characters.

**isCharacters()** - Method in class javax.xml.stream.util.StreamReaderDelegate

**isCharacters()** - Method in interface javax.xml.stream.XMLStreamReader
Returns true if the cursor points to a character data event

**isClosed()** - Method in interface javax.xml.registry.Connection
Indicated whether this Connection has been closed or not.

**isComment()** - Method in interface javax.xml.soap.Text
Retrieves whether this Text object represents a comment.

**isCommitted()** - Method in interface javax.servlet.ServletResponse
Returns a boolean indicating if the response has been committed.

**isCommitted()** - Method in class javax.servlet.ServletResponseWrapper
The default behavior of this method is to return isCommitted() on the wrapped response object.

**isComplete()** - Method in class javax.mail.internet.MimeMultipart
Return true if the final boundary line for this multipart was seen.

**isCompleted()** - Method in interface javax.enterprise.deploy.spi.status.DeploymentStatus
A convenience method to report if the operation is in the completed state.

**isConfirmed()** - Method in interface javax.xml.registry.infomodel.Association
Determines whether an Association has been confirmed completely.

**isConfirmedBySourceOwner()** - Method in interface javax.xml.registry.infomodel.Association
Determines whether an Association has been confirmed by the owner of the source object.

**isConfirmedByTargetOwner()** - Method in interface javax.xml.registry.infomodel.Association
Determines whether an Association has been confirmed by the owner of the target object.

**isConnected()** - Method in class javax.mail.Service
Is this service currently connected?
**isDataFlavorSupported(DataFlavor)** - Method in class javax.activation.DataHandler

Returns whether the specified data flavor is supported for this object.

**isDConfigBeanVersionSupported(DConfigBeanVersionType)** - Method in interface javax.enterprise.deploy.spi.DeploymentManager

Returns 'true' if the configuration beans support the J2EE platform version specified.

**isDefaultNamespaceDeclaration()** - Method in interface javax.xml.stream.events.Namespace

Returns true if this attribute declares the default namespace

**isDeferredMethod()** - Method in class javax.servlet.jsp.tagext.TagAttributeInfo

Returns true if this attribute is to be passed a MethodExpression so that expression evaluation can be deferred.

**isDeferredValue()** - Method in class javax.servlet.jsp.tagext.TagAttributeInfo

Returns true if this attribute is to be passed a ValueExpression so that expression evaluation can be deferred.

**isDeliveryTransacted(Method)** - Method in interface javax.resource.spi.endpoint.MessageEndpointFactory

This is used to find out whether message deliveries to a target method on a message listener interface that is implemented by a message endpoint will be transacted or not.

**isDisabled()** - Method in class javax.faces.component.html.HtmlCommandButton

Return the value of the disabled property.

**isDisabled()** - Method in class javax.faces.component.html.HtmlCommandLink

Return the value of the disabled property.

**isDisabled()** - Method in class javax.faces.component.html.HtmlInputSecret

Return the value of the disabled property.

**isDisabled()** - Method in class javax.faces.component.html.HtmlInputText

Return the value of the disabled property.

**isDisabled()** - Method in class javax.faces.component.html.HtmlInputTextarea

Return the value of the disabled property.
javax.faces.component.html.HtmlOutputLink
   Return the value of the disabled property.
   isDisabled() - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
   Return the value of the disabled property.
   isDisabled() - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
   Return the value of the disabled property.
   isDisabled() - Method in class
javax.faces.component.html.HtmlSelectManyListbox
   Return the value of the disabled property.
   isDisabled() - Method in class
javax.faces.component.html.HtmlSelectManyMenu
   Return the value of the disabled property.
   isDisabled() - Method in class
javax.faces.component.html.HtmlSelectOneListbox
   Return the value of the disabled property.
   isDisabled() - Method in class
javax.faces.component.html.HtmlSelectOneMenu
   Return the value of the disabled property.
   isDisabled() - Method in class
javax.faces.component.html.HtmlSelectOneRadio
   Return the value of the disabled property.
   isDisabled() - Method in class javax.faces.model.SelectItem
   Return the disabled flag for this item, which should modify the rendered output to make this item unavailable for selection by the user if set to true.
   isElement(Object) - Method in class javax.xml.bind.JAXBIntrospector
   Return true iff object represents a JAXB element.
   isEmpty() - Method in class javax.activation.MimeTypeParameterList
   Determine whether or not this list is empty.
   isEndElement() - Method in interface
javax.xml.stream.events.XMLEvent
   A utility function to check if this event is an EndDocument.
   isEndElement() - Method in interface
javax.xml.stream.events.XMLEvent
   A utility function to check if this event is aEndElement.
   isEndElement() - Method in class
javax.xml.stream.util.StreamReaderDelegate
**isEndElement()** - Method in interface javax.xml.stream.XMLStreamReader

Returns true if the cursor points to an end tag (otherwise false)

**isEntityReference()** - Method in interface javax.xml.stream.events.XMLEvent

A utility function to check if this event is an EntityReference.

**isEscape()** - Method in class javax.faces.component.html.HtmlOutputFormat

Return the value of the escape property.

**isEscape()** - Method in class javax.faces.component.html.HtmlOutputLabel

Return the value of the escape property.

**isEscape()** - Method in class javax.faces.component.html.HtmlOutputText

Return the value of the escape property.

**isExpunged()** - Method in class javax.mail.Message

Checks whether this message is expunged.

**isExternal()** - Method in interface javax.xml.registry.infomodel.Classification

Returns true if this is an external classification.

**isExternal()** - Method in interface javax.xml.registry.infomodel.ClassificationScheme

Determines whether this ClassificationScheme is an external ClassificationScheme or an internal ClassificationScheme.

**isExtramural()** - Method in interface javax.xml.registry.infomodel.Association

Determines whether an Association is extramural or not.

**isFailed()** - Method in interface javax.enterprise.deploy.spi.status.DeploymentStatus

A convenience method to report if the operation is in the failed state.

**isFormattedOutput()** - Method in class javax.xml.bind.helpers.AbstractMarshallerImpl

Convenience method for getting the formatted output flag.

**isFragment()** - Method in class javax.servlet.jsp.tagext.TagAttributeInfo

Whether this attribute is of type JspFragment.

**isFragment()** - Method in class
javax.xml.bind.helpers.**AbstractMarshallerImpl**
Convenience method for getting the fragment flag.

**isGlobalOnly()** - Method in class javax.faces.component.**UIMessages**
Return the flag indicating whether only global messages (that is, messages with no associated client identifier) should be rendered.

**isGlobalScope()** - Method in class javax.xml.bind.**JAXBElement**
Returns true iff this xml element declaration is global.

**isGroup()** - Method in class javax.mail.internet.**InternetAddress**
Indicates whether this address is an RFC 822 group address.

**isGroupingUsed()** - Method in class javax.faces.convert.**NumberConverter**
Return true if getAsString should include grouping separators if necessary.

**isIdentical(EJBLocalObject)** - Method in interface javax.ejb.**EJBLocalObject**
Test if a given EJB local object is identical to the invoked EJB local object.

**isIdentical(EJBOBJECT)** - Method in interface javax.ejb.**EJBObject**
Test if a given EJB object is identical to the invoked EJB object.

**isIgnorableWhiteSpace()** - Method in interface javax.xml.stream.events.**Characters**
Return true if this is ignorableWhiteSpace.

**isImmediate()** - Method in interface javax.faces.component.**ActionSource**
Return a flag indicating that the default **ActionListener** provided by the JavaServer Faces implementation should be executed immediately (that is, during **Apply Request Values** phase of the request processing lifecycle), rather than waiting until the **Invoke Application** phase.

**isImmediate()** - Method in interface javax.faces.component.**EditableValueHolder**
Return the "immediate" state for this component.

**isImmediate()** - Method in class javax.faces.component.**UIComponent**

**isIntegerOnly()** - Method in class javax.faces.convert.**NumberConverter**
Return true if only the integer portion of the given value should be returned from getAsObject().
**isIsmap()** - Method in class java.util.LinkedHashMap. **HtmlGraphicImage**
Return the value of the ismap property.

**isItemDisabled()** - Method in class javax.faces.component.UISelectItem
Return the disabled setting for this selection item.

**isItemEscaped()** - Method in class javax.faces.component.UISelectItem
Return the escape setting for the label of this selection item.

**isLiteralText()** - Method in class javax.el.Expression
Returns whether this expression was created from only literal text.

**isLocaleSupported(Locale)** - Method in interface javax.enterprise.deploy.spi.DeploymentManager
Reports if this implementation supports the designated locale.

**isLocalValueSet()** - Method in interface javax.faces.component.EditableValueHolder
Return the "local value set" state for this component.

**isLocalValueSet()** - Method in class javax.faces.component.UIInput
Return the "local value set" state for this component.

**isMimeType(String)** - Method in class javax.mail.internet.MimeBodyPart
Is this Part of the specified MIME type?

**isMimeType(String)** - Method in class javax.mail.internet.MimeMessage
Is this Part of the specified MIME type?

**isMimeType(String)** - Method in interface javax.mail.Part
Is this Part of the specified MIME type?

**isMimeTypeEqual(String)** - Method in class javax.activation.ActivationDataFlavor
Is the string representation of the MIME type passed in equivalent to the MIME type of this DataFlavor.

**isMTOMEnabled()** - Method in interface javax.xml.ws.soap.SOAPBinding
Returns true if the use of MTOM is enabled.

**isNamespace()** - Method in interface javax.xml.stream.events.XMLEvent
A utility function to check if this event is a Namespace.

**isNew()** - Method in interface javax.servlet.http.HttpServletRequest
Returns true if the client does not yet know about the session or if the client chooses not to join the session.

**isNil()** - Method in class javax.xml.bind.JAXBElement
Returns true iff this element instance content model is nil.

**isOpaque()** - Method in interface javax.xml.registry.infomodel.ExtrinsicObject
Determines whether the ExtrinsicObject is opaque (not readable) by the registry operator.

**isOpen()** - Method in class `javax.mail.Folder`
Indicates whether this Folder is in the 'open' state.

**isOpen()** - Method in interface `javax.persistence.EntityManager`
Determine whether the EntityManager is open.

**isOpen()** - Method in interface `javax.persistence.EntityManagerFactory`
Indicates whether or not this factory is open.

**isParameterAndReturnSpecRequired(QName)** - Method in interface `javax.xml.rpc.Call`
Indicates whether `addParameter` and `setReturnType` methods are to be invoked to specify the parameter and return type specification for a specific operation.

**isPartialResponse()** - Method in interface `javax.xml.registry.BulkResponse`
Determines whether the response is a partial response due to large result set.

**isPermanent()** - Method in exception `javax.servlet.UnavailableException`
Returns a boolean indicating whether the servlet is permanently unavailable.

**isPostback(FacesContext)** - Method in class `javax.faces.render.ResponseStateManager`
Return true if the current request is a postback.

**isPrependId()** - Method in class `javax.faces.component.UIForm`

**isProcessingInstruction()** - Method in interface `javax.xml.stream.events.XMLEvent`
A utility function to check if this event is a ProcessingInstruction.

**isPropertyResolved()** - Method in class `javax.el.ELContext`
Returns whether an `ELResolver` has successfully resolved a given (base, property) pair.

**isPropertySupported(String)** - Method in class `javax.xml.stream.XMLInputFactory`
Query the set of properties that this factory supports.

**isPropertySupported(String)** - Method in class `javax.xml.stream.XMLOutputFactory`
Query the set of properties that this factory supports.

**isPublished()** - Method in class `javax.xml.ws.Endpoint`
Returns true if the endpoint is in the published state.
isReadOnly(ELContext, Object, Object) - Method in class javax.el.ArrayELResolver
If the base object is a Java language array, returns whether a call to

isReadOnly() - Method in class javax.el.BeanELResolver.BeanProperty

isReadOnly(ELContext, Object, Object) - Method in class javax.el.BeanELResolver
If the base object is not null, returns whether a call to

isReadOnly(ELContext, Object, Object) - Method in class javax.el.CompositeELResolver
For a given base and property, attempts to determine whether a call to

isReadOnly(ELContext, Object, Object) - Method in class javax.el.EELResolver
For a given base and property, attempts to determine whether a call to

isReadOnly(ELContext, Object, Object) - Method in class javax.el.ListELResolver
If the base object is a list, returns whether a call to

isReadOnly(ELContext, Object, Object) - Method in class javax.el.MapELResolver
If the base object is a map, returns whether a call to

isReadOnly(ELContext, Object, Object) - Method in class javax.el ResourceBundleELResolver
If the base object is not null and an instance of ResourceBundle, return true.

isReadOnly(ELContext) - Method in class javax.el.ValueExpression
Evaluates the expression relative to the provided context, and returns true if a call to
ValueExpression.setValue(javax.el.ELContext, java.lang.Object) will always fail.

**isReadonly()** - Method in class
javax.faces.component.html.HtmlCommandButton
```
Return the value of the readonly property.
```

**isReadonly()** - Method in class
javax.faces.component.html.HtmlInputSecret
```
Return the value of the readonly property.
```

**isReadonly()** - Method in class
javax.faces.component.html.HtmlInputText
```
Return the value of the readonly property.
```

**isReadonly()** - Method in class
javax.faces.component.html.HtmlInputTextarea
```
Return the value of the readonly property.
```

**isReadonly()** - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
```
Return the value of the readonly property.
```

**isReadonly()** - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
```
Return the value of the readonly property.
```

**isReadonly()** - Method in class
javax.faces.component.html.HtmlSelectManyListbox
```
Return the value of the readonly property.
```

**isReadonly()** - Method in class
javax.faces.component.html.HtmlSelectManyMenu
```
Return the value of the readonly property.
```

**isReadonly()** - Method in class
javax.faces.component.html.HtmlSelectOneListbox
```
Return the value of the readonly property.
```

**isReadonly()** - Method in class
javax.faces.component.html.HtmlSelectOneMenu
```
Return the value of the readonly property.
```

**isReadonly()** - Method in class
javax.faces.component.html.HtmlSelectOneRadio
```
Return the value of the readonly property.
```

**isReadOnly(Object, Object)** - Method in class
javax.faces.el.PropertyResolver
```
Deprecated. Checks if the specified property is read-only.
```

**isReadOnly(Object, int)** - Method in class
isReadOnly(FacesContext) - Method in class javax.faces.el.ValueBinding
  Deprecated. Return true if the specified property of the specified property is known to be immutable; otherwise, return false.

isReadOnly(ELContext, Object, Object) - Method in class javax.servlet.jsp.el.ImplicitObjectELResolver
  If the base object is null, and the property matches the name of a JSP implicit object, returns true to indicate that implicit objects cannot be overwritten.

isReadOnly(ELContext, Object, Object) - Method in class javax.servlet.jsp.el.ScopedAttributeELResolver
  If the base object is null, returns false to indicate that scoped attributes are never read-only.

isRedeploySupported() - Method in interface javax.enterprise.deploy.spi.DeploymentManager
  This method designates whether this platform vendor provides application redeployment functionality.

isRedisplay() - Method in class javax.faces.component.html.HtmlInputSecret
  Return the value of the redisplay property.

isRegistered(ObjectName) - Method in interface javax.management.j2ee.Management
  Checks whether a managed object, identified by its object name, is already registered with the MEJB.

isRegistered(Class, QName) - Method in interface javax.xml.rpc.encoding.TypeMapping
  Checks whether or not type mapping between specified XML type and Java type is registered.

isRemoved() - Method in class javax.mail.event.MessageCountEvent
  Indicates whether this event is the result of an explicit expunge by this client, or due to an expunge from external sources.

isRemoveEvent() - Method in class javax.enterprise.deploy.model.XpathEvent
  Is this a remove event?

isRendered() - Method in class javax.faces.component.UICOMPONENT
  Return true if this component (and its children) should be rendered during the Render Response phase of the request processing
lifecycle.

**isRendered()** - Method in class javax.faces.component.UIComponentBase

**isRequestedSessionIdFromCookie()** - Method in interface javax.servlet.http.HttpServletRequest

Checks whether the requested session ID came in as a cookie.

**isRequestedSessionIdFromCookie()** - Method in class javax.servlet.http.HttpServletRequestWrapper

The default behavior of this method is to return isRequestedSessionIdFromCookie() on the wrapped request object.

**isRequestedSessionIdFromUrl()** - Method in interface javax.servlet.http.HttpServletRequest

Checks whether the requested session ID came in as part of the request URL.

**isRequestedSessionIdFromUrl()** - Method in interface javax.servlet.http.HttpServletRequestWrapper

Deprecated. As of Version 2.1 of the Java Servlet API, use HttpServletRequest.isRequestedSessionIdFromURL() instead.

**isRequestedSessionIdFromUrl()** - Method in class javax.servlet.http.HttpServletRequestWrapper

The default behavior of this method is to return isRequestedSessionIdFromUrl() on the wrapped request object.

**isRequestedSessionIdValid()** - Method in interface javax.servlet.http.HttpServletRequest

Checks whether the requested session ID is still valid.

**isRequestedSessionIdValid()** - Method in class javax.servlet.http.HttpServletRequestWrapper

The default behavior of this method is to return isRequestedSessionIdValid() on the wrapped request object.

**isRequired()** - Method in interface javax.faces.component.EdtiableValueHolder

Return the "required field" state for this component.

**isRequired()** - Method in class javax.faces.component.UIInput

Return the "required field" state for this component.
**isRequired()** - Method in class `javax.servlet.jsp.tagext.TagAttributeInfo`  
Whether this attribute is required.

**isRowAvailable()** - Method in class `javax.faces.component.UIData`  
Return a flag indicating whether there is `rowData` available at the current `rowIndex`.

**isRowAvailable()** - Method in class `javax.faces.model.ListDataModel`  
Return true if there is `wrappedData` available, and the current value of `rowIndex` is greater than or equal to zero, and less than the size of the list.

**isRowAvailable()** - Method in class `javax.faces.model.ResultDataModel`  
Return true if there is `wrappedData` available, and the current value of `rowIndex` is greater than or equal to zero, and less than the length of the array returned by calling `getRows()` on the underlying `Result`.

**isRowAvailable()** - Method in class `javax.faces.model.ResultSetDataModel`  
Return true if there is `wrappedData` available, and the result of calling `absolute()` on the underlying `ResultSet`, passing the current value of `rowIndex` plus one (to account for the fact that `ResultSet` uses one-relative indexing), returns true.

**isSameRM(XAResource)** - Method in interface `javax.transaction.xa.XAResource`  
This method is called to determine if the resource manager instance represented by the target object is the same as the resource manager instance represented by the parameter `xares`.

**isSavingStateInClient(FacesContext)** - Method in class `javax.faces.application.StateManager`
**isSavingStateInClient(FacesContext)** - Method in class javax.faces.application.StateManagerWrapper

The default behavior of this method is to call `StateManager.isSavingStateInClient(javax.faces.context.FacesContext)` on the wrapped `StateManager` object.

**isSecure()** - Method in interface javax.servlet.ServletRequest

Returns a boolean indicating whether this request was made using a secure channel, such as HTTPS.

**isSecure()** - Method in class javax.servlet.ServletRequestWrapper

The default behavior of this method is to return isSecure() on the wrapped request object.

**isSelected()** - Method in class javax.faces.component.UISelectBoolean

Return the local value of the selected state of this component.

**isSession()** - Method in interface javax.ejb.EJBMetaData

Test if the enterprise Bean's type is "session".

**isSet(Flags.Flag)** - Method in class javax.mail.internet.MimeMessage

Check whether the flag specified in the `flag` argument is set in this message.

**isSet(Flags.Flag)** - Method in class javax.mail.Message

Check whether the flag specified in the `flag` argument is set in this message.

**isShowDetail()** - Method in class javax.faces.component.UIMessage

Return the flag indicating whether the `detail` property of the associated message(s) should be displayed.

**isShowDetail()** - Method in class javax.faces.component.UIMessages

Return the flag indicating whether the `detail` property of the associated message(s) should be displayed.

**isShowSummary()** - Method in class javax.faces.component.UIMessage

Return the flag indicating whether the `summary` property of the associated message(s) should be displayed.

**isShowSummary()** - Method in class javax.faces.component.UIMessages

Return the flag indicating whether the `summary` property of the associated message(s) should be displayed.

**isSpecified()** - Method in interface javax.xml.stream.events.Attribute

A flag indicating whether this attribute was actually specified in the start-tag of its element, or was defaulted from the schema.

**isStandalone()** - Method in interface
javax.xml.stream.events.\texttt{StartDocument}
Returns if this XML is standalone
\texttt{isStandalone()} - Method in class
javax.xml.stream.util.\texttt{StreamReaderDelegate}

\texttt{isStandalone()} - Method in interface
javax.xml.stream.\texttt{XMLStreamReader}
Get the standalone declaration from the xml declaration
\texttt{isStartDocument()} - Method in interface
javax.xml.stream.events.\texttt{XMLEvent}
A utility function to check if this event is a StartDocument.
\texttt{isStartElement()} - Method in interface
javax.xml.stream.events.\texttt{XMLEvent}
A utility function to check if this event is a StartElement.
\texttt{isStartElement()} - Method in class
javax.xml.stream.util.\texttt{StreamReaderDelegate}

\texttt{isStartElement()} - Method in interface
javax.xml.stream.\texttt{XMLStreamReader}
Returns true if the cursor points to a start tag (otherwise false)
\texttt{isStatelessSession()} - Method in interface javax.ejb.\texttt{EJBMetaData}
Test if the enterprise Bean's type is "stateless session".
\texttt{isStopSupported()} - Method in interface
javax.enterprise.deploy.spi.status.\texttt{ProgressObject}
Tests whether the vendor supports a stop operation for deployment activities.
\texttt{isSubmitted()} - Method in class javax.faces.component.\texttt{UIForm}
Returns the current value of the \texttt{submitted} property.
\texttt{isSubscribed()} - Method in class javax.mail.\texttt{Folder}
Returns true if this Folder is subscribed.
\texttt{isSuppressed()} - Method in class javax.faces.webapp.\texttt{UIComponentTag}
Deprecated.
\texttt{isSynchronous()} - Method in interface javax.xml.registry.\texttt{Connection}
Indicates whether a client uses synchronous communication with JAXR provider or not.
\texttt{isTooltip()} - Method in class javax.faces.component.html.\texttt{HtmlMessage}
Return the value of the \texttt{tooltip} property.
\texttt{isTooltip()} - Method in class javax.faces.component.html.\texttt{HtmlMessages}
Return the value of the \texttt{tooltip} property.
**isTransactional()** - Method in interface javax.management.j2ee.statistics.JMSConnectionStats
  Returns the transactional state of this JMS connection.

**isTransient()** - Method in interface javax.faces.component.StateHolder
  If true, the Object implementing this interface must not participate in state saving or restoring.

**isTransient()** - Method in class javax.faces.component.UIComponentBase

**isTransient()** - Method in class javax.faces.events.MethodExpressionActionListener

**isTransient()** - Method in class javax.faces.events.MethodExpressionValueChangeListener

**isTransient()** - Method in class javax.faces.validator.DoubleRangeValidator

**isTransient()** - Method in class javax.faces.validator.LengthValidator

**isTypeSubstituted()** - Method in class javax.xml.bind.JAXBElement
  Returns true iff this xml element instance's value has a different type than xml element declaration's declared type.

**isUserInRole(String)** - Method in class javax.faces.context.ExternalContext
  Return true if the currently authenticated user is included in the specified role.

**isUserInRole(String)** - Method in interface
javax.servlet.http.HttpServletRequest
Returns a boolean indicating whether the authenticated user is included in the specified logical "role".

isUserInRole(String) - Method in class javax.servlet.http.HttpServletRequestWrapper
The default behavior of this method is to return isUserInRole(String role) on the wrapped request object.

isUserInRole(String) - Method in interface javax.xml.rpc.server.ServletEndpointContext
Returns a boolean indicating whether the authenticated user for the current method invocation on the endpoint instance is included in the specified logical "role".

isUserInRole(String) - Method in interface javax.xml.ws.WebServiceContext
Returns a boolean indicating whether the authenticated user is included in the specified logical role.

isValid() - Method in interface javax.faces.component.EditableValueHolder
Return a flag indicating whether the local value of this component is valid (no conversion error has occurred).

isValid() - Method in class javax.faces.component.UIInput

isValid(TagData) - Method in class javax.servlet.jsp.tagext.TagExtraInfo
Translation-time validation of the attributes.

isValid(TagData) - Method in class javax.servlet.jsp.tagext.TagInfo
Translation-time validation of the attributes.

isValidating() - Method in class javax.xml.bind.helpers.AbstractUnmarshallerImpl
Indicates whether or not the Unmarshaller is configured to validate during unmarshal operations.

isValidating() - Method in interface javax.xml.bindUnmarshaller
Deprecated. since JAXB2.0, please see Unmarshaller.getSchema()

isValiding() - Method in interface javax.xml.bind.Unmarshaller

isValueReference(String) - Static method in class javax.faces.webapp.UIComponentTag
Deprecated. Return true if the specified value conforms to the syntax requirements of a value binding expression.

isWhiteSpace(char) - Static method in class javax.xml.bind.annotation.adapters.CollapsedStringAdapter
returns true if the specified char is a white space character.
isWhiteSpace() - Method in interface javax.xml.stream.events.Characters
Returns true if this set of Characters is all whitespace.

isWhiteSpace() - Method in class javax.xml.stream.util.StreamReaderDelegate

isWhiteSpace() - Method in interface javax.xml.stream.XMLStreamReader
Returns true if the cursor points to a character data event that consists of all whitespace.

isWhiteSpaceExceptSpace(char) - Static method in class javax.xml.bind.annotation.adapters.NormalizedStringAdapter
Returns true if the specified char is a white space character but not 0x20.

isXOPPackage() - Method in class javax.xml.bind.attachment.AttachmentMarshaller
Read-only property that returns true if JAXB marshaller should enable XOP creation.

isXOPPackage() - Method in class javax.xml.bind.attachment.AttachmentUnmarshaller
Read-only property that returns true if JAXB unmarshaller needs to perform XOP processing.

itemExists(String) - Method in interface javax.jms.MapMessage
Indicates whether an item exists in this MapMessage object.

IterationTag - Interface in javax.servlet.jsp.tagext
The IterationTag interface extends Tag by defining one additional method that controls the reevaluation of its body.
**J2eeApplicationObject** - Interface in `javax.enterprise.deploy.model`
J2eeApplicationObject is an interface that represents a J2EE application (EAR); it maintains a DeployableObject for each module in the archive.

**javaCharset(String)** - Static method in class `javax.mail.internet.MimeUtility`
Convert a MIME charset name into a valid Java charset name.

**JavaMailStats** - Interface in `javax.management.j2ee.statistics`
Specifies the statistics provided by a JavaMail resource.

**javax.activation** - package `javax.activation`
The JavaBeans(TM) Activation Framework is used by the JavaMail(TM) API to manage MIME data.

**javax.annotation** - package `javax.annotation`

**javax.annotation.security** - package `javax.annotation.security`

**javax.ejb** - package `javax.ejb`
The `javax.ejb` package contains the Enterprise JavaBeans classes and interfaces that define the contracts between the enterprise bean and its clients and between the enterprise bean and the EJB container.

**javax.ejb.spi** - package `javax.ejb.spi`
The `javax.ejb.spi` package defines interfaces that are implemented by the EJB container.

**javax.el** - package `javax.el`
Provides the API for the **Unified Expression Language** shared by the JSP 2.1 and JSF 1.2 technologies.

**javax.enterprise.deploy.model** - package `javax.enterprise.deploy.model`
Provides Tool Vendor implementation classes.

**javax.enterprise.deploy.model.exceptions** - package `javax.enterprise.deploy.model.exceptions`
Provides Tool Vendor exception implementation classes.

**javax.enterprise.deploy.shared** - package `javax.enterprise.deploy.shared`
Provides shared objects for Tool Vendor and Product Vendor
implementation classes.

**javax.enterprise.deploy.shared.factories** - package javax.enterprise.deploy.shared.factories
Provides shared factory manager object for Tool Vendor and Product Vendor implementation classes.

**javax.enterprise.deploy.spi** - package javax.enterprise.deploy.spi
Provides J2EE Product Vendor implementation classes.

**javax.enterprise.deploy.spi.exceptions** - package javax.enterprise.deploy.spi.exceptions
Provides J2EE Product Vendor deployment exception implementation classes.

**javax.enterprise.deploy.spi.factories** - package javax.enterprise.deploy.spi.factories
Provides J2EE Product Vendor deployment factory implementation classes.

**javax.enterprise.deploy.spi.status** - package javax.enterprise.deploy.spi.status
Provides J2EE Product Vendor deployment status implementation classes.

**javax.faces** - package javax.faces
Top level classes for the JavaServer(tm) Faces API.

**javax.faces.application** - package javax.faces.application
APIs that are used to link an application's business logic objects to JavaServer Faces, as well as convenient pluggable mechanisms to manage the execution of an application that is based on JavaServer Faces.

**javax.faces.component** - package javax.faces.component
Fundamental APIs for user interface components.

**javax.faces.component.html** - package javax.faces.component.html
Specialized user interface component classes for HTML.

**javax.faces.context** - package javax.faces.context
Classes and interfaces defining per-request state information.

**javax.faces.convert** - package javax.faces.convert
Contains classes and interfaces defining converters.

**javax.faces.el** - package javax.faces.el
DEPRECATED Classes and interfaces for evaluating and processing reference expressions.

**javax.faces.event** - package javax.faces.event
Interfaces describing events and event listeners, and concrete event
implementation classes.

**javax.faces.lifecycle** - package javax.faces.lifecycle

Classes and interfaces defining lifecycle management for the JavaServer Faces implementation.

**javax.faces.model** - package javax.faces.model

Standard model data beans for JavaServer Faces.

**javax.faces.render** - package javax.faces.render

Classes and interfaces defining the rendering model.

**javax.faces.validator** - package javax.faces.validator

Interface defining the validator model, and concrete validator implementation classes.

**javax.faces.webapp** - package javax.faces.webapp

Classes required for integration of JavaServer Faces into web applications, including a standard servlet, base classes for JSP custom component tags, and concrete tag implementations for core tags.

**javax.interceptor** - package javax.interceptor

The javax.interceptor package contains classes and interfaces for use with EJB interceptors.

**javax.jms** - package javax.jms

The Java Message Service (JMS) API provides a common way for Java programs to create, send, receive and read an enterprise messaging system's messages.

**javax.jws** - package javax.jws

**javax.jws.soap** - package javax.jws.soap

**javax.mail** - package javax.mail

The JavaMail™ API provides classes that model a mail system.

**javax.mail.event** - package javax.mail.event

Listeners and events for the JavaMail API.

**javax.mail.internet** - package javax.mail.internet

Classes specific to Internet mail systems.

**javax.mail.search** - package javax.mail.search

Message search terms for the JavaMail API.

**javax.mail.util** - package javax.mail.util

Utility classes.

**javax.management.j2ee** - package javax.management.j2ee

Provides the J2EE Management Enterprise Bean component
(MEJB) interfaces.

**javax.management.j2ee.statistics** - package javax.management.j2ee.statistics

Provides the standard interfaces for accessing performance data from J2EE managed objects. Package Specification [JSR 77, J2EE Management](http://www.jcp.org/en/jsr/detail?id=77) Related Documentation For overviews, tutorials, examples, guides, and tool documentation, please see: J2EE Tools

**javax.persistence** - package javax.persistence

The `javax.persistence` package contains the classes and interfaces that define the contracts between a persistence provider and the managed classes and the clients of the Java Persistence API.

**javax.persistence.spi** - package javax.persistence.spi

The `javax.persistence.spi` package defines the classes and interfaces that are implemented by the persistence provider and the Java EE container for use by the container, provider, and/or Persistence bootstrap class in deployment and bootstrapping.

**javax.resource** - package javax.resource

The `javax.resource` package is the top-level package for the J2EE Connector API specification.

**javax.resource.cci** - package javax.resource.cci

The `javax.resource.cci` package contains API specification for the Common Client Interface (CCI).

**javax.resource.spi** - package javax.resource.spi

The `javax.resource.spi` package contains APIs for the system contracts defined in the J2EE Connector Architecture specification.

**javax.resource.spi.endpoint** - package javax.resource.spi.endpoint

This package contains system contracts for service endpoint interactions.

**javax.resource.spi.security** - package javax.resource.spi.security

The `javax.resource.spi.security` package contains APIs for the security management contract.

**javax.resource.spi.work** - package javax.resource.spi.work

This package contains APIs for the work management contract.

**javax.security.jacc** - package javax.security.jacc

This package contains the Java Authorization Contract for Containers API

**javax.servlet** - package javax.servlet

The `javax.servlet` package contains a number of classes and interfaces that describe and define the contracts between a servlet
class and the runtime environment provided for an instance of such a class by a conforming servlet container.

**javax.servlet.http** - package javax.servlet.http
The javax.servlet.http package contains a number of classes and interfaces that describe and define the contracts between a servlet class running under the HTTP protocol and the runtime environment provided for an instance of such a class by a conforming servlet container.

**javax.servlet.jsp** - package javax.servlet.jsp
Classes and interfaces for the Core JSP 2.1 API.

**javax.servlet.jsp.el** - package javax.servlet.jsp.el
Provides the ELResolver classes that define the object resolution rules that must be supported by a JSP container with the new unified Expression Language.

**javax.servlet.jsp.tagext** - package javax.servlet.jsp.tagext
Classes and interfaces for the definition of JavaServer Pages Tag Libraries.

**javax.transaction** - package javax.transaction
Provides the API that defines the contract between the transaction manager and the various parties involved in a distributed transaction namely: resource manager, application, and application server.

**javax.transaction.xa** - package javax.transaction.xa
Provides the API that defines the contract between the transaction manager and the resource manager, which allows the transaction manager to enlist and delist resource objects (supplied by the resource manager driver) in JTA transactions.

**javax.xml.bind** - package javax.xml.bind
Provides a runtime binding framework for client applications including unmarshalling, marshalling, and validation capabilities.

**javax.xml.bind.annotation** - package javax.xml.bind.annotation
Defines annotations for customizing Java program elements to XML Schema mapping.

**javax.xml.bind.annotation.adapters** - package javax.xml.bind.annotation.adapters
**XmlAdapter** and its spec-defined sub-classes to allow arbitrary Java classes to be used with JAXB.

**javax.xml.bind.attachment** - package javax.xml.bind.attachment
This package is implemented by a MIME-based package processor that enables the interpretation and creation of optimized binary data
within an MIME-based package format.

**javax.xml.bind.helpers** - package `javax.xml.bind.helpers`  
**JAXB Provider Use Only:** Provides partial default implementations for some of the `javax.xml.bind` interfaces.

**javax.xml.bind.util** - package `javax.xml.bind.util`  
Useful client utility classes.

**javax.xml.registry** - package `javax.xml.registry`  
This package and its sub-packages describe the API classes and interfaces for the JAXR API.

**javax.xml.registry.infomodel** - package `javax.xml.registry.infomodel`  
This package describes the information model for the JAXR API.

**javax.xml.rpc** - package `javax.xml.rpc`  
This package contains the core JAX-RPC APIs for the client programming model.

**javax.xml.rpc.encoding** - package `javax.xml.rpc.encoding`  
This package defines APIs for the extensible type mapping framework.

**javax.xml.rpc.handler** - package `javax.xml.rpc.handler`  
This package defines APIs for SOAP Message Handlers

**javax.xml.rpc.handler.soap** - package `javax.xml.rpc.handler.soap`  
This package defines APIs for SOAP Message Handlers

**javax.xml.rpc.holders** - package `javax.xml.rpc.holders`  
This package contains the standard Java Holder classes.

**javax.xml.rpc.server** - package `javax.xml.rpc.server`  
This package defines APIs for the servlet based JAX-RPC endpoint model.

**javax.xml.rpc.soap** - package `javax.xml.rpc.soap`  
This package defines APIs specific to the SOAP binding.

**javax.xml.soap** - package `javax.xml.soap`  
Provides the API for creating and building SOAP messages.

**javax.xml.stream** - package `javax.xml.stream`  

**javax.xml.stream.events** - package `javax.xml.stream.events`  

**javax.xml.stream.util** - package `javax.xml.stream.util`  

**javax.xml.ws** - package `javax.xml.ws`  
This package contains the core JAX-WS APIs.

**javax.xml.ws.handler** - package `javax.xml.ws.handler`
This package defines APIs for message handlers.

**javax.xml.ws.handler.soap** - package javax.xml.ws.handler.soap
This package defines APIs for SOAP message handlers.

This package defines APIs specific to the HTTP binding.

**javax.xml.ws.soap** - package javax.xml.ws.soap
This package defines APIs specific to the SOAP binding.

**javax.xml.ws.spi** - package javax.xml.ws.spi
This package defines SPIs for JAX-WS 2.0.

**JAXB_CONTEXT_FACTORY** - Static variable in class javax.xml.bind.JAXBContext
The name of the property that contains the name of the class capable of creating new JAXBContext objects.

**JAXB_ENCODING** - Static variable in interface javax.xml.bind.Marshaller
The name of the property used to specify the output encoding in the marshalled XML data.

**JAXB_FORMATTED_OUTPUT** - Static variable in interface javax.xml.bind.Marshaller
The name of the property used to specify whether or not the marshalled XML data is formatted with linefeeds and indentation.

**JAXB_FRAGMENT** - Static variable in interface javax.xml.bind.Marshaller
The name of the property used to specify whether or not the marshaller will generate document level events (ie calling startDocument or endDocument).

**JAXB_NO_NAMESPACE_SCHEMA_LOCATION** - Static variable in interface javax.xml.bind.Marshaller
The name of the property used to specify the xsi:noNamespaceSchemaLocation attribute value to place in the marshalled XML output.

**JAXB_SCHEMA_LOCATION** - Static variable in interface javax.xml.bind.Marshaller
The name of the property used to specify the xsi:schemaLocation attribute value to place in the marshalled XML output.

**JAXBContext** - Class in javax.xml.bind
The JAXBContext class provides the client's entry point to the JAXB API.

**JAXBContext()** - Constructor for class javax.xml.bind.JAXBContext
JAXBElement<T> - Class in javax.xml.bind
   JAXB representation of an Xml Element.
JAXBElement(QName, Class<T>, Class, T) - Constructor for class
   javax.xml.bind.JAXBElement
   Construct an xml element instance.
JAXBElement(QName, Class<T>, T) - Constructor for class
   javax.xml.bind.JAXBElement
   Construct an xml element instance.
JAXBElement.GlobalScope - Class in javax.xml.bind
   Designates global scope for an xml element.
JAXBElement.GlobalScope() - Constructor for class
   javax.xml.bind.JAXBElement.GlobalScope
JAXBException - Exception in javax.xml.bind
   This is the root exception class for all JAXB exceptions.
JAXBException(String) - Constructor for exception
   javax.xml.bind.JAXBException
   Construct a JAXBException with the specified detail message.
JAXBException(String, String) - Constructor for exception
   javax.xml.bind.JAXBException
   Construct a JAXBException with the specified detail message and
   vendor specific errorCode.
JAXBException(Throwabler) - Constructor for exception
   javax.xml.bind.JAXBException
   Construct a JAXBException with a linkedException.
JAXBException(String, Throwable) - Constructor for exception
   javax.xml.bind.JAXBException
   Construct a JAXBException with the specified detail message and
   linkedException.
JAXBException(String, String, Throwable) - Constructor for exception
   javax.xml.bind.JAXBException
   Construct a JAXBException with the specified detail message,
   vendor specific errorCode, and linkedException.
JAXBIntrospector - Class in javax.xml.bind
   Provide access to JAXB xml binding data for a JAXB object.
JAXBIntrospector() - Constructor for class
   javax.xml.bind.JAXBIntrospector
JAXBResult - Class in javax.xml.bind.util
JAXP Result implementation that unmarshals a JAXB object.

JAXBResult(JAXBContext) - Constructor for class javax.xml.bind.util.JAXBResult
Creates a new instance that uses the specified JAXBContext to unmarshal.

JAXBResult(Unmarshaller) - Constructor for class javax.xml.bind.util.JAXBResult
Creates a new instance that uses the specified Unmarshaller to unmarshal an object.

JAXBSource - Class in javax.xml.bind.util
JAXP Source implementation that marshals a JAXB-generated object.

JAXBSource(JAXBContext, Object) - Constructor for class javax.xml.bind.util.JAXBSource
Creates a new Source for the given content object.

JAXBSource(Marshaller, Object) - Constructor for class javax.xml.bind.util.JAXBSource
Creates a new Source for the given content object.

JAXRException - Exception in javax.xml.registry
Signals that a JAXR exception has occurred.

JAXRException() - Constructor for exception javax.xml.registry.JAXRException
Constructs a JAXRException object with no reason or embedded Throwable.

JAXRException(String) - Constructor for exception javax.xml.registry.JAXRException
Constructs a JAXRException object with the given String as the reason for the exception being thrown.

JAXRException(String, Throwable) - Constructor for exception javax.xml.registry.JAXRException
Constructs a JAXRException object with the given String as the reason for the exception being thrown and the given Throwable object as an embedded Throwable.

JAXRException(Throwerable) - Constructor for exception javax.xml.registry.JAXRException
Constructs a JAXRException object initialized with the given Throwable object.

JAXRPCException - Exception in javax.xml.rpc
The javax.xml.rpc.JAXRPCException is thrown from the core JAX-
RPC APIs to indicate an exception related to the JAX-RPC runtime mechanisms.

**JAXRPCException()** - Constructor for exception

```java
javax.xml.rpc.JAXRPCException
```

Constructs a new exception with null as its detail message.

**JAXRPCException(String)** - Constructor for exception

```java
javax.xml.rpc.JAXRPCException
```

Constructs a new exception with the specified detail message.

**JAXRPCException(String, Throwable)** - Constructor for exception

```java
javax.xml.rpc.JAXRPCException
```

Constructs a new exception with the specified detail message and cause.

**JAXRPCException(Throwables)** - Constructor for exception

```java
javax.xml.rpc.JAXRPCException
```

Constructs a new JAXRPCException with the specified cause and a detail message of (cause==null ?

**JAXRResponse** - Interface in `javax.xml.registry`

A JAXR requests' response.

**JAXWSPROVIDER_PROPERTY** - Static variable in class

```java
javax.xml.ws.spi.Provider
```

A constant representing the property used to lookup the name of a Provider implementation class.

**JCAConnectionPoolStats** - Interface in `javax.management.j2ee.statistics`

Specifies the statistics provided by a JCA Connection Pool

**JCAConnectionStats** - Interface in `javax.management.j2ee.statistics`

Specifies the statistics provided by a JCA connection

**JCASTats** - Interface in `javax.management.j2ee.statistics`

Specifies statistics provided by a JCA resource

**JDBCConnectionPoolStats** - Interface in `javax.management.j2ee.statistics`

Specifies the statistics provided by a JDBC connection pool.

**JDBCConnectionStats** - Interface in `javax.management.j2ee.statistics`

Specifies the statistics provided by all (pooled and non-pooled) JDBC connections.

**JDBCSStats** - Interface in `javax.management.j2ee.statistics`

Statistics provided by a JDBC resource

**JMSConnectionStats** - Interface in `javax.management.j2ee.statistics`

Specifies the statistics provided by a JMS connection

**JMSConsumerStats** - Interface in `javax.management.j2ee.statistics`

Specifies the statistics provided by a JMS message consumer

**JMSEndpointStats** - Interface in `javax.management.j2ee.statistics`

Specifies the statistics provided by a JMS message producer or a JMS message consumer.

**JMSEException** - Exception in `javax.jms`
This is the root class of all JMS API exceptions.

**JMSEException(String, String)** - Constructor for exception

```java
javax.jms.JMSEException
```

Constructs a JMSEException with the specified reason and error code.

**JMSEException(String)** - Constructor for exception

```java
javax.jms.JMSEException
```

Constructs a JMSEException with the specified reason and with the error code defaulting to null.

**JMSProducerStats** - Interface in `javax.management.j2ee.statistics`

Specifies the statistics provided by a JMS message producer

**JMSSecurityException** - Exception in `javax.jms`

This exception must be thrown when a provider rejects a user name/password submitted by a client.

**JMSSecurityException(String, String)** - Constructor for exception

```java
javax.jms.JMSSecurityException
```

Constructs a JMSSecurityException with the specified reason and error code.

**JMSSecurityException(String)** - Constructor for exception

```java
javax.jms.JMSSecurityException
```

Constructs a JMSSecurityException with the specified reason.

**JMSSessionStats** - Interface in `javax.management.j2ee.statistics`

Specifies the statistics provided by a JMS session.

**JMSStats** - Interface in `javax.management.j2ee.statistics`

Specifies the statistics provided by a JMS Resource

**JoinColumn** - Annotation Type in `javax.persistence`

Is used to specify a mapped column for joining an entity association.

**JoinColumns** - Annotation Type in `javax.persistence`

 Defines mapping for the composite foreign keys.

**JoinColumn** - Annotation Type in `javax.persistence`

 This annotation is used in the mapping of associations.

**joinTransaction()** - Method in interface

```java
javax.persistence.EntityManager
```

Indicate to the EntityManager that a JTA transaction is active.

**JspApplicationContext** - Interface in `javax.servlet.jsp`

Stores application-scoped information relevant to JSP containers.

**JspContext** - Class in `javax.servlet.jsp`

JspContext serves as the base class for the PageContext class and abstracts all information that is not specific to servlets.

**JspContext()** - Constructor for class `javax.servlet.jsp.JspContext`

Sole constructor.

**jspDestroy()** - Method in interface `javax.servlet.jsp.JspPage`

The jspDestroy() method is invoked when the JSP page is about to be destroyed.

**JspEngineInfo** - Class in `javax.servlet.jsp`

The JspEngineInfo is an abstract class that provides information on the current JSP engine.

**JspEngineInfo()** - Constructor for class
javax.servlet.jsp.

**JspEngineInfo**

Sole constructor.

**JspException** - Exception in javax.servlet.jsp

A generic exception known to the JSP engine; uncaught JspExceptions will result in an invocation of the errorpage machinery.

**JspException()** - Constructor for exception

Construct a JspException.

**JspException(String)** - Constructor for exception

Constructs a new JSP exception with the specified message.

**JspException(String, Throwable)** - Constructor for exception

Constructs a new JspException with the specified detail message and cause.

**JspException(Throwabla)** - Constructor for exception

Constructs a new JspException with the specified cause.

**JspFactory** - Class in javax.servlet.jsp

The JspFactory is an abstract class that defines a number of factory methods available to a JSP page at runtime for the purposes of creating instances of various interfaces and classes used to support the JSP implementation.

**JspFactory()** - Constructor for class javax.servlet.jsp.JspFactory

Sole constructor.

**JspFragment** - Class in javax.servlet.jsp.tagext

Encapsulates a portion of JSP code in an object that can be invoked as many times as needed.

**JspFragment()** - Constructor for class

jersey.servlet.jsp.tagext.JspFragment

**JspIdConsumer** - Interface in javax.servlet.jsp.tagext

This interface indicates to the container that a tag handler wishes to be provided with a compiler generated ID.

**jspInit()** - Method in interface javax.servlet.jsp.JspPage

The jspInit() method is invoked when the JSP page is initialized.

**JspPage** - Interface in javax.servlet.jsp

The JspPage interface describes the generic interaction that a JSP Page Implementation class must satisfy; pages that use the HTTP protocol are described by the HttpJspPage interface.

**JspTag** - Interface in javax.servlet.jsp.tagext

Serves as a base class for Tag and SimpleTag.

**JspTagException** - Exception in javax.servlet.jsp

Exception to be used by a Tag Handler to indicate some unrecoverable error.

**JspTagException(String)** - Constructor for exception

Constructs a new JspTagException with the specified message.
**JspTagException()** - Constructor for exception

*javax.servlet.jsp.JspTagException*

Constructs a new JspTagException with no message.

**JspTagException(String, Throwable)** - Constructor for exception

*javax.servlet.jsp.JspTagException*

Constructs a new JspTagException when the JSP Tag needs to throw an exception and include a message about the "root cause" exception that interfered with its normal operation, including a description message.

**JspTagException(Throwable)** - Constructor for exception

*javax.servlet.jsp.JspTagException*

Constructs a new JSP Tag exception when the JSP Tag needs to throw an exception and include a message about the "root cause" exception that interfered with its normal operation.

**jspversion** - Variable in class

*javax.servlet.jsp.tagext.TagLibraryInfo*

The version of the JSP specification this tag library is written to.

**JspWriter** - Class in *javax.servlet.jsp*

The actions and template data in a JSP page is written using the JspWriter object that is referenced by the implicit variable out which is initialized automatically using methods in the PageContext object.

**JspWriter(int, boolean)** - Constructor for class

*javax.servlet.jsp.JspWriter*

Protected constructor.

**JTAStats** - Interface in *javax.management.j2ee.statistics*

Specifies the statistics provided by a JTA resource.

**JVMStats** - Interface in *javax.management.j2ee.statistics*

Specifies the statistics provided by a Java VM.
Key - Interface in `javax.xml.registry.infomodel`
   Represents a unique key that identifies a RegistryObject.
KEY - Static variable in interface `javax.xml.registry.LifeCycleManager`
LASTUID - Static variable in interface javax.mail.UIDFolder
This is a special value that can be used as the end parameter in getMessagesByUID(start, end), to denote the UID of the last message in the folder.

LazyAssociatableConnectionManager - Interface in javax.resource.spi
This is a mix-in interface that may be optionally implemented by a ConnectionManager implementation.

LazyEnlist(ManagedConnection) - Method in interface javax.resource.spi.LazyEnlistableConnectionManager
This method is called by a resource adapter (that is capable of lazy transaction enlistment optimization) in order to lazily enlist a connection object with a XA transaction.

LazyEnlistableConnectionManager - Interface in javax.resource.spi
This is a mix-in interface that may be optionally implemented by a ConnectionManager implementation.

LazyEnlistableManagedConnection - Interface in javax.resource.spi
This is a mix-in interface that may be optionally implemented by a ManagedConnection implementation.

LE - Static variable in class javax.mail.search.ComparisonTerm

LengthValidator - Class in javax.faces.validator
LengthValidator is a Validator that checks the number of characters in the String representation of the value of the associated component.

LengthValidator() - Constructor for class javax.faces.validator.LengthValidator
Construct a Validator with no preconfigured limits.

LengthValidator(int) - Constructor for class javax.faces.validator.LengthValidator
Construct a Validator with the specified preconfigured limit.

LengthValidator(int, int) - Constructor for class javax.faces.validator.LengthValidator
Construct a Validator with the specified preconfigured limits.

Lifecycle - Class in javax.faces.lifecycle
Lifecycle manages the processing of the entire lifecycle of a particular JavaServer Faces request.

Lifecycle() - Constructor for class javax.faces.lifecycle.Lifecycle

LIFECYCLE_FACTORY - Static variable in class javax.faces.FactoryFinder
The property name for the LifecycleFactory class name.

LIFECYCLE_ID_ATTR - Static variable in class javax.faces.webapp.FacesServlet
Context initialization parameter name for the lifecycle identifier of the Lifecycle instance to be utilized.

LifecycleFactory - Class in javax.faces.lifecycle
**LifecycleFactory** is a factory object that creates (if needed) and returns **Lifecycle** instances.

**LifecycleFactory()** - Constructor for class
javax.faces.lifecycle.LifecycleFactory

**LifeCycleManager** - Interface in javax.xml.registry
The LifeCycleManager interface is the main interface in the API for managing life cycle operations on objects defined by the information model.

**limit** - Variable in class javax.mail.Quota.Resource
The usage limit for the resource.

**linkConfiguration(PolicyConfiguration)** - Method in interface
javax.security.jacc.PolicyConfiguration
Creates a relationship between this configuration and another such that they share the same principal-to-role mappings.

**list(String)** - Method in class javax.mail.Folder
Returns a list of Folders belonging to this Folder's namespace that match the specified pattern.

**list()** - Method in class javax.mail.Folder
Convenience method that returns the list of folders under this Folder.

**ListDataModel** - Class in javax.faces.model
**ListDataModel** is a convenience implementation of **DataModel** that wraps an List of Java objects.

**ListDataModel()** - Constructor for class
javax.faces.model.ListDataModel
Construct a new ListDataModel with no specified wrapped data.

**ListDataModel(List)** - Constructor for class
javax.faces.model.ListDataModel
Construct a new ListDataModel wrapping the specified list.

**ListELResolver** - Class in javax.el
Defines property resolution behavior on instances of **List**.

**ListELResolver()** - Constructor for class javax.el.ListELResolver
Creates a new read/write ListELResolver.

**ListELResolver(boolean)** - Constructor for class
javax.el.ListELResolver
Creates a new ListELResolver whose read-only status is determined by the given parameter.

**ListenerRegistration** - Interface in javax.management.j2ee
ListenerRegistration defines the methods which clients of the MEJB use to add and remove event listeners.

**listSubscribed(String)** - Method in class javax.mail.Folder
Returns a list of subscribed Folders belonging to this Folder's namespace that match the specified pattern.

**listSubscribed()** - Method in class javax.mail.Folder
Convenience method that returns the list of subscribed folders under this Folder.

**load(InputStream)** - Method in class
javax.mail.internet.InternetHeaders
Read and parse the given RFC822 message stream till the blank
line separating the header from the body.

**loadService(Class)** - Method in class `javax.xml.rpc.ServiceFactory`
Create an instance of the generated service implementation class for a given service interface, if available.

**loadService(URL, Class, Properties)** - Method in class `javax.xml.rpc.ServiceFactory`
Create an instance of the generated service implementation class for a given service interface, if available.

**loadService(URL, QName, Properties)** - Method in class `javax.xml.rpc.ServiceFactory`
Create an instance of the generated service implementation class for a given service, if available.

**Lob** - Annotation Type in `javax.persistence`
Specifies that a persistent property or field should be persisted as a large object to a database-supported large object type.

**Local** - Annotation Type in `javax.ejb`
When used on the bean class, declares the local business interface(s) for a session bean.

**LOCAL_TRANSACTION_COMMITTED** - Static variable in class `javax.resource.spi.ConnectionEvent`
Event notification that a Resource Manager Local Transaction was committed on the connection

**LOCAL_TRANSACTION_ROLLEDBACK** - Static variable in class `javax.resource.spi.ConnectionEvent`
Event notification that a Resource Manager Local Transaction was rolled back on the connection

**LOCAL_TRANSACTION_STARTED** - Static variable in class `javax.resource.spi.ConnectionEvent`
Event notification that a Resource Manager Local Transaction was started on the connection

**LocalHome** - Annotation Type in `javax.ejb`
Declares the Local Home or adapted Local Home interface for a session bean.

**LOCALIZED_STRING** - Static variable in interface `javax.xml.registry.LifeCycleManager`

**LocalizedMessage** - Interface in `javax.xml.registry.infomodel`
This interface is used as a simple wrapper interface that associates a String with its Locale.

**LocalTransaction** - Interface in `javax.resource.cci`
The LocalTransaction defines a transaction demarcation interface for resource manager local transactions.

**LocalTransaction** - Interface in `javax.resource.spi`
LocalTransaction interface provides support for transactions that are managed internal to an EIS resource manager, and do not require an external transaction manager.

**localTransactionCommitted(ConnectionEvent)** - Method in interface `javax.resource.spi.ConnectionEventListener`
Notifies that a Resource Manager Local Transaction was
committed on the ManagedConnection instance.

LocalTransactionException - Exception in javax.resource.spi
A LocalTransactionException represents various error conditions related to the local transaction management contract.

LocalTransactionException() - Constructor for exception
javax.resource.spi.LocalTransactionException
Constructs a new instance with null as its detail message.

LocalTransactionException(String) - Constructor for exception
javax.resource.spi.LocalTransactionException
Constructs a new instance with the specified detail message.

LocalTransactionException(Throwable) - Constructor for exception
javax.resource.spi.LocalTransactionException
Constructs a new throwable with the specified cause.

LocalTransactionException(String, Throwable) - Constructor for exception
javax.resource.spi.LocalTransactionException
Constructs a new throwable with the specified detail message and cause.

LocalTransactionRolledback(ConnectionEvent) - Method in interface
javax.resource.spi.ConnectionEventListener
Notifies that a Resource Manager Local Transaction was rolled back on the ManagedConnection instance.

LocalTransactionStarted(ConnectionEvent) - Method in interface
javax.resource.spi.ConnectionEventListener
Notifies that a Resource Manager Local Transaction was started on the ManagedConnection instance.

Location - Interface in javax.xml.stream
Provides information on the location of an event.

location - Variable in exception
javax.xml.stream.XMLStreamException

lock(Object, LockModeType) - Method in interface
javax.persistence.EntityManager
Set the lock mode for an entity object contained in the persistence context.

LockModeType - Enum in javax.persistence
Lock modes that can be specified by means of the EntityManager.lock() method.

log(String) - Method in class javax.faces.context.ExternalContext
Log the specified message to the application object.

log(String, Throwable) - Method in class
javax.faces.context.ExternalContext
Log the specified message and exception to the application object.

log - Static variable in class
javax.faces.webapp.UICOMPONENTTAGBASE
**log(String)** - Method in class `javax.servlet.GenericServlet`

Writes the specified message to a servlet log file, prepended by the servlet's name.

**log(String, Throwable)** - Method in class `javax.servlet.GenericServlet`

Writes an explanatory message and a stack trace for a given Throwable exception to the servlet log file, prepended by the servlet's name.

**log(String)** - Method in interface `javax.servlet.ServletContext`

Writes the specified message to a servlet log file, usually an event log.

**log(Exception, String)** - Method in interface `javax.servlet.ServletContext`

Deprecated. As of Java Servlet API 2.1, use `ServletContext.log(String message, Throwable throwable)` instead.

This method was originally defined to write an exception's stack trace and an explanatory error message to the servlet log file.

**log(String, Throwable)** - Method in interface `javax.servlet.ServletContext`

Writes an explanatory message and a stack trace for a given Throwable exception to the servlet log file.

**LogicalHandler**<C> extends `LogicalMessageContext` - Interface in `javax.xml.ws.handler`

The LogicalHandler extends Handler to provide typesafety for the message context parameter.

**LogicalMessage** - Interface in `javax.xml.ws`

The LogicalMessage interface represents a protocol agnostic XML message and contains methods that provide access to the payload of the message.

**LogicalMessageContext** - Interface in `javax.xml.ws.handler`

The LogicalMessageContext interface extends MessageContext to provide access to a the contained message as a protocol neutral LogicalMessage

**LONG_ID** - Static variable in class `javax.faces.convert.LongConverter`

The message identifier of the `FacesMessage` to be created if the conversion to Long fails.

**LongConverter** - Class in `javax.faces.convert`

Converter implementation for java.lang.Long (and long primitive) values.

**LongConverter()** - Constructor for class `javax.faces.convert.LongConverter`

**LongHolder** - Class in `javax.xml.rpc.holders`

**LongHolder()** - Constructor for class
javax.xml.rpc.holders.LongHolder

LongHolder(long) - Constructor for class javax.xml.rpc.holders.LongHolder

LongRangeValidator - Class in javax.faces.validator
   LongRangeValidator is a Validator that checks the value of the corresponding component against specified minimum and maximum values.
LongRangeValidator() - Constructor for class javax.faces.validator.LongRangeValidator
   Construct a Validator with no preconfigured limits.
LongRangeValidator(long) - Constructor for class javax.faces.validator.LongRangeValidator
   Construct a Validator with the specified preconfigured limit.
LongRangeValidator(long, long) - Constructor for class javax.faces.validator.LongRangeValidator
   Construct a Validator with the specified preconfigured limits.
LongWrapperHolder - Class in javax.xml.rpc.holders
LongWrapperHolder() - Constructor for class javax.xml.rpc.holders.LongWrapperHolder
LongWrapperHolder(Long) - Constructor for class javax.xml.rpc.holders.LongWrapperHolder

lookup(String) - Method in interface javax.ejb.EJBContext
   Lookup a resource within the component's private naming context.
LT - Static variable in class javax.mail.search.ComparisonTerm
**MailcapCommandMap** - Class in `javax.activation`
MailcapCommandMap extends the CommandMap abstract class.

**MailcapCommandMap()** - Constructor for class
`javax.activation.MailcapCommandMap`
The default Constructor.

**MailcapCommandMap(String)** - Constructor for class
`javax.activation.MailcapCommandMap`
Constructor that allows the caller to specify the path of a mailcap file.

**MailcapCommandMap(InputStream)** - Constructor for class
`javax.activation.MailcapCommandMap`
Constructor that allows the caller to specify an InputStream containing a mailcap file.

**MailDateFormat** - Class in `javax.mail.internet`

**MailDateFormat()** - Constructor for class
`javax.mail.internet.MailDateFormat`

**MailEvent** - Class in `javax.mail.event`
Common base class for mail events, defining the dispatch method.

**MailEvent(Object)** - Constructor for class
`javax.mail.event.MailEvent`

**makeRegistrySpecificRequest(String)** - Method in interface
`javax.xml.registry.RegistryService`
Takes a String that is an XML request in a registry-specific format, sends the request to the registry, and returns a String that is the registry-specific XML response.

**ManagedConnection** - Interface in `javax.resource.spi`
ManagedConnection instance represents a physical connection to the underlying EIS.

**ManagedConnectionFactory** - Interface in `javax.resource.spi`
ManagedConnectionFactory instance is a factory of both ManagedConnection and EIS-specific connection factory instances.

**ManagedConnectionMetaData** - Interface in `javax.resource.spi`
The ManagedConnectionMetaData interface provides information about the underlying EIS instance associated with a ManagedConnection instance.

**Management** - Interface in `javax.management.j2ee`
The Management interface provides the APIs to navigate and manipulate managed objects.

**ManagementHome** - Interface in `javax.management.j2ee`
The required home interface for the J2EE Management EJB
component (MEJB).

ManyToMany - Annotation Type in javax.persistence
Defines a many-valued association with many-to-many multiplicity.

ManyToOne - Annotation Type in javax.persistence
This annotation defines a single-valued association to another entity class that has many-to-one multiplicity.

MapELResolver - Class in javax.el
Defines property resolution behavior on instances of Map.
MapELResolver() - Constructor for class javax.el.MapELResolver
Creates a new read/write MapELResolver.
MapELResolver(boolean) - Constructor for class javax.el.MapELResolver
Creates a new MapELResolver whose read-only status is determined by the given parameter.

MapKey - Annotation Type in javax.persistence
Is used to specify the map key for associations of type Map.

MapMessage - Interface in javax.jms
A MapMessage object is used to send a set of name-value pairs.

MappedRecord - Interface in javax.resource.cci
The interface javax.resource.cci.MappedRecord is used for key-value map based representation of record elements.

MappedSuperclass - Annotation Type in javax.persistence
Designates a class whose mapping information is applied to the entities that inherit from it.

mark(int) - Method in class javax.mail.util.SharedFileInputStream
See the general contract of the mark method of InputStream.
markSupported() - Method in class javax.mail.util.SharedFileInputStream
Tests if this input stream supports the mark and reset methods.
marshal(String) - Method in class javax.xml.bind.annotation.adapters.CollapsedStringAdapter
No-op.
marshal(byte[]) - Method in class javax.xml.bind.annotation.adapters.HexBinaryAdapter

marshal(String) - Method in class javax.xml.bind.annotation.adapters.NormalizedStringAdapter
No-op.
marshal(BoundType) - Method in class javax.xml.bind.annotation.adapters.XmlAdapter
Convert a bound type to a value type.
marshal(ElementT, ValidationEventHandler) - Method in interface javax.xml.bind.annotation.DomHandler
This method is called when a JAXB provider needs to marshal an element to XML.
marshal(Element, ValidationEventHandler) - Method in class javax.xml.bind.annotation.W3CDomHandler

marshal(Object, XmlNode) - Method in class javax.xml.bind.Binder
Marshal a JAXB object tree to a new XML document.

**marshal(Object, OutputStream)** - Method in class
javax.xml.bind.helpers.AbstractMarshallerImpl

**marshal(Object, Writer)** - Method in class
javax.xml.bind.helpers.AbstractMarshallerImpl

**marshal(Object, ContentHandler)** - Method in class
javax.xml.bind.helpers.AbstractMarshallerImpl

**marshal(Object, Node)** - Method in class
javax.xml.bind.helpers.AbstractMarshallerImpl

**marshal(Object, XMLEventWriter)** - Method in class
javax.xml.bind.helpers.AbstractMarshallerImpl

**marshal(Object, XMLStreamWriter)** - Method in class
javax.xml.bind.helpers.AbstractMarshallerImpl

**marshal(Object, Result)** - Method in interface
developed as the implementation

**MarshalException** - Exception in javax.xml.bind
This exception indicates that an error has occurred while performing a marshal operation that the provider is unable to recover from.

**MarshalException(String)** - Constructor for exception
javax.xml.bind.**MarshalException**

Construct a MarshalException with the specified detail message.

**MarshalException(String, String)** - Constructor for exception

javax.xml.bind.**MarshalException**

Construct a MarshalException with the specified detail message and vendor specific errorCode.

**MarshalException(Throwable)** - Constructor for exception

javax.xml.bind.**MarshalException**

Construct a MarshalException with a linkedException.

**MarshalException(String, Throwable)** - Constructor for exception

javax.xml.bind.**MarshalException**

Construct a MarshalException with the specified detail message and linkedException.

**MarshalException(String, String, Throwable)** - Constructor for exception

javax.xml.bind.**MarshalException**

Construct a MarshalException with the specified detail message, vendor specific errorCode, and linkedException.

**Marshaller** - Interface in **javax.xml.bind**

The Marshaller class is responsible for governing the process of serializing Java content trees back into XML data.

**Marshaller.Listener** - Class in **javax.xml.bind**

Register an instance of an implementation of this class with a **Marshaller** to externally listen for marshal events.

**Marshaller.Listener()** - Constructor for class

javax.xml.bind.**Marshaller.Listener**

**match(MimeType)** - Method in class java.activation.**MimeType**

Determine if the primary and sub type of this object is the same as what is in the given type.

**match(String)** - Method in class java.activation.**MimeType**

Determine if the primary and sub type of this object is the same as the content type described in rawdata.

**match(ContentType)** - Method in class javax.mail.internet.**ContentType**

Match with the specified ContentType object.

**match(String)** - Method in class javax.mail.internet.**ContentType**

Match with the specified content-type string.

**match(SearchTerm)** - Method in class javax.mail.**Message**

Apply the specified Search criterion to this message.

**match(Address)** - Method in class javax.mail.search.**AddressStringTerm**

Check whether the address pattern specified in the constructor is a substring of the string representation of the given Address object.

**match(Address)** - Method in class javax.mail.search.**AddressTerm**

Match against the argument Address.

**match(Message)** - Method in class javax.mail.search.**AndTerm**

The AND operation.

**match(Message)** - Method in class javax.mail.search.**BodyTerm**
The match method.

**match(Date)** - Method in class **javax.mail.search.DateTerm**
The date comparison method.

**match(Message)** - Method in class **javax.mail.search.FlagTerm**
The comparison method.

**match(Message)** - Method in class **javax.mail.search.FromStringTerm**
Check whether the address string specified in the constructor is a substring of the From address of this Message.

**match(Message)** - Method in class **javax.mail.search.FromTerm**
The address comparator.

**match(Message)** - Method in class **javax.mail.search.HeaderTerm**
The header match method.

**match(int)** - Method in class **javax.mail.search.IntegerComparisonTerm**

**match(Message)** - Method in class **javax.mail.search.MessageIDTerm**
The match method.

**match(Message)** - Method in class **javax.mail.search.MessageNumberTerm**
The match method.

**match(Message)** - Method in class **javax.mail.search.NotTerm**

**match(Message)** - Method in class **javax.mail.search.OrTerm**
The OR operation.

**match(Message)** - Method in class **javax.mail.search.ReceivedDateTerm**
The match method.

**match(Message)** - Method in class **javax.mail.search.RecipientStringTerm**
Check whether the address specified in the constructor is a substring of the recipient address of this Message.

**match(Message)** - Method in class **javax.mail.search.RecipientTerm**
The match method.

**match(Message)** - Method in class **javax.mail.search.SearchTerm**
This method applies a specific match criterion to the given message and returns the result.

**match(Message)** - Method in class **javax.mail.search.SentDateTerm**
The match method.

**match(Message)** - Method in class **javax.mail.search.SizeTerm**
The match method.

**match(String)** - Method in class **javax.mail.search.StringTerm**
The match method.

**match(Message)** - Method in class **javax.mail.search.SubjectTerm**
The match method.

**matchManagedConnections(Set, Subject, ConnectionRequestInfo)** - Method in interface **javax.resource.spi.ManagedConnectionFactory**
Returns a matched connection from the candidate set of connections.

**MAXBQUALSIZE** - Static variable in interface **javax.transaction.xa.Xid**
Maximum number of bytes returned by getBqual.
**MAXGTRIDSIZE** - Static variable in interface javax.transaction.xa.Xid
   Maximum number of bytes returned by getGtrid.

**MAXIMUM MESSAGE ID** - Static variable in class javax.faces.validator.DoubleRangeValidator
   The message identifier of the FacesMessage to be created if the maximum value check fails.

**MAXIMUM MESSAGE ID** - Static variable in class javax.faces.validator.LengthValidator
   The message identifier of the FacesMessage to be created if the maximum length check fails.

**MAXIMUM MESSAGE ID** - Static variable in class javax.faces.validator.LongRangeValidator
   The message identifier of the FacesMessage to be created if the maximum value check fails.

**merge(T)** - Method in interface javax.persistence.EntityManager
   Merge the state of the given entity into the current persistence context.

**Message** - Interface in javax.jms
   The Message interface is the root interface of all JMS messages.

**message** - Variable in class javax.mail.event.StoreEvent
   The message text to be presented to the user.

**Message** - Class in javax.mail
   This class models an email message.

**Message()** - Constructor for class javax.mail.Message
   No-arg version of the constructor.

**Message(Folder, int)** - Constructor for class javax.mail.Message
   Constructor that takes a Folder and a message number.

**Message(Session)** - Constructor for class javax.mail.Message
   Constructor that takes a Session.

**Message.RecipientType** - Class in javax.mail
   This inner class defines the types of recipients allowed by the Message class.

**Message.RecipientType(String)** - Constructor for class javax.mail.Message.RecipientType
   Constructor for use by subclasses.

**MESSAGE_DELIVERED** - Static variable in class javax.mail.event.TransportEvent
   Message has been successfully delivered to all recipients by the transport firing this event. validSent[] contains all the addresses this transport sent to successfully. validUnsent[] and invalid[] should be null.

**MESSAGE_NOT_DELIVERED** - Static variable in class javax.mail.event.TransportEvent
   Message was not sent for some reason. validSent[] should be null.

**MESSAGE_OUTBOUND_PROPERTY** - Static variable in interface javax.xml.ws.handler.MessageContext
   Standard property: message direction, true for outbound...
messages, false for inbound.

**MESSAGE_PARTIALLY_DELIVERED** - Static variable in class javax.mail.event.TransportEvent
Message was successfully sent to some recipients but not to all.

**MessageAware** - Interface in javax.mail
An interface optionally implemented by DataSources to supply information to a DataContentHandler about the message context in which the data content object is operating.

**messageChanged(MessageChangedEvent)** - Method in interface javax.mail.event.MessageChangedListener
Invoked when a message is changed.

**MessageChangedEvent** - Class in javax.mail.event
This class models Message change events.

**MessageChangedEvent(Object, int, Message)** - Constructor for class javax.mail.event.MessageChangedEvent
Constructor.

**MessageChangedListener** - Interface in javax.mail.event
This is the Listener interface for MessageChanged events

**MessageConsumer** - Interface in javax.jms
A client uses a MessageConsumer object to receive messages from a destination.

**MessageContext** - Class in javax.mail
The context in which a piece of Message content is contained.

**MessageContext(Part)** - Constructor for class javax.mail.MessageContext
Create a MessageContext object describing the context of the given Part.

**MessageContext** - Interface in javax.xml.rpc.handler
The interface MessageContext abstracts the message context that is processed by a handler in the handle method.

**MessageContext** - Interface in javax.xml.ws.handler
The interface MessageContext abstracts the message context that is processed by a handler in the handle method.

**MessageContext.Scope** - Enum in javax.xml.ws.handler
Property scope.

**MessageCountAdapter** - Class in javax.mail.event
The adapter which receives MessageCount events.

**MessageCountAdapter()** - Constructor for class javax.mail.event.MessageCountAdapter

**MessageCountEvent** - Class in javax.mail.event
This class notifies changes in the number of messages in a folder.

**MessageCountEvent(Folder, int, boolean, Message[])** - Constructor for class javax.mail.event.MessageCountEvent
Constructor.

**MessageCountListener** - Interface in javax.mail.event
This is the Listener interface for MessageCount events.

**messageDelivered(TransportEvent)** - Method in class
javax.mail.event.TransportAdapter

messageDelivered(TransportEvent) - Method in interface javax.mail.event.TransportListener
Invoked when a Message is successfully delivered.

MessageDriven - Annotation Type in javax.ejb
Component-defining annotation for a message driven bean.

MessageDrivenBean - Interface in javax.ejb
The MessageDrivenBean interface is implemented by every message-driven enterprise Bean class.

MessageDrivenBeanStats - Interface in javax.management.j2ee.statistics
Specifies the statistics provided by a message driven bean.

MessageDrivenContext - Interface in javax.ejb
The MessageDrivenContext interface provides access to the runtime message-driven context that the container provides for a message-driven enterprise Bean instance.

MessageEndpoint - Interface in javax.resource.spi.endpoint
This defines a contract for a message endpoint.

MessageEndpointFactory - Interface in javax.resource.spi.endpoint
This serves as a factory for creating message endpoints.

MessageEOFException - Exception in javax.jms
This exception must be thrown when an unexpected end of stream has been reached when a StreamMessage or BytesMessage is being read.

MessageEOFException(String, String) - Constructor for exception javax.jms.MessageEOFException
Constructs a MessageEOFException with the specified reason and error code.

MessageEOFException(String) - Constructor for exception javax.jms.MessageEOFException
Constructs a MessageEOFException with the specified reason.

MessageFactory - Class in javax.xml.soap
A factory for creating SOAPMessage objects.
MessageFactory() - Constructor for class javax.xml.soap.MessageFactory

MessageFormatException - Exception in javax.jms
This exception must be thrown when a JMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

MessageFormatException(String, String) - Constructor for exception javax.jms.MessageFormatException
Constructs a MessageFormatException with the specified reason and error code.

MessageFormatException(String) - Constructor for exception javax.jms.MessageFormatException
Constructs a MessageFormatException with the specified reason.

MessageIDTerm - Class in javax.mail.search
This term models the RFC822 "MessageId" - a message-id for
Internet messages that is supposed to be unique per message.

**MessageIDTerm(String)** - Constructor for class javax.mail.search.MessageIDTerm

**MessageListener** - Interface in javax.jms

A MessageListener object is used to receive asynchronously delivered messages.

**MessageListener** - Interface in javax.resource.cci

This serves as a request-response message listener type that message endpoints (message-driven beans) may implement.

**messageNotDelivered(TransportEvent)** - Method in class javax.mail.event.TransportAdapter

**MessageNotReadableException** - Exception in javax.jms

This exception must be thrown when a JMS client attempts to read a write-only message.

**MessageNotReadableException(String, String)** - Constructor for exception javax.jms.MessageNotReadableException

Constructs a MessageNotReadableException with the specified reason and error code.

**MessageNotReadableException(String)** - Constructor for exception javax.jms.MessageNotReadableException

Constructs a MessageNotReadableException with the specified reason.

**MessageNotWriteableException** - Exception in javax.jms

This exception must be thrown when a JMS client attempts to write to a read-only message.

**MessageNotWriteableException(String, String)** - Constructor for exception javax.jms.MessageNotWriteableException

Constructs a MessageNotWriteableException with the specified reason and error code.

**MessageNotWriteableException(String)** - Constructor for exception javax.jms.MessageNotWriteableException

Constructs a MessageNotWriteableException with the specified reason.

**MessageNumberTerm** - Class in javax.mail.search

This class implements comparisons for Message numbers.

**MessageNumberTerm(int)** - Constructor for class javax.mail.search.MessageNumberTerm

**messagePartiallyDelivered(TransportEvent)** - Method in class javax.mail.event.TransportAdapter

**MessageProducer** - Interface in javax.jms
A client uses a MessageProducer object to send messages to a destination.

**MessageRemovedException** - Exception in `javax.mail`
- The exception thrown when an invalid method is invoked on an expunged Message.

**MessageRemovedException()** - Constructor for exception `javax.mail.Message RemovedException`
- Constructs a MessageRemovedException with no detail message.

**MessageRemovedException(String)** - Constructor for exception `javax.mail.Message RemovedException`
- Constructs a MessageRemovedException with the specified detail message.

**messagesAdded(MessageCountEvent)** - Method in class `javax.mail.event.MessageCountAdapter`

**messagesAdded(MessageCountEvent)** - Method in interface `javax.mail.event.MessageCountListener`
- Invoked when messages are added into a folder.

**messagesRemoved(MessageCountEvent)** - Method in class `javax.mail.event.MessageCountAdapter`

**messagesRemoved(MessageCountEvent)** - Method in interface `javax.mail.event.MessageCountListener`
- Invoked when messages are removed (expunged) from a folder.

**MessagingException** - Exception in `javax.mail`
- The base class for all exceptions thrown by the Messaging classes.

**MessagingException()** - Constructor for exception `javax.mail.MessagingException`
- Constructs a MessagingException with no detail message.

**MessagingException(String)** - Constructor for exception `javax.mail.MessagingException`
- Constructs a MessagingException with the specified detail message.

**MessagingException(String, Exception)** - Constructor for exception `javax.mail.MessagingException`
- Constructs a MessagingException with the specified Exception and detail message.

**MethodBinding** - Class in `javax.faces.el`
- Deprecated. This has been replaced by `MethodExpression`.

**MethodBinding()** - Constructor for class `javax.faces.el.MethodBinding`
- Deprecated.

**MethodExpression** - Class in `javax.el`
- An Expression that refers to a method on an object.

**MethodExpression()** - Constructor for class `javax.el.MethodExpression`

**MethodExpressionActionListener** - Class in `javax.faces.event`
- `MethodExpressionActionListener` is an `ActionListener` that wraps
a MethodExpression.
MethodExpressionActionListener() - Constructor for class javax.faces.event.MethodExpressionActionListener
MethodExpressionActionListener(MethodExpression) - Constructor for class javax.faces.event.MethodExpressionActionListener
  Construct a ValueChangeListener that contains a MethodExpression.
MethodExpressionValidator - Class in javax.faces.validator
  MethodExpressionValidator is a Validator that wraps a MethodExpression, and it performs validation by executing a method on an object identified by the MethodExpression.
MethodExpressionValidator() - Constructor for class javax.faces.validator.MethodExpressionValidator
MethodExpressionValidator(MethodExpression) - Constructor for class javax.faces.validator.MethodExpressionValidator
  Construct a Validator that contains a MethodExpression.
MethodExpressionValueChangeListener - Class in javax.faces.event
  MethodExpressionValueChangeListener is a ValueChangeListener that wraps a MethodExpression.
MethodExpressionValueChangeListener() - Constructor for class javax.faces.event.MethodExpressionValueChangeListener
MethodExpressionValueChangeListener(MethodExpression) - Constructor for class javax.faces.event.MethodExpressionValueChangeListener
  Construct a ValueChangeListener that contains a MethodExpression.
MethodInfo - Class in javax.el
  Holds information about a method that a MethodExpression evaluated to.
MethodInfo(String, Class<?>, Class<?>[]) - Constructor for class javax.el.MethodInfo
  Creates a new instance of MethodInfo with the given information.
MethodNotFoundException - Exception in javax.el
  Thrown when a method could not be found while evaluating a MethodExpression.
MethodNotFoundException() - Constructor for exception javax.el.MethodNotFoundException
  Creates a MethodNotFoundException with no detail message.
MethodNotFoundException(String) - Constructor for exception javax.el.MethodNotFoundException
  Creates a MethodNotFoundException with the provided detail message.
MethodNotFoundException(Throwables) - Constructor for exception javax.el.MethodNotFoundException
  Creates a MethodNotFoundException with the given root cause.
MethodNotFoundException(String, Throwable) - Constructor for exception javax.el.MethodNotFoundException
Creates a MethodNotFoundException with the given detail message and root cause.

**MethodNotFoundException** - Exception in javax.faces.el

*Deprecated.* *This has been replaced by MethodNotFoundException.*

**MethodNotFoundException()** - Constructor for exception javax.faces.el.MethodNotFoundException

*Deprecated.* Construct a new exception with no detail message or root cause.

**MethodNotFoundException(String)** - Constructor for exception javax.faces.el.MethodNotFoundException

*Deprecated.* Construct a new exception with the specified detail message and no root cause.

**MethodNotFoundException(Throwable)** - Constructor for exception javax.faces.el.MethodNotFoundException

*Deprecated.* Construct a new exception with the specified root cause.

**MethodNotFoundException(String, Throwable)** - Constructor for exception javax.faces.el.MethodNotFoundException

*Deprecated.* Construct a new exception with the specified detail message and root cause.

**MethodNotSupportedException** - Exception in javax.mail

The exception thrown when a method is not supported by the implementation

**MethodNotSupportedException()** - Constructor for exception javax.mail.MethodNotSupportedException

Constructs a MethodNotSupportedException with no detail message.

**MethodNotSupportedException(String)** - Constructor for exception javax.mail.MethodNotSupportedException

Constructs a MethodNotSupportedException with the specified detail message.

**MIME** - Static variable in class javax.mail.internet.HeaderTokenizer

MIME specials

**MimeBodyPart** - Class in javax.mail.internet

This class represents a MIME body part.

**MimeBodyPart()** - Constructor for class javax.mail.internet.MimeBodyPart

An empty MimeBodyPart object is created.

**MimeBodyPart(InputStream)** - Constructor for class javax.mail.internet.MimeBodyPart

Constructs a MimeBodyPart by reading and parsing the data from the specified input stream.

**MimeBodyPart(InternetHeaders, byte[])** - Constructor for class javax.mail.internet.MimeBodyPart

Constructs a MimeBodyPart using the given header and content bytes.

**mimeCharset(String)** - Static method in class javax.mail.internet.MimeUtility

Convert a Java charset into its MIME charset name.

**MimeHeader** - Class in javax.xml.soap
An object that stores a MIME header name and its value.

**MimeHeader(String, String)** - Constructor for class javax.xml.soap.MimeHeader
Constructs a MimeHeader object initialized with the given name and value.

**MimeHeaders** - Class in javax.xml.soap
A container for MimeHeader objects, which represent the MIME headers present in a MIME part of a message.

**MimeHeaders()** - Constructor for class javax.xml.soap.MimeHeaders
Constructs a default MimeHeaders object initialized with an empty Vector object.

**MimeMessage** - Class in javax.mail.internet
This class represents a MIME style email message.

**MimeMessage(Session)** - Constructor for class javax.mail.internet.MimeMessage
Default constructor.

**MimeMessage(Session, InputStream)** - Constructor for class javax.mail.internet.MimeMessage
Constructs a MimeMessage by reading and parsing the data from the specified MIME InputStream.

**MimeMessage(MimeMessage)** - Constructor for class javax.mail.internet.MimeMessage
Constructs a new MimeMessage with content initialized from the source MimeMessage.

**MimeMessage(Folder, int)** - Constructor for class javax.mail.internet.MimeMessage
Constructs an empty MimeMessage object with the given Folder and message number.

**MimeMessage(Folder, InputStream, int)** - Constructor for class javax.mail.internet.MimeMessage
Constructs a MimeMessage by reading and parsing the data from the specified MIME InputStream.

**MimeMessage(Folder, InternetHeaders, byte[], int)** - Constructor for class javax.mail.internet.MimeMessage
Constructs a MimeMessage from the given InternetHeaders object and content.

**MimeMessage.RecipientType** - Class in javax.mail.internet
This inner class extends the javax.mail.Message.RecipientType class to add additional RecipientTypes.

**MimeMessage.RecipientType(String)** - Constructor for class javax.mail.internet.MimeMessage.RecipientType

**MimeMultipart** - Class in javax.mail.internet
The MimeMultipart class is an implementation of the abstract Multipart class that uses MIME conventions for the multipart data.

**MimeMultipart()** - Constructor for class javax.mail.internet.MimeMultipart
Default constructor.

**MimeMultipart(String)** - Constructor for class
javax.mail.internet. **MimeMultipart**
Construct a MimeMultipart object of the given subtype.

**MimeMultipart(DataSource)** - Constructor for class
Constructs a MimeMultipart object and its bodyparts from the given DataSource.

**MimePart** - Interface in *javax.mail.internet*
The MimePart interface models an **Entity** as defined by MIME (RFC2045, Section 2.4).

**MimePartDataSource** - Class in *javax.mail.internet*
A utility class that implements a DataSource out of a MimePart.

**MimePartDataSource(MimePart)** - Constructor for class
Constructs a DataSource from a MimePart.

**MimeType** - Class in *javax.activation*
A Multipurpose Internet Mail Extension (MIME) type, as defined in RFC 2045 and 2046.

**MimeType()** - Constructor for class *javax.activation.MimeType*
Default constructor.

**MimeType(String)** - Constructor for class *javax.activation.MimeType*
Constructor that builds a MimeType from a String.

**MimeType(String, String)** - Constructor for class *javax.activation.MimeType*
Constructor that builds a MimeType with the given primary and sub type but has an empty parameter list.

**MimeTypeParameterList** - Class in *javax.activation*
A parameter list of a MimeType as defined in RFC 2045 and 2046.

**MimeTypeParameterList()** - Constructor for class
Default constructor.

**MimeTypeParameterList(String)** - Constructor for class
Constructs a new MimeTypeParameterList with the passed in data.

**MimeTypeParseException** - Exception in *javax.activation*
A class to encapsulate MimeType parsing related exceptions.

**MimeTypeParseException()** - Constructor for exception
Constructs a MimeTypeParseException with no specified detail message.

**MimeTypeParseException(String)** - Constructor for exception
Constructs a MimeTypeParseException with the specified detail message.

**MimetypesFileTypeMap** - Class in *javax.activation*
This class extends FileTypeMap and provides data typing of files via their file extension.

**MimetypesFileTypeMap()** - Constructor for class
The default constructor.

**MimetypesFileTypeMap(String)** - Constructor for class
javax.activation.MimetypesFileTypeMap
Construct a MimetypesFileTypeMap with programmatic entries added from the named file.

MimetypesFileTypeMap(InputStream) - Constructor for class javax.activation.MimetypesFileTypeMap
Construct a MimetypesFileTypeMap with programmatic entries added from the InputStream.

MimeUtility - Class in javax.mail.internet
This is a utility class that provides various MIME related functionality.

MINIMUM_MESSAGE_ID - Static variable in class javax.mail.validator.DoubleRangeValidator
The message identifier of the FacesMessage to be created if the minimum value check fails.

MINIMUM_MESSAGE_ID - Static variable in class javax.mail.validator.LengthValidator
The message identifier of the FacesMessage to be created if the minimum length check fails.

MINIMUM_MESSAGE_ID - Static variable in class javax.mail.validator.LongRangeValidator
The message identifier of the FacesMessage to be created if the minimum value check fails.

mode - Variable in class javax.mail.Folder
The open mode of this folder.

modified - Variable in class javax.mail.internet.MimeMessage
A flag indicating whether the message has been modified.

ModuleType - Class in javax.enterprise.deploy.shared
Class ModuleTypes defines enumeration values for the J2EE module types.

ModuleType(int) - Constructor for class javax.enterprise.deploy.shared.ModuleType
Construct a new enumeration value with the given integer value.

msg - Variable in class javax.mail.event.MessageChangedEvent
The message that changed.

msgnum - Variable in class javax.mail.Message
The number of this message within its folder, or zero if the message was not retrieved from a folder.

msgs - Variable in class javax.mail.event.MessageCountEvent
The messages.

Multipart - Class in javax.mail
Multipart is a container that holds multiple body parts.

Multipart() - Constructor for class javax.mail.Multipart
Default constructor.

MultipartDataSource - Interface in javax.mail
MultipartDataSource is a DataSource that contains body parts.
name - Variable in class javax.mail.
- The name of the header.
name - Variable in class javax.mail.
- The name of the resource.
name - Variable in class javax.xml.bind.
- xml element tag name
Name - Interface in javax.xml.soap
- A representation of an XML name.
NamedNativeQueries - Annotation Type in javax.persistence
- Is used to specify an array of native SQL named queries.
NamedNativeQuery - Annotation Type in javax.persistence
- Is used to specify a native SQL named query.
NamedQuery - Annotation Type in javax.persistence
- Specifies an array of named Java Persistence query language queries.
Namespace - Interface in javax.xml.stream.events
- An interface that contains information about a namespace.
NAMESPACE - Static variable in interface
javax.xml.stream.XMLStreamConstants
- Indicates the event is a namespace declaration
NamespaceConstants - Class in javax.xml.rpc
- Constants used in JAX-RPC for namespace prefixes and URIs
NamespaceConstants() - Constructor for class
javax.xml.rpc.NamespaceConstants

NamingContainer - Interface in javax.faces.component
- NamingContainer is an interface that must be implemented by any
  UIComponent that wants to be a naming container.
NavigationHandler - Class in javax.faces.application
- A NavigationHandler is passed the outcome string returned by an
  application action invoked for this application, and will use
  this (along with related state information) to choose the view
  to be displayed next.
NavigationHandler() - Constructor for class
javax.faces.application.NavigationHandler

NE - Static variable in class javax.mail.search.
- ComparisonTerm
NESTED - Static variable in class
javax.servlet.jsp.tagext.VariableInfo
- Scope information that scripting variable is visible only
  within the start/end tags.
nested - Variable in exception javax.xml.stream.
- XMLStreamException
`newFolder` - Variable in class `javax.mail.event.FolderEvent`
The folder that represents the new name, in case of a RENAMED event.

`newInstance()` - Static method in class `javax.el.ExpressionFactory`
Creates a new instance of a ExpressionFactory.

`newInstance(Properties)` - Static method in class `javax.el.ExpressionFactory`
Create a new instance of a ExpressionFactory, with optional properties.

`newInstance()` - Static method in class `javax.mail.event.FolderEvent`
The folder that represents the new name, in case of a RENAMED event.

`newInstance(String)` - Static method in class `javax.xml.bind.JAXBContext`
Obtain a new instance of a JAXBContext class.

`newInstance(String, ClassLoader)` - Static method in class `javax.xml.bind.JAXBContext`
Obtain a new instance of a JAXBContext class.

`newInstance(String, ClassLoader, Map<String, ?>>)` - Static method in class `javax.xml.bind.JAXBContext`
Obtain a new instance of a JAXBContext class.

`newInstance(Class...)` - Static method in class `javax.xml.bind.JAXBContext`
Obtain a new instance of a JAXBContext class.

`newInstance(Class[], Map<String, ?>>)` - Static method in class `javax.xml.bind.JAXBContext`
Obtain a new instance of a JAXBContext class.

`newInstance()` - Static method in class `javax.xml.registry.ConnectionFactory`
Creates a defaultConnectionFactory object.

`newInstance()` - Static method in class `javax.xml.rpc.ServiceFactory`
Gets an instance of the ServiceFactory Only one copy of a factory exists and is returned to the application each time this method is called.

`newInstance()` - Static method in class `javax.xml.soap.MessageFactory`
Creates a new MessageFactory object that is an instance of the default implementation (SOAP 1.1), This method uses the following ordered lookup procedure to determine the MessageFactory implementation class to load: Use the javax.xml.soap.MessageFactory system property.

`newInstance(String)` - Static method in class `javax.xml.soap.MessageFactory`
Creates a new MessageFactory object that is an instance of the specified implementation.

`newInstance()` - Static method in class `javax.xml.soap.SOAPConnectionFactory`
Creates an instance of the default SOAPConnectionFactory object.

`newInstance()` - Static method in class `javax.xml.soap.SOAPElementFactory`
Deprecated. Creates a new instance of SOAPElementFactory.
newInstance() - Static method in class javax.xml.soap.SOAFactory
Creates a new SOAPFactory object that is an instance of the default implementation (SOAP 1.1). This method uses the following ordered lookup procedure to determine the SOAPFactory implementation class to load: Use the javax.xml.soap.SOAFactory system property.

newInstance(String) - Static method in class javax.xml.soap.SOAFactory
Creates a new SOAPFactory object that is an instance of the specified implementation, this method uses the SAAJMetaFactory to locate the implementation class and create the SOAPFactory instance.

newInstance() - Method in interface javax.xml.stream.util.XMLEventAllocator
This method creates an instance of the XMLEventAllocator.

newInstance() - Static method in class javax.xml.stream.XMLEventFactory
Create a new instance of the factory.

newInstance(String, ClassLoader) - Static method in class javax.xml.stream.XMLEventFactory
Create a new instance of the factory.

newInstance() - Static method in class javax.xml.stream.XMLInputFactory
Create a new instance of the factory.

newInstance(String, ClassLoader) - Static method in class javax.xml.stream.XMLInputFactory
Create a new instance of the factory.

newInstance() - Static method in class javax.xml.stream.XMLOutputFactory
Create a new instance of the factory.

newInstance(String, ClassLoader) - Static method in class javax.xml.stream.XMLOutputFactory
Create a new instance of the factory.

newLine() - Method in class javax.servlet.jsp.JspWriter
Write a line separator.

newMessageFactory(String) - Method in class javax.xml.soap.SAAJMetaFactory
Creates a MessageFactory object for the given String protocol.

NewsAddress - Class in javax.mail.internet
This class models an RFC1036 newsgroup address.

NewsAddress() - Constructor for class javax.mail.internet.NewsAddress
Default constructor.

NewsAddress(String) - Constructor for class javax.mail.internet.NewsAddress
Construct a NewsAddress with the given newsgroup.

NewsAddress(String, String) - Constructor for class javax.mail.internet.NewsAddress
Construct a NewsAddress with the given newsgroup and host.

newsgroup - Variable in class javax.mail.internet.NewsAddress
**NEWSGROUPS** - Static variable in class
javax.mail.internet.MimeMessage.RecipientType
The "Newsgroup" (Usenet news) recipients.

**newSOAPFactory(String)** - Method in class
javax.xml.soap.SAAJMetaFactory
Creates a SOAPFactory object for the given String protocol.

**newStream(long, long)** - Method in interface
javax.mail.internet.SharedInputStream
Return a new InputStream representing a subset of the data from this InputStream, starting at start (inclusive) up to end (exclusive).

**newStream(long, long)** - Method in class
javax.mail.util.SharedByteArrayInputStream
Return a new InputStream representing a subset of the data from this InputStream, starting at start (inclusive) up to end (exclusive).

**newStream(long, long)** - Method in class
javax.mail.util.SharedFileInputStream
Return a new InputStream representing a subset of the data from this InputStream, starting at start (inclusive) up to end (exclusive).

**next()** - Method in class javax.mail.internet.HeaderTokenizer
Parses the next token from this String.

**next()** - Method in class javax.xml.stream.util.EventReaderDelegate

**next()** - Method in interface javax.xml.stream.XMLStreamReader
Get the next parsing event - a processor may return all contiguous character data in a single chunk, or it may split it into several chunks.

**nextEvent()** - Method in interface javax.xml.stream.XMLEventReader
Get the next XMLEvent

**nextTag()** - Method in class
javax.xml.stream.util.EventReaderDelegate

**nextTag()** - Method in class
javax.xml.stream.util.StreamReaderDelegate

**nextTag()** - Method in interface javax.xml.stream.XMLEventReader
Skips any insignificant space events until a START_ELEMENT or END_ELEMENT is reached.

**nextTag()** - Method in interface javax.xml.stream.XMLStreamReader
Skips any white space (isWhiteSpace() returns true), COMMENT, or PROCESSING_INSTRUCTION, until a START_ELEMENT or END_ELEMENT is reached.
**nil** - Variable in class javax.xml.bind.JAXBElement
  true iff the xml element instance has xsi:nil="true".

**NO_BUFFER** - Static variable in class javax.servlet.jsp.JspWriter
  Constant indicating that the Writer is not buffering output.

**Node** - Interface in javax.xml.soap
  A representation of a node (element) in an XML document.

**NON_PERSISTENT** - Static variable in interface javax.jms.DeliveryMode
  This is the lowest-overhead delivery mode because it does not require that the message be logged to stable storage.

**NonUniqueResultException** - Exception in javax.persistence
  Thrown by the persistence provider when getSingleResult() is executed on a query and there is more than one result from the query.

**NonUniqueResultException()** - Constructor for exception javax.persistence.NonUniqueResultException
  Constructs a new NonUniqueResultException exception with null as its detail message.

**NonUniqueResultException(String)** - Constructor for exception javax.persistence.NonUniqueResultException
  Constructs a new NonUniqueResultException exception with the specified detail message.

**NoResultException** - Exception in javax.persistence
  Thrown by the persistence provider when getSingleResult() is executed on a query and there is no result to return.

**NoResultException()** - Constructor for exception javax.persistence.NoResultException
  Constructs a new NoResultException exception with null as its detail message.

**NoResultException(String)** - Constructor for exception javax.persistence.NoResultException
  Constructs a new NoResultException exception with the specified detail message.

**NormalizedStringAdapter** - Class in javax.xml.bind.annotation.adapters
  XmlAdapter to handle xs:normalizedString.

**NormalizedStringAdapterFactory()** - Constructor for class javax.xml.bind.annotation.adapters.NormalizedStringAdapter

**normalizeMimeType(String)** - Method in class javax.activation.ActivationDataFlavor
  Deprecated.

**normalizeMimeTypeParameter(String, String)** - Method in class javax.activation.ActivationDataFlavor
  Deprecated.

**NoSuchEJBException** - Exception in javax.ejb
  A NoSuchEJBException is thrown if an attempt is made to invoke a method on an object that no longer exists.

**NoSuchEJBException()** - Constructor for exception javax.ejb.NoSuchEJBException
Constructs a NoSuchEJBException with no detail message.

**NoSuchEJBException(String)** - Constructor for exception

`javax.ejb.NoSuchEJBException`

Constructs a NoSuchEJBException with the specified detail message.

**NoSuchEJBException(String, Exception)** - Constructor for exception

`javax.ejb.NoSuchEJBException`

Constructs a NoSuchEJBException with the specified detail message and a nested exception.

**NoSuchEntityException** - Exception in `javax.ejb`

The NoSuchEntityException exception is thrown by an Entity Bean instance to its container to report that the invoked business method or callback method could not be completed because of the underlying entity was removed from the database.

**NoSuchEntityException()** - Constructor for exception

`javax.ejb.NoSuchEntityException`

Constructs a NoSuchEntityException with no detail message.

**NoSuchEntityException(String)** - Constructor for exception

`javax.ejb.NoSuchEntityException`

Constructs a NoSuchEntityException with the specified detailed message.

**NoSuchEntityException(Exception)** - Constructor for exception

`javax.ejb.NoSuchEntityException`

Constructs a NoSuchEntityException that embeds the originally thrown exception.

**NoSuchObjectLocalException** - Exception in `javax.ejb`

A NoSuchObjectLocalException is thrown if an attempt is made to invoke a method on an object that no longer exists.

**NoSuchObjectLocalException()** - Constructor for exception

`javax.ejb.NoSuchObjectLocalException`

Constructs a NoSuchObjectLocalException with no detail message.

**NoSuchObjectLocalException(String)** - Constructor for exception

`javax.ejb.NoSuchObjectLocalException`

Constructs a NoSuchObjectLocalException with the specified detail message.

**NoSuchObjectLocalException(String, Exception)** - Constructor for exception

`javax.ejb.NoSuchObjectLocalException`

Constructs a NoSuchObjectLocalException with the specified detail message and a nested exception.

**NoSuchProviderException** - Exception in `javax.mail`

This exception is thrown when Session attempts to instantiate a Provider that doesn't exist.

**NoSuchProviderException()** - Constructor for exception

`javax.mail.NoSuchProviderException`

Constructor.

**NoSuchProviderException(String)** - Constructor for exception

`javax.mail.NoSuchProviderException`

Constructor.

**NOT_IN_RANGE_MESSAGE_ID** - Static variable in class

`javax.faces.validator.DoubleRangeValidator`
The message identifier of the `FacesMessage` to be created if the maximum or minimum value check fails, and both the maximum and minimum values for this validator have been set.

**NOT IN RANGE MESSAGE ID** - Static variable in class `javax.faces.validator.LongRangeValidator`

The message identifier of the `FacesMessage` to be created if the maximum or minimum value check fails, and both the maximum and minimum values for this validator have been set.

**NOT IN RANGE MESSAGE ID** - Static variable in interface `javax.faces.validator.Validator`

*Deprecated.* Use `DoubleRangeValidator.NOT_IN_RANGE_MESSAGE_ID` or `LongRangeValidator.NOT_IN_RANGE_MESSAGE_ID` instead.

**NOTATION DECLARATION** - Static variable in interface `javax.xml.stream.XMLStreamConstants`

Indicates a Notation Declaration - Interface in `javax.xml.stream.events`

An interface for handling Notation Declarations. Receive notification of a notation declaration event.

**NOTICE** - Static variable in class `javax.mail.event.StoreEvent`

Indicates that this message is a NOTICE.

**NotIdentifiableEvent** - Interface in `javax.xml.bind`

This event indicates that a problem was encountered resolving an ID/IDREF.

**NotIdentifiableEventImpl** - Class in `javax.xml.bind.helpers`

Default implementation of the NotIdentifiableEvent interface.

**NotIdentifiableEventImpl(int, String, ValidationEventLocator)** - Constructor for class `javax.xml.bind.helpers.NotIdentifiableEventImpl`

Create a new NotIdentifiableEventImpl.

**NotIdentifiableEventImpl(int, String, ValidationEventLocator, Throwable)** - Constructor for class `javax.xml.bind.helpers.NotIdentifiableEventImpl`

Create a new NotIdentifiableEventImpl.

**notification(StoreEvent)** - Method in interface `javax.mail.event.StoreListener`

Invoked when the Store generates a notification event.

**notifyConnectionListeners(int)** - Method in class `javax.mail.Folder`

Notify all ConnectionListeners.

**notifyConnectionListeners(int)** - Method in class `javax.mail.Service`

Notify all ConnectionListeners.

**notifyDDChange(XpathEvent)** - Method in interface `javax.enterprise.deploy.spi.DConfigBean`

A notification that the DDBean provided in the event has changed and this bean or its child beans need to reevaluate themselves.

**notifyFolderListeners(int)** - Method in class `javax.mail.Folder`

Notify all FolderListeners registered on this Folder and this folder's Store.

**notifyFolderListeners(int, Folder)** - Method in class `javax.mail.Store`
Notify all FolderListeners.

**notifyFolderRenamedListeners(Folder)** - Method in class
javax.mail.Folder

Notify all FolderListeners registered on this Folder and this folder's Store about the renaming of this folder.

**notifyFolderRenamedListeners(Folder, Folder)** - Method in class
javax.mail.Store

Notify all FolderListeners about the renaming of a folder.

**notifyMessageAddedListeners(Message[])** - Method in class
javax.mail.Folder

Notify all MessageCountListeners about the addition of messages into this folder.

**notifyMessageChangedListeners(int, Message)** - Method in class
javax.mail.Folder

Notify all MessageChangedListeners.

**notifyMessageRemovedListeners(boolean, Message[])** - Method in class
javax.mail.Folder

Notify all MessageCountListeners about the removal of messages from this folder.

**notifyStoreListeners(int, String)** - Method in class
javax.mail.Store

Notify all StoreListeners.

**notifyTransportListeners(int, Address[], Address[], Address[], Message)** - Method in class javax.mail.Transport

Notify all TransportListeners.

**NotSupportedException** - Exception in javax.resource

A NotSupportedException is thrown to indicate that callee (resource adapter or application server for system contracts) cannot execute an operation because the operation is not a supported feature.

**NotSupportedException()** - Constructor for exception
javax.resource.NotSupportedException

Constructs a new instance with null as its detail message.

**NotSupportedException(String)** - Constructor for exception
javax.resource.NotSupportedException

Constructs a new instance with the specified detail message.

**NotSupportedException(ThrowVariable)** - Constructor for exception
javax.resource.NotSupportedException

Constructs a new throwable with the specified cause.

**NotSupportedException(String, Throwable)** - Constructor for exception
javax.resource.NotSupportedException

Constructs a new throwable with the specified detail message and cause.

**NotSupportedException(String, String)** - Constructor for exception
javax.resource.NotSupportedException

Constructs a new throwable with the specified detail message and error code.

**NotSupportedException** - Exception in javax.transaction

NotSupportedException exception indicates that the request cannot be executed because the operation is not a supported
NotSupportedException() - Constructor for exception
javax.transaction.NotSupportedException

NotSupportedException(String) - Constructor for exception
javax.transaction.NotSupportedException

NotTerm - Class in javax.mail.search
This class implements the logical NEGATION operator.
NotTerm(SearchTerm) - Constructor for class
javax.mail.search.NotTerm

NSPREFIX_SCHEMA_XSD - Static variable in class
javax.xml.rpc.NamespaceConstants
  Namespace prefix for XML schema XSD
NSPREFIX_SCHEMA_XSI - Static variable in class
javax.xml.rpc.NamespaceConstants
  Namespace prefix for XML Schema XSI
NSPREFIX_SOAP_ENCODING - Static variable in class
javax.xml.rpc.NamespaceConstants
  Namespace prefix for SOAP Encoding
NSPREFIX_SOAP_ENVELOPE - Static variable in class
javax.xml.rpc.NamespaceConstants
  Namespace prefix for SOAP Envelope
NSURI_SCHEMA_XSD - Static variable in class
javax.xml.rpc.NamespaceConstants
  Namespace URI for XML Schema XSD
NSURI_SCHEMA_XSI - Static variable in class
javax.xml.rpc.NamespaceConstants
  Namespace URI for XML Schema XSI
NSURI_SOAP_ENCODING - Static variable in class
javax.xml.rpc.NamespaceConstants
  Namespace URI for SOAP 1.1 Encoding
NSURI_SOAP_ENVELOPE - Static variable in class
javax.xml.rpc.NamespaceConstants
  Namespace URI for SOAP 1.1 Envelope
NSURI_SOAP_NEXT_ACTOR - Static variable in class
javax.xml.rpc.NamespaceConstants
  Namespace URI for SOAP 1.1 next actor role
number - Variable in class javax.mail.search.IntegerComparisonTerm
  The number.
NUMBER_ID - Static variable in class
javax.faces.convert.NumberConverter
  The message identifier of the FacesMessage to be created if the conversion to Number fails.
NumberConverter - Class in javax.faces.convert
  Converter implementation for java.lang.Number values.
NumberConverter() - Constructor for class
javax.faces.convert.NumberConverter
**ObjectHolder** - Class in *javax.xml.rpc.holders*

**ObjectHolder()** - Constructor for class
*javax.xml.rpc.holders.ObjectHolder*

**ObjectHolder(Object)** - Constructor for class
*javax.xml.rpc.holders.ObjectHolder*

**ObjectMessage** - Interface in *javax.jms*

An ObjectMessage object is used to send a message that contains a serializable object in the Java programming language ("Java object").

**ObjectNotFoundException** - Exception in *javax.ejb*

The ObjectNotFoundException exception is thrown by a finder method to indicate that the specified EJB object does not exist.

**ObjectNotFoundException()** - Constructor for exception
*javax.ejb.ObjectNotFoundException*

Constructs an ObjectNotFoundException with no detail message.

**ObjectNotFoundException(String)** - Constructor for exception
*javax.ejb.ObjectNotFoundException*

Constructs an ObjectNotFoundException with the specified detail message.

**OneToMany** - Annotation Type in *javax.persistence*

Defines a many-valued association with one-to-many multiplicity.

**OneToOne** - Annotation Type in *javax.persistence*

This annotation defines a single-valued association to another entity that has one-to-one multiplicity.

**Oneway** - Annotation Type in *javax.jws*

Indicates that the given @WebMethod has only an input message and no output.

**onException(JMSEException)** - Method in interface
*javax.jms.ExceptionListener*

Notifies user of a JMS exception.

**onMessage(Message)** - Method in interface *javax.jms.MessageListener*

Passes a message to the listener.

**onMessage(Record)** - Method in interface
*javax.resource.cci.MessageListener*

This method allows an EIS to call a message endpoint using a request-response style communication.

**open(int)** - Method in class *javax.mail.Folder*

Open this Folder.

**opened(ConnectionEvent)** - Method in class
*javax.mail.event.ConnectionAdapter*
**OPENED** - Static variable in class `javax.mail.event.ConnectionEvent`
A connection was opened.

**opened(ConnectionEvent)** - Method in interface `javax.mail.event.ConnectionListener`
Invoked when a Store/Folder/Transport is opened.

**OPERATION_STYLE_PROPERTY** - Static variable in interface `javax.xml.rpc.Call`
Standard property for operation style.

**OperationUnsupportedException** - Exception in `javax.enterprise.deploy.spi.exceptions`
This exception is to report that the method called is not supported by this implementation.

**OperationUnsupportedException(String)** - Constructor for exception `javax.enterprise.deploy.spi.exceptions.OperationUnsupportedException`
Creates a new OperationUnsupportedException object.

**OPERATOR SLOT** - Static variable in interface `javax.xml.registry.infomodel.Slot`
Name for pre-defined Slot used in Organization and ClassificationScheme by JAXR UDDI provider.

**OptimisticLockException** - Exception in `javax.persistence`
Thrown by the persistence provider when an optimistic locking conflict occurs.

**OptimisticLockException()** - Constructor for exception `javax.persistence.OptimisticLockException`
Constructs a new OptimisticLockException exception with null as its detail message.

**OptimisticLockException(String)** - Constructor for exception `javax.persistence.OptimisticLockException`
Constructs a new OptimisticLockException exception with the specified detail message.

**OptimisticLockException(String, Throwable)** - Constructor for exception `javax.persistence.OptimisticLockException`
Constructs a new OptimisticLockException exception with the specified detail message and cause.

**OptimisticLockException(Throwables)** - Constructor for exception `javax.persistence.OptimisticLockException`
Constructs a new OptimisticLockException exception with the specified cause.

**OptimisticLockException(Object)** - Constructor for exception `javax.persistence.OptimisticLockException`
Constructs a new OptimisticLockException exception with the specified entity.

**OptimisticLockException(String, Throwable, Object)** - Constructor for exception `javax.persistence.OptimisticLockException`
Constructs a new OptimisticLockException exception with the specified detail message, cause, and entity.

**OR_ALL_KEYS** - Static variable in interface `javax.xml.registry.FindQualifier`

**OR LIKE KEYS** - Static variable in interface
javax.xml.registry.FindQualifier

**OrderBy** - Annotation Type in [javax.persistence](https://javaee.oracle.com/javaee-8/docs/api/javax/persistence/package-summary.html)
This annotation specifies the ordering of the elements of a collection valued association at the point when the association is retrieved.

Organization instances provide information on organizations such as a Submitting Organization.

**ORGANIZATION** - Static variable in interface javax.xml.registry.[LifeCycleManager](https://javaee.oracle.com/javaee-8/docs/api/javax/xml/registry/LifeCycleManager.html)

**OrTerm** - Class in [javax.mail.search](https://javaee.oracle.com/javaee-8/docs/api/javax/mail/search/package-summary.html)
This class implements the logical OR operator on individual SearchTerms.

**OrTerm(SearchTerm, SearchTerm)** - Constructor for class javax.mail.search.[OrTerm](https://javaee.oracle.com/javaee-8/docs/api/javax/mail/search/OrTerm.html)
Constructor that takes two operands.

**OrTerm(SearchTerm[])** - Constructor for class javax.mail.search.[OrTerm](https://javaee.oracle.com/javaee-8/docs/api/javax/mail/search/OrTerm.html)
Constructor that takes an array of SearchTerms.

**othersDeletesAreVisible(int)** - Method in interface javax.resource.cci.[ResultSetInfo](https://javaee.oracle.com/javaee-8/docs/api/javax/resource/cci/ResultSetInfo.html)
Indicates whether deletes made by others are visible.

**othersInsertsAreVisible(int)** - Method in interface javax.resource.cci.[ResultSetInfo](https://javaee.oracle.com/javaee-8/docs/api/javax/resource/cci/ResultSetInfo.html)
Indicates whether inserts made by others are visible.

**othersUpdatesAreVisible(int)** - Method in interface javax.resource.cci.[ResultSetInfo](https://javaee.oracle.com/javaee-8/docs/api/javax/resource/cci/ResultSetInfo.html)
Indicates whether updates made by others are visible.

**OUT** - Static variable in class javax.servlet.jsp.[PageContext](https://javaee.oracle.com/javaee-8/docs/api/javax/servlet/jsp/PageContext.html)
Name used to store current JspWriter in PageContext name table.

**OUT** - Static variable in class javax.xml.rpc.[ParameterMode](https://javaee.oracle.com/javaee-8/docs/api/javax/xml/rpc/ParameterMode.html)
OUT mode for parameter passing

**OUTBOUND_MESSAGE_ATTACHMENTS** - Static variable in interface javax.xml.ws.handler.[MessageContext](https://javaee.oracle.com/javaee-8/docs/api/javax/xml/ws/handler/MessageContext.html)
Standard property: Map of attachments to a message for the outbound message, key is the MIME Content-ID, value is a DataHandler.

**ownDeletesAreVisible(int)** - Method in interface javax.resource.cci.[ResultSetInfo](https://javaee.oracle.com/javaee-8/docs/api/javax/resource/cci/ResultSetInfo.html)

**ownInsertsAreVisible(int)** - Method in interface javax.resource.cci.[ResultSetInfo](https://javaee.oracle.com/javaee-8/docs/api/javax/resource/cci/ResultSetInfo.html)

**ownUpdatesAreVisible(int)** - Method in interface javax.resource.cci.[ResultSetInfo](https://javaee.oracle.com/javaee-8/docs/api/javax/resource/cci/ResultSetInfo.html)
PAGE - Static variable in class javax.servlet.jsp.PageContext
Name used to store the Servlet in this PageContext's nametables.

PAGE_SCOPE - Static variable in class javax.servlet.jsp.PageContext
Page scope: (this is the default) the named reference remains available in this PageContext until the return from the current Servlet.service() invocation.

pageContext - Variable in class javax.faces.webapp.UIComponentClassicTagBase
The JSP PageContext for the page we are embedded in.

PageContext - Class in javax.servlet.jsp
PageContext extends JspContext to provide useful context information for when JSP technology is used in a Servlet environment.

PageContext() - Constructor for class javax.servlet.jsp.PageContext
Sole constructor.

PAGECONTEXT - Static variable in class javax.servlet.jsp.PageContext
Name used to store this PageContext in it's own name table.

pageContext - Variable in class javax.servlet.jsp.tagext.TagSupport
The PageContext.

PageData - Class in javax.servlet.jsp.tagext
Translation-time information on a JSP page.

PageData() - Constructor for class javax.servlet.jsp.tagext.PageData
Sole constructor.

ParameterList - Class in javax.mail.internet
This class holds MIME parameters (attribute-value pairs).

ParameterList() - Constructor for class javax.mail.internet.ParameterList
No-arg Constructor.

ParameterList(String) - Constructor for class javax.mail.internet.ParameterList
Constructor that takes a parameter-list string.

ParameterMode - Class in javax.xml.rpc
The javax.xml.rpc.ParameterMode is a type-safe enumeration for parameter mode.

parent - Variable in class javax.mail.BodyPart
The Multipart object containing this BodyPart, if known.

parent - Variable in class javax.mail.Multipart
The Part containing this Multipart, if known.

parse(String) - Method in class javax.activation.MimeTypeParameterList
A routine for parsing the parameter list out of a String.

parse(String) - Static method in class javax.mail.internet.InternetAddress
Parse the given comma separated sequence of addresses into InternetAddress objects.

**parse(String, boolean)** - Static method in class
javax.mail.internet.InternetAddress
Parse the given sequence of addresses into InternetAddress objects.

**parse(String, ParsePosition)** - Method in class
javax.mail.internet.MailDateFormat
Parses the given date in the format specified by draft-ietf-drums-msg-fmt-08 in the current TimeZone.

**parse(InputStream)** - Method in class
javax.mail.internet.MimeMessage
Parse the InputStream setting the headers and content fields appropriately.

**parse()** - Method in class javax.mail.internet.MimeMultipart
Parse the InputStream from our DataSource, constructing the appropriate MimeBodyParts.

**parse(String)** - Static method in class
javax.mail.internet.NewsAddress
Parse the given comma separated sequence of newsgroup into NewsAddress objects.

**parseAnySimpleType(String)** - Static method in class
javax.xml.bind.DatatypeConverter
Return a string containing the lexical representation of the simple type.

**parseAnySimpleType(String)** - Method in interface
javax.xml.bind.DatatypeConverterInterface
Return a string containing the lexical representation of the simple type.

**parseBase64Binary(String)** - Static method in class
javax.xml.bind.DatatypeConverter
Converts the string argument into an array of bytes.

**parseBase64Binary(String)** - Method in interface
javax.xml.bind.DatatypeConverterInterface
Converts the string argument into an array of bytes.

**parseBoolean(String)** - Static method in class
javax.xml.bind.DatatypeConverter
Converts the string argument into a boolean value.

**parseBoolean(String)** - Method in interface
javax.xml.bind.DatatypeConverterInterface
Converts the string argument into a boolean value.

**parseByte(String)** - Static method in class
javax.xml.bind.DatatypeConverter
Converts the string argument into a byte value.

**parseByte(String)** - Method in interface
javax.xml.bind.DatatypeConverterInterface
Converts the string argument into a byte value.

**ParseConversionEvent** - Interface in javax.xml.bind
This event indicates that a problem was encountered while converting a string from the XML data into a value of the
target Java data type.

**ParseConversionEventImpl** - Class in [javax.xml.bind.helpers](https://docs.oracle.com/javaee/8/api/javax/xml/bind/helpers/index.html)

Default implementation of the ParseConversionEvent interface.

**ParseConversionEventImpl(int, String, ValidationEventLocator)** - Constructor for class

javax.xml.bind.helpers.ParseConversionEventImpl

Create a new ParseConversionEventImpl.

**ParseConversionEventImpl(int, String, ValidationEventLocator, Throwable)** - Constructor for class

javax.xml.bind.helpers.ParseConversionEventImpl

Create a new ParseConversionEventImpl.

**parsed** - Variable in class [javax.mail.internet.MimeMultipart](https://docs.oracle.com/javase/8/docs/api/javax/mail/internet/MimeMultipart.html)

Have we parsed the data from our InputStream yet?

**parseDate(String)** - Static method in class

javax.xml.bind.DatatypeConverter

Converts the string argument into a Calendar value.

**parseDate(String)** - Method in interface

javax.xml.bind.DatatypeConverterInterface

Converts the string argument into a Calendar value.

**parseDateTime(String)** - Static method in class

javax.xml.bind.DatatypeConverter

Converts the string argument into a Calendar value.

**parseDateTime(String)** - Method in interface

javax.xml.bind.DatatypeConverterInterface

Converts the string argument into a Calendar value.

**parseDecimal(String)** - Static method in class

javax.xml.bind.DatatypeConverter

Converts the string argument into a BigDecimal value.

**parseDecimal(String)** - Method in interface

javax.xml.bind.DatatypeConverterInterface

Converts the string argument into a BigDecimal value.

**parseDouble(String)** - Static method in class

javax.xml.bind.DatatypeConverter

Converts the string argument into a double value.

**parseDouble(String)** - Method in interface

javax.xml.bind.DatatypeConverterInterface

Converts the string argument into a double value.

**ParseException** - Exception in [javax.mail.internet](https://docs.oracle.com/javase/8/docs/api/javax/mail/internet/index.html)

The exception thrown due to an error in parsing RFC822 or MIME headers

**ParseException()** - Constructor for exception

javax.mail.internet.ParseException

Constructs a ParseException with no detail message.

**ParseException(String)** - Constructor for exception

javax.mail.internet.ParseException

Constructs a ParseException with the specified detail message.

**parseExpression(String, Class, FunctionMapper)** - Method in class

javax.servlet.jsp.el.ExpressionEvaluator

Deprecated. Prepare an expression for later evaluation.

**parseFloat(String)** - Static method in class
javax.xml.bind.**DatatypeConverter**
Converts the string argument into a float value.

**parseFloat(String)** - Method in interface
javax.xml.bind.**DatatypeConverterInterface**
Converts the string argument into a float value.

**parseHeader(String, boolean)** - Static method in class
javax.mail.internet.**InternetAddress**
Parse the given sequence of addresses into InternetAddress objects.

**parseHexBinary(String)** - Static method in class
javax.xml.bind.**DatatypeConverter**
Converts the string argument into an array of bytes.

**parseHexBinary(String)** - Method in interface
javax.xml.bind.**DatatypeConverterInterface**
Converts the string argument into an array of bytes.

**parseInt(String)** - Static method in class
javax.xml.bind.**DatatypeConverter**
Converts the string argument into an int value.

**parseInt(String)** - Method in interface
javax.xml.bind.**DatatypeConverterInterface**
Converts the string argument into an int value.

**parseInteger(String)** - Static method in class
javax.xml.bind.**DatatypeConverter**
Converts the string argument into a BigInteger value.

**parseInteger(String)** - Method in interface
javax.xml.bind.**DatatypeConverterInterface**
Converts the string argument into a BigInteger value.

**parseLong(String)** - Static method in class
javax.xml.bind.**DatatypeConverter**
Converts the string argument into a long value.

**parseLong(String)** - Method in interface
javax.xml.bind.**DatatypeConverterInterface**
Converts the string argument into a long value.

**parsePostData(int, ServletInputStream)** - Static method in class
javax.servlet.http.**HttpUtils**
*Deprecated.* Parses data from an HTML form that the client sends to the server using the HTTP POST method and the application/x-www-form-urlencoded MIME type.

**parseQName(String, NamespaceContext)** - Static method in class
javax.xml.bind.**DatatypeConverter**
Converts the string argument into a byte value.

**parseQName(String, NamespaceContext)** - Method in interface
javax.xml.bind.**DatatypeConverterInterface**
Converts the string argument into a QName value.

**parseQueryString(String)** - Static method in class
javax.servlet.http.**HttpUtils**
*Deprecated.* Parses a query string passed from the client to the server and builds a HashTable object with key-value pairs.

**parseShort(String)** - Static method in class
javax.xml.bind.**DatatypeConverter**
Converts the string argument into a short value.

**parseShort(String)** - Method in interface javax.xml.bind.DatatypeConverterInterface
Converts the string argument into a short value.

**parseString(String)** - Method in interface javax.xml.bind.URLName
Method which does all of the work of parsing the string.

**parseString(String)** - Static method in class javax.xml.bind.DatatypeConverter
Convert the lexical XSD string argument into a String value.

**parseString(String)** - Static method in class javax.xml.bind.DatatypeConverterInterface
Convert the string argument into a string.

**parseTime(String)** - Static method in class javax.xml.bind.DatatypeConverter
Converts the string argument into a Calendar value.

**parseTime(String)** - Method in interface javax.xml.bind.DatatypeConverterInterface
Converts the string argument into a Calendar value.

**parseUnsignedInt(String)** - Static method in class javax.xml.bind.DatatypeConverter
Converts the string argument into a long value.

**parseUnsignedInt(String)** - Method in interface javax.xml.bind.DatatypeConverterInterface
Converts the string argument into a long value.

**parseUnsignedShort(String)** - Static method in class javax.xml.bind.DatatypeConverter
Converts the string argument into an int value.

**parseUnsignedShort(String)** - Method in interface javax.xml.bind.DatatypeConverterInterface
Converts the string argument into an int value.

**part** - Variable in class javax.mail.internet.MimePartDataSource
The MimePart that provides the data for this DataSource.

**Part** - Interface in javax.mail
The Part interface is the common base interface for Messages and BodyParts.

**parts** - Variable in class javax.mail.Multipart
Vector of BodyPart objects.

**PASSWORD_PROPERTY** - Static variable in interface java.xml.rpc.Call
Standard property: Password for authentication Type: java.lang.String

**PASSWORD_PROPERTY** - Static variable in interface java.xml.rpc.Stub
Standard property: Password for authentication.

**PASSWORD_PROPERTY** - Static variable in interface javax.xml.ws.BindingProvider
Standard property: Password for authentication.

**PasswordAuthentication** - Class in javax.mail
The class PasswordAuthentication is a data holder that is used by Authenticator.

**PasswordAuthentication(String, String)** - Constructor for class javax.mail.PasswordAuthentication
Initialize a new PasswordAuthentication

**PasswordCredential** - Class in *javax.resource.spi.security*
The class PasswordCredential acts as a holder for username and password.

**PasswordCredential(String, char[])** - Constructor for class
*javax.resource.spi.security.PasswordCredential*
Creates a new PasswordCredential object from the given user name and password.

**PATH_INFO** - Static variable in interface
*javax.xml.ws.handler.MessageContext*
Standard property: Request Path Info Type: String

**pattern** - Variable in class *javax.mail.search.StringTerm*
The pattern.

**PATTERN_ID** - Static variable in class
*javax.faces.convert.NumberConverter*
The message identifier of the *FacesMessage* to be created if the conversion to Number fails.

**peek()** - Method in class *javax.mail.internet.HeaderTokenizer*
Peek at the next token, without actually removing the token from the parse stream.

**peek()** - Method in class *javax.xml.stream.util.EventReaderDelegate*
Check the next XMLEvent without reading it from the stream.

**PERCENT_ID** - Static variable in class
*javax.faces.convert.NumberConverter*
The message identifier of the *FacesMessage* to be created if the conversion to Number fails.

**PermitAll** - Annotation Type in *javax.annotation.security*
Specifies that all security roles are allowed to invoke the specified method(s) i.e that the specified method(s) are "unchecked".

**persist(Object)** - Method in interface
*javax.persistence.EntityManager*
Make an entity instance managed and persistent.

**Persistence** - Class in *javax.persistence*
Bootstrap class that is used to obtain an *EntityManagerFactory*.

**Persistence()** - Constructor for class *javax.persistence.Persistence*

**PERSISTENCE_PROVIDER** - Static variable in class
*javax.persistence.Persistence*

**PersistenceContext** - Annotation Type in *javax.persistence*
Expresses a dependency on an *EntityManager* persistence context.

**PersistenceContexts** - Annotation Type in *javax.persistence*
Declares one or more *PersistenceContext* annotations.

**PersistenceContextType** - Enum in *javax.persistence*
Specifies whether a transaction-scoped or extended persistence context is to be used in *PersistenceContext*.

**PersistenceException** - Exception in *javax.persistence*
Thrown by the persistence provider when a problem occurs.

**PersistenceException()** - Constructor for exception
```
java.lang.Exception
```
Constructs a new PersistenceException exception with null as its detail message.

**PersistenceException(String)** - Constructor for exception
```
java.lang.Exception
```
Constructs a new PersistenceException exception with the specified detail message.

**PersistenceException(String, Throwable)** - Constructor for exception
```
java.lang.Exception
```
Constructs a new PersistenceException exception with the specified detail message and cause.

**PersistenceException(Throwables)** - Constructor for exception
```
java.lang.Exception
```
Constructs a new PersistenceException exception with the specified cause.

**PersistenceProperty** - Annotation Type in `javax.persistence`
Describes a single container or persistence provider property.

**PersistenceProvider** - Interface in `javax.persistence.spi`
Interface implemented by a persistence provider.

**PersistenceUnit** - Annotation Type in `javax.persistence`
Expresses a dependency on an `EntityManagerFactory`.

**PersistenceUnitInfo** - Interface in `javax.persistence.spi`
Interface implemented by the container and used by the persistence provider when creating an `EntityManagerFactory`.

**PersistenceUnits** - Annotation Type in `javax.persistence`
Declares one or more `PersistenceUnit` annotations.

**PersistenceUnitTransactionType** - Enum in `javax.persistence.spi`
This enum class defines whether the entity managers created by the `EntityManagerFactory` will be JTA or resource-local entity managers.

**PERSISTENT** - Static variable in interface `javax.jms.DeliveryMode`
This delivery mode instructs the JMS provider to log the message to stable storage as part of the client's send operation.

**PERSON_NAME** - Static variable in interface
```
javax.xml.registry.LifeCycleManager
```

**personal** - Variable in class `javax.mail.internet.InternetAddress`
The personal name.

**PersonName** - Interface in `javax.xml.registry.infomodel`
Represents a person's name.

**PhaseEvent** - Class in `javax.faces.event`
`PhaseEvent` represents the beginning or ending of processing for a particular phase of the request processing lifecycle, for the request encapsulated by the specified `FacesContext`.

**PhaseEvent(FacesContext, PhaseId, Lifecycle)** - Constructor for class `javax.faces.event.PhaseEvent`
Construct a new event object from the specified parameters.
PhaseId - Class in javax.faces.event
Typesafe enumeration of the legal values that may be returned by the getPhaseId() method of the FacesEvent interface.

PhaseListener - Interface in javax.faces.event
An interface implemented by objects that wish to be notified at the beginning and ending of processing for each standard phase of the request processing lifecycle.

PolicyConfiguration - Interface in javax.security.jacc
The methods of this interface are used by containers to create policy statements in a Policy provider.

PolicyConfigurationFactory - Class in javax.security.jacc
Abstract factory and finder class for obtaining the instance of the class that implements the PolicyConfigurationFactory of a provider.

PolicyConfigurationFactory() - Constructor for class javax.security.jacc.PolicyConfigurationFactory

PolicyContext - Class in javax.security.jacc
This utility class is used by containers to communicate policy context identifiers and other policy relevant context to Policy providers.

PolicyContextException - Exception in javax.security.jacc
This checked exception is thrown by implementations of the javax.security.jacc.PolicyConfiguration Interface, the javax.security.jacc.PolicyConfigurationFactory abstract class, the javax.security.jacc.PolicyContext utility class, and implementations of the javax.security.jacc.PolicyContextException Interface.

PolicyContextException() - Constructor for exception javax.security.jacc.PolicyContextException
Constructs a new PolicyContextException with null as its detail message.

PolicyContextException(String) - Constructor for exception javax.security.jacc.PolicyContextException
Constructs a new PolicyContextException with the specified detail message

PolicyContextException(String, Throwable) - Constructor for exception javax.security.jacc.PolicyContextException
Constructs a new PolicyContextException with the specified detail message and cause.

PolicyContextException(Throwables) - Constructor for exception javax.security.jacc.PolicyContextException
Constructs a new PolicyContextException with the specified cause.

PolicyContextHandler - Interface in javax.security.jacc
This interface defines the methods that must be implemented by handlers that are to be registered and activated by the PolicyContext class.

popBody() - Method in class javax.servlet.jsp.JspContext
Return the previous JspWriter "out" saved by the matching
pushBody(), and update the value of the "out" attribute in the page scope attribute namespace of the JspContext.

**PortInfo** - Interface in [javax.xml.ws.handler](https://docs.oracle.com/javase/10/docs/api/javax/xml/ws/handler/PortInfo.html)
The PortInfo interface is used by a HandlerResolver to query information about the port it is being asked to create a handler chain for.

**pos** - Variable in exception [javax.mail.internet.AddressException](https://docs.oracle.com/javase/10/docs/api/javax/mail/internet/AddressException.html)
The index in the string where the error occurred, or -1 if not known.

**PostActivate** - Annotation Type in [javax.ejb](https://docs.oracle.com/javase/10/docs/api/javax/ejb/)
Designates a method to receive a callback after a stateful session bean has been activated.

**POSTAL_ADDRESS** - Static variable in interface [javax.xml.registry.LifeCycleManager](https://docs.oracle.com/javase/10/docs/api/javax/xml/registry/LifeCycleManager.html)

**PostalAddress** - Interface in [javax.xml.registry.infomodel](https://docs.oracle.com/javase/10/docs/api/javax/xml/registry/infomodel/PostalAddress.html)
PostalAddress is a simple re-usable entity class that defines attributes of a postal Address.

**PostConstruct** - Annotation Type in [javax.annotation](https://docs.oracle.com/javase/10/docs/api/javax/annotation/PostConstruct.html)
The PostConstruct annotation is used on a method that needs to be executed after dependency injection is done to perform any initialization.

**PostLoad** - Annotation Type in [javax.persistence](https://docs.oracle.com/javase/10/docs/api/javax/persistence/)
Is used to specify callback methods for the corresponding lifecycle event.

**PostPersist** - Annotation Type in [javax.persistence](https://docs.oracle.com/javase/10/docs/api/javax/persistence/)
Is used to specify callback methods for the corresponding lifecycle event.

**PostRemove** - Annotation Type in [javax.persistence](https://docs.oracle.com/javase/10/docs/api/javax/persistence/)
Is used to specify callback methods for the corresponding lifecycle event.

**PostUpdate** - Annotation Type in [javax.persistence](https://docs.oracle.com/javase/10/docs/api/javax/persistence/)
Is used to specify callback methods for the corresponding lifecycle event.

**PreDestroy** - Annotation Type in [javax.annotation](https://docs.oracle.com/javase/10/docs/api/javax/annotation/PreDestroy.html)
The PreDestroy annotation is used on methods as a callback notification to signal that the instance is in the process of being removed by the container.

**PreencodedMimeBodyPart** - Class in [javax.mail.internet](https://docs.oracle.com/javase/10/docs/api/javax/mail/internet/PreencodedMimeBodyPart.html)
A MimeBodyPart that handles data that has already been encoded.

**PreencodedMimeBodyPart(String)** - Constructor for class [javax.mail.internet.PreencodedMimeBodyPart](https://docs.oracle.com/javase/10/docs/api/javax/mail/internet/PreencodedMimeBodyPart.html)
Create a PreencodedMimeBodyPart that assumes the data is encoded using the specified encoding.

**prefix** - Variable in class [javax.servlet.jsp.tagext.TagLibraryInfo](https://docs.oracle.com/javase/10/docs/api/javax/servlet/jsp/tagext/TagLibraryInfo.html)
The prefix assigned to this taglib from the taglib directive.

**prepare(Xid)** - Method in interface [javax.resource.spi.XATerminator](https://docs.oracle.com/javase/10/docs/api/javax/route/spi/XATerminator.html)
Ask the resource manager to prepare for a transaction commit of the transaction specified in xid.

**prepare(Xid)** - Method in interface [javax.transaction.xa.XAResource](https://docs.oracle.com/javase/10/docs/api/javax/transaction/xa/XAResource.html)
Ask the resource manager to prepare for a transaction commit of the transaction specified in xid.

**PrePassivate** - Annotation Type in *javax.ejb*
Designates a method to receive a callback before a stateful session bean is passivated.

**PrePersist** - Annotation Type in *javax.persistence*
Is used to specify callback methods for the corresponding lifecycle event.

**PreRemove** - Annotation Type in *javax.persistence*
Is used to specify callback methods for the corresponding lifecycle event.

**PreUpdate** - Annotation Type in *javax.persistence*
Is used to specify callback methods for the corresponding lifecycle event.

**PrimaryKeyJoinColumn** - Annotation Type in *javax.persistence*
This annotation specifies a primary key column that is used as a foreign key to join to another table.

**PrimaryKeyJoinColumn** - Annotation Type in *javax.persistence*
This annotation groups `PrimaryKeyJoinColumn` annotations.

**print(boolean)** - Method in class *javax.servlet.jsp.JspWriter*
Print a boolean value.

**print(char)** - Method in class *javax.servlet.jsp.JspWriter*
Print a character.

**print(int)** - Method in class *javax.servlet.jsp.JspWriter*
Print an integer.

**print(long)** - Method in class *javax.servlet.jsp.JspWriter*
Print a long integer.

**print(float)** - Method in class *javax.servlet.jsp.JspWriter*
Print a floating-point number.

**print(double)** - Method in class *javax.servlet.jsp.JspWriter*
Print a double-precision floating-point number.

**print(char[])** - Method in class *javax.servlet.jsp.JspWriter*
Print an array of characters.

**print(String)** - Method in class *javax.servlet.jsp.JspWriter*
Print a string.

**print(Object)** - Method in class *javax.servlet.jsp.JspWriter*
Print an object.

**print(String)** - Method in class *javax.servlet.ServletOutputStream*
Writes a String to the client, without a carriage return-line feed (CRLF) character at the end.

**print(boolean)** - Method in class *javax.servlet.ServletOutputStream*
Writes a boolean value to the client, with no carriage return-line feed (CRLF) character at the end.

**print(char)** - Method in class *javax.servlet.ServletOutputStream*
Writes a character to the client, with no carriage return-line feed (CRLF) at the end.

**print(int)** - Method in class *javax.servlet.ServletOutputStream*
Writes an int to the client, with no carriage return-line feed (CRLF) at the end.

**print(long)** - Method in class *javax.servlet.ServletOutputStream*
Writes a long value to the client, with no carriage return-line feed (CRLF) at the end.

**print(float)** - Method in class `javax.servlet.ServletOutputStream`
Writes a float value to the client, with no carriage return-line feed (CRLF) at the end.

**print(double)** - Method in class `javax.servlet.ServletOutputStream`
Writes a double value to the client, with no carriage return-line feed (CRLF) at the end.

**printAnySimpleType(String)** - Static method in class `javax.xml.bind.DatatypeConverter`
Converts a string value into a string.

**printAnySimpleType(String)** - Method in interface `javax.xml.bind.DatatypeConverterInterface`
Converts a string value into a string.

**printBase64Binary(byte[])** - Static method in class `javax.xml.bind.DatatypeConverter`
Converts an array of bytes into a string.

**printBase64Binary(byte[])** - Method in interface `javax.xml.bind.DatatypeConverterInterface`
Converts an array of bytes into a string.

**printBoolean(boolean)** - Static method in class `javax.xml.bind.DatatypeConverter`
Converts a boolean value into a string.

**printBoolean(boolean)** - Method in interface `javax.xml.bind.DatatypeConverterInterface`
Converts a boolean value into a string.

**printByte(byte)** - Static method in class `javax.xml.bind.DatatypeConverter`
Converts a byte value into a string.

**printByte(byte)** - Method in interface `javax.xml.bind.DatatypeConverterInterface`
Converts a byte value into a string.

**PrintConversionEvent** - Interface in `javax.xml.bind`
This event indicates that a problem was encountered while converting data from the Java content tree into its lexical representation.

**PrintConversionEventImpl** - Class in `javax.xml.bind.helpers`
Default implementation of the PrintConversionEvent interface.

**PrintConversionEventImpl(int, String, ValidationEventLocator)** - Constructor for class `javax.xml.bind.helpers.PrintConversionEventImpl`
Create a new PrintConversionEventImpl.

**PrintConversionEventImpl(int, String, ValidationEventLocator, Throwable)** - Constructor for class `javax.xml.bind.helpers.PrintConversionEventImpl`
Create a new PrintConversionEventImpl.

**printDate(Calendar)** - Static method in class `javax.xml.bind.DatatypeConverter`
Converts a Calendar value into a string.

**printDate(Calendar)** - Method in interface
javax.xml.bind.**DatatypeConverter**
Converts a Calendar value into a string.

**printDateTime(Calendar)** - Static method in class
javax.xml.bind.**DatatypeConverter**
Converts a Calendar value into a string.

**printDateTime(Calendar)** - Method in interface
javax.xml.bind.**DatatypeConverterInterface**
Converts a Calendar value into a string.

**printDecimal(BigDecimal)** - Static method in class
javax.xml.bind.**DatatypeConverter**
Converts a BigDecimal value into a string.

**printDecimal(BigDecimal)** - Method in interface
javax.xml.bind.**DatatypeConverterInterface**
Converts a BigDecimal value into a string.

**printDouble(double)** - Static method in class
javax.xml.bind.**DatatypeConverter**
Converts a double value into a string.

**printDouble(double)** - Method in interface
javax.xml.bind.**DatatypeConverterInterface**
Converts a double value into a string.

**printFloat(float)** - Static method in class
javax.xml.bind.**DatatypeConverter**
Converts a float value into a string.

**printFloat(float)** - Method in interface
javax.xml.bind.**DatatypeConverterInterface**
Converts a float value into a string.

**printHexBinary(byte[])** - Static method in class
javax.xml.bind.**DatatypeConverter**
Converts an array of bytes into a string.

**printHexBinary(byte[])** - Method in interface
javax.xml.bind.**DatatypeConverterInterface**
Converts an array of bytes into a string.

**printInt(int)** - Static method in class
javax.xml.bind.**DatatypeConverter**
Converts an int value into a string.

**printInt(int)** - Method in interface
javax.xml.bind.**DatatypeConverterInterface**
Converts an int value into a string.

**printInteger(BigInteger)** - Static method in class
javax.xml.bind.**DatatypeConverter**
Converts a BigInteger value into a string.

**printInteger(BigInteger)** - Method in interface
javax.xml.bind.**DatatypeConverterInterface**
Converts a BigInteger value into a string.

**println()** - Method in class javax.servlet.jsp.**JspWriter**
Terminate the current line by writing the line separator string.

**println(boolean)** - Method in class javax.servlet.jsp.**JspWriter**
Print a boolean value and then terminate the line.

**println(char)** - Method in class javax.servlet.jsp.**JspWriter**
Print a character and then terminate the line.

**println(int)** - Method in class **javax.servlet.jsp.JspWriter**
Print an integer and then terminate the line.

**println(long)** - Method in class **javax.servlet.jsp.JspWriter**
Print a long integer and then terminate the line.

**println(float)** - Method in class **javax.servlet.jsp.JspWriter**
Print a floating-point number and then terminate the line.

**println(double)** - Method in class **javax.servlet.jsp.JspWriter**
Print a double-precision floating-point number and then terminate the line.

**println(char[])** - Method in class **javax.servlet.jsp.JspWriter**
Print an array of characters and then terminate the line.

**println(String)** - Method in class **javax.servlet.jsp.JspWriter**
Print a String and then terminate the line.

**println(Object)** - Method in class **javax.servlet.jsp.JspWriter**
Print an Object and then terminate the line.

**println()** - Method in class **javax.servlet.ServletOutputStream**
Writes a carriage return-line feed (CRLF) to the client.

**println(String)** - Method in class **javax.servlet.ServletOutputStream**
Writes a String to the client, followed by a carriage return-line feed (CRLF).

**println(boolean)** - Method in class **javax.servlet.ServletOutputStream**
Writes a boolean value to the client, followed by a carriage return-line feed (CRLF).

**println(char)** - Method in class **javax.servlet.ServletOutputStream**
Writes a character to the client, followed by a carriage return-line feed (CRLF).

**println(int)** - Method in class **javax.servlet.ServletOutputStream**
Writes an int to the client, followed by a carriage return-line feed (CRLF).

**println(long)** - Method in class **javax.servlet.ServletOutputStream**
Writes a long value to the client, followed by a carriage return-line feed (CRLF).

**println(float)** - Method in class **javax.servlet.ServletOutputStream**
Writes a float value to the client, followed by a carriage return-line feed (CRLF).

**println(double)** - Method in class **javax.servlet.ServletOutputStream**
Writes a double value to the client, followed by a carriage return-line feed (CRLF).

**printLong(long)** - Static method in class **javax.xml.bind.DatatypeConverter**
Converts a long value into a string.

**printLong(long)** - Method in interface **javax.xml.bind.DatatypeConverterInterface**
Converts a long value into a string.

**printQName(QName, NamespaceContext)** - Static method in class **javax.xml.bind.DatatypeConverter**
Converts a QName instance into a string.

**printQName(QName, NamespaceContext)** - Method in interface
javax.xml.bind.**DatatypeConverterInterface**

Converts a QName instance into a string.

**printShort(short)** - Static method in class

javax.xml.bind.**DatatypeConverter**

Converts a short value into a string.

**printShort(short)** - Method in interface

javax.xml.bind.**DatatypeConverterInterface**

Converts a short value into a string.

**printStackTrace(PrintStream)** - Method in exception

javax.ejb.**EJBException**

Prints the composite message and the embedded stack trace to the specified stream ps.

**printStackTrace()** - Method in exception javax.ejb.**EJBException**

Prints the composite message to System.err.

**printStackTrace(PrintWriter)** - Method in exception

javax.ejb.**EJBException**

Prints the composite message and the embedded stack trace to the specified print writer pw.

**printStackTrace(PrintStream)** - Method in exception

javax.xml.bind.**JAXBException**

Prints this JAXBException and its stack trace (including the stack trace of the linkedException if it is non-null) to the PrintStream.

**printStackTrace()** - Method in exception

javax.xml.bind.**JAXBException**

Prints this JAXBException and its stack trace (including the stack trace of the linkedException if it is non-null) to System.err.

**printStackTrace(PrintWriter)** - Method in exception

javax.xml.bind.**JAXBException**

Prints this JAXBException and its stack trace (including the stack trace of the linkedException if it is non-null) to the PrintWriter.

**printStackTrace(PrintStream)** - Method in exception

javax.xml.bind.**TypeConstraintException**

Prints this TypeConstraintException and its stack trace (including the stack trace of the linkedException if it is non-null) to the PrintStream.

**printStackTrace()** - Method in exception

javax.xml.bind.**TypeConstraintException**

Prints this TypeConstraintException and its stack trace (including the stack trace of the linkedException if it is non-null) to System.err.

**printString(String)** - Static method in class

javax.xml.bind.**DatatypeConverter**

Converts the string argument into a string.

**printString(String)** - Method in interface

javax.xml.bind.**DatatypeConverterInterface**

Converts the string argument into a string.

**printTime(Calendar)** - Static method in class
javax.xml.bind.**DatatypeConverter**  
Converts a Calendar value into a string.

**printTime(Calendar)** - Method in interface

javax.xml.bind.**DatatypeConverterInterface**  
Converts a Calendar value into a string.

**printUnsignedInt(long)** - Static method in class

javax.xml.bind.**DatatypeConverter**  
Converts a long value into a string.

**printUnsignedInt(long)** - Method in interface

javax.xml.bind.**DatatypeConverterInterface**  
Converts a long value into a string.

**printUnsignedShort(int)** - Static method in class

javax.xml.bind.**DatatypeConverter**  
Converts an int value into a string.

**printUnsignedShort(int)** - Method in interface

javax.xml.bind.**DatatypeConverterInterface**  
Converts an int value into a string.

**proceed()** - Method in interface **javax.interceptor.InvocationContext**  
Proceed to the next entry in the interceptor chain.

**PROCESS_VALIDATIONS** - Static variable in class

javax.faces.event.**PhaseId**  
Identifier that indicates an interest in events queued for the **Process Validations** phase of the request processing lifecycle.

**processAction(ActionEvent)** - Method in interface

javax.faces.event.**ActionListener**  
Invoked when the action described by the specified **ActionEvent** occurs.

**processAction(ActionEvent)** - Method in class

javax.faces.event.**MethodExpressionActionListener**

**processApplication(FacesContext)** - Method in class

javax.faces.component.**UIViewRoot**  
Broadcast any events that have been queued for the **Invoke Application** phase of the request processing lifecycle and to clear out any events for later phases if the event processing for this phase caused **FacesContext.renderResponse()** or **FacesContext.responseComplete()** to be called.

**processDecodes(FacesContext)** - Method in class

javax.faces.component.**UIComponent**  
Perform the component tree processing required by the **Apply Request Values** phase of the request processing lifecycle for all facets of this component, all children of this component, and this component itself, as follows.

**processDecodes(FacesContext)** - Method in class

javax.faces.component.**UIData**  
Override the default **UIComponentBase.processDecodes(javax.faces.context.FacesContext)**
processing to perform the following steps.

**processDecodes(FacesContext)** - Method in class javax.faces.component.UIForm

Override

**UIComponent.processDecodes(javax.faces.context.FacesContext)** to ensure that the form is decoded **before** its children.

**processDecodes(FacesContext)** - Method in class javax.faces.component.UIInput

Specialized decode behavior on top of that provided by the superclass.

**processDecodes(FacesContext)** - Method in class javax.faces.component.UIViewRoot

Override the default

**UIComponentBase.processDecodes(javax.faces.context.FacesContext)** behavior to broadcast any queued events after the default processing has been completed and to clear out any events for later phases if the event processing for this phase caused **FacesContext.renderResponse()** or **FacesContext.responseComplete()** to be called.

**PROCESSING_INSTRUCTION** - Static variable in interface javax.xml.stream.XMLStreamConstants

Indicates an event is a processing instruction

**ProcessingInstruction** - Interface in javax.xml.stream.events

An interface that describes the data found in processing instructions

**processListener(FacesListener)** - Method in class javax.faces.event.ActionEvent

Broadcast this **FacesEvent** to the specified **FacesListener**, by whatever mechanism is appropriate.

**processListener(FacesListener)** - Method in class javax.faces.event.FacesEvent

Broadcast this **FacesEvent** to the specified **FacesListener**, by whatever mechanism is appropriate.

**processListener(FacesListener)** - Method in class javax.faces.event.ValueChangeEvent

Perform the component tree processing required by the **Restore View** phase of the request processing lifecycle for all facets of this component, all children of this component, and this component itself, as follows.

**processRestoreState(FacesContext, Object)** - Method in class javax.faces.component.UIComponent

Perform the component tree processing required by the **Restore View** phase of the request processing lifecycle for all facets of this component, all children of this component, and this component itself, as follows.

**processRestoreState(FacesContext, Object)** - Method in class javax.faces.component.UIComponentBase

**processSaveState(FacesContext)** - Method in class javax.faces.component.UIComponent

Perform the component tree processing required by the state saving portion of the **Render Response** phase of the request processing lifecycle for all facets of this component, all children of this component, and this component itself, as
follows.

**processSaveState(FacesContext)** - Method in class
javax.faces.component.UIComponentBase

**processUpdates(FacesContext)** - Method in class
javax.faces.component.UIComponent

Perform the component tree processing required by the Update Model Values phase of the request processing lifecycle for all facets of this component, all children of this component, and this component itself, as follows.

**processUpdates(FacesContext)** - Method in class
javax.faces.component.UIComponentBase

Override the default UIComponentBase.processUpdates(javax.faces.context.FacesContext) processing to perform the following steps.

**processUpdates(FacesContext)** - Method in class
javax.faces.component.UIData

Override the default UIComponentBase.processUpdates(javax.faces.context.FacesContext) processing to perform the following steps.

**processUpdates(FacesContext)** - Method in class
javax.faces.component.UIForm

Override UIComponent.processUpdates(javax.faces.context.FacesContext) to ensure that the children of this UIForm instance are only processed if UIForm.isSubmitted() returns true.

**processUpdates(FacesContext)** - Method in class
javax.faces.component.UIInput

In addition to the standard processUpdates behavior inherited from UIComponentBase, calls updateModel().

**processUpdates(FacesContext)** - Method in class
javax.faces.component.UIViewRoot

Override the default UIComponentBase behavior to broadcast any queued events after the default processing has been completed and to clear out any events for later phases if the event processing for this phase caused FacesContext.renderResponse() or FacesContext.responseComplete() to be called.

**processValidators(FacesContext)** - Method in class
javax.faces.component.UIComponent

Perform the component tree processing required by the Process Validations phase of the request processing lifecycle for all facets of this component, all children of this component, and this component itself, as follows.

**processValidators(FacesContext)** - Method in class
javax.faces.component.UIComponentBase

**processValidators(FacesContext)** - Method in class
javax.faces.component.UIData

Override the default UIComponentBase.processValidators(javax.faces.context.FacesContext) processing to perform the following steps.

**processValidators(FacesContext)** - Method in class
javax.faces.component.UIForm
Override
UIComponent.processValidators(javax.faces.context.FacesContext)
to ensure that the children of this UIForm instance are only_processed if UIForm.isSubmitted() returns true.

processValidators(FacesContext) - Method in class
domains.component.UIInput
In addition to the standard processValidators behavior
inherited from UIComponentBase, calls validate() if the
immediate property is false (which is the default); if the
component is invalid afterwards, calls
FacesContext.renderResponse().

processValidators(FacesContext) - Method in class
domains.component.UIViewRoot
Override the default
UIComponentBase.processValidators(javax.faces.context.FacesCon
text) behavior to broadcast any queued events after the default
processing has been completed and to clear out any events for
later phases if the event processing for this phase caused
FacesContext.renderResponse() or
FacesContext.responseComplete() to be called.

processValueChange(ValueChangeEvent) - Method in class
domains.event.MethodExpressionValueChangeListener
Invoked when the value change described by the specified
ValueChangeEvent occurs.

ProgressEvent - Class in javax.enterprise.deploy.spi.status
An event which indicates that a deployment status change has
occurred.

ProgressEvent(Object, TargetModuleID, DeploymentStatus) - Constructor for class
domains.enterprise.deploy.spi.status.ProgressEvent
Creates a new object representing a deployment progress event.

ProgressListener - Interface in javax.enterprise.deploy.spi.status
The listener interface for receiving deployment progress
events.

ProgressObject - Interface in javax.enterprise.deploy.spi.status
The ProgressObject interface tracks and reports the progress of
the deployment activities, distribute, start, stop, undeploy.

PropertyException - Exception in javax.xml.bind
This exception indicates that an error was encountered while
getting or setting a property.

PropertyException(String) - Constructor for exception
domains.xml.bind.PropertyException
Construct a PropertyException with the specified detail
message.

PropertyException(String, String) - Constructor for exception
domains.xml.bind.PropertyException
Construct a PropertyException with the specified detail message and vendor specific errorCode.

**PropertyException( Throwable )** - Constructor for exception
javax.xml.bind.PropertyException

Construct a PropertyException with a linkedException.

**PropertyException( String, Throwable )** - Constructor for exception
javax.xml.bind.PropertyException

Construct a PropertyException with the specified detail message, vendor specific errorCode, and linkedException.

**PropertyException( String, String, Throwable )** - Constructor for exception
javax.xml.bind.PropertyException

Construct a PropertyException whose message field is set based on the name of the property and value.toString().

**propertyExists( String )** - Method in interface javax.jms.Message
Indicates whether a property value exists.

**PropertyNotFoundException** - Exception in javax.el
Thrown when a property could not be found while evaluating a ValueExpression or MethodExpression.

**PropertyNotFoundException()** - Constructor for exception
javax.el.PropertyNotFoundException

Creates a PropertyNotFoundException with no detail message.

**PropertyNotFoundException( String )** - Constructor for exception
javax.el.PropertyNotFoundException

Creates a PropertyNotFoundException with the provided detail message.

**PropertyNotFoundException( Throwable )** - Constructor for exception
javax.el.PropertyNotFoundException

Creates a PropertyNotFoundException with the given root cause.

**PropertyNotFoundException( String, Throwable )** - Constructor for exception
javax.el.PropertyNotFoundException

Creates a PropertyNotFoundException with the given detail message and root cause.

**PropertyNotFoundException** - Exception in javax.faces.el

*Deprecated.* This has been replaced by PropertyNotFoundException.

**PropertyNotFoundException()** - Constructor for exception
javax.faces.el.PropertyNotFoundException

*Deprecated.* Construct a new exception with no detail message or root cause.

**PropertyNotFoundException( String )** - Constructor for exception
javax.faces.el.PropertyNotFoundException

*Deprecated.* Construct a new exception with the specified detail message and no root cause.

**PropertyNotFoundException( Throwable )** - Constructor for exception
javax.faces.el.PropertyNotFoundException

*Deprecated.* Construct a new exception with the specified root cause.
cause.

**PropertyNotFoundException(String, Throwable)** - Constructor for exception `javax.faces.el.PropertyNotFoundException`  
*Deprecated.* Construct a new exception with the specified detail message and root cause.

**PropertyNotFoundException** - Exception in `javax.el`  
Thrown when a property could not be written to while setting the value on a `ValueExpression`.

**PropertyNotFoundException()** - Constructor for exception `javax.el.PropertyNotFoundException`  
Creates a `PropertyNotFoundException` with no detail message.

**PropertyNotFoundException(String)** - Constructor for exception `javax.el.PropertyNotFoundException`  
Creates a `PropertyNotFoundException` with the provided detail message.

**PropertyNotFoundException(Throwables)** - Constructor for exception `javax.el.PropertyNotFoundException`  
Creates a `PropertyNotFoundException` with the given root cause.

**PropertyNotFoundException(String, Throwable)** - Constructor for exception `javax.el.PropertyNotFoundException`  
Creates a `PropertyNotFoundException` with the given detail message and root cause.

**PropertyResolver** - Class in `javax.faces.el`  
*Deprecated.* This has been replaced by `ELResolver`.

**PropertyResolver()** - Constructor for class `javax.faces.el.PropertyResolver`  
*Deprecated.*

**protocolConnect(String, int, String, String)** - Method in class `javax.mail.Service`  
The service implementation should override this method to perform the actual protocol-specific connection attempt.

**ProtocolException** - Exception in `javax.xml.ws`  
The `ProtocolException` class is a base class for exceptions related to a specific protocol binding.

**ProtocolException()** - Constructor for exception `javax.xml.ws.ProtocolException`  
Constructs a new protocol exception with null as its detail message.

**ProtocolException(String)** - Constructor for exception `javax.xml.ws.ProtocolException`  
Constructs a new protocol exception with the specified detail message.

**ProtocolException(String, Throwable)** - Constructor for exception `javax.xml.ws.ProtocolException`  
Constructs a new runtime exception with the specified detail message and cause.

**ProtocolException(Throwables)** - Constructor for exception `javax.xml.ws.ProtocolException`  
Constructs a new runtime exception with the specified cause and
The Provider is a class that describes a protocol implementation.

Provider(Provider.Type, String, String, String, String) - Constructor for class javax.mail.Provider
Create a new provider of the specified type for the specified protocol.

Provider< T > - Interface in javax.xml.ws
Service endpoints may implement the Provider interface as a dynamic alternative to an SEI.

Provider - Class in javax.xml.ws.spi
Service provider for ServiceDelegate and Endpoint objects.

Provider() - Constructor for class javax.xml.ws.spi.Provider
Creates a new instance of Provider

provider() - Static method in class javax.xml.ws.spi.Provider
Creates a new provider object.

Provider.Type - Class in javax.mail
This inner class defines the Provider type.

providers - Static variable in class javax.persistence.Persistence

publish(Message) - Method in interface javax.jms.TopicPublisher
Publishes a message to the topic.
publish(Message, int, int, long) - Method in interface javax.jms.TopicPublisher
Publishes a message to the topic, specifying delivery mode, priority, and time to live.
publish(Topic, Message) - Method in interface javax.jms.TopicPublisher
Publishes a message to a topic for an unidentified message producer.
publish(Topic, Message, int, int, long) - Method in interface javax.jms.TopicPublisher
Publishes a message to a topic for an unidentified message producer, specifying delivery mode, priority and time to live.
publish(String) - Method in class javax.xml.ws.Endpoint
Publishes this endpoint at the given address.
publish(String, Object) - Static method in class javax.xml.ws.Endpoint
Creates and publishes an endpoint for the specified implementor object at the given address.
publish(Object) - Method in class javax.xml.ws.Endpoint
Publishes this endpoint at the provided server context.
pushBody(Writer) - Method in class javax.servlet.jsp.JspContext
Return a new JspWriter object that sends output to the provided Writer.
pushBody() - Method in class javax.servlet.jsp.PageContext
Return a new BodyContent object, save the current "out" JspWriter, and update the value of the "out" attribute in the page scope attribute namespace of the PageContext.
**putContext(Class, Object)** - Method in class javax.el.ELContext
Associates a context object with this ELContext.

**putResource(Object, Object)** - Method in interface javax.transaction.TransactionSynchronizationRegistry
Add or replace an object in the Map of resources being managed for the transaction bound to the current thread at the time this method is called.

**putValue(String, Object)** - Method in interface javax.servlet.http.HttpSession
**Deprecated. As of Version 2.2, this method is replaced by HttpSession.setAttribute(java.lang.String, java.lang.Object)**
QNAMeHolder - Class in javax.xml.rpc.holders

QNAMeHolder() - Constructor for class javax.xml.rpc.holders.QNameHolder

QNAMeHolder(QName) - Constructor for class javax.xml.rpc.holders.QNameHolder

Query - Interface in javax.persistence
  Interface used to control query execution.

Query - Interface in javax.xml.registry
  The Query interface encapsulates a query in a declarative query language.

QUERY_STRING - Static variable in interface javax.xml.ws.handler.MessageContext
  Standard property: Query string for request.

QUERY_TYPE_EBXML_FILTER_QUERY - Static variable in interface javax.xml.registry.Query
  An OASIS ebXML Registry XML Filter Query type.

QUERY_TYPE_SQL - Static variable in interface javax.xml.registry.Query
  An SQL query type.

QUERY_TYPE_XQUERY - Static variable in interface javax.xml.registry.Query
  A W3C XQuery type.

QueryHint - Annotation Type in javax.persistence
  An implementation-specific Query hint.

QueryManager - Interface in javax.xml.registry
  This is the common base interface for all QueryManagers in the API.

queryNames(ObjectName, QueryExp) - Method in interface javax.management.j2ee.Management
  Gets the names of managed objects controlled by the MEJB.

queue() - Method in class javax.faces.event.FacesEvent
  Convenience method to queue this event for broadcast at the end of the current request processing lifecycle phase.

Queue - Interface in javax.jms
  A Queue object encapsulates a provider-specific queue name.

QueueBrowser - Interface in javax.jms
  A client uses a QueueBrowser object to look at messages on a queue without removing them.

QueueConnection - Interface in javax.jms
  A QueueConnection object is an active connection to a point-to-point JMS provider.

QueueConnectionFactory - Interface in javax.jms
  A client uses a QueueConnectionFactory object to create
QueueConnection objects with a point-to-point JMS provider.

queueEvent(FacesEvent) - Method in class javax.faces.component.UICommand
Intercept queueEvent and, for ActionEvents, mark the phaseId for the event to be PhaseId.APPLY_REQUEST_VALUES if the immediate flag is true, PhaseId.INVOKE_APPLICATION otherwise.

queueEvent(FacesEvent) - Method in class javax.faces.component.UIComponent
Queue an event for broadcast at the end of the current request processing lifecycle phase.

queueEvent(FacesEvent) - Method in class javax.faces.component.UIComponentBase

queueEvent(FacesEvent) - Method in class javax.faces.component.UIData
Override the default UICOMPONENTBase.queueEvent(javax.faces.event.FacesEvent) processing to wrap any queued events in a wrapper so that we can reset the current row index in broadcast().

queueEvent(FacesEvent) - Method in class javax.faces.componentUIViewRoot
Override the default UICOMPONENTBase.queueEvent(javax.faces.event.FacesEvent) behavior to accumulate the queued events for later broadcasting.

queueEvent(MailEvent, Vector) - Method in class javax.mail.Service
Add the event and vector of listeners to the queue to be delivered.

QueueReceiver - Interface in javax.jms
A client uses a QueueReceiver object to receive messages that have been delivered to a queue.

QueueRequestor - Class in javax.jms
The QueueRequestor helper class simplifies making service requests.

QueueRequestor(QueueSession, Queue) - Constructor for class javax.jms.QueueRequestor
Constructor for the QueueRequestor class.

QueueSender - Interface in javax.jms
A client uses a QueueSender object to send messages to a queue.

QueueSession - Interface in javax.jms
A QueueSession object provides methods for creating QueueReceiver, QueueSender, QueueBrowser, and TemporaryQueue objects.

Quota - Class in javax.mail
This class represents a set of quotas for a given quota root.

Quota(String) - Constructor for class javax.mail.Quota
Create a Quota object for the named quotaroot with no associated resources.

Quota_Resource - Class in javax.mail
An individual resource in a quota root.
**Quota.Resource(String, long, long)** - Constructor for class `javax.mail.Quota.Resource`
   Construct a Resource object with the given name, usage, and limit.

**QuotaAwareStore** - Interface in `javax.mail`
   An interface implemented by Stores that support quotas.

**quotaRoot** - Variable in class `javax.mail.Quota`
   The name of the quota root.

**quote(String, String)** - Static method in class `javax.mail.internet.MimeUtility`
   A utility method to quote a word, if the word contains any characters from the specified 'specials' list.

**QUOTEDSTRING** - Static variable in class `javax.mail.internet.HeaderTokenizer.Token`
   Token type indicating a quoted string.
**RangeStatistic** - Interface in javax.management.j2ee.statistics
   Specifies standard measurements of the lowest and highest values an attribute has held as well as its current value.

**RAR** - Static variable in class javax.enterprise.deploy.shared.ModuleType
   The module is an Connector archive.

**read()** - Method in class javax.mail.util.SharedFileInputStream
   See the general contract of the read method of InputStream.

**read(byte[], int, int)** - Method in class javax.mail.util.SharedFileInputStream
   Reads bytes from this stream into the specified byte array, starting at the given offset.

**read(InputStream)** - Method in interface javax.resource.cci.Streamable
   Read data from an InputStream and initialize fields of a Streamable object.

**READ ONLY** - Static variable in class javax.mail.Folder
   The Folder is read only.

**READ_WRITE** - Static variable in class javax.mail.Folder
   The state and contents of this folder can be modified.

**readBoolean()** - Method in interface javax.jms.BytesMessage
   Reads a boolean from the bytes message stream.

**readBoolean()** - Method in interface javax.jms.StreamMessage
   Reads a boolean from the stream message.

**readByte()** - Method in interface javax.jms.BytesMessage
   Reads a signed 8-bit value from the bytes message stream.

**readByte()** - Method in interface javax.jms.StreamMessage
   Reads a byte value from the stream message.

**readBytes(byte[])** - Method in interface javax.jms.BytesMessage
   Reads a byte array from the bytes message stream.

**readBytes(byte[], int)** - Method in interface javax.jms.BytesMessage
   Reads a portion of the bytes message stream.

**readBytes(byte[])** - Method in interface javax.jms.StreamMessage
   Reads a byte array field from the stream message into the specified byte[] object (the read buffer).

**readChar()** - Method in interface javax.jms.BytesMessage
   Reads a Unicode character value from the bytes message stream.

**readChar()** - Method in interface javax.jms.StreamMessage
   Reads a Unicode character value from the stream message.

**readDouble()** - Method in interface javax.jms.BytesMessage
   Reads a double from the bytes message stream.

**readDouble()** - Method in interface javax.jms.StreamMessage
   Reads a double from the stream message.

**readEJBHome(ObjectInputStream)** - Method in interface javax.ejb.spi.HandleDelegate
   Deserializes the EJBHome reference corresponding to a
**readEJBObject(ObjectInputStream)** - Method in interface `
javax.ejb.spi.HandleDelegate`

Deserialize the EJBObject reference corresponding to a Handle.

**readExternal(ObjectInput)** - Method in class `
javax.activation.MimeType`

The object implements the readExternal method to restore its contents by calling the methods of DataInput for primitive types and readObject for objects, strings and arrays.

**readFloat()** - Method in interface `
javax.jms.BytesMessage`

Reads a float from the bytes message stream.

**readFloat()** - Method in interface `
javax.jms.StreamMessage`

Reads a float from the stream message.

**readInt()** - Method in interface `
javax.jms.BytesMessage`

Reads a signed 32-bit integer from the bytes message stream.

**readInt()** - Method in interface `
javax.jms.StreamMessage`

Reads a 32-bit integer from the stream message.

**readLine(byte[], int, int)** - Method in class `
javax.servlet.ServletInputStream`

Reads the input stream, one line at a time.

**readLong()** - Method in interface `
javax.jms.BytesMessage`

Reads a signed 64-bit integer from the bytes message stream.

**readLong()** - Method in interface `
javax.jms.StreamMessage`

Reads a 64-bit integer from the stream message.

**readObject()** - Method in interface `
javax.jms.StreamMessage`

Reads an object from the stream message.

**ReadOnlyFolderException** - Exception in `
javax.mail`

This exception is thrown when an attempt is made to open a folder read-write access when the folder is marked read-only.

**ReadOnlyFolderException(Folder)** - Constructor for exception `
javax.mail.ReadOnlyFolderException`

Constructs a MessagingException with the specified folder.

**ReadOnlyFolderException(Folder, String)** - Constructor for exception `
javax.mail.ReadOnlyFolderException`

Constructs a MessagingException with the specified folder and the specified detail message.

**readResolve()** - Method in class `
javax.mail.internet.MimeMessage.RecipientType`

When deserializing a RecipientType, we need to make sure to return only one of the known static final instances defined in this class.

**readShort()** - Method in interface `
javax.jms.BytesMessage`

Reads a signed 16-bit number from the bytes message stream.

**readShort()** - Method in interface `
javax.jms.StreamMessage`

Reads a 16-bit integer from the stream message.

**readString()** - Method in interface `
javax.jms.StreamMessage`

Reads a String from the stream message.

**readUnsignedByte()** - Method in interface `
javax.jms.BytesMessage`

Reads an unsigned 8-bit number from the bytes message stream.

**readUnsignedShort()** - Method in interface javax.jms.BytesMessage
Reads an unsigned 16-bit number from the bytes message stream.

**readUTF()** - Method in interface javax.jms.BytesMessage
Reads a string that has been encoded using a modified UTF-8 format from the bytes message stream.

**receive()** - Method in interface javax.jms.MessageConsumer
Receives the next message produced for this message consumer.

**receive(long)** - Method in interface javax.jms.MessageConsumer
Receives the next message that arrives within the specified timeout interval.

**ReceivedDateTerm** - Class in javax.mail.search
This class implements comparisons for the Message Received date.

**ReceivedDateTerm(int, Date)** - Constructor for class javax.mail.search.ReceivedDateTerm
Constructor.

**receiveNoWait()** - Method in interface javax.jms.MessageConsumer
Receives the next message if one is immediately available.

**RECENT** - Static variable in class javax.mail.Flags.Flag
This message is recent.

**RecipientStringTerm** - Class in javax.mail.search
This class implements string comparisons for the Recipient Address headers.

**RecipientStringTerm(Message.RecipientType, String)** - Constructor for class javax.mail.search.RecipientStringTerm
Constructor.

**RecipientTerm** - Class in javax.mail.search
This class implements comparisons for the Recipient Address headers.

**RecipientTerm(Message.RecipientType, Address)** - Constructor for class javax.mail.search.RecipientTerm
Constructor.

**Record** - Interface in javax.resource.cci
The javax.resource.cci.Record interface is the base interface for the representation of an input or output to the execute methods defined on an Interaction.

**RecordFactory** - Interface in javax.resource.cci
The RecordFactory interface is used for creating MappedRecord and IndexedRecord instances.

**recover()** - Method in interface javax.jms.Session
Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

**recover(int)** - Method in interface javax.resource.spi.XATerminator
Obtains a list of prepared transaction branches from a resource manager.

**recover(int)** - Method in interface javax.transaction.xa.XAResource
Obtains a list of prepared transaction branches from a resource manager.

**recycleNode()** - Method in interface javax.xml.soap.Node
Notifies the implementation that this Node object is no longer
being used by the application and that the implementation is free to reuse this object for nodes that may be created later.

**REDEPLOY** - Static variable in class
javax.enterprise.deploy.shared.CommandType

The DeploymentManger action operation being processed is redeploy.

**redeploy(TargetModuleID[], File, File)** - Method in interface
javax.enterprise.deploy.spi.DeploymentManager

(optimal) The redeploy method provides a means for updating currently deployed J2EE applications.

**redeploy(TargetModuleID[], InputStream, InputStream)** - Method in interface
javax.enterprise.deploy.spi.DeploymentManager

(optimal) The redeploy method provides a means for updating currently deployed J2EE applications.

**redirect(String)** - Method in class
javax.faces.context.ExternalContext

Redirect a request to the specified URL, and cause the responseComplete() method to be called on the FacesContext instance for the current request.

**ref** - Variable in exception
javax.mail.internet.AddressException

The string being parsed.

**Referenceable** - Interface in
javax.resource

The Referenceable interface extends the javax.naming.Referenceable interface.

**ReferenceSyntaxException** - Exception in
javax.faces.el

Deprecated. This has been replaced by ELException.

**ReferenceSyntaxException()** - Constructor for exception
javax.faces.el.ReferenceSyntaxException

Deprecated. Construct a new exception with no detail message or root cause.

**ReferenceSyntaxException(String)** - Constructor for exception
javax.faces.el.ReferenceSyntaxException

Deprecated. Construct a new exception with the specified detail message and no root cause.

**ReferenceSyntaxException(Throw abl e)** - Constructor for exception
javax.faces.el.ReferenceSyntaxException

Deprecated. Construct a new exception with the specified root cause.

**ReferenceSyntaxException(String, Throwable)** - Constructor for exception
javax.faces.el.ReferenceSyntaxException

Deprecated. Construct a new exception with the specified detail message and root cause.

**refresh(Object)** - Method in interface
javax.persistence.EntityManager

Refresh the state of the instance from the database, overwriting changes made to the entity, if any.

**register(Class, QName, SerializerFactory, DeserializerFactory)** - Method in interface
javax.xml.rpc.encoding.TypeMapping

Registers SerializerFactory and DeserializerFactory for a specific type mapping between an XML type and Java type.
**register(String, TypeMapping)** - Method in interface `javax.xml.rpc.encoding.TypeMappingRegistry`
Registers a TypeMapping instance with the TypeMappingRegistry.

**registerDefault(TypeMapping)** - Method in interface `javax.xml.rpc.encoding.TypeMappingRegistry`
Registers the TypeMapping instance that is default for all encoding styles supported by the TypeMappingRegistry.

**registerDeploymentFactory(DeploymentFactory)** - Method in class `javax.enterprise.deploy.shared.factories.DeploymentFactoryManager`
Registers a DeploymentFactory so it will be able to handle requests.

**registerHandler(String, PolicyContextHandler, boolean)** - Static method in class `javax.security.jacc.PolicyContext`
Authorization protected method used to register a container specific PolicyContext handler.

**registerInterposedSynchronization(Synchronization)** - Method in interface `javax.transaction.TransactionSynchronizationRegistry`
Register a Synchronization instance with special ordering semantics.

**registerSynchronization(Synchronization)** - Method in interface `javax.transaction.Transaction`
Register a synchronization object for the transaction currently associated with the target object.

**REGISTRY_ENTRY** - Static variable in interface `javax.xml.registry.LifeCycleManager`

**REGISTRY_PACKAGE** - Static variable in interface `javax.xml.registry.LifeCycleManager`

**RegistryEntry** - Interface in `javax.xml.registry.infomodel`
The RegistryEntry interface is a base interface for interfaces in the model that require additional metadata beyond what is provided by the RegistryObject interface.

**RegistryException** - Exception in `javax.xml.registry`
This is the common base class for all Exceptions that are detected on the registry provider side rather than the JAXR client side.

**RegistryException()** - Constructor for exception `javax.xml.registry.RegistryException`
Constructs a JAXRException object with no reason or embedded Throwable.

**RegistryException(String)** - Constructor for exception `javax.xml.registry.RegistryException`
Constructs a JAXRException object with the given String as the reason for the exception being thrown.

**RegistryException(String, Throwable)** - Constructor for exception `javax.xml.registry.RegistryException`
Constructs a JAXRException object with the given String as the reason for the exception being thrown and the given Throwable object as an embedded Throwable.
RegistryException(Throwables) - Constructor for exception

java.xml.registry.RegistryException

Constructs a JAXRException object initialized with the given Throwable object.

RegistryObject - Interface in java.xml.registry.infomodel

The RegistryObject class is an abstract base class used by most classes in the model.

RegistryPackage - Interface in java.xml.registry.infomodel

RegistryPackage instances are RegistryEntries that group logically related RegistryEntries together.

RegistryService - Interface in java.xml.registry

This is the principal interface implemented by a JAXR provider.

release() - Method in interface

javax.enterprise.deploy.spi.DeploymentManager

The release method is the mechanism by which the tool signals to the DeploymentManager that the tool does not need it to continue running connected to the platform.

release() - Method in class javax.faces.context.FacesContext

Release any resources associated with this FacesContext instance.

release() - Method in class javax.faces.webapp.AttributeTag

Deprecated. Release references to any acquired resources.

release() - Method in class javax.faces.webapp.ConverterTag

Deprecated. Release references to any acquired resources.

release() - Method in class javax.faces.webapp.FacetTag

Release any resources allocated by this tag instance.

release() - Method in class

javax.faces.webapp.UIComponentClassicTagBase

Release any resources allocated during the execution of this tag handler.

release() - Method in class javax.faces.webapp.UIComponentELTag

Release any resources allocated during the execution of this tag handler.

release() - Method in class javax.faces.webapp.UIComponentTag

Deprecated. Release any resources allocated during the execution of this tag handler.

release() - Method in class javax.faces.webapp.ValidatorTag

Deprecated. Release references to any acquired resources.

release() - Method in interface

javax.resource.spi.endpoint.MessageEndpoint

This method may be called by the resource adapter to indicate that it no longer needs a proxy endpoint instance.

release() - Method in interface javax.resource.spi.work.Work

The WorkManager might call this method to hint the active Work instance to complete execution as soon as possible.

release() - Method in class javax.servlet.jsp.PageContext

This method shall "reset" the internal state of a PageContext, releasing all internal references, and preparing the PageContext for potential reuse by a later invocation of initialize().
**release()** - Method in class javax.servlet.jsp.tagext.BodyTagSupport
Release state.

**release()** - Method in interface javax.servlet.jsp.tagext.Tag
Called on a Tag handler to release state.

**release()** - Method in class javax.servlet.jsp.tagext.TagAdapter
Must not be called.

**release()** - Method in class javax.servlet.jsp.tagext.TagLibraryValidator
Release any data kept by this instance for validation purposes.

**release()** - Method in class javax.servlet.jsp.tagext.TagSupport
Release state.

**RELEASED** - Static variable in class
javax.enterprise.deploy.shared.StateType
The DeploymentManager is running in disconnected mode.

**releaseFactories()** - Static method in class
javax.faces.FactoryFinder
Release any references to factory instances associated with the class loader for the calling web application.

**releasePageContext(PageContext)** - Method in class
javax.servlet.jsp.JspFactory
called to release a previously allocated PageContext object.

**Remote** - Annotation Type in javax.ejb
Declares the remote business interface(s) for a session bean.

**RemoteHome** - Annotation Type in javax.ejb
Declares the Remote Home or adapted Remote Home interface for a session bean.

**remove(String)** - Method in class
javax.activation.MimeTypeParameterList
Remove any value associated with the given name.

**remove(Handle)** - Method in interface javax.ejb.EJBHome
Remove an EJB object identified by its handle.

**remove(Object)** - Method in interface javax.ejb.EJBHome
Remove an EJB object identified by its primary key.

**remove(Object)** - Method in interface javax.ejb.EJBLocalHome
Remove an EJB object identified by its primary key.

**remove()** - Method in interface javax.ejb.EJBLocalObject
Remove the EJB local object.

**remove()** - Method in interface javax.ejb.EJBObject
Remove the EJB object.

**Remove** - Annotation Type in javax.ejb
Applied to a business method of a stateful session bean class.

**remove(Flags.Flag)** - Method in class javax.mail.Flags
Remove the specified system flag from this Flags object.

**remove(String)** - Method in class javax.mail.Flags
Remove the specified user flag from this Flags object.

**remove(Flags)** - Method in class javax.mail.Flags
Remove all flags in the given Flags object from this Flags object.

**remove(String)** - Method in class javax.mail.internet.ParameterList
Removes the specified parameter from this ParameterList.
**remove(Object)** - Method in interface `javax.persistence.EntityManager`
Remove the entity instance.

**remove()** - Method in class `javax.xml.stream.util.EventReaderDelegate`

Remove an existing `ActionListener` (if any) from the set of listeners interested in being notified when `ActionEvents` occur.

**removeActionListener(ActionListener)** - Method in class `javax.faces.component.UICommand`

**removeAllAttachments()** - Method in class `javax.xml.soap.SOAPMessage`
Removes all AttachmentPart objects that have been added to this SOAPMessage object.

**removeAllFaultSubcodes()** - Method in interface `javax.xml.soap.SOAPFault`
Removes any Subcodes that may be contained by this SOAPFault.

**removeAllHeaders()** - Method in class `javax.xml.soap.MimeHeaders`
Removes all the header entries from this MimeHeaders object.

**removeAllMimeHeaders()** - Method in class `javax.xml.soap.SAPPart`
Removes all the MimeHeader objects for this SOAPEnvelope object.

**removeAllParameters()** - Method in interface `javax.xml.rpc.Call`
Removes all specified parameters from this Call instance.

**removeAssociation(Association)** - Method in interface `javax.xml.registry.infomodel.RegistryObject`
Removes specified Association from this object.

**removeAssociations(Collection)** - Method in interface `javax.xml.registry.infomodel.RegistryObject`
Removes specified Associations from this object.

**removeAttachments(MimeHeaders)** - Method in class `javax.xml.soap.SOAPMessage`
Removes all the AttachmentPart objects that have header entries that match the specified headers.

**removeAttribute(String)** - Method in interface `javax.servlet.http.HttpSession`
Removes the object bound with the specified name from this session.

**removeAttribute(String)** - Method in class `javax.servlet.jsp.JspContext`
Remove the object reference associated with the given name from all scopes.

**removeAttribute(String, int)** - Method in class `javax.servlet.jsp.JspContext`
Remove the object reference associated with the specified name
in the given scope.

**removeAttribute(String)** - Method in interface javax.servlet.ServletContext

Removes the attribute with the given name from the servlet context.

**removeAttribute(String)** - Method in interface javax.servlet.ServletRequest

Removes an attribute from this request.

**removeAttribute(String)** - Method in class javax.servlet.ServletRequestWrapper

The default behavior of this method is to call removeAttribute(String name) on the wrapped request object.

**removeAttribute(Name)** - Method in interface javax.xml.soap.SOAPElement

Removes the attribute with the specified name.

**removeAttribute(QName)** - Method in interface javax.xml.soap.SOAPElement

Removes the attribute with the specified qname.

**removeBodyPart(BodyPart)** - Method in class javax.mail.internet.MimeMultipart

Remove the specified part from the multipart message.

**removeBodyPart(int)** - Method in class javax.mail.internet.MimeMultipart

Remove the part at specified location (starting from 0).

**removeBodyPart(BodyPart)** - Method in class javax.mail.Multipart

Remove the specified part from the multipart message.

**removeBodyPart(int)** - Method in class javax.mail.Multipart

Remove the part at specified location (starting from 0).

**removeClassification(Classification)** - Method in interface javax.xml.registry.infomodel.ClassificationScheme

Removes specified Classification from this object.

**removeClassifications(Collection)** - Method in interface javax.xml.registry.infomodel.ClassificationScheme

Removes a Collection of children Concepts.

**removeChildConcept(Concept)** - Method in interface javax.xml.registry.infomodel.ClassificationScheme

Removes a child Concept.

**removeChildConcept(Concept)** - Method in interface javax.xml.registry.infomodel.Concept

Removes a child Concept.

**removeChildConcepts(Collection)** - Method in interface javax.xml.registry.infomodel.ClassificationScheme

Removes a Collection of children Concepts.

**removeChildConcepts(Collection)** - Method in interface javax.xml.registry.infomodel.Concept

Removes a Collection of children Concepts.

**removeChildOrganization(Organization)** - Method in interface javax.xml.registry.infomodel.Organization

Removes a child Organization.

**removeChildOrganizations(Collection)** - Method in interface javax.xml.registry.infomodel.Organization

Removes a Collection of children Organizations.

**removeClassification(Classification)** - Method in interface javax.xml.registry.infomodel.RegistryObject

Removes specified Classification from this object.

**removeClassifications(Collection)** - Method in interface
javax.xml.registry.infomodel.\texttt{RegistryObject}
Removes specified Classifications from this object.

\texttt{removeConnectionEventListener(ConnectionEventListener)} - Method in interface \texttt{javax.resource.spi.ManagedConnection}
Removes an already registered connection event listener from the ManagedConnection instance.

\texttt{removeConnectionListener(ConnectionListener)} - Method in class \texttt{javax.mail.Folder}
Remove a Connection event listener.

\texttt{removeConnectionListener(ConnectionListener)} - Method in class \texttt{javax.mail.Service}
Remove a Connection event listener.

\texttt{removeContents()} - Method in interface \texttt{javax.xml.soap.SOAPElement}
Detaches all children of this SOAPElement.

\texttt{REMOVED} - Static variable in class \texttt{javax.mail.event.MessageCountEvent}
The messages were removed from their folder

\texttt{removed} - Variable in class \texttt{javax.mail.event.MessageCountEvent}
If true, this event is the result of an explicit expunge by this client, and the messages in this folder have been renumbered to account for this.

\texttt{removeDataModelListener(DataModelListener)} - Method in class \texttt{javax.faces.model.DataModel}
Remove an existing \texttt{DataModelListener} from the set interested in notifications from this \texttt{DataModel}.

\texttt{removeDConfigBean(DConfigBean)} - Method in interface \texttt{javax.enterprise.deploy.spi.DConfigBean}
Remove a child DConfigBean from this bean.

\texttt{removeDConfigBean(DConfigBeanRoot)} - Method in interface \texttt{javax.enterprise.deploy.spi.DeploymentConfiguration}
Remove the root DConfigBean and all its children.

\texttt{removeDeserializer(Class, QName)} - Method in interface \texttt{javax.xml.rpc.encoding.TypeMapping}
Removes the DeserializerFactory registered for the specified pair of Java type and XML data type.

\texttt{removeELContextListener(ELContextListener)} - Method in class \texttt{javax.faces.application.Application}
Remove the argument listener from the list of \texttt{ELContextListeners}.

\texttt{RemoveException} - Exception in \texttt{javax.ejb}
The RemoveException exception is thrown at an attempt to remove an EJB object when the enterprise Bean or the container does not allow the EJB object to be removed.

\texttt{RemoveException()} - Constructor for exception \texttt{javax.ejb.RemoveException}
Constructs an RemoveException with no detail message.

\texttt{RemoveException(String)} - Constructor for exception \texttt{javax.ejb.RemoveException}
Constructs an RemoveException with the specified detail message.
removeExcludedPolicy() - Method in interface javax.security.jacc.PolicyConfiguration
    Used to remove any excluded policy statements from this PolicyConfiguration.

removeExternalIdentifier(ExternalIdentifier) - Method in interface javax.xml.registry.infomodel.RegistryObject
    Removes specified ExternalIdentifier as an external identifier from this object.

removeExternalIdentifiers(Collection) - Method in interface javax.xml.registry.infomodel.RegistryObject
    Removes specified ExternalIdentifiers as an external identifiers from this object.

removeExternallLink(ExternallLink) - Method in interface javax.xml.registry.infomodel.RegistryObject
    Removes specified ExternallLink from this object.

removeExtermallLinks(Collection) - Method in interface javax.xml.registry.infomodel.RegistryObject
    Removes specified ExternallLinks from this object.

removeFacesListener(FacesListener) - Method in class javax.faces.component.UIComponent
    Remove the specified FacesListener from the set of listeners registered to receive event notifications from this UIComponent.

removeFacesListener(FacesListener) - Method in class javax.faces.component.UIComponentBase
    Remove the specified FacesListener from the set of listeners registered to receive event notifications from this UIComponent.

removeFolderListener(FolderListener) - Method in class javax.mail.Store
    Remove a listener for Folder events.

removeHeader(String) - Method in class javax.mail.internet.InternetHeaders
    Remove all header entries that match the given name

removeHeader(String) - Method in class javax.mail.internet.MimeBodyPart
    Remove all headers with this name.

removeHeader(String) - Method in class javax.mail.internet.MimeMessage
    Remove all headers with this name.

removeHeader(String) - Method in interface javax.mail.Part
    Remove all MimeHeader objects whose name matches the given name.

removeLocalizedString(LocalizedString) - Method in interface javax.xml.registry.infomodel.InternationalString
    Remove the specified LocalizedString from the set of localizations registered to receive event notifications from this InternationalString.
Removes a LocalizedString from this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedStrings(Collection)` - Method in class `javax.mail.Folder`
Remove a MessageChanged listener. `removeMessageChangedListener(MessageChangedListener)` - Method in class `javax.mail.Folder`
Remove a MessageCount listener. `removeMessageCountListener(MessageCountListener)` - Method in class `javax.mail.Folder`
Remove a MessageChanged listener. `removeMessageChangedListener(MessageChangedListener)` - Method in class `javax.mail.Folder`
Remove a MessageCount listener. `removeMessageCountListener(MessageCountListener)` - Method in class `javax.mail.Folder`
Remove a MessageChanged listener. `removeMessageChangedListener(MessageChangedListener)` - Method in class `javax.mail.Folder`
Remove a MessageCount listener. `removeMessageCountListener(MessageCountListener)` - Method in class `javax.mail.Folder`
Remove a MessageChanged listener. `removeMessageChangedListener(MessageChangedListener)` - Method in class `javax.mail.Folder`
Remove a MessageCount listener. `removeMessageCountListener(MessageCountListener)` - Method in class `javax.mail.Folder`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.InternationalString`
Removes specified LocalizedStrings to this object. `removeLocalizedString` - Method in interface `javax.xml.registry.infomodel.Internat
removeRole(String) - Method in interface javax.security.jacc.PolicyConfiguration
    Used to remove a role and all its permissions from this PolicyConfiguration.
removeSerializer(Class, QName) - Method in interface javax.xml.rpc.encoding.TypeMapping
    Removes the SerializerFactory registered for the specified pair of Java type and XML data type.
removeService(Service) - Method in interface javax.xml.registry.infomodel.Organization
    Removes a Service from this object.
removeServiceBinding(ServiceBinding) - Method in interface javax.xml.registry.infomodel.Service
    Removes a child ServiceBinding.
removeServiceBindings(Collection) - Method in interface javax.xml.registry.infomodel.Service
    Removes a Collection of children ServiceBindings.
removeServices(Collection) - Method in interface javax.xml.registry.infomodel.Organization
    Removes a Collection of children Services from this object.
removeSlot(String) - Method in interface javax.xml.registry.infomodel.ExtensibleObject
    Removes a Slot from this object.
removeSlots(Collection) - Method in interface javax.xml.registry.infomodel.ExtensibleObject
    Removes specified Slots from this object.
removeSpecificationLink(SpecificationLink) - Method in interface javax.xml.registry.infomodel.ServiceBinding
    Removes a child SpecificationLink.
removeSpecificationLinks(Collection) - Method in interface javax.xml.registry.infomodel.ServiceBinding
    Removes a Collection of children SpecificationLinks.
removeStoreListener(StoreListener) - Method in class javax.mail.Store
    Remove a listener for Store events.
removeTransportListener(TransportListener) - Method in class javax.mail.Transport
    Remove a listener for Transport events.
removeTypeMapping(TypeMapping) - Method in interface javax.xml.rpc.encoding.TypeMappingRegistry
    Removes a TypeMapping from the TypeMappingRegistry.
removeUncheckedPolicy() - Method in interface javax.security.jacc.PolicyConfiguration
    Used to remove any unchecked policy statements from this PolicyConfiguration.
removeUser(User) - Method in interface javax.xml.registry.infomodel.Organization
    Removes a User.
removeUsers(Collection) - Method in interface javax.xml.registry.infomodel.Organization
Removes a Collection of Users.

**removeValidator(Validator)** - Method in interface `javax.faces.component.EditableValueHolder`
Remove a `Validator` instance from the set associated with this component, if it was previously associated.

**removeValidator(Validator)** - Method in class `javax.faces.component.UIInput`
Remove a `Validator` instance from the set associated with this `UIInput`, if it was previously associated.

**removeValue(String)** - Method in interface `javax.servlet.http.HttpSession`
*Deprecated.* As of Version 2.2, this method is replaced by `HttpSession.removeAttribute(java.lang.String)`
Remove a value associated with a key.

**removeValueChangeListener(ValueChangeListener)** - Method in interface `javax.faces.component.EditableValueHolder`
Remove an existing `ValueChangeListener` (if any) from the set of listeners interested in being notified when `ValueChangeEvent`s occur.

**removeValueChangeListener(ValueChangeListener)** - Method in class `javax.faces.component.UIInput`
Remove an existing `ValueChangeListener` (if any) from the set of listeners interested in being notified when `ValueChangeEvent`s occur.

**removeXpathListener(String, XpathListener)** - Method in interface `javax.enterprise.deploy.model/DDBean`
Unregister a listener for a specific XPath.

**removeXpathListener(ModuleType, String, XpathListener)** - Method in interface `javax.enterprise.deploy.model.J2eeApplicationObject`
Unregister the listener for an XPath.

**RENAMED** - Static variable in class `javax.mail.event.FolderEvent`
The folder was renamed.

**renameTo(Folder)** - Method in class `javax.mail.Folder`
Rename this Folder.

**render(FacesContext)** - Method in class `javax.faces.lifecycle.Lifecycle`
Execute the Render Response phase of the request processing lifecycle, unless the responseComplete() method has been called on the `FacesContext` instance associated with the current request.

**RENDER_KIT_FACTORY** - Static variable in class `javax.faces.FactoryFinder`
The property name for the `RenderKitFactory` class name.

**RENDER_KIT_ID_PARAM** - Static variable in class `javax.faces.render.ResponseStateManager`
The name of the request parameter used by the default implementation of `ViewHandler.calculateRenderKitId(javax.faces.context.FacesContext)`
to derive a RenderKit ID.

**RENDER_RESPONSE** - Static variable in class javax.faces.event.PhaseId

Identifier for the *Render Response* phase of the request processing lifecycle.

**Renderer** - Class in javax.faces.render

A *Renderer* converts the internal representation of *UIComponent* instances into the output stream (or writer) associated with the response we are creating for a particular request.

**Renderer()** - Constructor for class javax.faces.render.Renderer

**RenderKit** - Class in javax.faces.render

*RenderKit* represents a collection of *Renderer* instances that, together, know how to render JavaServer Faces *UIComponent* instances for a specific client.

**RenderKit()** - Constructor for class javax.faces.render.RenderKit

**RenderKitFactory** - Class in javax.faces.render

*RenderKitFactory* is a factory object that registers and returns *RenderKit* instances.

**RenderKitFactory()** - Constructor for class javax.faces.render.RenderKitFactory

**renderResponse()** - Method in class javax.faces.context.FacesContext

Signal the JavaServer faces implementation that, as soon as the current phase of the request processing lifecycle has been completed, control should be passed to the *Render Response* phase, bypassing any phases that have not been executed yet.

**renderView(FacesContext, UIViewRoot)** - Method in class javax.faces.application.ViewHandler

Perform whatever actions are required to render the response view to the response object associated with the current *FacesContext*.

**renderView(FacesContext, UIViewRoot)** - Method in class javax.faces.application.ViewHandlerWrapper

The default behavior of this method is to call ViewHandler.renderView(javax.faces.context.FacesContext, javax.faces.component.UIViewRoot) on the wrapped ViewHandler object.

**reply(boolean)** - Method in class javax.mail.internet.MimeMessage

Get a new Message suitable for a reply to this message.

**reply(boolean)** - Method in class javax.mail.Message

Get a new Message suitable for a reply to this message.

**report(String, String, Object, Location)** - Method in interface javax.xml.stream.XMLReporter

Report the desired message in an application specific format.

**REPORTER** - Static variable in class javax.xml.stream.XMLInputFactory

The property used to set/get the implementation of the XMLReporter interface
**request**/**Message** - Method in class `javax.jms.QueueRequestor`
Sends a request and waits for a reply.

**request**/**Message** - Method in class `javax.jms.TopicRequestor`
Sends a request and waits for a reply.

**REQUEST** - Static variable in class `javax.servlet.jsp.PageContext`
Name used to store ServletRequest in PageContext name table.

**REQUEST SCOPE** - Static variable in class `javax.servlet.jsp.PageContext`
Request scope: the named reference remains available from the ServletRequest associated with the Servlet until the current request is completed.

**REQUEST_TIME_VALUE** - Static variable in class `javax.servlet.jsp.tagext.TagData`
Distinguished value for an attribute to indicate its value is a request-time expression (which is not yet available because TagData instances are used at translation-time).

**requestDestroyed**/**ServletRequestEvent** - Method in interface `javax.servlet.ServletRequestListener`
The request is about to go out of scope of the web application.

**RequestDispatcher** - Interface in `javax.servlet`
Defines an object that receives requests from the client and sends them to any resource (such as a servlet, HTML file, or JSP file) on the server.

**requestInitialized**/**ServletRequestEvent** - Method in interface `javax.servlet.ServletRequestListener`
The request is about to come into scope of the web application.

**requestPasswordAuthentication**/**InetAddress**, **int**, **String**, **String**, **String** - Method in class `javax.mail.Session`
Call back to the application to get the needed user name and password.

**RequestWrapper** - Annotation Type in `javax.xml.ws`
Used to annotate methods in the Service Endpoint Interface with the request wrapper bean to be used at runtime.

**require**/**int**, **String**, **String** - Method in class `javax.xml.stream.utilStreamReaderDelegate`
Test if the current event is of the given type and if the namespace and name match the current namespace and name of the current event.

**REQUIRED_MESSAGE_ID** - Static variable in class `javax.faces.component.UIInput`
The message identifier of the FacesMessage to be created if a required check fails.

**reset()** - Method in interface `javax.jms.BytesMessage`
Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

**reset()** - Method in interface `javax.jms.StreamMessage`
Puts the message body in read-only mode and repositions the
stream to the beginning.

**reset()** - Method in class `javax.mail.util.SharedFileInputStream`
See the general contract of the reset method of InputStream.

**reset()** - Method in interface `javax.servlet.ServletResponse`
Clears any data that exists in the buffer as well as the status code and headers.

**reset()** - Method in class `javax.servlet.ServletResponseWrapper`
The default behavior of this method is to call reset() on the wrapped response object.

**reset()** - Method in class `javax.xml.bind.util.ValidationEventCollector`
Clear all collected errors and warnings.

**resetBuffer()** - Method in interface `javax.servlet.ServletResponse`
Clears the content of the underlying buffer in the response without clearing headers or status code.

**resetBuffer()** - Method in class `javax.servlet.ServletResponseWrapper`
The default behavior of this method is to call resetBuffer() on the wrapped response object.

**resetValue()** - Method in class `javax.faces.component.UIInput`
Convenience method to reset this component’s value to the un-initialized state.

**RESOLVABLE_AT_DESIGN_TIME** - Static variable in class `javax.el.ELResolver`
The attribute name of the named attribute in the FeatureDescriptor that specifies whether the variable or property can be resolved at runtime.

**resolveEntity(String, String, String, String)** - Method in interface `javax.xml.stream.XMLResolver`
Retrieves a resource.

**resolveFunction(String, String)** - Method in class `javax.el.FunctionMapper`
Resolves the specified prefix and local name into a java.lang.Method.

**resolveFunction(String, String)** - Method in interface `javax.servlet.jsp.el.FunctionMapper`
Deprecated. Resolves the specified local name and prefix into a Java.lang.Method.

**RESOLVER** - Static variable in class `javax.xml.stream.XMLInputFactory`
The property used to set/get the implementation of the XMLResolver.

**resolveVariable(String)** - Method in class `javax.el.VariableResolver`
Deprecated. Resolve the specified variable name, and return the corresponding object, if any; otherwise, return null.

**resolveVariable(FacesContext, String)** - Method in class `javax.faces.el.VariableResolver`

**resolveVariable(String)** - Method in interface `javax.servlet.jsp.el.VariableResolver`
**Deprecated.** Resolves the specified variable.

**Resource** - Annotation Type in javax.annotation

The Resource annotation marks a resource that is needed by the application.

**Resource.AuthenticationType** - Enum in javax.annotation

The two possible authentication types for a resource.

**ResourceAdapter** - Interface in javax.resource.spi

This represents a resource adapter instance and contains operations for lifecycle management and message endpoint setup.

**ResourceAdapterAssociation** - Interface in javax.resource.spi

This interface specifies the methods to associate a ResourceAdapter object with other objects that implement this interface like ManagedConnectionFactory and ActivationSpec.

**ResourceAdapterInternalException** - Exception in javax.resource.spi

A ResourceAdapterInternalException indicates any system-level error conditions related to a resource adapter.

**ResourceAdapterInternalException()** - Constructor for exception javax.resource.spi.ResourceAdapterInternalException

Constructs a new instance with null as its detail message.

**ResourceAdapterInternalException(String)** - Constructor for exception javax.resource.spi.ResourceAdapterInternalException

Constructs a new instance with the specified detail message.

**ResourceAdapterInternalException(Throwables)** - Constructor for exception javax.resource.spi.ResourceAdapterInternalException

Constructs a new throwable with the specified cause.

**ResourceAdapterInternalException(String, Throwable)** - Constructor for exception javax.resource.spi.ResourceAdapterInternalException

Constructs a new throwable with the specified detail message and cause.

**ResourceAdapterInternalException(String, String)** - Constructor for exception javax.resource.spi.ResourceAdapterInternalException

Constructs a new throwable with the specified detail message and an error code.

**ResourceAdapterMetaData** - Interface in javax.resource.cci

The interface javax.resource.cci.ResourceAdapterMetaData provides information about capabilities of a resource adapter implementation.

**ResourceAllocationException** - Exception in javax.jms

This exception is thrown when a provider is unable to allocate the resources required by a method.

**ResourceAllocationException(String, String)** - Constructor for exception javax.jms.ResourceAllocationException

Constructs a ResourceAllocationException with the specified reason and error code.

**ResourceAllocationException(String)** - Constructor for exception javax.jms.ResourceAllocationException

Constructs a ResourceAllocationException with the specified reason.

**ResourceAllocationException** - Exception in javax.resource.spi

A ResourceAllocationException can be thrown by an application
server or resource adapter to indicate any failure to allocate system resources (example: threads, physical connections).

**ResourceAllocationException()** - Constructor for exception

*javax.resource.spi.ResourceAllocationException*

Constructs a new instance with null as its detail message.

**ResourceAllocationException(String)** - Constructor for exception

*javax.resource.spi.ResourceAllocationException*

Constructs a new instance with the specified detail message.

**ResourceAllocationException(Throwables)** - Constructor for exception

*javax.resource.spi.ResourceAllocationException*

Constructs a new throwable with the specified cause.

**ResourceAllocationException(String, Throwable)** - Constructor for exception

*javax.resource.spi.ResourceAllocationException*

Constructs a new throwable with the specified detail message and cause.

**ResourceAllocationException(String, String)** - Constructor for exception

*javax.resource.spi.ResourceAllocationException*

Constructs a new throwable with the specified detail message and cause.

**ResourceBundleELResolver** - Class in *javax.el*

Defines property resolution behavior on instances of *ResourceBundle.*

**ResourceBundleELResolver()** - Constructor for class

*javax.el ResourceBundleELResolver*

**ResourceException** - Exception in *javax.resource*

This is the root interface of the exception hierarchy defined for the Connector architecture.

**ResourceException()** - Constructor for exception

*javax.resource.ResourceException*

Constructs a new instance with null as its detail message.

**ResourceException(String)** - Constructor for exception

*javax.resource.ResourceException*

Constructs a new instance with the specified detail message.

**ResourceException(Throwables)** - Constructor for exception

*javax.resource.ResourceException*

Constructs a new throwable with the specified cause.

**ResourceException(String, Throwable)** - Constructor for exception

*javax.resource.ResourceException*

Constructs a new throwable with the specified detail message and cause.

**ResourceException(String, String)** - Constructor for exception

*javax.resource.ResourceException*

Create a new throwable with the specified message and error code.

**Resources** - Annotation Type in *javax.annotation*

This class is used to allow multiple resources declarations.

**resources** - Variable in class *javax.mail.Quota*

The set of resources associated with this quota root.

**ResourceWarning** - Exception in *javax.resource.cci*
A ResourceWarning provides information on warnings related to execution of an interaction with an EIS.

**ResourceWarning()** - Constructor for exception

`javax.resource.cci.ResourceWarning`

Constructs a new instance with null as its detail message.

**ResourceWarning(String)** - Constructor for exception

`javax.resource.cci.ResourceWarning`

Constructs a new instance with the specified detail message.

**ResourceWarning( Throwable)** - Constructor for exception

`javax.resource.cci.ResourceWarning`

Constructs a new throwable with the specified cause.

**ResourceWarning(String, Throwable)** - Constructor for exception

`javax.resource.cci.ResourceWarning`

Constructs a new throwable with the specified detail message and cause.

**ResourceWarning(String, String)** - Constructor for exception

`javax.resource.cci.ResourceWarning`

Constructs a new throwable with the specified detail message and error code.

**RESPONSE** - Static variable in class `javax.servlet.jsp.PageContext`

Name used to store ServletResponse in PageContext name table.

**Response<T>** - Interface in `javax.xml.ws`

The Response interface provides methods used to obtain the payload and context of a message sent in response to an operation invocation.

**responseComplete()** - Method in class

`javax.faces.context.FacesContext`

Signal the JavaServer Faces implementation that the HTTP response for this request has already been generated (such as an HTTP redirect), and that the request processing lifecycle should be terminated as soon as the current phase is completed.

**ResponseStateManager** - Class in `javax.faces.render`

`ResponseStateManager` is the helper class to `StateManager` that knows the specific rendering technology being used to generate the response.

**ResponseStateManager()** - Constructor for class

`javax.faces.render.ResponseStateManager`

**ResponseStream** - Class in `javax.faces.context`

`ResponseStream` is an interface describing an adapter to an underlying output mechanism for binary output.

**ResponseStream()** - Constructor for class

`javax.faces.context.ResponseStream`

**ResponseWrapper** - Annotation Type in `javax.xml.ws`

Used to annotate methods in the Service Endpoint Interface with the response wrapper bean to be used at runtime.

**ResponseWriter** - Class in `javax.faces.context`

`ResponseWriter` is an abstract class describing an adapter to an underlying output mechanism for character-based output.
**ResponseWriter()** - Constructor for class `javax.faces.context.ResponseWriter`

**ResponseWriterWrapper** - Class in `javax.faces.context` provides a simple implementation of `ResponseWriter` that can be subclassed by developers wishing to provide specialized behavior to an existing `ResponseWriter` instance.

**ResponseWriterWrapper()** - Constructor for class `javax.faces.context.ResponseWriterWrapper`

**restore(InputStream)** - Method in interface `javax.enterprise.deploy.spi.DeploymentConfiguration`
Restore from disk to a full set of configuration beans previously stored.

**RESTORE_VIEW** - Static variable in class `javax.faces.event.PhaseId` Identifier that indicates an interest in events queued for the Restore View phase of the request processing lifecycle.

**restoreAttachedState(FacesContext, Object)** - Static method in class `javax.faces.component.UIComponentBase`
This method is called by `UIComponent` subclasses that need to restore the objects they saved using `UIComponentBase.saveAttachedState(javax.faces.context.FacesContext, java.lang.Object)`.

**restoreComponentState(FacesContext, UIViewRoot, String)** - Method in class `javax.faces.application.StateManager`
Deprecated. The distinction between tree structure and component state is now an implementation detail. The default implementation does nothing.

**restoreComponentState(FacesContext, UIViewRoot, String)** - Method in class `javax.faces.application.StateManagerWrapper`
The default behavior of this method is to call `StateManager.restoreComponentState(javax.faces.context.FacesContext, javax.faces.component.UIViewRoot, String)` on the wrapped `StateManager` object.

**restoreDConfigBean(InputStream, DDBeanRoot)** - Method in interface `javax.enterprise.deploy.spi.DeploymentConfiguration`
Restore from disk to instantated objects all the DConfigBeans associated with a specific deployment descriptor.

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlColumn`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlCommandButton`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlCommandLink`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlDataTable`
**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlForm`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlGraphicImage`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlInputHidden`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlInputSecret`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlInputText`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlInputTextarea`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlMessage`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlMessages`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlOutputFormat`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlOutputLabel`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlOutputLink`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlOutputText`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlPanelGrid`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlPanelGroup`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlSelectBooleanCheckbox`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlSelectManyCheckbox`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.html.HtmlSelectManyListbox`
`restoreState(FacesContext, Object)` - Method in class `javax.faces.component.html.HtmlSelectManyMenu`

`restoreState(FacesContext, Object)` - Method in class `javax.faces.component.html.HtmlSelectOneListbox`

`restoreState(FacesContext, Object)` - Method in class `javax.faces.component.html.HtmlSelectOneMenu`

`restoreState(FacesContext, Object)` - Method in class `javax.faces.component.html.HtmlSelectOneRadio`

`restoreState(FacesContext, Object)` - Method in interface `javax.faces.component.StateHolder`
   Perform any processing required to restore the state from the entries in the state Object.

`restoreState(FacesContext, Object)` - Method in class `javax.faces.component.UICommand`

`restoreState(FacesContext, Object)` - Method in class `javax.faces.component.UIComponentBase`

`restoreState(FacesContext, Object)` - Method in class `javax.faces.component.UIData`

`restoreState(FacesContext, Object)` - Method in class `javax.faces.component.UIGraphic`

`restoreState(FacesContext, Object)` - Method in class `javax.faces.component.UIInput`

`restoreState(FacesContext, Object)` - Method in class `javax.faces.component.UIMessage`

`restoreState(FacesContext, Object)` - Method in class `javax.faces.component.UIMessages`

`restoreState(FacesContext, Object)` - Method in class `javax.faces.component.UIOutput`

`restoreState(FacesContext, Object)` - Method in class `javax.faces.component.UIParameter`

`restoreState(FacesContext, Object)` - Method in class `javax.faces.component.UISelectItem`

`restoreState(FacesContext, Object)` - Method in class `javax.faces.component.UISelectItems`
**restoreState(FacesContext, Object)** - Method in class `javax.faces.component.UIViewRoot`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.convert.DateTimeConverter`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.convert.EnumConverter`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.convert.NumberConverter`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.event.MethodExpressionActionListener`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.event.MethodExpressionValueChangeListener`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.validator.DoubleRangeValidator`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.validator.LengthValidator`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.validator.LongRangeValidator`

**restoreState(FacesContext, Object)** - Method in class `javax.faces.validator.MethodExpressionValidator`

**restoreTreeStructure(FacesContext, String, String)** - Method in class `javax.faces.application.StateManager`

`Deprecated`. *the distinction between tree structure and component state is now an implementation detail. The default implementation returns null.*

**restoreTreeStructure(FacesContext, String, String)** - Method in class `javax.faces.application.StateManagerWrapper`

The default behavior of this method is to call `StateManager.restoreTreeStructure(javax.faces.context.FacesContext, String, String)` on the wrapped `StateManager` object.

**restoreView(FacesContext, String, String)** - Method in class `javax.faces.application.StateManager`

Restore the tree structure and the component state of the view for the specified viewId, in an implementation dependent manner, and return the restored `UIViewRoot`.

**restoreView(FacesContext, String, String)** - Method in class `javax.faces.application.StateManagerWrapper`

The default behavior of this method is to call `StateManager.restoreView(javax.faces.context.FacesContext, String, String)` on the wrapped `StateManager` object.
**restoreView(FacesContext, String)** - Method in class javax.faces.application.ViewHandler
Perform whatever actions are required to restore the view associated with the specified FacesContext and viewId.

**restoreView(FacesContext, String)** - Method in class javax.faces.application.ViewHandlerWrapper
The default behavior of this method is to call ViewHandler.restoreView(javax.faces.context.FacesContext, String) on the wrapped ViewHandler object.

**ResultDataModel** - Class in javax.faces.model
ResultDataModel is a convenience implementation of DataModel that wraps a JSTL Result object, typically representing the results of executing an SQL query via JSTL tags.

**ResultDataModel()** - Constructor for class javax.faces.model.ResultDataModel
Construct a new ResultDataModel with no specified wrapped data.

**ResultDataModel(Result)** - Constructor for class javax.faces.model.ResultDataModel
Construct a new ResultDataModel wrapping the specified Result.

**ResultSet** - Interface in javax.resource.cci
A ResultSet represents tabular data that is retrieved from an EIS instance by the execution of an Interaction..

**ResultSetDataModel** - Class in javax.faces.model
ResultSetDataModel is a convenience implementation of DataModel that wraps a ResultSet of Java objects.

**ResultSetDataModel()** - Constructor for class javax.faces.model.ResultSetDataModel
Construct a new ResultSetDataModel with no specified wrapped data.

**ResultSetDataModel(ResultSet)** - Constructor for class javax.faces.model.ResultSetDataModel
Construct a new ResultSetDataModel wrapping the specified ResultSet.

**ResultSetInfo** - Interface in javax.resource.cci
The interface javax.resource.cci.ResultSetInfo provides information on the support provided for ResultSet by a connected EIS instance.

**resume(Transaction)** - Method in interface javax.transaction.TransactionManager
Resume the transaction context association of the calling thread with the transaction represented by the supplied Transaction object.

**RFC822** - Static variable in class javax.mail.internet.HeaderTokenizer
RFC822 specials

**RolesAllowed** - Annotation Type in javax.annotation.security
Specifies the list of roles permitted to access method(s) in an application.

**rollback()** - Method in interface javax.jms.Session
Rolls back any messages done in this transaction and releases
any locks currently held.

**rollback()** - Method in interface `javax.jms.XASession`
Throws a `TransactionInProgressException`, since it should not be called for an XASession object.

**rollback()** - Method in interface `javax.persistence.EntityTransaction`
Roll back the current transaction

**rollback()** - Method in interface `javax.resource.cci.LocalTransaction`
Rollbacks the current resource manager local transaction.

**rollback()** - Method in interface `javax.resource.spi.LocalTransaction`
Rollback a local transaction

**rollback(Xid)** - Method in interface `javax.resource.spi.XATerminator`
Informs the resource manager to roll back work done on behalf of a transaction branch.

**rollback()** - Method in interface `javax.transaction.Transaction`
Rollback the transaction represented by this Transaction object.

**rollback()** - Method in interface `javax.transaction.TransactionManager`
Roll back the transaction associated with the current thread.

**rollback()** - Method in interface `javax.transaction.UserTransaction`
Roll back the transaction associated with the current thread.

**rollback(Xid)** - Method in interface `javax.transaction.xa.XAResource`
Informs the resource manager to roll back work done on behalf of a transaction branch.

**RollbackException** - Exception in `javax.persistence`
Thrown by the persistence provider when the `EntityTransaction.commit()` fails.

**RollbackException()** - Constructor for exception `javax.persistence.RollbackException`
Constructs a new RollbackException exception with null as its detail message.

**RollbackException(String)** - Constructor for exception `javax.persistence.RollbackException`
Constructs a new RollbackException exception with the specified detail message.

**RollbackException(String, Throwable)** - Constructor for exception `javax.persistence.RollbackException`
Constructs a new RollbackException exception with the specified detail message and cause.

**RollbackException(Throw)able** - Constructor for exception `javax.persistence.RollbackException`
Constructs a new RollbackException exception with the specified cause.

**RollbackException** - Exception in `javax.transaction`
RollbackException exception is thrown when the transaction has been marked for rollback only or the transaction has been rolled back instead of committed.
**RollbackException()** - Constructor for exception  
javax.transaction.RollbackException

**RollbackException(String)** - Constructor for exception  
javax.transaction.RollbackException

**rowSelected(DataModelEvent)** - Method in interface  
javax.faces.model.DataModelListener  
Notification that a particular row index, with the associated row data, has been selected for processing.

**run()** - Method in interface javax.jms.Session  
Optional operation, intended to be used only by Application Servers, not by ordinary JMS clients.

**RunAs** - Annotation Type in javax.annotation.security  
Defines the identity of the application during execution in a J2EE container.

**RUNNING** - Static variable in class  
javax.enterprise.deploy.shared.StateType  
The action operation is running normally.
**SAAJMetaFactory** - Class in `javax.xml.soap`
- The access point for the implementation classes of the factories defined in the SAAJ API.

**SAAJMetaFactory()** - Constructor for class `javax.xml.soap.SAAJMetaFactory`

**SAAJResult** - Class in `javax.xml.soap`
- Acts as a holder for the results of a JAXP transformation or a JAXB marshalling, in the form of a SAAJ tree.

**SAAJResult()** - Constructor for class `javax.xml.soap.SAAJResult`
- Creates a SAAJResult that will present results in the form of a SAAJ tree that supports the default (SOAP 1.1) protocol.

**SAAJResult(String)** - Constructor for class `javax.xml.soap.SAAJResult`
- Creates a SAAJResult that will present results in the form of a SAAJ tree that supports the specified protocol.

**SAAJResult(SOAPMessage)** - Constructor for class `javax.xml.soap.SAAJResult`
- Creates a SAAJResult that will write the results into the SOAPPart of the supplied SOAPMessage.

**SAAJResult(SOAPElement)** - Constructor for class `javax.xml.soap.SAAJResult`
- Creates a SAAJResult that will write the results as a child node of the SOAPElement specified.

**save(OutputStream)** - Method in interface `javax.enterprise.deploy.spi.DeploymentConfiguration`
- Save to disk the current set configuration beans created for this deployable module.

**saveAssociations(Collection, boolean)** - Method in interface `javax.xml.registry.BusinessLifeCycleManager`
- Saves the specified Association instances.

**saveAttachedState(FacesContext, Object)** - Static method in class `javax.faces.component.UIComponentBase`
- This method is called by `UIComponent` subclasses that want to save one or more attached objects.

**saveChanges()** - Method in class `javax.mail.internet.MimeMessage`
- Updates the appropriate header fields of this message to be consistent with the message's contents.

**saveChanges()** - Method in class `javax.mail.Message`
- Save any changes made to this message into the message-store when the containing folder is closed, if the message is contained in a folder.

**saveChanges()** - Method in class `javax.xml.soap.SOAPMessage`
- Updates this SOAPMessage object with all the changes that have been made to it.

**saveClassificationSchemes(Collection)** - Method in interface
javax.xml.registry.**BusinessLifeCycleManager**

Saves the specified ClassificationScheme instances.

**saveConcepts(Collection)** - Method in interface
javax.xml.registry.**BusinessLifeCycleManager**

Saves the specified Concepts.

**saved** - Variable in class javax.mail.internet.**MimeMessage**

Does the saveChanges method need to be called on this message?

**saveDConfigBean(OutputStream, DConfigBeanRoot)** - Method in interface java.util.deployment.spi.**DeploymentConfiguration**

Save to disk all the configuration beans associated with a particular deployment descriptor file.

**SaveException** - Exception in java.xml.registry

A RegistryException that occurs during a save action.

**SaveException()** - Constructor for exception
javax.xml.registry.**SaveException**

Constructs a JAXRException object with no reason or embedded Throwable.

**SaveException(String)** - Constructor for exception
javax.xml.registry.**SaveException**

Constructs a JAXRException object with the given String as the reason for the exception being thrown.

**SaveException(String, Throwable)** - Constructor for exception
javax.xml.registry.**SaveException**

Constructs a JAXRException object with the given String as the reason for the exception being thrown and the given Throwable object as an embedded Throwable.

**SaveException(Throwable)** - Constructor for exception
javax.xml.registry.**SaveException**

Constructs a JAXRException object initialized with the given Throwable object.

**saveFile(File)** - Method in class javax.mail.internet.**MimeBodyPart**

Save the contents of this part in the specified file.

**saveFile(String)** - Method in class javax.mail.internet.**MimeBodyPart**

Save the contents of this part in the specified file.

**saveObjects(Collection)** - Method in interface
javax.xml.registry.**LifeCycleManager**

Saves one or more Objects to the registry.

**saveOrganizations(Collection)** - Method in interface
javax.xml.registry.**BusinessLifeCycleManager**

Saves the specified Organizations.

**saveRequired()** - Method in class java.xml.soap.**SOAPMessage**

Indicates whether this SOAPMessage object needs to have the method saveChanges called on it.

**saveSerializedView(FacesContext)** - Method in class
javax.faces.application.**StateManager**

**Deprecated. this has been replaced by**

StateManager.saveView(javax.faces.context.**FacesContext**). The default implementation returns null.

**saveSerializedView(FacesContext)** - Method in class
javax.faces.application.**StateManagerWrapper**
The default behavior of this method is to call `StateManager.saveSerializedView(javax.faces.context.FacesContext)` on the wrapped `StateManager` object.

Saves the specified ServiceBindings.

Saves the specified Services.

**saveState(FacesContext)** - Method in class `javax.faces.component.html.HtmlColumn`

**saveState(FacesContext)** - Method in class `javax.faces.component.html.HtmlCommandButton`

**saveState(FacesContext)** - Method in class `javax.faces.component.html.HtmlCommandLink`

**saveState(FacesContext)** - Method in class `javax.faces.component.html.HtmlDataTable`

**saveState(FacesContext)** - Method in class `javax.faces.component.html.HtmlForm`

**saveState(FacesContext)** - Method in class `javax.faces.component.html.HtmlGraphicImage`

**saveState(FacesContext)** - Method in class `javax.faces.component.html.HtmlInputHidden`

**saveState(FacesContext)** - Method in class `javax.faces.component.html.HtmlInputSecret`

**saveState(FacesContext)** - Method in class `javax.faces.component.html.HtmlInputText`

**saveState(FacesContext)** - Method in class `javax.faces.component.html.HtmlInputTextarea`

**saveState(FacesContext)** - Method in class `javax.faces.component.html.HtmlMessage`

**saveState(FacesContext)** - Method in class `javax.faces.component.html.HtmlMessages`

**saveState(FacesContext)** - Method in class `javax.faces.component.html.HtmlOutputFormat`

**saveState(FacesContext)** - Method in class `javax.faces.component.html.HtmlOutputLabel`
saveState(FacesContext) - Method in class javax.faces.component.html.HtmlOutputLink

saveState(FacesContext) - Method in class javax.faces.component.html.HtmlOutputText

saveState(FacesContext) - Method in class javax.faces.component.html.HtmlPanelGrid

saveState(FacesContext) - Method in class javax.faces.component.html.HtmlPanelGroup

saveState(FacesContext) - Method in class javax.faces.component.html.HtmlSelectBooleanCheckbox

saveState(FacesContext) - Method in class javax.faces.component.html.HtmlSelectManyCheckbox

saveState(FacesContext) - Method in class javax.faces.component.html.HtmlSelectManyListbox

saveState(FacesContext) - Method in class javax.faces.component.html.HtmlSelectManyMenu

saveState(FacesContext) - Method in class javax.faces.component.html.HtmlSelectOneListbox

saveState(FacesContext) - Method in class javax.faces.component.html.HtmlSelectOneMenu

saveState(FacesContext) - Method in class javax.faces.component.html.HtmlSelectOneRadio

saveState(FacesContext) - Method in interface javax.faces.component.StateHolder

　Gets the state of the instance as a Serializable Object.

saveState(FacesContext) - Method in class javax.faces.component.UICommand

saveState(FacesContext) - Method in class javax.faces.component.UICOMPONENTBASE

saveState(FacesContext) - Method in class javax.faces.component.UIData

saveState(FacesContext) - Method in class javax.faces.component.UIGraphic

saveState(FacesContext) - Method in class...
javax.faces.component.UIInput

saveState(FacesContext) - Method in class
javax.faces.component.UIMessage

saveState(FacesContext) - Method in class
javax.faces.component.UIMessages

saveState(FacesContext) - Method in class
javax.faces.component.UIOutput

saveState(FacesContext) - Method in class
javax.faces.component.UIParameter

saveState(FacesContext) - Method in class
javax.faces.component.UISelectItem

saveState(FacesContext) - Method in class
javax.faces.component.UISelectItems

saveState(FacesContext) - Method in class
javax.faces.component.UIViewRoot

saveState(FacesContext) - Method in class
javax.faces.convert.DateTimeConverter

saveState(FacesContext) - Method in class
javax.faces.convert.EnumConverter

saveState(FacesContext) - Method in class
javax.faces.convert.NumberConverter

saveState(FacesContext) - Method in class
javax.faces.event.MethodExpressionActionListener

saveState(FacesContext) - Method in class
javax.faces.event.MethodExpressionValueChangeListener

saveState(FacesContext) - Method in class
javax.faces.validator.DoubleRangeValidator

saveState(FacesContext) - Method in class
javax.faces.validator.LengthValidator

saveState(FacesContext) - Method in class
javax.faces.validator.LongRangeValidator

saveState(FacesContext) - Method in class
javax.faces.validator.MethodExpressionValidator
**saveView(FacesContext)** - Method in class javax.faces.application.StateManager

Return an opaque Object containing sufficient information for this same instance to restore the state of the current UIViewRoot on a subsequent request.

**saveView(FacesContext)** - Method in class javax.faces.application.StateManagerWrapper

The default behavior of this method is to call StateManager.saveView(javax.faces.context.FacesContext) on the wrapped StateManager object.

**SC_ACCEPTED** - Static variable in interface javax.servlet.http.HttpServletResponse

Status code (202) indicating that a request was accepted for processing, but was not completed.

**SC_BAD_GATEWAY** - Static variable in interface javax.servlet.http.HttpServletResponse

Status code (502) indicating that the HTTP server received an invalid response from a server it consulted when acting as a proxy or gateway.

**SC_BAD_REQUEST** - Static variable in interface javax.servlet.http.HttpServletResponse

Status code (400) indicating the request sent by the client was syntactically incorrect.

**SC_CONFLICT** - Static variable in interface javax.servlet.http.HttpServletResponse

Status code (409) indicating that the request could not be completed due to a conflict with the current state of the resource.

**SC_CONTINUE** - Static variable in interface javax.servlet.http.HttpServletResponse

Status code (100) indicating the client can continue.

**SC_CREATED** - Static variable in interface javax.servlet.http.HttpServletResponse

Status code (201) indicating the request succeeded and created a new resource on the server.

**SC_EXPECTATION_FAILED** - Static variable in interface javax.servlet.http.HttpServletResponse

Status code (417) indicating that the server could not meet the expectation given in the Expect request header.

**SC_FORBIDDEN** - Static variable in interface javax.servlet.http.HttpServletResponse

Status code (403) indicating the server understood the request but refused to fulfill it.

**SC_FOUND** - Static variable in interface javax.servlet.http.HttpServletResponse

Status code (302) indicating that the resource reside temporarily under a different URI.

**SC_GATEWAY_TIMEOUT** - Static variable in interface javax.servlet.http.HttpServletResponse

Status code (504) indicating that the server did not receive a
timely response from the upstream server while acting as a gateway or proxy.

**SC GONE** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (410) indicating that the resource is no longer available at the server and no forwarding address is known.

**SC HTTP_VERSION_NOT_SUPPORTED** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (505) indicating that the server does not support or refuses to support the HTTP protocol version that was used in the request message.

**SC INTERNAL_SERVER_ERROR** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (500) indicating an error inside the HTTP server which prevented it from fulfilling the request.

**SC_LENGTH_REQUIRED** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (411) indicating that the request cannot be handled without a defined `Content-Length`.

**SC_METHOD_NOT_ALLOWED** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (405) indicating that the method specified in the `Request-Line` is not allowed for the resource identified by the `Request-URI`.

**SC_MOVED_PERMANENTLY** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (301) indicating that the resource has permanently moved to a new location, and that future references should use a new URI with their requests.

**SC_MOVED_TEMPORARILY** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (302) indicating that the resource has temporarily moved to another location, but that future references should still use the original URI to access the resource.

**SC_MULTIPLE_CHOICES** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (300) indicating that the requested resource corresponds to any one of a set of representations, each with its own specific location.

**SC_NO_CONTENT** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (204) indicating that the request succeeded but that there was no new information to return.

**SC_NON_AUTHORITATIVE_INFORMATION** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (203) indicating that the meta information presented by the client did not originate from the server.

**SC_NOT_ACCEPTABLE** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (406) indicating that the resource identified by
the request is only capable of generating response entities which have content characteristics not acceptable according to the accept headers sent in the request.

**SC_NOT_FOUND** - Static variable in interface javax.servlet.http.HttpServletResponse
Status code (404) indicating that the requested resource is not available.

**SC_NOT_IMPLEMENTED** - Static variable in interface javax.servlet.http.HttpServletResponse
Status code (501) indicating the HTTP server does not support the functionality needed to fulfill the request.

**SC_NOT_MODIFIED** - Static variable in interface javax.servlet.http.HttpServletResponse
Status code (304) indicating that a conditional GET operation found that the resource was available and not modified.

**SC_OK** - Static variable in interface javax.servlet.http.HttpServletResponse
Status code (200) indicating the request succeeded normally.

**SC_PARTIAL_CONTENT** - Static variable in interface javax.servlet.http.HttpServletResponse
Status code (206) indicating that the server has fulfilled the partial GET request for the resource.

**SC_PAYMENT_REQUIRED** - Static variable in interface javax.servlet.http.HttpServletResponse
Status code (402) reserved for future use.

**SC_PRECONDITION_FAILED** - Static variable in interface javax.servlet.http.HttpServletResponse
Status code (412) indicating that the precondition given in one or more of the request-header fields evaluated to false when it was tested on the server.

**SC_PROXY_AUTHENTICATION_REQUIRED** - Static variable in interface javax.servlet.http.HttpServletResponse
Status code (407) indicating that the client MUST first authenticate itself with the proxy.

**SC_REQUEST_ENTITY_TOO_LARGE** - Static variable in interface javax.servlet.http.HttpServletResponse
Status code (413) indicating that the server is refusing to process the request because the request entity is larger than the server is willing or able to process.

**SC_REQUEST_TIMEOUT** - Static variable in interface javax.servlet.http.HttpServletResponse
Status code (408) indicating that the client did not produce a request within the time that the server was prepared to wait.

**SC_REQUEST_URI_TOO_LONG** - Static variable in interface javax.servlet.http.HttpServletResponse
Status code (414) indicating that the server is refusing to service the request because the Request-URI is longer than the server is willing to interpret.

**SC_REQUESTED_RANGE_NOT_SATISFIABLE** - Static variable in interface javax.servlet.http.HttpServletResponse
Status code (416) indicating that the server cannot serve the requested byte range.

**SC_RESET_CONTENT** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (205) indicating that the agent SHOULD reset the document view which caused the request to be sent.

**SCSEE_OTHER** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (303) indicating that the response to the request can be found under a different URI.

**SC_SERVICE_UNAVAILABLE** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (503) indicating that the HTTP server is temporarily overloaded, and unable to handle the request.

**SC_SWITCHING_PROTOCOLS** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (101) indicating the server is switching protocols according to Upgrade header.

**SC_TEMPORARY_REDIRECT** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (307) indicating that the requested resource resides temporarily under a different URI.

**SC_UNAUTHORIZED** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (401) indicating that the request requires HTTP authentication.

**SC_UNSUPPORTED_MEDIA_TYPE** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (415) indicating that the server is refusing to service the request because the entity of the request is in a format not supported by the requested resource for the requested method.

**SC_USE_PROXY** - Static variable in interface `javax.servlet.http.HttpServletResponse`
Status code (305) indicating that the requested resource MUST be accessed through the proxy given by the Location field.

**ScalarDataModel** - Class in `javax.faces.model`
*ScalarDataModel* is a convenience implementation of `DataModel` that wraps an individual Java object.

**ScalarDataModel()** - Constructor for class `javax.faces.model.ScalarDataModel`
Construct a new `ScalarDataModel` with no specified wrapped data.

**ScalarDataModel(Object)** - Constructor for class `javax.faces.model.ScalarDataModel`
Construct a new `ScalarDataModel` wrapping the specified scalar object.

**scheduleWork(Work)** - Method in interface `javax.resource.spi.work.WorkManager`
Accepts a Work instance for processing.

**scheduleWork(Work, long, ExecutionContext, WorkListener)** - Method
in interface javax.resource.spi.work.WorkManager
  Accepts a Work instance for processing.

**SchemaOutputResolver** - Class in **javax.xml.bind**
  Controls where a JAXB implementation puts the generates schema files.

**SchemaOutputResolver()** - Constructor for class
javax.xml.bind.SchemaOutputResolver

**scope** - Variable in class javax.xml.bind.JAXBElement
  Scope of xml element declaration representing this xml element instance.

**ScopedAttributeELResolver** - Class in **javax.servlet.jsp.el**
  Defines variable resolution behavior for scoped attributes.

**ScopedAttributeELResolver()** - Constructor for class
javax.servlet.jsp.el.ScopedAttributeELResolver

**search(SearchTerm)** - Method in class javax.mail.Folder
  Search this Folder for messages matching the specified search criterion.

**search(SearchTerm, Message[])** - Method in class javax.mail.Folder
  Search the given array of messages for those that match the specified search criterion.

**SearchException** - Exception in **javax.mail.search**
  The exception thrown when a Search expression could not be handled.

**SearchException()** - Constructor for exception
javax.mail.search.SearchException
  Constructs a SearchException with no detail message.

**SearchException(String)** - Constructor for exception
javax.mail.search.SearchException
  Constructs a SearchException with the specified detail message.

**SearchTerm** - Class in **javax.mail.search**
  Search criteria are expressed as a tree of search-terms, forming a parse-tree for the search expression.

**SearchTerm()** - Constructor for class javax.mail.search.SearchTerm

**SecondaryTable** - Annotation Type in **javax.persistence**
  This annotation is used to specify a secondary table for the annotated entity class.

**SecondaryTables** - Annotation Type in **javax.persistence**
  This annotation is used to specify multiple secondary tables for an entity.

**SecurityException** - Exception in **javax.resource.spi**
  A SecurityException indicates error conditions related to the security contract between an application server and resource adapter.

**SecurityException()** - Constructor for exception
javax.resource.spi.SecurityException
  Constructs a new instance with null as its detail message.

**SecurityException(String)** - Constructor for exception
javax.resource.spi.SecurityException
Constructs a new instance with the specified detail message.

SecurityException(Throwable) - Constructor for exception
Constructs a new throwable with the specified cause.

SecurityException(String, Throwable) - Constructor for exception
Constructs a new throwable with the specified detail message and cause.

SecurityException(String, String) - Constructor for exception
Constructs a new throwable with the specified detail message and an error code.

SEEN - Static variable in class javax.mail.Flags.Flag
This message is seen.

SelectItem - Class in javax.faces.model
SelectItem represents a single item in the list of supported items associated with a UISelectMany or UISelectOne component.

SelectItem() - Constructor for class javax.faces.model.SelectItem
Construct a SelectItem with no initialized property values.

SelectItem(Object) - Constructor for class javax.faces.model.SelectItem
Construct a SelectItem with the specified value.

SelectItem(Object, String) - Constructor for class javax.faces.model.SelectItem
Construct a SelectItem with the specified value and label.

SelectItem(Object, String, String) - Constructor for class javax.faces.model.SelectItem
Construct a SelectItem instance with the specified value, label and description.

SelectItem(Object, String, String, boolean) - Constructor for class javax.faces.model.SelectItem
Construct a SelectItem instance with the specified property values.

SelectItem(Object, String, boolean, boolean) - Constructor for class javax.faces.model.SelectItem
Construct a SelectItem instance with the specified property values.

SelectItemGroup - Class in javax.faces.model
SelectItemGroup is a subclass of SelectItem that identifies a set of options that will be made available as a subordinate "submenu" or "options list", depending upon the requirements of the UISelectMany or UISelectOne renderer that is actually used.

SelectItemGroup() - Constructor for class javax.faces.model.SelectItemGroup
Construct a SelectItemGroup with no initialized property values.

SelectItemGroup(String) - Constructor for class javax.faces.model.SelectItemGroup
Construct a SelectItemGroup with the specified label and no
associated selectItems.

`SelectItemGroup(String, String, boolean, SelectItem[])` - Constructor for class `javax.faces.model.SelectItemGroup`

Construct a SelectItemGroup with the specified properties.

`send(Message)` - Method in interface `javax.jms.MessageProducer`

Sends a message using the MessageProducer's default delivery mode, priority, and time to live.

`send(Message, int, int, long)` - Method in interface `javax.jms.MessageProducer`

Sends a message to the destination, specifying delivery mode, priority, and time to live.

`send(Destination, Message)` - Method in interface `javax.jms.MessageProducer`

Sends a message to a destination for an unidentified message producer.

`send(Destination, Message, int, int, long)` - Method in interface `javax.jms.MessageProducer`

Sends a message to a destination for an unidentified message producer, specifying delivery mode, priority and time to live.

`send(Message)` - Method in interface `javax.jms.QueueSender`

Sends a message to the queue.

`send(Message, int, int, long)` - Method in interface `javax.jms.QueueSender`

Sends a message to the queue, specifying delivery mode, priority, and time to live.

`send(Queue, Message)` - Method in interface `javax.jms.QueueSender`

Sends a message to a queue for an unidentified message producer.

`send(Queue, Message, int, int, long)` - Method in interface `javax.jms.QueueSender`

Sends a message to a queue for an unidentified message producer, specifying delivery mode, priority and time to live.

`send(Message)` - Static method in class `javax.mail.Transport`

Send a message.

`send(Message, Address[])` - Static method in class `javax.mail.Transport`

Send the message to the specified addresses, ignoring any recipients specified in the message itself.

Sends an error response to the client using the specified status.

`sendError(int)` - Method in interface `javax.servlet.http.HttpServletResponse`

Sends an error response to the client using the specified status code and clearing the buffer.

`sendError(int, String)` - Method in class `javax.servlet.http.HttpServletResponseWrapper`

The default behavior of this method is to call sendError(int sc, String msg) on the wrapped response object.
**sendError(int)** - Method in class javax.servlet.http.HttpServletResponseWrapper
The default behavior of this method is to call sendError(int sc) on the wrapped response object.

**SendFailedException** - Exception in javax.mail
This exception is thrown when the message cannot be sent.

**SendFailedException()** - Constructor for exception
javax.mail.SendFailedException
Constructs a SendFailedException with no detail message.

**SendFailedException(String)** - Constructor for exception
javax.mail.SendFailedException
Constructs a SendFailedException with the specified detail message.

**SendFailedException(String, Exception)** - Constructor for exception
javax.mail.SendFailedException
Constructs a SendFailedException with the specified Exception and detail message.

**SendFailedException(String, Exception, Address[], Address[], Address[])** - Constructor for exception
javax.mail.SendFailedException
Constructs a SendFailedException with the specified string and the specified address objects.

**sendMessage(Message, Address[])** - Method in class
javax.mail.Transport
Send the Message to the specified list of addresses.

**sendRedirect(String)** - Method in interface
javax.servlet.http.HttpServletResponse
Sends a temporary redirect response to the client using the specified redirect location URL.

**sendRedirect(String)** - Method in class
javax.servlet.http.HttpServletResponseWrapper
The default behavior of this method is to return sendRedirect(String location) on the wrapped response object.

**SentDateTerm** - Class in javax.mail.search
This class implements comparisons for the Message SentDate.

**SentDateTerm(int, Date)** - Constructor for class
javax.mail.search.SentDateTerm
Constructor.

**SEPARATOR_CHAR** - Static variable in interface
javax.faces.component.NamingContainer
The separator character used in component identifiers to demarcate navigation to a child naming container.

**SequenceGenerator** - Annotation Type in javax.persistence
This annotation defines a primary key generator that may be referenced by name when a generator element is specified for the GeneratedValue annotation.

**SerializationContext** - Interface in javax.xml.rpc.encoding
The javax.xml.rpc.encoding.SerializationContext interface is implemented by the JAX-RPC runtime system in an XML processing mechanism specific manner.
**Serializer** - Interface in `javax.xml.rpc.encoding`
The `javax.xml.rpc.encoding.Serializer` interface defines the base interface for serializers.

**SerializerFactory** - Interface in `javax.xml.rpc.encoding`
The `javax.xml.rpc.encoding.SerializerFactory` is a factory of the serializers.

**ServerSession** - Interface in `javax.jms`
A `ServerSession` object is an application server object that is used by a server to associate a thread with a JMS session (optional).

**ServerSessionPool** - Interface in `javax.jms`
A `ServerSessionPool` object is an object implemented by an application server to provide a pool of `ServerSession` objects for processing the messages of a `ConnectionConsumer` (optional).

**service(ServletRequest, ServletResponse)** - Method in class `javax.faces.webapp.FacesServlet`
Process an incoming request, and create the corresponding response, by executing the request processing lifecycle.

**Service** - Class in `javax.mail`
An abstract class that contains the functionality common to messaging services, such as stores and transports.

**Service(Session, URLName)** - Constructor for class `javax.mail.Service`
Constructor.

**service(ServletRequest, ServletResponse)** - Method in class `javax.servlet.GenericServlet`
Called by the servlet container to allow the servlet to respond to a request.

**service(HttpServletRequest, HttpServletResponse)** - Method in class `javax.servlet.http.HttpServlet`
Receives standard HTTP requests from the public service method and dispatches them to the doXXX methods defined in this class.

Dispatches client requests to the protected service method.

**Service(ServletRequest, ServletResponse)** - Method in interface `javax.servlet.Servlet`
Called by the servlet container to allow the servlet to respond to a request.

**Service** - Interface in `javax.xml.registry.infomodel`
Service instances are RegistryObjects that provide information on services (for example, web services) offered by an Organization.

**SERVICE** - Static variable in interface `javax.xml.registry.LifeCycleManager`

**Service** - Interface in `javax.xml.rpc`
Service class acts as a factory of the following: Dynamic proxy for the target service endpoint.

**Service** - Class in `javax.xml.ws`
Service objects provide the client view of a Web service. 
**Service(URL, QName)** - Constructor for class javax.xml.ws.Service

**Service.Mode** - Enum in javax.xml.ws
The orientation of a dynamic client or service.
**SERVICE_BINDING** - Static variable in interface javax.xml.registry.LifeCycleManager
Maps to UDDI serviceSubset.

**SERVICE_SUBSET** - Static variable in interface javax.xml.registry.FindQualifier
Maps to UDDI serviceSubset.

**ServiceBinding** - Interface in javax.xml.registry.infomodel
ServiceBinding instances are RegistryObjects that represent technical information on a specific way to access a specific interface offered by a Service instance.

**ServiceDelegate** - Class in javax.xml.ws.spi
Service delegates are used internally by Service objects to allow pluggability of JAX-WS implementations.
**ServiceDelegate()** - Constructor for class javax.xml.ws.spi.ServiceDelegate

**ServiceException** - Exception in javax.xml.rpc
The javax.xml.rpc.ServiceException is thrown from the methods in the javax.xml.rpc.Service interface and ServiceFactory class.

**ServiceException()** - Constructor for exception javax.xml.rpc.ServiceException
Constructs a new exception with null as its detail message.

**ServiceException(String)** - Constructor for exception javax.xml.rpc.ServiceException
Constructs a new exception with the specified detail message.

**ServiceException(String, Throwable)** - Constructor for exception javax.xml.rpc.ServiceException
Constructs a new exception with the specified detail message and cause.

**ServiceException(Throwlable)** - Constructor for exception javax.xml.rpc.ServiceException
Constructs a new exception with the specified cause and a detail message of (cause==null ?

**ServiceFactory** - Class in javax.xml.rpc
The javax.xml.rpc.ServiceFactory is an abstract class that provides a factory for the creation of instances of the type javax.xml.rpc.Service.

**ServiceFactory()** - Constructor for class javax.xml.rpc.ServiceFactory

**SERVICEFACTORY_PROPERTY** - Static variable in class javax.xml.rpc.ServiceFactory
A constant representing the property used to lookup the name of a ServiceFactory implementation class.
**ServiceLifecycle** - Interface in [javax.xml.rpc.server](http://example.com/)
The javax.xml.rpc.server.ServiceLifecycle defines a lifecycle interface for a JAX-RPC service endpoint.

**ServiceMode** - Annotation Type in [javax.xml.ws](http://example.com/)
Used to indicate whether a Provider implementation wishes to work with entire protocol messages or just with protocol message payloads.

**Servlet** - Interface in [javax.servlet](http://example.com/)
Defines methods that all servlets must implement.

**SERVLET CONTEXT** - Static variable in interface javax.xml.ws.handler.MessageContext
Standard property: servlet context object.

**SERVLET REQUEST** - Static variable in interface javax.xml.ws.handler.MessageContext
Standard property: servlet request object.

**SERVLET RESPONSE** - Static variable in interface javax.xml.ws.handler.MessageContext
Standard property: servlet response object.

**ServletConfig** - Interface in [javax.servlet](http://example.com/)
A servlet configuration object used by a servlet container to pass information to a servlet during initialization.

**ServletContext** - Interface in [javax.servlet](http://example.com/)
Defines a set of methods that a servlet uses to communicate with its servlet container, for example, to get the MIME type of a file, dispatch requests, or write to a log file.

**ServletContextAttributeEvent** - Class in [javax.servlet](http://example.com/)
This is the event class for notifications about changes to the attributes of the servlet context of a web application.

**ServletContextAttributeEvent(ServletContext, String, Object)** - Constructor for class javax.servlet.ServletContextAttributeEvent
Construct a ServletContextAttributeEvent from the given context for the given attribute name and attribute value.

**ServletContextAttributeListener** - Interface in [javax.servlet](http://example.com/)
Implementations of this interface receive notifications of changes to the attribute list on the servlet context of a web application.

**ServletContextEvent** - Class in [javax.servlet](http://example.com/)
This is the event class for notifications about changes to the servlet context of a web application.

**ServletContextEvent(ServletContext)** - Constructor for class javax.servlet.ServletContextEvent
Construct a ServletContextEvent from the given context.

**ServletContextListener** - Interface in [javax.servlet](http://example.com/)
Implementations of this interface receive notifications about changes to the servlet context of the web application they are part of.

**ServletEndpointContext** - Interface in [javax.xml.rpc.server](http://example.com/)
The ServletEndpointContext provides an endpoint context maintained by the underlying servlet container based JAX-RPC runtime system.
**ServletException** - Exception in `javax.servlet`
Defines a general exception a servlet can throw when it encounters difficulty.

**ServletException()** - Constructor for exception
java.servlet. ServletException
Constructs a new servlet exception.

**ServletException(String)** - Constructor for exception
java.servlet. ServletException
Constructs a new servlet exception with the specified message.

**ServletException(String, Throwable)** - Constructor for exception
java.servlet. ServletException
Constructs a new servlet exception when the servlet needs to throw an exception and include a message about the "root cause" exception that interfered with its normal operation, including a description message.

**ServletException( Throwable)** - Constructor for exception
java.servlet. ServletException
Constructs a new servlet exception when the servlet needs to throw an exception and include a message about the "root cause" exception that interfered with its normal operation.

**ServletInputStream** - Class in `javax.servlet`
Provides an input stream for reading binary data from a client request, including an efficient `readLine` method for reading data one line at a time.

**ServletInputStream()** - Constructor for class
java.servlet. ServletInputStream
Does nothing, because this is an abstract class.

**ServletOutputStream** - Class in `javax.servlet`
Provides an output stream for sending binary data to the client.

**ServletOutputStream()** - Constructor for class
java.servlet. ServletOutputStream
Does nothing, because this is an abstract class.

**ServletRequest** - Interface in `javax.servlet`
Defines an object to provide client request information to a servlet.

**ServletRequestAttributeEvent** - Class in `javax.servlet`
This is the event class for notifications of changes to the attributes of the servlet request in an application.

**ServletRequestAttributeEvent(ServletContext, ServletRequest, String, Object)** - Constructor for class
java.servlet. ServletRequestAttributeEvent
Construct a ServletRequestAttributeEvent giving the servlet context of this web application, the ServletRequest whose attributes are changing and the name and value of the attribute.

**ServletRequestAttributeListener** - Interface in `javax.servlet`
A ServletRequestAttributeListener can be implemented by the developer interested in being notified of request attribute changes.
ServletRequestEvent - Class in javax.servlet
Events of this kind indicate lifecycle events for a ServletRequest.

ServletRequestEvent(ServletContext, ServletRequest) - Constructor for class javax.servlet.ServletRequestEvent
Construct a ServletRequestEvent for the given ServletContext and ServletRequest.

ServletRequestListener - Interface in javax.servlet
A ServletRequestListener can be implemented by the developer interested in being notified of requests coming in and out of scope in a web component.

ServletRequestWrapper - Class in javax.servlet
Provides a convenient implementation of the ServletRequest interface that can be subclassed by developers wishing to adapt the request to a Servlet.

ServletRequestWrapper(ServletRequest) - Constructor for class javax.servlet.ServletRequestWrapper
Creates a ServletRequest adaptor wrapping the given request object.

ServletResponse - Interface in javax.servlet
Defines an object to assist a servlet in sending a response to the client.

ServletResponseWrapper - Class in javax.servlet
Provides a convenient implementation of the ServletResponse interface that can be subclassed by developers wishing to adapt the response from a Servlet.

ServletResponseWrapper(ServletResponse) - Constructor for class javax.servletServletResponseWrapper
Creates a ServletResponse adaptor wrapping the given response object.

ServletStats - Interface in javax.management.j2ee.statistics
Specifies the statistics provided by a Servlet.

Session - Interface in javax.jms
A Session object is a single-threaded context for producing and consuming messages.

session - Variable in class javax.mail.Message
The Session object for this Message

session - Variable in class javax.mail.Service
The session from which this service was created.

Session - Class in javax.mail
The Session class represents a mail session and is not subclassed.

SESSION - Static variable in class javax.servlet.jsp.PageContext
Name used to store HttpSession in PageContext name table.

SESSION_MAINTAIN_PROPERTY - Static variable in interface javax.xml.rpc.Call
Standard property: This boolean property is used by a service client to indicate whether or not it wants to participate in a session with a service endpoint.

SESSION_MAINTAIN_PROPERTY - Static variable in interface
javax.xml.rpc.Stub
Standard property: This boolean property is used by a service client to indicate whether or not it wants to participate in a session with a service endpoint.

SESSION_MAINTAIN_PROPERTY - Static variable in interface javax.xml.ws.BindingProvider
Standard property: This boolean property is used by a service client to indicate whether or not it wants to participate in a session with a service endpoint.

SESSION_SCOPE - Static variable in class javax.servlet.jsp.PageContext
Session scope (only valid if this page participates in a session): the named reference remains available from the HttpSession (if any) associated with the Servlet until the HttpSession is invalidated.

SESSION_TRANSACTED - Static variable in interface javax.jms.Session
This value is returned from the method getAcknowledgeMode if the session is transacted.

SessionBean - Interface in javax.ejb
The SessionBean interface is implemented by every session enterprise Bean class.

SessionBeanStats - Interface in javax.management.j2ee.statistics
Specifies the statistics provided by session beans of both stateful and stateless types.

SessionContext - Interface in javax.ejb
The SessionContext interface provides access to the runtime session context that the container provides for a session enterprise Bean instance.

sessionCreated(HttpSessionEvent) - Method in interface javax.servlet.http.HttpSessionListener
Notification that a session was created.

sessionDestroyed(HttpSessionEvent) - Method in interface javax.servlet.http.HttpSessionListener
Notification that a session is about to be invalidated.

sessionDidActivate(HttpSessionEvent) - Method in interface javax.servlet.http.HttpSessionActivationListener
Notification that the session has just been activated.

SessionSynchronization - Interface in javax.ejb
The SessionSynchronization interface allows a session Bean instance to be notified by its container of transaction boundaries.

sessionWillPassivate(HttpSessionEvent) - Method in interface javax.servlet.http.HttpSessionActivationListener
Notification that the session is about to be passivated.

set(String, String) - Method in class javax.activation.MimeTypeParameterList
Set the value to be associated with the given name, replacing any previous association.

set(String, String) - Method in class javax.mail.internet.ParameterList
Set a parameter.

**set(String, String, String)** - Method in class
javax.mail.internet.*ParameterList*

Set a parameter.

**set** - Variable in class javax.mail.search.*FlagTerm*
Indicates whether to test for the presence or absence of the specified Flag.

**setAccept(String)** - Method in class
javax.faces.component.html.*HtmlForm*
Set the value of the accept property.

**setAcceptcharset(String)** - Method in class
javax.faces.component.html.*HtmlForm*
Set the value of the acceptcharset property.

**setAccesskey(String)** - Method in class
javax.faces.component.html.*HtmlCommandButton*
Set the value of the accesskey property.

**setAccesskey(String)** - Method in class
javax.faces.component.html.*HtmlCommandLink*
Set the value of the accesskey property.

**setAccesskey(String)** - Method in class
javax.faces.component.html.*HtmlInputSecret*
Set the value of the accesskey property.

**setAccesskey(String)** - Method in class
javax.faces.component.html.*HtmlInputText*
Set the value of the accesskey property.

**setAccesskey(String)** - Method in class
javax.faces.component.html.*HtmlInputTextarea*
Set the value of the accesskey property.

**setAccesskey(String)** - Method in class
javax.faces.component.html.*HtmlOutputLabel*
Set the value of the accesskey property.

**setAccesskey(String)** - Method in class
javax.faces.component.html.*HtmlOutputLink*
Set the value of the accesskey property.

**setAccesskey(String)** - Method in class
javax.faces.component.html.*HtmlSelectBooleanCheckbox*
Set the value of the accesskey property.

**setAccesskey(String)** - Method in class
javax.faces.component.html.*HtmlSelectManyCheckbox*
Set the value of the accesskey property.

**setAccesskey(String)** - Method in class
javax.faces.component.html.*HtmlSelectManyListbox*
Set the value of the accesskey property.

**setAccesskey(String)** - Method in class
javax.faces.component.html.*HtmlSelectManyMenu*
Set the value of the accesskey property.

**setAccesskey(String)** - Method in class
javax.faces.component.html.*HtmlSelectOneListbox*
Set the value of the accesskey property.
javax.faces.component.html.HtmlSelectOneMenu

- Set the value of the accesskey property.

`setAccesskey(String)` - Method in class

javax.faces.component.html.HtmlSelectOneRadio

- Set the value of the accesskey property.

`setAccessURI(String)` - Method in interface

javax.xml.registry.infomodel.ServiceBinding

- Sets the URI that gives access to the service via this binding.

`setaction(MethodBinding)` - Method in interface

javax.faces.component.ActionSource

- Deprecated. This has been replaced by

`setaction(MethodBinding)` - Method in class

javax.faces.component.UICommand

- Deprecated. This has been replaced by

`setactionExpression(MethodExpression)` - Method in interface

javax.faces.component.ActionSource2

- Set the `MethodExpression` pointing at the application action to be invoked, if this `UIComponent` is activated by the user, during the Apply Request Values or Invoke Application phase of the request processing lifecycle, depending on the value of the immediate property.

`setactionExpression(MethodExpression)` - Method in class

javax.faces.component.UICommand

`setActionListener(ActionListener)` - Method in class

javax.faces.application.Application

- Set the default `ActionListener` to be registered for all `ActionSource` components.

`setactionListener(MethodBinding)` - Method in interface

javax.faces.component.ActionSource

- Deprecated. This has been replaced by

`setactionListener(MethodBinding)` - Method in class

javax.faces.component.UICommand

- Deprecated. This has been replaced by

`setActor(String)` - Method in interface

javax.xml.soap.SOAPHeaderElement

- Sets the actor associated with this SOAPHeaderElement object to the specified actor.

`setaapter(XmlAdapter)` - Method in class

javax.xml.bind.helpers.AbstractMarshallerImpl

`setAdapter(Class<A>, A)` - Method in class

javax.xml.bind.helpers.AbstractMarshallerImpl

`setaapter(XmlAdapter)` - Method in class

javax.xml.bind.helpers.AbstractUnmarshallerImpl
**setAdapter(Class<A>, A)** - Method in class
javax.xml.bind.helpers.*AbstractUnmarshallerImpl*

**setAdapter(XmlAdapter)** - Method in interface
javax.xml.bind.*Marshaller*
Associates a configured instance of *XmlAdapter* with this marshaller.

**setAdapter(Class<A>, A)** - Method in interface
javax.xml.bind.*Marshaller*
Associates a configured instance of *XmlAdapter* with this marshaller.

**setAdapter(XmlAdapter)** - Method in interface
javax.xml.bind.*Unmarshaller*
Associates a configured instance of *XmlAdapter* with this unmarshaller.

**setAdapter(Class<A>, A)** - Method in interface
javax.xml.bind.*Unmarshaller*
Associates a configured instance of *XmlAdapter* with this unmarshaller.

**setAddress(String)** - Method in class
javax.mail.internet.*InternetAddress*
Set the email address.

**setAddress(String)** - Method in interface
javax.xml.registry.infomodel.*EmailAddress*
Sets the email address for this object.

**setAfterPhaseListener(MethodExpression)** - Method in class
javax.faces.component.*UIViewRoot*
Allow an arbitrary method to be called for the "afterPhase" event as the UIViewRoot runs through its lifecycle.

**setAlt(String)** - Method in class
javax.faces.component.html.*HtmlCommandButton*
Set the value of the alt property.

**setAlt(String)** - Method in class
javax.faces.component.html.*HtmlGraphicImage*
Set the value of the alt property.

**setAlt(String)** - Method in class
javax.faces.component.html.*HtmlInputSecret*
Set the value of the alt property.

**setAlt(String)** - Method in class
javax.faces.component.html.*HtmlInputText*
Set the value of the alt property.

**setApplication(Application)** - Method in class
javax.faces.application.*ApplicationFactory*
Replace the *Application* instance that will be returned for this web application.

**setAreaCode(String)** - Method in interface
javax.xml.registry.infomodel.*TelephoneNumber*
Sets the area code.

**setAssociations(Collection)** - Method in interface
Replaces all previous Associations from this object with specified Associations.

**setAssociationType(Concept)** - Method in interface `javax.xml.registry.infomodel.Association`
Sets the association type for this Association.

**setAttachmentMarshaller(AttachmentMarshaller)** - Method in class `javax.xml.bind.helpers.AbstractMarshallerImpl`
Associate a context that enables binary data within an XML document to be transmitted as XML-binary optimized attachment.

**setAttachmentUnmarshaller(AttachmentUnmarshaller)** - Method in class `javax.xml.bind.helpers.AbstractUnmarshallerImpl`
Associate a context that resolves cid's, content-id URIs, to binary data passed as attachments.

**setAttribute(ObjectName, Attribute)** - Method in interface `javax.management.j2ee.Management`
Sets the value of a specific attribute of a named managed object.

**setAttribute(String, Object)** - Method in interface `javax.servlet.http.HttpSession`
Binds an object to this session, using the name specified.

**setAttribute(String, Object)** - Method in class `javax.servlet.jsp.JspContext`
Register the name and value specified with page scope semantics.

**setAttribute(String, Object, int)** - Method in class `javax.servlet.jsp.JspContext`
Register the name and value specified with appropriate scope semantics.

**setAttribute(String, Object)** - Method in class `javax.servlet.jsp.tagext.TagData`
Set the value of an attribute.

**setAttribute(String, Object)** - Method in interface `javax.servlet.ServletContext`
Binds an object to a given attribute name in this servlet context.

**setAttribute(String, Object)** - Method in interface `javax.servlet.HttpServletRequest`
Stores an attribute in this request.

**setAttribute(String, Object)** - Method in class `javax.servlet.HttpServletRequestWrapper`
The default behavior of this method is to return `setAttribute(String name, Object o)` on the wrapped request object.
**setAttributes(ObjectName, AttributeList)** - Method in interface `javax.management.j2ee.Management`
Sets the values of several attributes of a named managed object.

**setAutocomplete(String)** - Method in class `javax.faces.component.html.HtmlInputSecret`
Set the value of the autocomplete property.

**setAutocomplete(String)** - Method in class `javax.faces.component.html.HtmlInputText`
Set the value of the autocomplete property.

**setBase64Content(InputStream, String)** - Method in class `javax.xml.soap.AttachmentPart`
Sets the content of this attachment part from the Base64 source InputStream and sets the value of the Content-Type header to the value contained in contentType, This method would first decode the base64 input and write the resulting raw bytes to the attachment.

**setBeforePhaseListener(MethodExpression)** - Method in class `javax.faces.component.UIViewRoot`
Allow an arbitrary method to be called for the "beforePhase" event as the UIViewRoot runs through its lifecycle.

**setBgcolor(String)** - Method in class `javax.faces.component.html.HtmlDataTable`
Set the value of the bgcolor property.

**setBgcolor(String)** - Method in class `javax.faces.component.html.HtmlPanelGrid`
Set the value of the bgcolor property.

**setBinding(String)** - Method in class `javax.faces.webapp.ConverterTag`
Deprecated. Set the expression that will be used to create a `ValueExpression` that references a backing bean property of the `Converter` instance to be created.

**setBinding(ValueExpression)** - Method in class `javax.faces.webapp.UIComponentELTag`
Set the value expression for our component.

**setBinding(String)** - Method in class `javax.faces.webapp.UIComponentTag`
Deprecated. Set the value binding expression for our component.

**setBinding(String)** - Method in class `javax.faces.webapp.ValidatorTag`
Deprecated. Set the expression that will be used to create a `ValueExpression` that references a backing bean property of the `Validator` instance to be created.

**setBodyContent(BodyContent)** - Method in class `javax.faces.webapp.UIComponentClassicTagBase`
Set the `bodyContent` for this tag handler.

**setBodyContent(BodyContent)** - Method in class `javax.servlet.jsp.tagext.BodyTag`
Set the `bodyContent` property.

**setBodyContent(BodyContent)** - Method in class
javax.servlet.jsp.tagext.**BodyTagSupport**

Prepare for evaluation of the body: stash the bodyContent away.

`setBoolean(String, boolean)` - Method in interface javax.jms.**MapMessage**

Sets a boolean value with the specified name into the Map.

`setBooleanProperty(String, boolean)` - Method in interface javax.jms.**Message**

Sets a boolean property value with the specified name into the message.

`setBorder(int)` - Method in class javax.faces.component.html.**HtmlDataTable**

Set the value of the border property.

`setBorder(int)` - Method in class javax.faces.component.html.**HtmlPanelGrid**

Set the value of the border property.

`setBorder(int)` - Method in class javax.faces.component.html.**HtmlSelectManyCheckbox**

Set the value of the border property.

`setBorder(int)` - Method in class javax.faces.component.html.**HtmlSelectOneRadio**

Set the value of the border property.

`setBufferSize(int)` - Method in interface javax.servlet.**ServletResponse**

Sets the preferred buffer size for the body of the response.

`setBufferSize(int)` - Method in class javax.servlet.**ServletResponseWrapper**

The default behavior of this method is to call `setBufferSize(int size)` on the wrapped response object.

`setBuilder(DocumentBuilder)` - Method in interface javax.xml.bind.annotation.**W3CDomHandler**

`setByte(String, byte)` - Method in interface javax.jms.**MapMessage**

Sets a byte value with the specified name into the Map.

`setByteProperty(String, byte)` - Method in interface javax.jms.**Message**

Sets a byte property value with the specified name into the message.

`setBytes(String, byte[])` - Method in interface javax.jms.**MapMessage**

Sets a byte array value with the specified name into the Map.

`setBytes(String, byte[], int, int)` - Method in interface javax.jms.**MapMessage**

Sets a portion of the byte array value with the specified name into the Map.

`setCalendar(Calendar)` - Method in class javax.mail.internet.**MailDateFormat**

Don't allow setting the calendar.

`setCaptionClass(String)` - Method in class javax.faces.component.html.**HtmlDataTable**

Set the value of the captionClass property.

`setCaptionClass(String)` - Method in class
javax.faces.component.html.HtmlPanelGrid
Set the value of the captionClass property.

setCaptionStyle(String) - Method in class
javax.faces.component.html.HtmlDataTable
Set the value of the captionStyle property.

setCaptionStyle(String) - Method in class
javax.faces.component.html.HtmlPanelGrid
Set the value of the captionStyle property.

setCellpadding(String) - Method in class
javax.faces.component.html.HtmlDataTable
Set the value of the cellpadding property.

setCellpadding(String) - Method in class
javax.faces.component.html.HtmlPanelGrid
Set the value of the cellpadding property.

setCellspacing(String) - Method in class
javax.faces.component.html.HtmlDataTable
Set the value of the cellspacing property.

setCellspacing(String) - Method in class
javax.faces.component.html.HtmlPanelGrid
Set the value of the cellspacing property.

setChangeEvent(PropertyChangeEvent) - Method in class
javax.enterprise.deploy.model.XpathEvent

setChar(String, char) - Method in interface javax.jms.MapMessage
Sets a Unicode character value with the specified name into the Map.

setCharacterEncoding(String) - Method in interface
javax.servlet.ServletRequest
Overrides the name of the character encoding used in the body of this request.

setCharacterEncoding(String) - Method in class
javax.servlet.ServletRequestWrapper
The default behavior of this method is to set the character encoding on the wrapped request object.

setCharacterEncoding(String) - Method in interface
javax.servlet.ServletResponse
Sets the character encoding (MIME charset) of the response being sent to the client, for example, to UTF-8.

setCharacterEncoding(String) - Method in class
javax.servlet.ServletResponseWrapper
The default behavior of this method is to call setCharacterEncoding(String charset) on the wrapped response object.

setCharset(String) - Method in class
javax.faces.component.html.HtmlCommandLink
Set the value of the charset property.

setCharset(String) - Method in class
javax.faces.component.html.HtmlOutputLink
Set the value of the charset property.

setCharsetName(String) - Method in interface
javax.xml.registry.infomodel.LocalizedString
Set the canonical name for the charset for this object.

setCity(String) - Method in interface
javax.xml.registry.infomodel.PostalAddress
Sets the city.

setClassifications(Collection) - Method in interface
javax.xml.registry.infomodel.RegistryObject
Replaces all previous Classifications with specified
Classifications.

setClassificationScheme(ClassificationScheme) - Method in interface
javax.xml.registry.infomodel.Classification
Sets the ClassificationScheme for this external classification.

setClassifiedObject(RegistryObject) - Method in interface
javax.xml.registry.infomodel.Classification
Sets the object that is being classified.

setClientID(String) - Method in interface javax.jms.Connection
Sets the client identifier for this connection.

setCols(int) - Method in class
javax.faces.component.html.HtmlInputTextarea
Set the value of the cols property.

setColumnClasses(String) - Method in class
javax.faces.component.html.HtmlDataTable
Set the value of the columnClasses property.

setColumnClasses(String) - Method in class
javax.faces.component.html.HtmlPanelGrid
Set the value of the columnClasses property.

setColumnNumber(int) - Method in class
javax.xml.bind.helpers.ValidationEventLocatorImpl
Set the columnNumber field on this event locator.

setColumns(int) - Method in class
javax.faces.component.html.HtmlPanelGrid
Set the value of the columns property.

setCommandContext(String, DataHandler) - Method in interface
javax.activation.CommandObject
Initialize the Command with the verb it is requested to handle
and the DataHandler that describes the data it will operate on.

setCommandMap(CommandMap) - Method in class
javax.activation.DataHandler
Set the CommandMap for use by this DataHandler.

setComment(String) - Method in class javax.servlet.http.Cookie
Specifies a comment that describes a cookie's purpose.

setConcept(Concept) - Method in interface
javax.xml.registry.infomodel.Classification
Sets the concept for this internal classification.

setConnected(boolean) - Method in class javax.mail.Service
Set the connection state of this service.

setConnectionHandle(Object) - Method in class
javax.resource.spi.ConnectionEvent
Set the connection handle.

setContent(Object, String) - Method in class
A convenience method for setting this body part's content.

**setContent(Multipart)** - Method in class

This method sets the body part's content to a Multipart object.

**setContent(Object, String)** - Method in class

A convenience method for setting this Message's content.

**setContent(Multipart)** - Method in class

This method sets the Message's content to a Multipart object.

**setContent(Object, String)** - Method in interface javax.mail.Part

A convenience method for setting this part's content.

**setContent(Multipart)** - Method in interface javax.mail.Part

This method sets the given Multipart object as this message's content.

**setContent(Object, String)** - Method in class

Sets the content of this attachment part to that of the given Object and sets the value of the Content-Type header to the given type.

**setContent(Source)** - Method in class javax.xml.soap.SOAPPart

Sets the content of the SOAPEnvelop object with the data from the given Source object.

**setContentDescription(String)** - Method in class

Sets the description of this SOAPMessage object's content with the given description.

**setContentID(String)** - Method in class

Set the "Content-ID" header field of this body part.

**setContentID(String)** - Method in class

Set the "Content-ID" header field of this Message.

**setContentID(String)** - Method in class

Sets the MIME header whose name is "Content-ID" with the given value.

**setContentLanguage(String[])** - Method in class

Set the Content-Language header of this MimePart.

**setContentLanguage(String[])** - Method in class

Set the "Content-Language" header of this MimePart.

**setContentLanguage(String[])** - Method in interface

Set the Content-Language header of this MimePart.
**setContentType(String)** - Method in interface
javax.servlet.
Sets the content type of the response being sent to the client, if the response has not been committed yet.

**setContentType(String)** - Method in class
javax.servlet.
The default behavior of this method is to call
setContentType(String type) on the wrapped response object.

**setContentType(String)** - Method in class
javax.xml.soap.
Sets the MIME header whose name is "Content-Type" with the given value.

**setContextID(String)** - Static method in class
javax.security.jacc.
Authorization protected method used to modify the value of the policy context identifier associated with the thread on which this method is called.

**setConverter(Converter)** - Method in class
javax.faces.component.
Set the Converter (if any) that is registered for this UIComponent.

**setConverterId(String)** - Method in class
javax.faces.component.

javax.faces.webapp.ConverterTag
   Deprecated. Set the identifier of the Converter instance to be created.

setConverterMessage(String) - Method in class
   javax.faces.component.UIInput
   Override any ValueExpression set for the "converterMessage"
   with the literal argument provided to this method.

setCoords(String) - Method in class
   javax.faces.component.html.HtmlCommandLink
   Set the value of the coords property.

setCoords(String) - Method in class
   javax.faces.component.html.HtmlOutputLink
   Set the value of the coords property.

setCountry(String) - Method in interface
   javax.xml.registry.infomodel.PostalAddress
   Sets the country.

setCountryCode(String) - Method in interface
   javax.xml.registry.infomodel.TelephoneNumber
   Sets country code.

setCredentials(Set) - Method in interface
   javax.xml.registry.Connection
   Sets the Credentials associated with this client.

setCurrencyCode(String) - Method in class
   javax.faces.convert.NumberConverter
   Set the ISO 4217 currency code used by getAsString() with a
   type of currency.

setCurrencySymbol(String) - Method in class
   javax.faces.convert.NumberConverter
   Set the currency symbol used by getAsString() with a type of
   currency.

setCurrentInstance(FacesContext) - Static method in class
   javax.faces.context.FacesContext
   Set the FacesContext instance for the request that is being
   processed by the current thread.

setDataContentHandlerFactory(DataContentHandlerFactory) - Static
   method in class javax.activation.DataHandler
   Sets the DataContentHandlerFactory.

setDataHandler(DataHandler) - Method in class
   javax.mail.internet.MimeBodyPart
   This method provides the mechanism to set this body part's
   content.

setDataHandler(DataHandler) - Method in class
   javax.mail.internet.MimeMessage
   This method provides the mechanism to set this part's content.

setDataHandler(DataHandler) - Method in interface javax.mail.Part
   This method provides the mechanism to set this part's content.

setDataHandler(DataHandler) - Method in class
   javax.xml.soap.AttachmentPart
   Sets the given DataHandler object as the data handler for this
   AttachmentPart object.
**setDataModel(DataModel)** - Method in class javax.faces.component.UIData
   Set the internal DataModel.

**setDatatypeConverter(DatatypeConverterInterface)** - Static method in class javax.xml.bind.DatatypeConverter
   This method is for JAXB provider use only.

**setDateHeader(String, long)** - Method in interface javax.servlet.http.HttpServletRequest
   Sets a response header with the given name and date-value.

**setDateHeader(String, long)** - Method in class javax.servlet.http.HttpServletResponseWrapper
   The default behavior of this method is to call 
   setDateHeader(String name, long date) on the wrapped response object.

**setDateStyle(String)** - Method in class javax.faces.convert.DateTimeConverter
   Set the style to be used to format or parse dates.

**setDConfigBeanVersion(DConfigBeanVersionType)** - Method in interface javax.enterprise.deploy.spi.DeploymentManager
   Set the configuration beans to be used to the J2EE platform version specified.

**setDebug(boolean)** - Method in class javax.mail.Session
   Set the debug setting for this Session.

**setDebugOut(PrintStream)** - Method in class javax.mail.Session
   Set the stream to be used for debugging output for this session.

**setDefaultCommandMap(CommandMap)** - Static method in class javax.activation.CommandMap
   Set the default CommandMap.

**setDefaultFactory(JspFactory)** - Static method in class javax.servlet.jsp.JspFactory
   Set the default factory for this implementation.

**setDefaultFileTypeMap(FileTypeMap)** - Static method in class javax.activation.FileTypeMap
   Sets the default FileTypeMap for the system.

**setDefaultLocale(Locale)** - Method in class javax.faces.application.Application
   Set the default Locale for this application.

**setDefaultNamespace(String)** - Method in interface javax.xml.stream.XMLEventWriter
   Binds a URI to the default namespace This URI is bound in the 
   scope of the current START_ELEMENT / END_ELEMENT pair.

**setDefaultNamespace(String)** - Method in interface javax.xml.stream.XMLStreamWriter
   Binds a URI to the default namespace This URI is bound in the 
   scope of the current START_ELEMENT / END_ELEMENT pair.

**setDefaultRenderKitId(String)** - Method in class javax.faces.application.Application
   Set the renderKitId to be used to render this application.

**setDeliveryMode(int)** - Method in interface

---

**setDataModel(DataModel)** - Method in class javax.faces.component.UIData
   Set the internal DataModel.

**setDatatypeConverter(DatatypeConverterInterface)** - Static method in class javax.xml.bind.DatatypeConverter
   This method is for JAXB provider use only.

**setDateHeader(String, long)** - Method in interface javax.servlet.http.HttpServletRequest
   Sets a response header with the given name and date-value.

**setDateHeader(String, long)** - Method in class javax.servlet.http.HttpServletResponseWrapper
   The default behavior of this method is to call 
   setDateHeader(String name, long date) on the wrapped response object.

**setDateStyle(String)** - Method in class javax.faces.convert.DateTimeConverter
   Set the style to be used to format or parse dates.

**setDConfigBeanVersion(DConfigBeanVersionType)** - Method in interface javax.enterprise.deploy.spi.DeploymentManager
   Set the configuration beans to be used to the J2EE platform version specified.

**setDebug(boolean)** - Method in class javax.mail.Session
   Set the debug setting for this Session.

**setDebugOut(PrintStream)** - Method in class javax.mail.Session
   Set the stream to be used for debugging output for this session.

**setDefaultCommandMap(CommandMap)** - Static method in class javax.activation.CommandMap
   Set the default CommandMap.

**setDefaultFactory(JspFactory)** - Static method in class javax.servlet.jsp.JspFactory
   Set the default factory for this implementation.

**setDefaultFileTypeMap(FileTypeMap)** - Static method in class javax.activation.FileTypeMap
   Sets the default FileTypeMap for the system.

**setDefaultLocale(Locale)** - Method in class javax.faces.application.Application
   Set the default Locale for this application.

**setDefaultNamespace(String)** - Method in interface javax.xml.stream.XMLEventWriter
   Binds a URI to the default namespace This URI is bound in the 
   scope of the current START_ELEMENT / END_ELEMENT pair.

**setDefaultNamespace(String)** - Method in interface javax.xml.stream.XMLStreamWriter
   Binds a URI to the default namespace This URI is bound in the 
   scope of the current START_ELEMENT / END_ELEMENT pair.

**setDefaultRenderKitId(String)** - Method in class javax.faces.application.Application
   Set the renderKitId to be used to render this application.

**setDeliveryMode(int)** - Method in interface
javax.jms.**MessageProducer**
Sets the producer's default delivery mode.

**setDescription(String)** - Method in class

javax.faces.model.**SelectItem**
Set the description of this item, for use in development tools.

**setDescription(String)** - Method in class

javax.mail.internet.**MimeBodyPart**
Set the "Content-Description" header field for this body part.

**setDescription(String, String)** - Method in class

javax.mail.internet.**MimeBodyPart**
Set the "Content-Description" header field for this body part.

**setDescription(String)** - Method in class

javax.mail.internet.**MimeMessage**
Set the "Content-Description" header field for this Message.

**setDescription(String, String)** - Method in class

javax.mail.internet.**MimeMessage**
Set the "Content-Description" header field for this Message.

**setDescription(String)** - Method in class

javax.mail.internet.**Part**
Set a description String for this part.

**setDescription(InternationalString)** - Method in class

javax.xml.registry.infomodel.**RegistryObject**
Sets the context independent textual description for this object.

**setDetail(String)** - Method in class

javax.faces.application.**FacesMessage**
Set the localized detail text.

**setDir(String)** - Method in class

javax.faces.component.html.**HtmlCommandButton**
Set the value of the dir property.

**setDir(String)** - Method in class

javax.faces.component.html.**HtmlCommandLink**
Set the value of the dir property.

**setDir(String)** - Method in class

javax.faces.component.html.**HtmlDataTable**
Set the value of the dir property.

**setDir(String)** - Method in class

javax.faces.component.html.**HtmlForm**
Set the value of the dir property.

**setDir(String)** - Method in class

javax.faces.component.html.**HtmlGraphicImage**
Set the value of the dir property.

**setDir(String)** - Method in class

javax.faces.component.html.**HtmlInputSecret**
Set the value of the dir property.

**setDir(String)** - Method in class

javax.faces.component.html.**HtmlInputText**
Set the value of the dir property.

**setDir(String)** - Method in class

javax.faces.component.html.**HtmlInputTextarea**
Set the value of the dir property.
**setDir(String)** - Method in class
javax.faces.component.html.HtmlMessage
Set the value of the dir property.

**setDir(String)** - Method in class
javax.faces.component.html.HtmlMessages
Set the value of the dir property.

**setDir(String)** - Method in class
javax.faces.component.html.HtmlOutputFormat
Set the value of the dir property.

**setDir(String)** - Method in class
javax.faces.component.html.HtmlOutputLabel
Set the value of the dir property.

**setDir(String)** - Method in class
javax.faces.component.html.HtmlOutputLink
Set the value of the dir property.

**setDir(String)** - Method in class
javax.faces.component.html.HtmlOutputText
Set the value of the dir property.

**setDir(String)** - Method in class
javax.faces.component.html.HtmlPanelGrid
Set the value of the dir property.

**setDir(String)** - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
Set the value of the dir property.

**setDir(String)** - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
Set the value of the dir property.

**setDir(String)** - Method in class
javax.faces.component.html.HtmlSelectManyListbox
Set the value of the dir property.

**setDir(String)** - Method in class
javax.faces.component.html.HtmlSelectManyMenu
Set the value of the dir property.

**setDir(String)** - Method in class
javax.faces.component.html.HtmlSelectOneListbox
Set the value of the dir property.

**setDir(String)** - Method in class
javax.faces.component.html.HtmlSelectOneMenu
Set the value of the dir property.

**setDir(String)** - Method in class
javax.faces.component.html.HtmlSelectOneRadio
Set the value of the dir property.

**setDisabled(boolean)** - Method in class
javax.faces.component.html.HtmlCommandButton
Set the value of the disabled property.

**setDisabled(boolean)** - Method in class
javax.faces.component.html.HtmlCommandLink
Set the value of the disabled property.

**setDisabled(boolean)** - Method in class
javax.faces.component.html.HtmlInputSecret
Set the value of the disabled property.  
**setDisabled(boolean)** - Method in class  
javax.faces.component.html.HtmlInputText  
Set the value of the disabled property.  
**setDisabled(boolean)** - Method in class  
javax.faces.component.html.HtmlInputTextarea  
Set the value of the disabled property.  
**setDisabled(boolean)** - Method in class  
javax.faces.component.html.HtmlOutputLink  
Set the value of the disabled property.  
**setDisabled(boolean)** - Method in class  
javax.faces.component.html.HtmlSelectBooleanCheckbox  
Set the value of the disabled property.  
**setDisabled(boolean)** - Method in class  
javax.faces.component.html.HtmlSelectManyCheckbox  
Set the value of the disabled property.  
**setDisabled(boolean)** - Method in class  
javax.faces.component.html.HtmlSelectManyListbox  
Set the value of the disabled property.  
**setDisabled(boolean)** - Method in class  
javax.faces.component.html.HtmlSelectManyMenu  
Set the value of the disabled property.  
**setDisabled(boolean)** - Method in class  
javax.faces.component.html.HtmlSelectOneListbox  
Set the value of the disabled property.  
**setDisabled(boolean)** - Method in class  
javax.faces.component.html.HtmlSelectOneMenu  
Set the value of the disabled property.  
**setDisabled(boolean)** - Method in class  
javax.faces.component.html.HtmlSelectOneRadio  
Set the value of the disabled property.  
Set the disabled flag for this item, which should modify the rendered output to make this item unavailable for selection by the user if set to true.  
**setDisabledClass(String)** - Method in class  
javax.faces.component.html.HtmlSelectManyCheckbox  
Set the value of the disabledClass property.  
**setDisabledClass(String)** - Method in class  
javax.faces.component.html.HtmlSelectManyListbox  
Set the value of the disabledClass property.  
**setDisabledClass(String)** - Method in class  
javax.faces.component.html.HtmlSelectManyMenu  
Set the value of the disabledClass property.  
**setDisabledClass(String)** - Method in class  
javax.faces.component.html.HtmlSelectOneListbox  
Set the value of the disabledClass property.  
**setDisabledClass(String)** - Method in class  
javax.faces.component.html.HtmlSelectOneMenu  
Set the value of the disabledClass property.  
**setDisabledClass(String)** - Method in class  
javax.faces.component.html.HtmlSelectOneMenu
**setDisabledClass(String)** - Method in class
javax.faces.component.html.HtmlSelectOneRadio
Set the value of the disabledClass property.

**setDisableMessageID(boolean)** - Method in interface
javax.jms.MessageProducer
Sets whether message IDs are disabled.

**setDisableMessageTimestamp(boolean)** - Method in interface
javax.jms.MessageProducer
Sets whether message timestamps are disabled.

**setDisposition(String)** - Method in class
javax.mail.internet.ContentDisposition
Set the disposition.

**setDisposition(String)** - Method in class
javax.mail.internet.MimeBodyPart
Set the "Content-Disposition" header field of this body part.

**setDisposition(String)** - Method in class
javax.mail.internet.MimeMessage
Set the "Content-Disposition" header field of this Message.

**setDisposition(String)** - Method in interface javax.mail.Part
Set the disposition of this part.

**setDomain(String)** - Method in class javax.servlet.http.Cookie
Specifies the domain within which this cookie should be presented.

**setDouble(String, double)** - Method in interface
javax.jms.MapMessage
Sets a double value with the specified name into the Map.

**setDoubleProperty(String, double)** - Method in interface
javax.jms.Message
Sets a double property value with the specified name into the message.

**setDynamicAttribute(String, String, Object)** - Method in interface
javax.servlet.jsp.tagext.DynamicAttributes
Called when a tag declared to accept dynamic attributes is passed an attribute that is not declared in the Tag Library Descriptor.

**setElementQName(QName)** - Method in interface
javax.xml.soap.SOAPElement
Changes the name of this Element to newName if possible.

**setEmailAddresses(Collection)** - Method in interface
javax.xml.registry.infomodel.User
Sets the Collection of EmailAddress instances for this User.

**setEnabledClass(String)** - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
Set the value of the enabledClass property.

**setEnabledClass(String)** - Method in class
javax.faces.component.html.HtmlSelectManyListbox
Set the value of the enabledClass property.

**setEnabledClass(String)** - Method in class
javax.faces.component.html.HtmlSelectManyMenu
Set the value of the enabledClass property.
setEnabledClass(String) - Method in class
javax.faces.component.html.HtmSelectOneListbox
  Set the value of the enabledClass property.
setEnabledClass(String) - Method in class
javax.faces.component.html.HtmSelectOneMenu
  Set the value of the enabledClass property.
setEnabledClass(String) - Method in class
javax.faces.component.html.HtmSelectOneRadio
  Set the value of the enabledClass property.
setEncoding(String) - Method in class
javax.xml.bind.helpers.AbstractMarshallerImpl
  Convenience method for setting the output encoding.
setEncodingStyle(String) - Method in interface
javax.xml.soap.SOAPElement
  Sets the encoding style for this SOAPElement object to one specified.
setEncType(String) - Method in class
javax.faces.component.html.HtmForm
  Set the value of the encType property.
setEntityContext(EntityContext) - Method in interface
javax.ejb.EntityBean
  Set the associated entity context.
setErrorClass(String) - Method in class
javax.faces.component.html.HtmMessage
  Set the value of the errorClass property.
setErrorClass(String) - Method in class
javax.faces.component.html.HtmMessages
  Set the value of the errorClass property.
setErrorCode(String) - Method in exception
javax.resource.ResourceException
  Set the error code.
setErrorObjectKey(Key) - Method in exception
javax.xml.registry.RegistryException
  Sets the Key to the first object that encountered an error in the registry.
setErrorStyle(String) - Method in class
javax.faces.component.html.HtmMessage
  Set the value of the errorStyle property.
setErrorStyle(String) - Method in class
javax.faces.component.html.HtmMessages
  Set the value of the errorStyle property.
setEscape(boolean) - Method in class
javax.faces.component.html.HtmOutputFormat
  Set the value of the escape property.
setEscape(boolean) - Method in class
javax.faces.component.html.HtmOutputLabel
  Set the value of the escape property.
setEscape(boolean) - Method in class
javax.faces.component.html.HtmOutputText
  Set the value of the escape property.
**setEscape(boolean)** - Method in class `javax.faces.model.SelectItem`
  Setter for property escape.

**setEventAllocator(XMLEventAllocator)** - Method in class `javax.xml.stream.XMLInputFactory`
  Set a user defined event allocator for events.

**setEventHandler(ValidationEventHandler)** - Method in class `javax.xml.bind.Binder`
  Allow an application to register a ValidationEventHandler.

**setEventHandler(ValidationEventHandler)** - Method in class `javax.xml.bind.helpers.AbstractMarshallerImpl`

**setEventHandler(ValidationEventHandler)** - Method in class `javax.xml.bind.helpers.AbstractUnmarshallerImpl`

**setEventHandler(ValidationEventHandler)** - Method in interface `javax.xml.bind.Marerisher`
  Allow an application to register a validation event handler.

**setEventHandler(ValidationEventHandler)** - Method in interface `javax.xml.bind.Unmarshaller`
  Allow an application to register a validation event handler.

**setEventHandler(ValidationEventHandler)** - Method in interface `javax.xml.bind.Validator`
  Deprecated. since JAXB2.0

**setExceptionListener(ExceptionListener)** - Method in interface `javax.jms.Connection`
  Sets an exception listener for this connection.

**setExecutor(Executor)** - Method in class `javax.xml.ws.Endpoint`
  Sets the executor for this Endpoint instance.

**setExecutor(Executor)** - Method in class `javax.xml.ws.Service`
  Sets the executor for this Service instance.

**setExecutor(Executor)** - Method in class `javax.xml.ws.spi.ServiceDelegate`
  Sets the executor for this Service instance.

**setExpiration(Date)** - Method in interface `javax.xml.registry.infomodel.RegistryEntry`
  Sets the expirationDate.

**setExpunged(boolean)** - Method in class `javax.mail.Message`
  Sets the expunged flag for this Message.

**setExtension(String)** - Method in interface `javax.xml.registry.infomodel.TelephoneNumber`
  Sets the internal extension.

**setExternalIdentifiers(Collection)** - Method in interface `javax.xml.registry.infomodel.RegistryObject`
  Replaces all previous external identifiers with specified Collection of ExternalIdentifiers as an external identifier.

**setExternalLinks(Collection)** - Method in interface `javax.xml.registry.infomodel.RegistryObject`
  Replaces all previous ExternalLinks with specified ExternalLinks.

**setExternalURI(String)** - Method in interface
javax.xml.registry.infomodel.Externallink
Sets URI for an external resource.

**setFactory(String, String)** - Static method in class javax.faces.FactoryFinder
This method will store the argument factoryName/implName mapping in such a way that FactoryFinder.getFactory(java.lang.String) will find this mapping when searching for a match.

**setFatalClass(String)** - Method in class javax.faces.component.html.HtmlMessage
Set the value of the fatalClass property.

**setFatalClass(String)** - Method in class javax.faces.component.html.HtmlMessages
Set the value of the fatalClass property.

**setFatalStyle(String)** - Method in class javax.faces.component.html.HtmlMessage
Set the value of the fatalStyle property.

**setFatalStyle(String)** - Method in class javax.faces.component.html.HtmlMessages
Set the value of the fatalStyle property.

**setFaultActor(String)** - Method in interface javax.xml.soap.SOAPFault
Sets this SOAPFault object with the given fault actor.

**setFaultCode(Name)** - Method in interface javax.xml.soap.SOAPFault
Sets this SOAPFault object with the given fault code.

**setFaultCode(QName)** - Method in interface javax.xml.soap.SOAPFault
Sets this SOAPFault object with the given fault code.

**setFaultCode(String)** - Method in interface javax.xml.soap.SOAPFault
Sets this SOAPFault object with the given fault code.

**setFaultNode(String)** - Method in interface javax.xml.soap.SOAPFault
Creates or replaces any existing Node element value for this SOAPFault object.

**setFaultRole(String)** - Method in interface javax.xml.soap.SOAPFault
Creates or replaces any existing Role element value for this SOAPFault object.

**setFaultString(String)** - Method in interface javax.xml.soap.SOAPFault
Sets the fault string for this SOAPFault object to the given string.

**setFaultString(String, Locale)** - Method in interface javax.xml.soap.SOAPFault
Sets the fault string for this SOAPFault object to the given string and localized to the given locale.

**setFileName(String)** - Method in class javax.mail.internet.MimeBodyPart
Set the filename associated with this body part, if possible.

**setFileName(String)** - Method in class javax.mail.internet.MimeMessage
Set the filename associated with this part, if possible.

**setFileName(String)** - Method in interface javax.mail.Part
Set the filename associated with this part, if possible.

**setFileTypeMap(FileTypeMap)** - Method in class javax.activation.FileDataSource
Set the FileTypeMap to use with this FileDataSource

**setFirst(int)** - Method in class javax.faces.component.UIData
Set the zero-relative row number of the first row to be displayed.

**setFirstName(String)** - Method in interface javax.xml.registry.infomodel.PersonName
Sets the first name for this Person.

**setFirstResult(int)** - Method in interface javax.persistence.Query
Set the position of the first result to retrieve.

**setFlag(Flags.Flag, boolean)** - Method in class javax.mail.Message
Set the specified flag on this message to the specified value.

**setFlags(Message[], Flags, boolean)** - Method in class javax.mail.Folder
Set the specified flags on the messages specified in the array.

**setFlags(int, int, Flags, boolean)** - Method in class javax.mail.Folder
Set the specified flags on the messages numbered from start through end, both start and end inclusive.

**setFlags(int[], Flags, boolean)** - Method in class javax.mail.Folder
Set the specified flags on the messages whose message numbers are in the array.

**setFlags(Flags, boolean)** - Method in class javax.mail.internet.MimeMessage
Set the flags for this message.

**setFlags(Flags, boolean)** - Method in class javax.mail.Message
Set the specified flags on this message to the specified value.

**setFloat(String, float)** - Method in interface javax.jms.MapMessage
Sets a float value with the specified name into the Map.

**setFloatProperty(String, float)** - Method in interface javax.jms.Message
Sets a float property value with the specified name into the message.

**setFlushMode(FlushModeType)** - Method in interface javax.persistence.EntityManager
Set the flush mode that applies to all objects contained in the persistence context.

**setFlushMode(FlushModeType)** - Method in interface javax.persistence.Query
Set the flush mode type to be used for the query execution.

**setFooter(UIComponent)** - Method in class javax.faces.component.UIColumn
Set the footer facet of the column.

**setFooter(UIComponent)** - Method in class javax.faces.component.UIData
Set the footer facet of this component.

**setFooterClass(String)** - Method in class javax.faces.component.html.HtmlColumn
Set the value of the footerClass property.

**setFooterClass(String)** - Method in class
javax.faces.component.html.HtmlDataTable
  Set the value of the footerClass property.

**setFooterClass(String)** - Method in class
javax.faces.component.html.HtmlPanelGrid
  Set the value of the footerClass property.

**setFor(String)** - Method in class
javax.faces.component.html.HtmlOutputLabel
  Set the value of the for property.

**setFor(String)** - Method in class javax.faces.component.UIMessage
  Set the client identifier of the component for which this component represents associated message(s) (if any).

**setFormattedOutput(boolean)** - Method in class
javax.xml.bind.helpers.AbstractMarshallerImpl
  Convenience method for setting the formatted output flag.

**setFragment(boolean)** - Method in class
javax.xml.bind.helpers.AbstractMarshallerImpl
  Convenience method for setting the fragment flag.

**setFrame(String)** - Method in class
javax.faces.component.html.HtmlDataTable
  Set the value of the frame property.

**setFrame(String)** - Method in class
javax.faces.component.html.HtmlPanelGrid
  Set the value of the frame property.

**setFrom(Address)** - Method in class
javax.mail.internet.MimeMessage
  Set the RFC 822 "From" header field.

**setFrom()** - Method in class javax.mail.internet.MimeMessage
  Set the RFC 822 "From" header field using the value of the InternetAddress.getLocalAddress method.

**setFrom()** - Method in class javax.mail.Message
  Set the "From" attribute in this Message.

**setFrom(Address)** - Method in class javax.mail.Message
  Set the "From" attribute in this Message.

**setFullName(String)** - Method in interface
javax.xml.registry.infomodel.PersonName
  Sets the fully formatted name for this person.

**setGlobalOnly(boolean)** - Method in class
javax.faces.component.UIMessages
  Set the flag indicating whether only global messages (that is, messages with no associated client identifier) should be rendered.

**setGroupingUsed(boolean)** - Method in class
javax.faces.convert.NumberConverter
  Set the flag indicating whether getAsString() should include grouping separators if necessary.

**setHandlerChain(QName, List)** - Method in interface
javax.xml.rpc.handler.HandlerRegistry
  Sets the handler chain for the specified service endpoint as a java.util.List.
**setHandlerChain(List<Handler>)** - Method in interface `javax.xml.ws.Binding`  
Sets the handler chain for the protocol binding instance.

**setHandlerClass(Class)** - Method in class `javax.xml.rpc.handler.HandlerInfo`  
Sets the Handler class

**setHandlerConfig(Map)** - Method in class `javax.xml.rpc.handler.HandlerInfo`  
Sets the Handler configuration as `java.util.Map`

**setHandlerData(Object)** - Static method in class `javax.security.jacc.PolicyContext`  
Authorization protected method that may be used to associate a thread-scoped handler data object with the PolicyContext.

**setHandlerResolver(HandlerResolver)** - Method in class `javax.xml.ws.Service`  
Sets the `HandlerResolver` for this `Service` instance.

**setHandlerResolver(HandlerResolver)** - Method in class `javax.xml.ws.spi.ServiceDelegate`  
Sets the `HandlerResolver` for this `Service` instance.

**setHeader(UIComponent)** - Method in class `javax.faces.component.UIColumn`  
Set the header facet of the column.

**setHeader(UIComponent)** - Method in class `javax.faces.component.UIData`  
Set the header facet of this component.

**setHeader(String, String)** - Method in class `javax.mail.internet.InternetHeaders`  
Change the first header line that matches name to have value, adding a new header if no existing header matches.

**setHeader(String, String)** - Method in class `javax.mail.internet.MimeBodyPart`  
Set the value for this header name.

**setHeader(String, String)** - Method in class `javax.mail.internet.MimeMessage`  
Set the value for this header name.

**setHeader(String, String)** - Method in interface `javax.mail.Part`  
Set the value for this header name.

**setHeader(String, String)** - Method in interface `javax.servlet.http.HttpServletResponse`  
Sets a response header with the given name and value.

**setHeader(String, String)** - Method in class `javax.servlet.http.HttpServletResponseWrapper`  
The default behavior of this method is to return `setHeader(String name, String value)` on the wrapped response object.

**setHeader(String, String)** - Method in class `javax.xml.soap.MimeHeaders`  
Replaces the current value of the first header entry whose name matches the given name with the given value, adding a new header if no existing header name matches.
**setHeaderClass(String)** - Method in class javax.faces.component.html.HtmlColumn
Set the value of the headerClass property.

**setHeaderClass(String)** - Method in class javax.faces.component.html.HtmlDataTable
Set the value of the headerClass property.

**setHeaderClass(String)** - Method in class javax.faces.component.html.HtmlPanelGrid
Set the value of the headerClass property.

**setHeaders(QName[])** - Method in class javax.xml.rpc.handler.HandlerInfo
Sets the header blocks processed by this Handler.

**setHeight(String)** - Method in class javax.faces.component.html.HtmlGraphicImage
Set the value of the height property.

**setHint(String, Object)** - Method in interface javax.persistence.Query
Set an implementation-specific hint.

**setHost(String)** - Method in class javax.mail.internet.NewsAddress
Set the host.

**setHreflang(String)** - Method in class javax.faces.component.html.HtmlCommandLink
Set the value of the hreflang property.

**setHreflang(String)** - Method in class javax.faces.component.html.HtmlOutputLink
Set the value of the hreflang property.

**setHumanPresentableName(String)** - Method in class javax.activation.ActivationDataFlavor
Set the human presentable name.

**setId(String)** - Method in class javax.faces.component.UIComponent
Set the component identifier of this UIComponent (if any).

**setId(String)** - Method in class javax.faces.component.UIComponentBase

**setId(String)** - Method in class javax.faces.webapp.UIComponentClassicTagBase
Set the component identifier for our component.

**setId(String)** - Method in class javax.faces.webapp.UIComponentTagBase
Set the component identifier for the component corresponding to this tag instance.

**setId(String)** - Method in class javax.servlet.jsp.tagext.TagSupport
Set the id attribute for this tag.

**setId(String)** - Method in interface javax.xml.registry.infomodel.Key
Sets the unique id associated with this key.

**setIdentificationScheme(ClassificationScheme)** - Method in interface javax.xml.registry.infomodel.ExternalIdentifier
Sets the ClassificationScheme that is used as the identification scheme for identifying this object.
**setImage(String)** - Method in class
javax.faces.component.html.HtmCommandButton
Set the value of the image property.

**setImmediate(boolean)** - Method in interface
javax.faces.component.ActionSource
Set the "immediate execution" flag for this UIComponent.

**setImmediate(boolean)** - Method in interface
javax.faces.componentEditableValueHolder
Set the "immediate" state for this component.

**setImmediate(boolean)** - Method in class
javax.faces.component.UICommand

**setImmediate(boolean)** - Method in class
javax.faces.component.UIInput

**setInfoClass(String)** - Method in class
javax.faces.component.html.HtmMessage
Set the value of the infoClass property.

**setInfoClass(String)** - Method in class
javax.faces.component.html.HtmMessages
Set the value of the infoClass property.

**setInfoStyle(String)** - Method in class
javax.faces.component.html.HtmMessage
Set the value of the infoStyle property.

**setInfoStyle(String)** - Method in class
javax.faces.component.html.HtmMessages
Set the value of the infoStyle property.

**setInitParameters(Map<String, Object>)** - Method in class
javax.servlet.jsp.tagext.TagLibraryValidator
Set the init data in the TLD for this validator.

**setInt(String, int)** - Method in interface javax.jms.MapMessage
Sets an int value with the specified name into the Map.

**setIntegerOnly(boolean)** - Method in class
javax.faces.convert.NumberConverter
Set to true if only the integer portion of the given value should be returned from getAsObject().

**setIntHeader(String, int)** - Method in interface
javax.servlet.http.HttpServletRequest
Sets a response header with the given name and integer value.

**setIntHeader(String, int)** - Method in class
javax.servlet.http.HttpServletRequestWrapper
The default behavior of this method is to call
setIntHeader(String name, int value) on the wrapped response object.

**setIntProperty(String, int)** - Method in interface javax.jms.Message
Sets an int property value with the specified name into the message.

**setInvalidPropertyDescriptors(PropertyDescriptor[])** - Method in
exception javax.resource.spi.InvalidPropertyException
Set a list of invalid properties.
**setIsmap(boolean)** - Method in class javax.faces.component.html.HtmlGraphicImage
Set the value of the ismap property.

**setItemDescription(String)** - Method in class javax.faces.component.UISelectItem
Set the description for this selection item.

**setItemDisabled(boolean)** - Method in class javax.faces.component.UISelectItem
Set the disabled value for this selection item.

**setItemEscaped(boolean)** - Method in class javax.faces.component.UISelectItem
Set the escape value for the label of this selection item.

**setItemLabel(String)** - Method in class javax.faces.component.UISelectItem
Set the localized label for this selection item.

**setItemValue(Object)** - Method in class javax.faces.component.UISelectItem
Set the server value for this selection item.

**setJMSCorrelationID(String)** - Method in interface javax.jms.Message
Sets the correlation ID for the message.

**setJMSCorrelationIDAsBytes(byte[])** - Method in interface javax.jms.Message
Sets the correlation ID as an array of bytes for the message.

**setJMSDeliveryMode(int)** - Method in interface javax.jms.Message
Sets the DeliveryMode value for this message.

**setJMSDestination(Destination)** - Method in interface javax.jms.Message
Sets the Destination object for this message.

**setJMSExpiration(long)** - Method in interface javax.jms.Message
Sets the message's expiration value.

**setJMSMessageID(String)** - Method in interface javax.jms.Message
Sets the message ID.

**setJMSPriority(int)** - Method in interface javax.jms.Message
Sets the priority level for this message.

**setJMSRedelivered(boolean)** - Method in interface javax.jms.Message
Specifies whether this message is being redelivered.

**setJMSReplyTo(Destination)** - Method in interface javax.jms.Message
Sets the Destination object to which a reply to this message should be sent.

**setJMSTimestamp(long)** - Method in interface javax.jms.Message
Sets the message timestamp.

**setJMSType(String)** - Method in interface javax.jms.Message
Sets the message type.

**setJspBody(JspFragment)** - Method in interface javax.servlet.jsp.tagext.SimpleTag
Provides the body of this tag as a JspFragment object, able to be invoked zero or more times by the tag handler.

**setJspBody(JspFragment)** - Method in class javax.servlet.jsp.tagext.SimpleTagSupport
Stores the provided JspFragment.
setJspContext(JspContext) - Method in interface javax.servlet.jsp.tagext.SimpleTag
   Called by the container to provide this tag handler with the JspContext for this invocation.

setJspContext(JspContext) - Method in class javax.servlet.jsp.tagext.SimpleTagSupport
   Stores the provided JSP context in the private jspContext field.

setJspId(String) - Method in class javax.faces.webapp.UIComponentClassicTagBase
   Defined on JspIdConsumer.

setJspId(String) - Method in interface javax.servlet.jsp.tagext.JspIdConsumer
   Called by the container generated code to set a value for the jspId attribute.

setKey(Key) - Method in interface javax.xml.registry.infomodel.RegistryObject
   Sets the key representing the universally unique ID (UUID) for this object.

setLabel(String) - Method in class javax.faces.component.html.HtmlCommandButton
   Set the value of the label property.

setLabel(String) - Method in class javax.faces.component.html.HtmlInputSecret
   Set the value of the label property.

setLabel(String) - Method in class javax.faces.component.html.HtmlInputText
   Set the value of the label property.

setLabel(String) - Method in class javax.faces.component.html.HtmlInputTextarea
   Set the value of the label property.

setLabel(String) - Method in class javax.faces.component.html.HtmlSelectBooleanCheckbox
   Set the value of the label property.

setLabel(String) - Method in class javax.faces.component.html.HtmlSelectManyCheckbox
   Set the value of the label property.

setLabel(String) - Method in class javax.faces.component.html.HtmlSelectManyListbox
   Set the value of the label property.

setLabel(String) - Method in class javax.faces.component.html.HtmlSelectOneListbox
   Set the value of the label property.

setLabel(String) - Method in class javax.faces.component.html.HtmlSelectOneMenu
   Set the value of the label property.

setLabel(String) - Method in class
javax.faces.component.html.HtmlSelectOneRadio
Set the value of the label property.

setLabel(String) - Method in class javax.faces.model.SelectItem
Set the label of this item, to be rendered visibly for the user.

setLang(String) - Method in class
javax.faces.component.html.HtmlCommandButton
Set the value of the lang property.

setLang(String) - Method in class
javax.faces.component.html.HtmlCommandLink
Set the value of the lang property.

setLang(String) - Method in class
javax.faces.component.html.HtmlDataTable
Set the value of the lang property.

setLang(String) - Method in class
javax.faces.component.html.HtmlForm
Set the value of the lang property.

setLang(String) - Method in class
javax.faces.component.html.HtmlGraphicImage
Set the value of the lang property.

setLang(String) - Method in class
javax.faces.component.html.HtmlInputSecret
Set the value of the lang property.

setLang(String) - Method in class
javax.faces.component.html.HtmlInputText
Set the value of the lang property.

setLang(String) - Method in class
javax.faces.component.html.HtmlInputTextarea
Set the value of the lang property.

setLang(String) - Method in class
javax.faces.component.html.HtmlMessage
Set the value of the lang property.

setLang(String) - Method in class
javax.faces.component.html.HtmlMessages
Set the value of the lang property.

setLang(String) - Method in class
javax.faces.component.html.HtmlOutputFormat
Set the value of the lang property.

setLang(String) - Method in class
javax.faces.component.html.HtmlOutputLabel
Set the value of the lang property.

setLang(String) - Method in class
javax.faces.component.html.HtmlOutputLink
Set the value of the lang property.

setLang(String) - Method in class
javax.faces.component.html.HtmlOutputText
Set the value of the lang property.

setLang(String) - Method in class
javax.faces.component.html.HtmlPanelGrid
Set the value of the lang property.
**setLang(String)** - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
  Set the value of the lang property.

**setLang(String)** - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
  Set the value of the lang property.

**setLang(String)** - Method in class
javax.faces.component.html.HtmlSelectManyListbox
  Set the value of the lang property.

**setLang(String)** - Method in class
javax.faces.component.html.HtmlSelectManyMenu
  Set the value of the lang property.

**setLang(String)** - Method in class
javax.faces.component.html.HtmlSelectOneListbox
  Set the value of the lang property.

**setLang(String)** - Method in class
javax.faces.component.html.HtmlSelectOneMenu
  Set the value of the lang property.

**setLang(String)** - Method in class
javax.faces.component.html.HtmlSelectOneRadio
  Set the value of the lang property.

**setLastName(String)** - Method in interface
javax.xml.registry.infomodel.PersonName
  Sets the last name (surname) for this Person.

**setLayout(String)** - Method in class
javax.faces.component.html.HtmlMessages
  Set the value of the layout property.

**setLayout(String)** - Method in class
javax.faces.component.html.HtmlPanelGroup
  Set the value of the layout property.

**setLayout(String)** - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
  Set the value of the layout property.

**setLayout(String)** - Method in class
javax.faces.component.html.HtmlSelectOneListbox
  Set the value of the layout property.

**setLayout(String)** - Method in class
javax.faces.component.html.HtmlSelectOneMenu
  Set the value of the layout property.

**setLayout(String)** - Method in class
javax.faces.component.html.HtmlSelectOneRadio
  Set the value of the layout property.

**setLineNumber(int)** - Method in class
javax.xml.bind.helpers.ValidationEventLocatorImpl
  Set the lineNumber field on this event locator.

**setLinkedException(Exception)** - Method in exception
javax.jms.JMSException
  Adds a linked Exception.

**setLinkedException(Exception)** - Method in exception
javax.resource.ResourceException
  Deprecated. J2SE release 1.4 supports a chained exception facility that allows any throwable to know about another throwable, if any, that caused it to get thrown. Refer to get Cause and initCause methods of the java.lang.Throwable class.

**setLinkedException(Throwable)** - Method in class
javax.xml.bind.helpers.**ValidationEventImpl**
Set the linked exception field of this event.
`setLinkedException(Throwable)` - Method in exception
javax.xml.bind.**JAXBException**
Add a linked Exception.
`setLinkedException(Throwable)` - Method in exception
javax.xml.bind.**TypeConstraintException**
Add a linked Exception.
`setLinkedException(Throwable)` - Method in exception
javax.resource.cci.**ResourceWarning**
`Deprecated`. J2SE release 1.4 supports a chained exception facility that allows any throwable to know about another throwable, if any, that caused it to get thrown. Refer to `getCause` and `initCause` methods of the `java.lang.Throwable` class.
`setListener(Marshaller.Listener)` - Method in class
javax.xml.bind.helpers.**AbstractMarshallerImpl**
`setListener(Unmarshaller.Listener)` - Method in class
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**
`setListener(Marshaller.Listener)` - Method in interface
javax.xml.bind.**Marshaller**
Register marshal event callback `Marshaller.Listener` with this `Marshaller`.
`setListener(Unmarshaller.Listener)` - Method in interface
javax.xml.bind.**Unmarshaller**
Register unmarshal event callback `Unmarshaller.Listener` with this `Unmarshaller`.
`setLocale(Locale)` - Method in class
javax.el.**ELContext**
Set the Locale for this instance.
`setLocale(Locale)` - Method in interface
javax.enterprise.deploy.spi.**DeploymentManager**
Set the active locale for this implementation of `javax.enterprise.deploy.spi` subpackages to run.
`setLocale(Locale)` - Method in class
javax.faces.component.**UIViewRoot**
Set the Locale to be used in localizing the response being created for this view.
`setLocale(Locale)` - Method in class
javax.faces.convert.**DateTimeConverter**
Set the Locale to be used when parsing or formatting dates and times.
`setLocale(Locale)` - Method in class
javax.faces.convert.**NumberConverter**
Set the Locale to be used when parsing numbers.
`setLocale(Locale)` - Method in interface
javax.servlet.**ServletResponse**
Sets the locale of the response, if the response has not been committed yet.
**setLocale(Locale)** - Method in class javax.servlet.ServletResponseWrapper
The default behavior of this method is to call setLocale(Locale loc) on the wrapped response object.

**setLocale(Locale)** - Method in interface javax.xml.registry.infomodelLocalizedString
Set the Locale for this object.

**setLocalValueSet(boolean)** - Method in interface javax.faces.component.EditableValueHolder
Sets the "local value set" state for this component.

**setLocalValueSet(boolean)** - Method in class javax.faces.component.UIInput
Sets the "local value set" state for this component.

**setLocation(Location)** - Method in class javax.xml.stream.XMLEventFactory
This method allows setting of the Location on each event that is created by this factory.

**setLocator(ValidationEventLocator)** - Method in class javax.resource.spi.security.PasswordCredential
Sets the target ManagedConnectionFactory instance for which the user name and password has been set by the application server.

**setMaxAge(int)** - Method in class javax.servlet.http.Cookie
Sets the maximum age of the cookie in seconds.

**setMaxFractionDigits(int)** - Method in class javax.faces.convert.NumberConverter
Set the maximum number of digits getAsString() should render in the fraction portion of the result.

**setMaximum(double)** - Method in class
javax.faces.validator.**DoubleRangeValidator**
Set the maximum value to be enforced by this **Validator**.
`setMaximum(int)` - Method in class

javax.faces.validator.**LengthValidator**
Set the maximum length to be enforced by this **Validator**.
`setMaximum(long)` - Method in class

javax.faces.validator.**LongRangeValidator**
Set the maximum value to be enforced by this **Validator**.
`setMaxInactiveInterval(int)` - Method in interface
javax.servlet.http.**HttpSession**
Specifies the time, in seconds, between client requests before the servlet container will invalidate this session.

javax.faces.convert.**NumberConverter**
Set the maximum number of digits `getAsString()` should render in the integer portion of the result.
`setMaxLength(int)` - Method in class

javax.faces.component.html.**HtmlInputSecret**
Set the value of the `maxlength` property.
`setMaxLength(int)` - Method in class

javax.faces.component.html.**HtmlInputText**
Set the value of the `maxlength` property.
`setMaxResults(int)` - Method in interface javax.persistence.**Query**
Set the maximum number of results to retrieve.
`setMessage(String)` - Method in class
javax.xml.bind.helpers.**ValidationEventImpl**
Set the message field of this event.
`setMessage(SOAPMessage)` - Method in interface
javax.xml.rpc.handler.soap.**SOAPMessageContext**
Sets the SOAPMessage in this message context
`setMessage(SOAPMessage)` - Method in interface
javax.xml.ws.handler.soap.**SOAPMessageContext**
Sets the SOAPMessage in this message context
`setMessageBundle(String)` - Method in class
javax.faces.application.**Application**
Set the fully qualified class name of the ResourceBundle to be used for JavaServer Faces messages for this application.
`setMessageDrivenContext(MessageDrivenContext)` - Method in interface
javax.ejb.**MessageDrivenBean**
Set the associated message-driven context.
`setMessageListener(MessageListener)` - Method in interface
javax.jms.**MessageConsumer**
Sets the message consumer's MessageListener.
`setMessageListener(MessageListener)` - Method in interface
javax.jms.**Session**
Sets the session's distinguished message listener (optional).
`setMessageNumber(int)` - Method in class javax.mail.**Message**
Set the Message number for this Message.
`setMetadata(List<Source>)` - Method in class javax.xml.ws.**Endpoint**
Sets the metadata for this endpoint.
setMiddleName(String) - Method in interface
javax.xml.registry.infomodel.PersonName
Sets the middle name for this Person.

setMimeHeader(String, String) - Method in class
javax.xml.soap.AttachmentPart
Changes the first header entry that matches the given name to the given value, adding a new header if no existing header matches.

setMimeHeader(String, String) - Method in class
javax.xml.soap.SOAPPart
Changes the first header entry that matches the given header name so that its value is the given value, adding a new header with the given name and value if no existing header is a match.

setMimeType(String) - Method in interface
javax.xml.registry.infomodel.ExtrinsicObject
Sets the mime type associated with this object.

setMinFractionDigits(int) - Method in class
javax.faces.convert.NumberConverter
Set the minimum number of digits getAsString() should render in the fraction portion of the result.

setMinimum(double) - Method in class
javax.faces.validator.DoubleRangeValidator
Set the minimum value to be enforced by this Validator.

setMinimum(int) - Method in class
javax.faces.validator.LengthValidator
Set the minimum length to be enforced by this Validator.

setMinimum(Long) - Method in class
javax.faces.validator.LongRangeValidator
Set the minimum value to be enforced by this Validator.

setMinIntegerDigits(int) - Method in class
javax.faces.convert.NumberConverter
Set the minimum number of digits getAsString() should render in the integer portion of the result.

setMinorVersion(int) - Method in interface
javax.xml.registry.infomodel.Versionable
Sets the minor revision number for this version of the Versionable object.

setMTOMEnabled(boolean) - Method in interface
javax.xml.ws.soap.SOAPBinding
Enables or disables use of MTOM.

setMultipartDataSource(MultipartDataSource) - Method in class
javax.mail.Multipart
Setup this Multipart object from the given MultipartDataSource.

setMustUnderstand(boolean) - Method in interface
javax.xml.soap.SOAPHeaderElement
Sets the mustUnderstand attribute for this SOAPHeaderElement object to be either true or false.

setName(String) - Method in class javax.faces.component.UIParameter
Set the optional parameter name for this parameter.

setName(String) - Method in class javax.faces.webapp.AttributeTag
**Deprecated.** Set the attribute name.

**setName(String)** - Method in class javax.faces.webapp.FacetTag  
Set the name to be assigned to this facet.

**setName(String)** - Method in class javax.mail.util.ByteArrayDataSource  
Set the name of the data.

**setName(InternationalString)** - Method in interface javax.xml.registry.infomodel.RegistryObject  
Sets user-friendly name of object in repository.

**setName(String)** - Method in interface javax.xml.registry.infomodel.Slot  
Sets the name for this Slot.

**setNamespaceContext(NamespaceContext)** - Method in interface javax.xml.stream.XMLEventWriter  
Sets the current namespace context for prefix and uri bindings.

Sets the current namespace context for prefix and uri bindings.

Set the NavigationHandler instance that will be passed the outcome returned by any invoked application action for this web application.

**setNewsgroup(String)** - Method in class javax.mail.internet.NewsAddress  
Set the newsgroup.

**setNextException(Exception)** - Method in exception javax.mail.MessagingException  
Add an exception to the end of the chain.

**setNil(boolean)** - Method in class javax.xml.bind.JAXBElement  
Set whether this element has nil content.

**setNode(Node)** - Method in class javax.xml.bind.helpers.ValidationEventLocatorImpl  
Set the Node field on this event locator.

**setNoNSSchemaLocation(String)** - Method in class javax.xml.bind.helpers.AbstractMarshallerImpl  
Convenience method for setting the noNamespaceSchemaLocation.

**setNumber(String)** - Method in interface javax.xml.registry.infomodel.TelephoneNumber  
Sets the telephone number suffix, not including the country or area code.

**setNumberFormat(NumberFormat)** - Method in class javax.mail.internet.MailDateFormat  
Don't allow setting the NumberFormat

**setObject(String, Object)** - Method in interface javax.jms.MapMessage  
Sets an object value with the specified name into the Map.

**setObject(Serializable)** - Method in interface javax.jms.ObjectMessage  
Sets the serializable object containing this message's data.
**setObject(Object)** - Method in class
javax.xml.bind.helpers.**ValidationEventLocatorImpl**
Set the Object field on this event locator.

**setObjectProperty(String, Object)** - Method in interface
javax.jms.**Message**
Sets a Java object property value with the specified name into the message.

**setOffset(int)** - Method in class
javax.xml.bind.helpers.**ValidationEventLocatorImpl**
Set the offset field on this event locator.

**setOnblur(String)** - Method in class
javax.faces.component.html.**HtmlCommandButton**
Set the value of the onblur property.

**setOnblur(String)** - Method in class
javax.faces.component.html.**HtmlCommandLink**
Set the value of the onblur property.

**setOnblur(String)** - Method in class
javax.faces.component.html.**HtmlInputSecret**
Set the value of the onblur property.

**setOnblur(String)** - Method in class
javax.faces.component.html.**HtmlInputText**
Set the value of the onblur property.

**setOnblur(String)** - Method in class
javax.faces.component.html.**HtmlInputTextarea**
Set the value of the onblur property.

**setOnblur(String)** - Method in class
javax.faces.component.html.**HtmlOutputLabel**
Set the value of the onblur property.

**setOnblur(String)** - Method in class
javax.faces.component.html.**HtmlOutputLink**
Set the value of the onblur property.

**setOnblur(String)** - Method in class
javax.faces.component.html.**HtmlSelectBooleanCheckbox**
Set the value of the onblur property.

**setOnblur(String)** - Method in class
javax.faces.component.html.**HtmlSelectManyCheckbox**
Set the value of the onblur property.

**setOnblur(String)** - Method in class
javax.faces.component.html.**HtmlSelectManyListbox**
Set the value of the onblur property.

**setOnblur(String)** - Method in class
javax.faces.component.html.**HtmlSelectOneListbox**
Set the value of the onblur property.

**setOnblur(String)** - Method in class
javax.faces.component.html.**HtmlSelectOneMenu**
Set the value of the onblur property.
javax.faces.component.html.HtmlSelectOneRadio
   Set the value of the onblur property.
setOnchange(String) - Method in class
javax.faces.component.html.HtmlCommandButton
   Set the value of the onchange property.
setOnchange(String) - Method in class
javax.faces.component.html.HtmlInputElement
   Set the value of the onchange property.
setOnchange(String) - Method in class
javax.faces.component.html.HtmlInputPassword
   Set the value of the onchange property.
setOnchange(String) - Method in class
javax.faces.component.html.HtmlInputText
   Set the value of the onchange property.
setOnchange(String) - Method in class
javax.faces.component.html.HtmlInputTextarea
   Set the value of the onchange property.
setOnchange(String) - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
   Set the value of the onchange property.
setOnchange(String) - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
   Set the value of the onchange property.
setOnchange(String) - Method in class
javax.faces.component.html.HtmlSelectManyListbox
   Set the value of the onchange property.
setOnchange(String) - Method in class
javax.faces.component.html.HtmlSelectManyMenu
   Set the value of the onchange property.
setOnchange(String) - Method in class
javax.faces.component.html.HtmlSelectOneListbox
   Set the value of the onchange property.
setOnchange(String) - Method in class
javax.faces.component.html.HtmlSelectOneMenu
   Set the value of the onchange property.
setOnchange(String) - Method in class
javax.faces.component.html.HtmlSelectOneRadio
   Set the value of the onchange property.
setOnclick(String) - Method in class
javax.faces.component.html.HtmlCommandButton
   Set the value of the onclick property.
setOnclick(String) - Method in class
javax.faces.component.html.HtmlCommandLink
   Set the value of the onclick property.
setOnclick(String) - Method in class
javax.faces.component.html.HtmlDataTable
   Set the value of the onclick property.
setOnclick(String) - Method in class
javax.faces.component.html.HtmlForm
   Set the value of the onclick property.
setOnclick(String) - Method in class
javax.faces.component.html.HtmlGraphicImage
   Set the value of the onclick property.
**setOnclick(String)** - Method in class
javax.faces.component.html.HtmlInputSecret
  Set the value of the onclick property.

**setOnclick(String)** - Method in class
javax.faces.component.html.HtmlInputText
  Set the value of the onclick property.

**setOnclick(String)** - Method in class
javax.faces.component.html.HtmlInputTextarea
  Set the value of the onclick property.

**setOnclick(String)** - Method in class
javax.faces.component.html.HtmlOutputLabel
  Set the value of the onclick property.

**setOnclick(String)** - Method in class
javax.faces.component.html.HtmlOutputLink
  Set the value of the onclick property.

**setOnclick(String)** - Method in class
javax.faces.component.html.HtmlPanelGrid
  Set the value of the onclick property.

**setOnclick(String)** - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
  Set the value of the onclick property.

**setOnclick(String)** - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
  Set the value of the onclick property.

**setOnclick(String)** - Method in class
javax.faces.component.html.HtmlSelectManyListbox
  Set the value of the onclick property.

**setOnclick(String)** - Method in class
javax.faces.component.html.HtmlSelectManyMenu
  Set the value of the onclick property.

**setOnclick(String)** - Method in class
javax.faces.component.html.HtmlSelectOneListbox
  Set the value of the onclick property.

**setOnclick(String)** - Method in class
javax.faces.component.html.HtmlSelectOneMenu
  Set the value of the onclick property.

**setOnclick(String)** - Method in class
javax.faces.component.html.HtmlSelectOneRadio
  Set the value of the onclick property.

**setOndblclick(String)** - Method in class
javax.faces.component.html.HtmlCommandButton
  Set the value of the ondblclick property.

**setOndblclick(String)** - Method in class
javax.faces.component.html.HtmlCommandLink
  Set the value of the ondblclick property.

**setOndblclick(String)** - Method in class
javax.faces.component.html.HtmlDataTable
  Set the value of the ondblclick property.

**setOndblclick(String)** - Method in class
javax.faces.component.html.HtmlForm
  Set the value of the ondblclick property.
Set the value of the ondblclick property.

**setOndblclick(String)** - Method in class javax.faces.component.html.HtmlGraphicImage

Set the value of the ondblclick property.

**setOndblclick(String)** - Method in class javax.faces.component.html.HtmlInputSecret

Set the value of the ondblclick property.

**setOndblclick(String)** - Method in class javax.faces.component.html.HtmlInputText

Set the value of the ondblclick property.

**setOndblclick(String)** - Method in class javax.faces.component.html.HtmlInputTextarea

Set the value of the ondblclick property.

**setOndblclick(String)** - Method in class javax.faces.component.html.HtmlInputLabel

Set the value of the ondblclick property.

**setOnfocus(String)** - Method in class javax.faces.component.html.HtmlOutputLink

Set the value of the ondblclick property.

**setOnfocus(String)** - Method in class javax.faces.component.html.HtmlPanelGrid

Set the value of the ondblclick property.

**setOnfocus(String)** - Method in class javax.faces.component.html.HtmlSelectBooleanCheckbox

Set the value of the ondblclick property.

**setOnfocus(String)** - Method in class javax.faces.component.html.HtmlSelectManyCheckbox

Set the value of the ondblclick property.

**setOnfocus(String)** - Method in class javax.faces.component.html.HtmlSelectManyListbox

Set the value of the ondblclick property.

**setOnfocus(String)** - Method in class javax.faces.component.html.HtmlSelectManyMenu

Set the value of the ondblclick property.

**setOnfocus(String)** - Method in class javax.faces.component.html.HtmlSelectOneListbox

Set the value of the ondblclick property.

**setOnfocus(String)** - Method in class javax.faces.component.html.HtmlSelectOneMenu

Set the value of the ondblclick property.

**setOnfocus(String)** - Method in class javax.faces.component.html.HtmlSelectOneRadio

Set the value of the ondblclick property.

**setOnfocus(String)** - Method in class javax.faces.component.html.HtmlCommandButton

Set the value of the onfocus property.

**setOnfocus(String)** - Method in class javax.faces.component.html.HtmlCommandLink

Set the value of the onfocus property.
javax.faces.component.html.HtmlInputSecret
Set the value of the onfocus property.

setOnfocus(String) - Method in class
javax.faces.component.html.HtmlInputText
Set the value of the onfocus property.

setOnfocus(String) - Method in class
javax.faces.component.html.HtmlInputTextarea
Set the value of the onfocus property.

setOnfocus(String) - Method in class
javax.faces.component.html.HtmlOutputLabel
Set the value of the onfocus property.

setOnfocus(String) - Method in class
javax.faces.component.html.HtmlOutputLink
Set the value of the onfocus property.

setOnfocus(String) - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
Set the value of the onfocus property.

setOnfocus(String) - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
Set the value of the onfocus property.

setOnfocus(String) - Method in class
javax.faces.component.html.HtmlSelectManyListbox
Set the value of the onfocus property.

setOnfocus(String) - Method in class
javax.faces.component.html.HtmlSelectManyMenu
Set the value of the onfocus property.

setOnfocus(String) - Method in class
javax.faces.component.html.HtmlSelectOneListbox
Set the value of the onfocus property.

setOnfocus(String) - Method in class
javax.faces.component.html.HtmlSelectOneMenu
Set the value of the onfocus property.

setOnfocus(String) - Method in class
javax.faces.component.html.HtmlSelectOneRadio
Set the value of the onfocus property.

setOnkeydown(String) - Method in class
javax.faces.component.html.HtmlCommandButton
Set the value of the onkeydown property.

setOnkeydown(String) - Method in class
javax.faces.component.html.HtmlCommandLink
Set the value of the onkeydown property.

setOnkeydown(String) - Method in class
javax.faces.component.html.HtmlDataTable
Set the value of the onkeydown property.

setOnkeydown(String) - Method in class
javax.faces.component.html.HtmlForm
Set the value of the onkeydown property.

setOnkeydown(String) - Method in class
javax.faces.component.html.HtmlGraphicImage
Set the value of the onkeydown property.
**setOnkeydown(String)** - Method in class javax.faces.component.html.HtmlInputSecret
  Set the value of the onkeydown property.

**setOnkeydown(String)** - Method in class javax.faces.component.html.HtmlInputText
  Set the value of the onkeydown property.

**setOnkeydown(String)** - Method in class javax.faces.component.html.HtmlInputTextarea
  Set the value of the onkeydown property.

**setOnkeydown(String)** - Method in class javax.faces.component.html.HtmlOutputLabel
  Set the value of the onkeydown property.

**setOnkeydown(String)** - Method in class javax.faces.component.html.HtmlOutputLink
  Set the value of the onkeydown property.

**setOnkeydown(String)** - Method in class javax.faces.component.html.HtmlPanelGrid
  Set the value of the onkeydown property.

**setOnkeydown(String)** - Method in class javax.faces.component.html.HtmlSelectBooleanCheckbox
  Set the value of the onkeydown property.

**setOnkeydown(String)** - Method in class javax.faces.component.html.HtmlSelectManyCheckbox
  Set the value of the onkeydown property.

**setOnkeydown(String)** - Method in class javax.faces.component.html.HtmlSelectManyListbox
  Set the value of the onkeydown property.

**setOnkeydown(String)** - Method in class javax.faces.component.html.HtmlSelectManyMenu
  Set the value of the onkeydown property.

**setOnkeydown(String)** - Method in class javax.faces.component.html.HtmlSelectOneListbox
  Set the value of the onkeydown property.

**setOnkeydown(String)** - Method in class javax.faces.component.html.HtmlSelectOneMenu
  Set the value of the onkeydown property.

**setOnkeydown(String)** - Method in class javax.faces.component.html.HtmlSelectOneRadio
  Set the value of the onkeydown property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlCommandButton
  Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlCommandLink
  Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlDataTable
  Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlForm
Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlGraphicImage

Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlInputSecret

Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlInputText

Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlInputTextarea

Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlOutputLabel

Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlOutputLink

Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlPanelGrid

Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlSelectBooleanCheckbox

Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlSelectManyCheckbox

Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlSelect MANYListbox

Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlSelect MANYMenu

Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlSelectOneListbox

Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlSelectOneMenu

Set the value of the onkeypress property.

**setOnkeypress(String)** - Method in class javax.faces.component.html.HtmlSelectOneRadio

Set the value of the onkeypress property.

**setOnkeyup(String)** - Method in class javax.faces.component.html.HtmlCommandButton

Set the value of the onkeyup property.

**setOnkeyup(String)** - Method in class javax.faces.component.html.HtmlCommandLink

Set the value of the onkeyup property.
javax.faces.component.html.HtdmlDataTable
  Set the value of the onkeyup property.
**setOnkeyup(String)** - Method in class
javax.faces.component.html.HtdmlForm
  Set the value of the onkeyup property.
**setOnkeyup(String)** - Method in class
javax.faces.component.html.HtdmlGraphicImage
  Set the value of the onkeyup property.
**setOnkeyup(String)** - Method in class
javax.faces.component.html.HtdmlInputSecret
  Set the value of the onkeyup property.
**setOnkeyup(String)** - Method in class
javax.faces.component.html.HtdmlInputText
  Set the value of the onkeyup property.
**setOnkeyup(String)** - Method in class
javax.faces.component.html.HtdmlInputTextarea
  Set the value of the onkeyup property.
**setOnkeyup(String)** - Method in class
javax.faces.component.html.HtdmlOutputLabel
  Set the value of the onkeyup property.
**setOnkeyup(String)** - Method in class
javax.faces.component.html.HtdmlOutputLink
  Set the value of the onkeyup property.
**setOnkeyup(String)** - Method in class
javax.faces.component.html.HtdmlPanelGrid
  Set the value of the onkeyup property.
**setOnkeyup(String)** - Method in class
javax.faces.component.html.HtdmlSelectBooleanCheckbox
  Set the value of the onkeyup property.
**setOnkeyup(String)** - Method in class
javax.faces.component.html.HtdmlSelectManyCheckbox
  Set the value of the onkeyup property.
**setOnkeyup(String)** - Method in class
javax.faces.component.html.HtdmlSelectManyListbox
  Set the value of the onkeyup property.
**setOnkeyup(String)** - Method in class
javax.faces.component.html.HtdmlSelectManyMenu
  Set the value of the onkeyup property.
**setOnkeyup(String)** - Method in class
javax.faces.component.html.HtdmlSelectOneListbox
  Set the value of the onkeyup property.
**setOnkeyup(String)** - Method in class
javax.faces.component.html.HtdmlSelectOneMenu
  Set the value of the onkeyup property.
**setOnkeyup(String)** - Method in class
javax.faces.component.html.HtdmlSelectOneRadio
  Set the value of the onkeyup property.
**setOnmousedown(String)** - Method in class
javax.faces.component.html.HtdmlCommandButton
  Set the value of the onmousedown property.
`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlCommandLink`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlDataTable`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlForm`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlGraphicImage`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlInputSecret`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlInputText`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlInputTextarea`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlOutputLabel`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlOutputLink`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlPanelGrid`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlSelectBooleanCheckbox`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlSelectManyCheckbox`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlSelectManyListbox`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlSelectManyMenu`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlSelectOneListbox`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlSelectOneMenu`
Set the value of the onmousedown property.

`setOnmousedown(String)` - Method in class `javax.faces.component.html.HtmlSelectOneRadio`
Set the value of the onmousedown property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlCommandButton`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlCommandLink`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlDataTable`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlForm`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlGraphicImage`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlInputSecret`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlInputText`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlInputTextarea`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlOutputLabel`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlOutputLink`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlPanelGrid`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlSelectBooleanCheckbox`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlSelectManyCheckbox`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlSelectManyListbox`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlSelectManyMenu`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class `javax.faces.component.html.HtmlSelectOneListbox`
Set the value of the onmousemove property.

`setOnmousemove(String)` - Method in class
Set the value of the onmousemove property.

**setOnmousemove(String)** - Method in class

- javax.faces.component.html.HtmlSelectOneMenu

Set the value of the onmousemove property.

**setOnmousemove(String)** - Method in class

- javax.faces.component.html.HtmlSelectOneRadio

Set the value of the onmousemove property.

**setOnmousemove(String)** - Method in class

- javax.faces.component.html.HtmlCommandButton

Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class

- javax.faces.component.html.HtmlCommandLink

Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class

- javax.faces.component.html.HtmlDataTable

Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class

- javax.faces.component.html.HtmlForm

Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class

- javax.faces.component.html.HtmlGraphicImage

Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class

- javax.faces.component.html.HtmlInputSecret

Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class

- javax.faces.component.html.HtmlInputText

Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class

- javax.faces.component.html.HtmlInputTextarea

Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class

- javax.faces.component.html.HtmlOutputLabel

Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class

- javax.faces.component.html.HtmlOutputLink

Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class

- javax.faces.component.html.HtmlPanelGrid

Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class

- javax.faces.component.html.HtmlSelectBooleanCheckbox

Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class

- javax.faces.component.html.HtmlSelectManyCheckbox

Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class

- javax.faces.component.html.HtmlSelectManyListbox

Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class

- javax.faces.component.html.HtmlSelectManyMenu

Set the value of the onmouseout property.
**setOnmouseout(String)** - Method in class `javax.faces.component.html.HtmlSelectOneListbox`
  Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class `javax.faces.component.html.HtmlSelectOneMenu`
  Set the value of the onmouseout property.

**setOnmouseout(String)** - Method in class `javax.faces.component.html.HtmlSelectOneRadio`
  Set the value of the onmouseout property.

**setOnmouseover(String)** - Method in class `javax.faces.component.html.HtmlCommandButton`
  Set the value of the onmouseover property.

**setOnmouseover(String)** - Method in class `javax.faces.component.html.HtmlCommandLink`
  Set the value of the onmouseover property.

**setOnmouseover(String)** - Method in class `javax.faces.component.html.HtmlDataTable`
  Set the value of the onmouseover property.

**setOnmouseover(String)** - Method in class `javax.faces.component.html.HtmlForm`
  Set the value of the onmouseover property.

**setOnmouseover(String)** - Method in class `javax.faces.component.html.HtmlGraphicImage`
  Set the value of the onmouseover property.

**setOnmouseover(String)** - Method in class `javax.faces.component.html.HtmlInputSecret`
  Set the value of the onmouseover property.

**setOnmouseover(String)** - Method in class `javax.faces.component.html.HtmlInputText`
  Set the value of the onmouseover property.

**setOnmouseover(String)** - Method in class `javax.faces.component.html.HtmlInputTextarea`
  Set the value of the onmouseover property.

**setOnmouseover(String)** - Method in class `javax.faces.component.html.HtmlOutputLabel`
  Set the value of the onmouseover property.

**setOnmouseover(String)** - Method in class `javax.faces.component.html.HtmlOutputLink`
  Set the value of the onmouseover property.

**setOnmouseover(String)** - Method in class `javax.faces.component.html.HtmlPanelGrid`
  Set the value of the onmouseover property.

**setOnmouseover(String)** - Method in class `javax.faces.component.html.HtmlSelectBooleanCheckbox`
  Set the value of the onmouseover property.

**setOnmouseover(String)** - Method in class `javax.faces.component.html.HtmlSelectManyCheckbox`
  Set the value of the onmouseover property.

**setOnmouseover(String)** - Method in class `javax.faces.component.html.HtmlSelectManyListbox`
  Set the value of the onmouseover property.
Set the value of the onmouseover property.
\texttt{setOnmouseover(String)} - Method in class
\texttt{javax.faces.component.html.HtmlSelectManyMenu}

Set the value of the onmouseover property.
\texttt{setOnmouseover(String)} - Method in class
\texttt{javax.faces.component.html.HtmlSelectOneListbox}

Set the value of the onmouseover property.
\texttt{setOnmouseover(String)} - Method in class
\texttt{javax.faces.component.html.HtmlSelectOneMenu}

Set the value of the onmouseover property.
\texttt{setOnmouseover(String)} - Method in class
\texttt{javax.faces.component.html.HtmlSelectOneRadio}

Set the value of the onmouseup property.
\texttt{setOnmouseup(String)} - Method in class
\texttt{javax.faces.component.html.HtmlCommandButton}

Set the value of the onmouseup property.
\texttt{setOnmouseup(String)} - Method in class
\texttt{javax.faces.component.html.HtmlCommandLink}

Set the value of the onmouseup property.
\texttt{setOnmouseup(String)} - Method in class
\texttt{javax.faces.component.html.HtmlDataTable}

Set the value of the onmouseup property.
\texttt{setOnmouseup(String)} - Method in class
\texttt{javax.faces.component.html.HtmlForm}

Set the value of the onmouseup property.
\texttt{setOnmouseup(String)} - Method in class
\texttt{javax.faces.component.html.HtmlGraphicImage}

Set the value of the onmouseup property.
\texttt{setOnmouseup(String)} - Method in class
\texttt{javax.faces.component.html.HtmlInputSecret}

Set the value of the onmouseup property.
\texttt{setOnmouseup(String)} - Method in class
\texttt{javax.faces.component.html.HtmlInputText}

Set the value of the onmouseup property.
\texttt{setOnmouseup(String)} - Method in class
\texttt{javax.faces.component.html.HtmlInputTextarea}

Set the value of the onmouseup property.
\texttt{setOnmouseup(String)} - Method in class
\texttt{javax.faces.component.html.HtmlOutputLabel}

Set the value of the onmouseup property.
\texttt{setOnmouseup(String)} - Method in class
\texttt{javax.faces.component.html.HtmlOutputLink}

Set the value of the onmouseup property.
\texttt{setOnmouseup(String)} - Method in class
\texttt{javax.faces.component.html.HtmlPanelGrid}

Set the value of the onmouseup property.
\texttt{setOnmouseup(String)} - Method in class
\texttt{javax.faces.component.html.HtmlSelectBooleanCheckbox}
Set the value of the onmouseup property.

`setOnmouseup(String)` - Method in class `javax.faces.component.html.HtmlSelectManyCheckbox`

Set the value of the onmouseup property.

`setOnmouseup(String)` - Method in class `javax.faces.component.html.HtmlSelectManyListbox`

Set the value of the onmouseup property.

`setOnmouseup(String)` - Method in class `javax.faces.component.html.HtmlSelectManyMenu`

Set the value of the onmouseup property.

`setOnmouseup(String)` - Method in class `javax.faces.component.html.HtmlSelectOneListbox`

Set the value of the onmouseup property.

`setOnmouseup(String)` - Method in class `javax.faces.component.html.HtmlSelectOneMenu`

Set the value of the onmouseup property.

`setOnmouseup(String)` - Method in class `javax.faces.component.html.HtmlSelectOneRadio`

Set the value of the onmouseup property.

`setOnreset(String)` - Method in class `javax.faces.component.html.HtmlInputSecret`

Set the value of the onreset property.

`setOnreset(String)` - Method in class `javax.faces.component.html.HtmlInputText`

Set the value of the onreset property.

`setOnreset(String)` - Method in class `javax.faces.component.html.HtmlInputTextarea`

Set the value of the onreset property.

`setOnreset(String)` - Method in class `javax.faces.component.html.HtmlSelectBooleanCheckbox`

Set the value of the onreset property.

`setOnreset(String)` - Method in class `javax.faces.component.html.HtmlSelectManyCheckbox`

Set the value of the onreset property.

`setOnreset(String)` - Method in class `javax.faces.component.html.HtmlSelectManyListbox`

Set the value of the onreset property.

`setOnreset(String)` - Method in class `javax.faces.component.html.HtmlSelectManyMenu`

Set the value of the onreset property.

`setOnreset(String)` - Method in class `javax.faces.component.html.HtmlSelectOneListbox`

Set the value of the onreset property.

`setOnreset(String)` - Method in class `javax.faces.component.html.HtmlSelectOneMenu`

Set the value of the onreset property.

`setOnreset(String)` - Method in class `javax.faces.component.html.HtmlSelectOneMenu`

Set the value of the onreset property.
**setOnselect(String)** - Method in class
javax.faces.component.html.HtmlSelectOneRadio
Set the value of the onselect property.

**setOnsubmit(String)** - Method in class
javax.faces.component.html.HtmlForm
Set the value of the onsubmit property.

**setOpaque(boolean)** - Method in interface
javax.xml.registry.infomodel.ExtrinsicObject
Sets whether the ExtrinsicObject is opaque (not readable) by the registry.

**setOperationName(QName)** - Method in interface javax.xml.rpc.Call
Sets the name of the operation to be invoked using this Call instance.

**setPageContext(PageContext)** - Method in class
javax.faces.webapp.UICOMPONENTCLASSICTAGBASE
Set the PageContext of the page containing this tag instance.

**setPageContext(PageContext)** - Method in interface
javax.servlet.jsp.tagext.Tag
Set the current page context.

**setPageContext(PageContext)** - Method in class
javax.servlet.jsp.tagext.TagAdapter
Must not be called.

**setPageContext(PageContext)** - Method in class
javax.servlet.jsp.tagext.TagSupport
Set the page context.

**setParameter(String, String)** - Method in class
javax.activation.MimeType
Set the value to be associated with the given name, replacing any previous association.

**setParameter(String, String)** - Method in class
javax.mail.internet.ContentDisposition
Set the specified parameter.

**setParameter(String, String)** - Method in class
javax.mail.internet.ContentType
Set the specified parameter.

**setParameter(String, Object)** - Method in interface
javax.persistence.Query
Bind an argument to a named parameter.

**setParameter(String, Date, TemporalType)** - Method in interface
javax.persistence.Query
Bind an instance of java.util.Date to a named parameter.

**setParameter(String, Calendar, TemporalType)** - Method in interface
javax.persistence.Query
Bind an instance of java.util.Calendar to a named parameter.

**setParameter(int, Object)** - Method in interface
javax.persistence.Query
Bind an argument to a positional parameter.

**setParameter(int, Date, TemporalType)** - Method in interface
javax.persistence.Query
Bind an instance of java.util.Date to a positional parameter.
setParameter(int, Calendar, TemporalType) - Method in interface
javax.persistence.Query
    Bind an instance of java.util.Calendar to a positional parameter.
setParameterList(ParameterList) - Method in class
javax.mail.internet.ContentDisposition
    Set a new ParameterList.
setParameterList(ParameterList) - Method in class
javax.mail.internet.ContentType
    Set a new ParameterList.
setParameter(Object[]) - Method in interface
javax.interceptor.InvocationContext
    Sets the parameters that will be used to invoke the business method.
setParameter(UIComponent) - Method in class
javax.faces.component.UIComponent
    Set the parent UIComponent of this UIComponent.
setParameter(UIComponent) - Method in class
javax.faces.component.UIComponentBase
setParameter(Tag) - Method in class
javax.faces.webapp.UIComponentClassicTagBase
    Set the Tag that is the parent of this instance.
setParameter(Part) - Method in class javax.mail.Multipart
    Set the parent of this Multipart to be the specified Part.
setParameter(JspTag) - Method in interface
javax.servlet.jsp.tagext.SimpleTag
    Sets the parent of this tag, for collaboration purposes.
setParameter(JspTag) - Method in class
javax.servlet.jsp.tagext.SimpleTagSupport
    Sets the parent of this tag, for collaboration purposes.
setParameter(Tag) - Method in interface javax.servlet.jsp.tagext.Tag
    Set the parent (closest enclosing tag handler) of this tag handler.
setParameter(Tag) - Method in class
javax.servlet.jsp.tagext.TagAdapter
    Must not be called.
setParameter(Tag) - Method in class
javax.servlet.jsp.tagext.TagSupport
    Set the nesting tag of this tag.
setParameter(XMLEventReader) - Method in class
javax.xml.stream.util.EventReaderDelegate
    Set the parent of this instance.
setParameter(XMLStreamReader) - Method in class
javax.xml.stream.util.StreamReaderDelegate
    Set the parent of this instance.
setParameterElement(SOAPElement) - Method in interface
javax.xml.soap.Node
    Sets the parent of this Node object to the given SOAPElement object.
**setPasswordAuthentication(URLName, PasswordAuthentication)** - Method in class `javax.mail.Session`  
Save a PasswordAuthentication for this (store or transport) URLName.

**setPath(String)** - Method in class `javax.servlet.http.Cookie`  
Specifies a path for the cookie to which the client should return the cookie.

**setPattern(String)** - Method in class `javax.faces.convert.DateTimeConverter`  
Set the format pattern to be used when formatting and parsing dates and times.

**setPattern(String)** - Method in class `javax.faces.convert.NumberConverter`  
Set the format pattern to be used when formatting and parsing numbers.

**setPayload(Source)** - Method in interface `javax.xml.ws.LogicalMessage`  
Sets the message payload.

**setPayload(Object, JAXBContext)** - Method in interface `javax.xml.ws.LogicalMessage`  
Sets the message payload.

**setPersonal(String, String)** - Method in class `javax.mail.internet.InternetAddress`  
Set the personal name.

**setPersonal(String)** - Method in class `javax.mail.internet.InternetAddress`  
Set the personal name.

**setPersonName(PersonName)** - Method in interface `javax.xml.registry.infomodel.User`  
Sets the name of this User.

**setPhaseId(PhaseId)** - Method in class `javax.faces.event.FacesEvent`  
Set the **PhaseId** during which this event will be delivered.

**setPortTypeName(QName)** - Method in interface `javax.xml.rpc.Call`  
Sets the qualified name of the port type.

**setPostalAddress(PostalAddress)** - Method in interface `javax.xml.registry.infomodel.Organization`  
Sets the address for this Organization.

**setPostalAddresses(Collection)** - Method in interface `javax.xml.registry.infomodel.User`  
Sets the addresses for this User.

**setPostalCode(String)** - Method in interface `javax.xml.registry.infomodel.PostalAddress`  
Sets the postal or zip code.

**setPostalScheme(ClassificationScheme)** - Method in interface `javax.xml.registry.infomodel.PostalAddress`  
Sets a user-defined postal scheme for codifying the attributes of PostalAddress.

**setPreamble(String)** - Method in class `javax.mail.internet.MimeMultipart`  
Set the preamble text to be included before the first body
part.

**setPrefix(String, String)** - Method in interface javax.xml.stream.XMLEventWriter
Sets the prefix the uri is bound to.

**setPrefix(String, String)** - Method in interface javax.xml.stream.XMLStreamWriter
Sets the prefix the uri is bound to.

**setPrependId(boolean)** - Method in class javax.faces.component.UIForm

**setPrimaryContact(User)** - Method in interface javax.xml.registry.infomodel.Organization
Sets the primary contact for this Organization.

**setPrimaryType(String)** - Method in class javax.activation.MimeType
Set the primary type for this object to the given String.

**setPrimaryType(String)** - Method in class javax.mail.internet.ContentType
Set the primary type.

**setPriority(int)** - Method in interface javax.jms.MessageProducer
Sets the producer's default priority.

**setProperties(UIComponent)** - Method in class javax.faces.webapp.UIComponentClassicTagBase
Override properties and attributes of the specified component, if the corresponding properties of this tag handler instance were explicitly set.

**setProperties(UIComponent)** - Method in class javax.faces.webapp.UIComponentELTag
Override properties and attributes of the specified component, if the corresponding properties of this tag handler instance were explicitly set.

**setProperties(UIComponent)** - Method in class javax.faces.webapp.UIComponentTag
Deprecated.

**setProperties(Properties)** - Method in class javax.xml.registry.infomodel.ConnectionFactory
Sets the Properties used during createConnection and createFederatedConnection calls.

**setProperties(Map<String, Object>)** - Method in class javax.xml.ws.Endpoint
Sets the property bag for this Endpoint instance.

**setProperty(String, Object)** - Method in class javax.xml.bind.Binder
Set the particular property in the underlying implementation of Binder.

**setProperty(String, Object)** - Method in class javax.xml.bind.helpers.AbstractMarshallerImpl
Default implementation of the setProperty method handles the four defined properties in Marshaller.

**setProperty(String, Object)** - Method in class javax.xml.bind.helpers.AbstractUnmarshallerImpl
Default implementation of the setProperty method always throws
setProperty(String, Object) - Method in interface javax.xml.bind.Marshaller
Set the particular property in the underlying implementation of Marshaller.

setProperty(String, Object) - Method in interface javax.xml.bind.Unmarshaller
Set the particular property in the underlying implementation of Unmarshaller.

setProperty(String, Object) - Method in interface javax.xml.bind.databind.Secret

setProperty(String, Object) - Method in interface javax.xml.bind.Valideator
Deprecated. since JAXB2.0

setProperty(String, Object) - Method in interface javax.xml.rpc.Call
Sets the value for a named property.

setProperty(String, Object) - Method in interface javax.xml.rpc.handler.MessageContext
Sets the name and value of a property associated with the MessageContext.

setProperty(String, Object) - Method in class javax.xml.soap.SOAPMessage
Associates the specified value with the specified property.

setProperty(String, Object) - Method in class javax.xml.stream.XMLInputFactory
Allows the user to set specific feature/property on the underlying implementation.

setProperty(String, Object) - Method in class javax.xml.stream.XMLOutputFactory
Allows the user to set specific features/properties on the underlying implementation.

setPropertyResolved(boolean) - Method in class javax.el.ELContext
Called to indicate that a ELResolver has successfully resolved a given (base, property) pair.

setPropertyResolver(PropertyResolver) - Method in class javax.faces.application.Application
Deprecated. The recommended way to affect the execution of the EL is to provide an <el-resolver> element at the right place in the application configuration resources which will be considered in the normal course of expression evaluation. This method now will cause the argument resolver to be wrapped inside an implementation of ELResolver and exposed to the EL resolution system as if the user had called Application.addELResolver(javax.el.ELResolver).

setProtocolForAddress(String, String) - Method in class javax.mail.Session
Set the default transport protocol to use for addresses of the specified type.

setProvider(Provider) - Method in class javax.mail.Session
Set the passed Provider to be the default implementation for the protocol in Provider.protocol overriding any previous
values.

**setProvidingOrganization(Organization)** - Method in interface javax.xml.registry.infomodel.Service
   Sets the Organization that provides this service.

**setQuota(Quota)** - Method in interface javax.mail.QuotaAwareStore
   Set the quotas for the quota root specified in the quota argument.

**setRawContent(InputStream, String)** - Method in class javax.xml.soap.AttachmentPart
   Sets the content of this attachment part to that contained by the InputStream content and sets the value of the Content-Type header to the value contained in contentType.

**setRawContentBytes(byte[], int, int, String)** - Method in class javax.xml.soap.AttachmentPart
   Sets the content of this attachment part to that contained by the byte[] array content and sets the value of the Content-Type header to the value contained in contentType.

**setReadonly(boolean)** - Method in class javax.faces.component.html.HtmlCommandButton
   Set the value of the readonly property.

**setReadonly(boolean)** - Method in class javax.faces.component.html.HtmlInputSecret
   Set the value of the readonly property.

**setReadonly(boolean)** - Method in class javax.faces.component.html.HtmlInputText
   Set the value of the readonly property.

**setReadonly(boolean)** - Method in class javax.faces.component.html.HtmlInputTextarea
   Set the value of the readonly property.

**setReadonly(boolean)** - Method in class javax.faces.component.html.HtmlSelectBooleanCheckbox
   Set the value of the readonly property.

**setReadonly(boolean)** - Method in class javax.faces.component.html.HtmlSelectManyCheckbox
   Set the value of the readonly property.

**setReadonly(boolean)** - Method in class javax.faces.component.html.HtmlSelectManyListbox
   Set the value of the readonly property.

**setReadonly(boolean)** - Method in class javax.faces.component.html.HtmlSelectManyMenu
   Set the value of the readonly property.

**setReadonly(boolean)** - Method in class javax.faces.component.html.HtmlSelectOneListbox
   Set the value of the readonly property.

**setReadonly(boolean)** - Method in class javax.faces.component.html.HtmlSelectOneMenu
   Set the value of the readonly property.

**setReadonly(boolean)** - Method in class javax.faces.component.html.HtmlSelectOneRadio
   Set the value of the readonly property.
**setRecipient(Message.RecipientType, Address)** - Method in class `javax.mail.Message`
Set the recipient address.

**setRecipients(Message.RecipientType, Address[])** - Method in class `javax.mail.internet.MimeMessage`
Set the specified recipient type to the given addresses.

**setRecipients(Message.RecipientType, String)** - Method in class `javax.mail.internet.MimeMessage`
Set the specified recipient type to the given addresses.

**setRecipients(Message.RecipientType, Address[])** - Method in class `javax.mail.Message`
Set the recipient addresses.

**setRecordName(String)** - Method in interface `javax.resource.cci.Record`
Sets the name of the Record.

**setRecordShortDescription(String)** - Method in interface `javax.resource.cci.Record`
Sets a short description string for the Record.

**setRedisplay(boolean)** - Method in class `javax.faces.component.html.HtmlInputSecret`
Set the value of the redisplay property.

**setReference(Reference)** - Method in interface `javax.resource.Referenceable`
Sets the Reference instance.

**setRel(String)** - Method in class `javax.faces.component.html.HtmlCommandLink`
Set the value of the rel property.

**setRel(String)** - Method in class `javax.faces.component.html.HtmlOutputLink`
Set the value of the rel property.

**setRelay(boolean)** - Method in interface `javax.xml.soap.SOAPHeaderElement`
Sets the relay attribute for this SOAPHeaderElement to be either true or false.

**setRendered(boolean)** - Method in class `javax.faces.component.UIComponent`
Set the rendered property of this `UIComponent`.

**setRendered(boolean)** - Method in class `javax.faces.component.UIComponentBase`
Set an override for the rendered property.

**setRendererType(String)** - Method in class `javax.faces.component.UIComponent`
Set the `Renderer` type for this `UIComponent`, or null for components that render themselves.
**setRendererType(String)** - Method in class
javax.faces.component.UIComponentBase

**setRenderKitId(String)** - Method in class
javax.faces.componentUIViewRoot

Set the render kit identifier of the RenderKit associated with this view.

**setReplyTo(Address[])** - Method in class
javax.mail.internet.MimeMessage

Set the RFC 822 "Reply-To" header field.

**setReplyTo(Address[])** - Method in class javax.mail.Message

Set the addresses to which replies should be directed.

**setRepositoryItem(DataHandler)** - Method in interface
javax.xml.registry.infomodel.ExtrinsicObject

Sets the repository item for this object.

**setRequest(Object)** - Method in class
javax.faces.context.ExternalContext

Set the environment-specific request to be returned by subsequent calls to ExternalContext.getRequest().

**setRequest(ServletRequest)** - Method in class
javax.servlet.HttpServletRequestWrapper

Sets the request object being wrapped.

**setRequestCharacterEncoding(String)** - Method in class
javax.faces.context.ExternalContext

Overrides the name of the character encoding used in the body of this request.

**setRequired(boolean)** - Method in interface
javax.faces.component.EditableValueHolder

Set the "required field" state for this component.

**setRequired(boolean)** - Method in class
javax.faces.component.UIInput

Set the "required field" state for this component.

**setRequiredMessage(String)** - Method in class
javax.faces.component.UIInput

Override any ValueExpression set for the "requiredMessage" with the literal argument provided to this method.

**setResourceAdapter(ResourceAdapter)** - Method in interface
javax.resource.spi.ResourceAdapterAssociation

Associate this object with a ResourceAdapter object.

**setResourceLimit(String, long)** - Method in class javax.mail.Quota

Set a resource limit for this quota root.

**setResponse(Object)** - Method in class
javax.faces.context.ExternalContext

Set the environment-specific response to be returned by subsequent calls to ExternalContext.getResponse().

**setResponse(ServletResponse)** - Method in class
javax.servlet.HttpServletResponseWrapper

Sets the response being wrapped.

**setResponseCharacterEncoding(String)** - Method in class
javax.faces.context.ExternalContext
Sets the character encoding (MIME charset) of the response being sent to the client, for example, to UTF-8.

Set the `ResponseStream` to which components should direct their binary output.

Set the `ResponseWriter` to which components should direct their character-based output.

**setReturnType(QName)** - Method in interface `javax.xml.rpc.Call`

Sets the return type for a specific operation.

**setReturnType(QName, Class)** - Method in interface `javax.xml.rpc.Call`

Sets the return type for a specific operation.

**setRev(String)** - Method in class `javax.faces.component.html.HtmlCommandLink`

Set the value of the `rev` property.

**setRev(String)** - Method in class `javax.faces.component.html.HtmlOutputLink`

Set the value of the `rev` property.

**setRole(String)** - Method in interface `javax.xml.soap.SOAPHeaderElement`

Sets the Role associated with this SOAPHeaderElement object to the specified Role.

**setRoles(String[])** - Method in interface `javax.xml.rpc.handler.HandlerChain`

Sets SOAP Actor roles for this HandlerChain.

**setRoles(Set<String>)** - Method in interface `javax.xml.ws.soap.SOAPBinding`

Sets the roles played by the SOAP binding instance.

**setRollbackOnly()** - Method in interface `javax.ejb.EJBContext`

Mark the current transaction for rollback.

**setRollbackOnly()** - Method in interface `javax.persistence.EntityTransaction`

Mark the current transaction so that the only possible outcome of the transaction is for the transaction to be rolled back.

**setRollbackOnly()** - Method in interface `javax.transaction.Transaction`

Modify the transaction associated with the target object such that the only possible outcome of the transaction is to roll back the transaction.

**setRollbackOnly()** - Method in interface `javax.transaction.TransactionManager`

Modify the transaction associated with the current thread such that the only possible outcome of the transaction is to roll back the transaction.

**setRollbackOnly()** - Method in interface `javax.transaction.TransactionSynchronizationRegistry`

Set the rollbackOnly status of the transaction bound to the...
current thread at the time this method is called.

**setRollbackOnly()** - Method in interface
javax.transaction.UserTransaction
Modify the transaction associated with the current thread such that the only possible outcome of the transaction is to rollback the transaction.

**setRowClasses(String)** - Method in class
javax.faces.component.html.HtmlDataTable
Set the value of the rowClasses property.

**setRowClasses(String)** - Method in class
javax.faces.component.html.HtmlPanelGrid
Set the value of the rowClasses property.

**setRowIndex(int)** - Method in class
javax.faces.model.UIData
Set the zero relative index of the current row, or -1 to indicate that no row is currently selected, by implementing the following algorithm.

**setRowIndex(int)** - Method in class
javax.faces.model.ArrayDataModel
Set the zero-relative index of the currently selected row, or -1 to indicate that we are not positioned on a row.

**setRowIndex(int)** - Method in class
javax.faces.model.ListDataModel

**setRowIndex(int)** - Method in class
javax.faces.model.ResultSetDataModel

**setRowIndex(int)** - Method in class
javax.faces.model.ScalarDataModel

**setRows(int)** - Method in class
javax.faces.component.html.HtmlInputTextarea
Set the value of the rows property.

**setRows(int)** - Method in class
javax.faces.component.UIData
Set the number of rows to be displayed, or zero for all remaining rows in the table.

**setRules(String)** - Method in class
javax.faces.component.html.HtmlDataTable
Set the value of the rules property.

**setRules(String)** - Method in class
javax.faces.component.html.HtmlPanelGrid
Set the value of the rules property.

**setSchema(Schema)** - Method in class
javax.xml.bind.Binder
Specifies whether marshal, unmarshal and update methods performs validation on their XML content.

**setSchema(Schema)** - Method in class
javax.xml.bind.helpers.AbstractMarshallerImpl
**setSchema(Schema)** - Method in class
javax.xml.bind.helpers.AbstractUnmarshallerImpl

**setSchema(Schema)** - Method in interface javax.xml.bind.Marshaller
Specify the JAXP 1.3 Schema object that should be used to validate subsequent marshal operations against.

**setSchema(Schema)** - Method in interface javax.xml.bind.Unmarshaller
Specify the JAXP 1.3 Schema object that should be used to validate subsequent unmarshal operations against.

**setSchemaLocation(String)** - Method in class
javax.xml.bind.helpers.AbstractMarshallerImpl
Convenience method for setting the schemaLocation.

**setScope(String, MessageContext.Scope)** - Method in interface
javax.xml.ws.handler.MessageContext
Sets the scope of a property.

Indicates to the browser whether the cookie should only be sent using a secure protocol, such as HTTPS or SSL.

**setSelected(boolean)** - Method in class
javax.faces.component.UISelectBoolean
Set the local value of the selected state of this component.

**setSelectedValues(Object[])** - Method in class
javax.faces.component.UISelectMany
Set the currently selected values, or null to indicate that there are no currently selected values.

**setSelectItems(SelectItem[])** - Method in class
javax.faces.model.SelectItemGroup
Set the set of subordinate SelectItems for this group.

**setSender(Address)** - Method in class
javax.mail.internet.MimeMessage
Set the RFC 822 "Sender" header field.

**setSentDate(Date)** - Method in class javax.mail.internet.MimeMessage
Set the RFC 822 "Date" header field.

**setSentDate(Date)** - Method in class javax.mail.Message
Set the sent date of this message.

**setSessionContext(SessionContext)** - Method in interface
javax.ejb.SessionBean
Set the associated session context.

**setSeverity(FacesMessage.Severity)** - Method in class
javax.faces.application.FacesMessage
Set the severity level.

**setSeverity(int)** - Method in class
javax.xml.bind.helpers.ValidationEventImpl
Set the severity field of this event.

**setShape(String)** - Method in class
javax.faces.component.html.HtmlCommandLink
Set the value of the shape property.

**setShape(String)** - Method in class
javax.faces.component.html.HtmlOutputLink
Set the value of the shape property.
**setShort(String, short)** - Method in interface `javax.jms.MapMessage`
Sets a short value with the specified name into the Map.

**setShortProperty(String, short)** - Method in interface `javax.jms.Message`
Sets a short property value with the specified name into the message.

**setShowDetail(boolean)** - Method in class `javax.faces.component/UIMessage`
Set the flag indicating whether the detail property of the associated message(s) should be displayed.

**setShowSummary(boolean)** - Method in class `javax.faces.component/UIMessage`
Set the flag indicating whether the summary property of the associated message(s) should be displayed.

**setSize(int)** - Method in class `javax.faces.component.html.HtmlInputSecret`
Set the value of the size property.

**setSize(int)** - Method in class `javax.faces.component.html.HtmlInputText`
Set the value of the size property.

**setSize(int)** - Method in class `javax.faces.component.html.HtmlSelectManyListbox`
Set the value of the size property.

**setSize(int)** - Method in class `javax.faces.component.html.HtmlSelectOneListbox`
Set the value of the size property.

**setSlotType(String)** - Method in interface `javax.xml.registry.infomodel.Slot`
Sets the slotType for this Slot.

**setSourceObject(RegistryObject)** - Method in interface `javax.xml.registry.infomodel.Association`
Sets the Object that is the source of this Association.

Sets the specification object for this object.

**setStability(int)** - Method in interface `javax.xml.registry.infomodel.RegistryEntry`
Sets the stability indicator for the RegistryEntry.

**setStateManager(StateManager)** - Method in class `javax.faces.application.Application`
Set the StateManager instance that will be utilized during the Restore View and Render Response phases of the request.
processing lifecycle.

**setStateOrProvince(String)** - Method in interface
javax.xml.registry.infomodel.PostalAddress
Sets the state or province.

**setStatus(int)** - Method in interface
javax.servlet.http.HttpServletResponse
Sets the status code for this response.

**setStatus(int, String)** - Method in interface
javax.servlet.http.HttpServletResponse
**Deprecated.** As of version 2.1, due to ambiguous meaning of the message parameter. To set a status code use setStatus(int), to send an error with a description use sendError(int, String).
Sets the status code and message for this response.

**setStatus(int)** - Method in class
javax.servlet.http.HttpServletResponseWrapper
The default behavior of this method is to call setStatus(int sc) on the wrapped response object.

**setStatus(int, String)** - Method in class
javax.servlet.http.HttpServletResponseWrapper
The default behavior of this method is to call setStatus(int sc, String sm) on the wrapped response object.

**setStreet(String)** - Method in interface
javax.xml.registry.infomodel.PostalAddress
Sets the street name.

**setStreetNumber(String)** - Method in interface
javax.xml.registry.infomodel.PostalAddress
Sets the street number.

**setString(String, String)** - Method in interface
javax.jms.MapMessage
Sets a String value with the specified name into the Map.

**setStringProperty(String, String)** - Method in interface
javax.jms.Message
Sets a String property value with the specified name into the message.

**setStyle(String)** - Method in class
javax.faces.component.html.HtmlCommandButton
Set the value of the style property.

**setStyle(String)** - Method in class
javax.faces.component.html.HtmlCommandLink
Set the value of the style property.

**setStyle(String)** - Method in class
javax.faces.component.html.HtmlDataTable
Set the value of the style property.

**setStyle(String)** - Method in class
javax.faces.component.html.HtmlForm
Set the value of the style property.

**setStyle(String)** - Method in class
javax.faces.component.html.HtmlGraphicImage
Set the value of the style property.
javax.faces.component.html.HtmlInputSecret
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlInputSecret

javax.faces.component.html.HtmlInputText
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlInputText

javax.faces.component.html.HtmlInputTextarea
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlInputTextarea

javax.faces.component.html.HtmlMessage
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlMessage

javax.faces.component.html.HtmlMessages
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlMessages

javax.faces.component.html.HtmlOutputFormat
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlOutputFormat

javax.faces.component.html.HtmlOutputLabel
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlOutputLabel

javax.faces.component.html.HtmlOutputLink
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlOutputLink

javax.faces.component.html.HtmlOutputText
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlOutputText

javax.faces.component.html.HtmlPanelGrid
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlPanelGrid

javax.faces.component.html.HtmlPanelGroup
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlPanelGroup

javax.faces.component.html.HtmlSelectBooleanCheckbox
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlSelectBooleanCheckbox

javax.faces.component.html.HtmlSelectManyCheckbox
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlSelectManyCheckbox

javax.faces.component.html.HtmlSelectManyListbox
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlSelectManyListbox

javax.faces.component.html.HtmlSelectManyMenu
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlSelectManyMenu

javax.faces.component.html.HtmlSelectOneListbox
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlSelectOneListbox

javax.faces.component.html.HtmlSelectOneMenu
   Set the value of the style property.
setStyle(String) - Method in class javax.faces.component.html.HtmlSelectOneMenu
**setStyle(String)** - Method in class
javax.faces.component.html.HtmlSelectOneRadio
Set the value of the style property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlCommandButton
Set the value of the styleClass property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlCommandLink
Set the value of the styleClass property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlDataTable
Set the value of the styleClass property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlForm
Set the value of the styleClass property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlGraphicImage
Set the value of the styleClass property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlInputSecret
Set the value of the styleClass property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlInputText
Set the value of the styleClass property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlInputTextarea
Set the value of the styleClass property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlMessage
Set the value of the styleClass property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlMessages
Set the value of the styleClass property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlOutputFormat
Set the value of the styleClass property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlOutputLabel
Set the value of the styleClass property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlOutputLink
Set the value of the styleClass property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlOutputText
Set the value of the styleClass property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlPanelGrid
Set the value of the styleClass property.

**setStyleClass(String)** - Method in class
javax.faces.component.html.HtmlPanelGroup
Set the value of the styleClass property.

```
setStyleClass(String) - Method in class
javax.faces.component.html.HtmlSelectBooleanCheckbox
```
Set the value of the styleClass property.

```
setStyleClass(String) - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
```
Set the value of the styleClass property.

```
setStyleClass(String) - Method in class
javax.faces.component.html.HtmlSelectManyListbox
```
Set the value of the styleClass property.

```
setStyleClass(String) - Method in class
javax.faces.component.html.HtmlSelectManyMenu
```
Set the value of the styleClass property.

```
setStyleClass(String) - Method in class
javax.faces.component.html.HtmlSelectOneListbox
```
Set the value of the styleClass property.

```
setStyleClass(String) - Method in class
javax.faces.component.html.HtmlSelectOneMenu
```
Set the value of the styleClass property.

```
setStyleClass(String) - Method in class
javax.faces.component.html.HtmlSelectOneRadio
```
Set the value of the styleClass property.

```
setSubject(String) - Method in class
javax.mail.internet.MimeMessage
```
Set the "Subject" header field.

```
setSubject(String, String) - Method in class
javax.mail.internet.MimeMessage
```
Set the "Subject" header field.

```
setSubject(String) - Method in class
javax.mail.Message
```
Set the subject of this message.

```
setSubmitted(boolean) - Method in class
javax.faces.component.UIForm
```
If this UIForm instance (as opposed to other forms in the page) is experiencing a submit during this request processing lifecycle, this method must be called, with true as the argument, during the

```
UIComponent.decode(javax.faces.context.FacesContext) for this UIForm instance.
```

```
setSubmittedValue(Object) - Method in interface
javax.faces.component.EditableValueHolder
```
Set the submittedValue value of this component.

```
setSubmittedValue(Object) - Method in class
javax.faces.component.UIInput
```
Set the submittedValue value of this UIInput component.

```
setSubscribed(boolean) - Method in class
javax.mail.Folder
```
Subscribe or unsubscribe this Folder.

```
setSubType(String) - Method in class
javax.activationMimeType
```
Set the subtype for this object to the given String.

```
setSubType(String) - Method in class
javax.mail.internet.ContentType
```
Set the subType.

**setSubType(String)** - Method in class
javax.mail.internet.MimeMultipart
Set the subtype.

**setSummary(String)** - Method in class
javax.faces.application.FacesMessage
Set the localized summary text.

**setSummary(String)** - Method in class
javax.faces.component.html.DataTable
Set the value of the summary property.

**setSummary(String)** - Method in class
javax.faces.component.html.DataTable
Set the value of the summary property.

**setSupportedEncodings(String[])** - Method in interface
javax.xml.rpc.encoding.TypeMapping
Sets the encodingStyle URIs supported by this TypeMapping instance.

**setSupportedLocales(Collection<Locale>)** - Method in class
javax.faces.application.Application
Set the Locale instances representing the supported Locales for this application.

**setSynchronous(boolean)** - Method in interface
javax.xml.registry.Connection
Sets whether the client uses synchronous communication or not.

**setTabindex(String)** - Method in class
javax.faces.component.html.CommandButton
Set the value of the tabindex property.

**setTabindex(String)** - Method in class
javax.faces.component.html.CommandLink
Set the value of the tabindex property.

**setTabindex(String)** - Method in class
javax.faces.component.html.InputSecret
Set the value of the tabindex property.

**setTabindex(String)** - Method in class
javax.faces.component.html.InputText
Set the value of the tabindex property.

**setTabindex(String)** - Method in class
javax.faces.component.html.InputTextarea
Set the value of the tabindex property.

**setTabindex(String)** - Method in class
javax.faces.component.html.OutputLabel
Set the value of the tabindex property.

**setTabindex(String)** - Method in class
javax.faces.component.html.OutputLink
Set the value of the tabindex property.

**setTabindex(String)** - Method in class
javax.faces.component.html.SelectBooleanCheckbox
Set the value of the tabindex property.

**setTabindex(String)** - Method in class
javax.faces.component.html.SelectManyCheckbox
Set the value of the tabindex property.

```
setTabindex(String) - Method in class
javax.faces.component.html.HtmlSelectManyListbox
```
Set the value of the tabindex property.
```
setTabindex(String) - Method in class
javax.faces.component.html.HtmlSelectManyMenu
```
Set the value of the tabindex property.
```
setTabindex(String) - Method in class
javax.faces.component.html.HtmlSelectOneListbox
```
Set the value of the tabindex property.
```
setTabindex(String) - Method in class
javax.faces.component.html.HtmlSelectOneMenu
```
Set the value of the tabindex property.
```
setTabindex(String) - Method in class
javax.faces.component.html.HtmlSelectOneRadio
```
Set the value of the tabindex property.
```
setTagExtraInfo(TagExtraInfo) - Method in class
javax.servlet.jsp.tagext.TagInfo
```
Set the instance for extra tag information.
```
setTagInfo(TagInfo) - Method in class
javax.servlet.jsp.tagext.TagExtraInfo
```
Set the TagInfo for this class.
```
setTagLibrary(TagLibraryInfo) - Method in class
javax.servlet.jsp.tagext.TagInfo
```
Set the TagLibraryInfo property.
```
setTarget(String) - Method in class
javax.faces.component.html.HtmlCommandLink
```
Set the value of the target property.
```
setTarget(String) - Method in class
javax.faces.component.html.HtmlForm
```
Set the value of the target property.
```
setTarget(String) - Method in class
javax.faces.component.html.HtmlOutputLink
```
Set the value of the target property.
```
setTargetBinding(ServiceBinding) - Method in interface
javax.xml.registry.infomodel.ServiceBinding
```
Sets the next ServiceBinding in case there is a redirection.
```
setTargetEndpointAddress(String) - Method in interface
javax.xml.rpc.Call
```
Sets the address of the target service endpoint.
```
setTargetObject(RegistryObject) - Method in interface
javax.xml.registry.infomodel.Association
```
Sets the Object that is the target of this Association.
```
setTelephoneNumbers(Collection) - Method in interface
javax.xml.registry.infomodel.Organization
```
Sets the various telephone numbers for this user.
```
setTelephoneNumbers(Collection) - Method in interface
javax.xml.registry.infomodel.User
```
Sets the various telephone numbers for this user.
```
setText(String) - Method in interface java.util.TextMessage
```

Sets the string containing this message's data.

**setText(String)** - Method in class javax.mail.internet.MimeBodyPart
Convenience method that sets the given String as this part's content, with a MIME type of "text/plain".

**setText(String, String)** - Method in class javax.mail.internet.MimeBodyPart
Convenience method that sets the given String as this part's content, with a MIME type of "text/plain" and the specified charset.

**setText(String, String, String)** - Method in class javax.mail.internet.MimeBodyPart
Convenience method that sets the given String as this part's content, with a primary MIME type of "text" and the specified MIME subtype.

**setText(String)** - Method in class javax.mail.internet.MimeMessage
Convenience method that sets the given String as this part's content, with a MIME type of "text/plain".

**setText(String, String)** - Method in class javax.mail.internet.MimeMessage
Convenience method that sets the given String as this part's content, with a MIME type of "text/plain" and the specified charset.

**setText(String, String, String)** - Method in class javax.mail.internet.MimeMessage
Convenience method that sets the given String as this part's content, with a primary MIME type of "text" and the specified MIME subtype.

**setText(String)** - Method in class javax.mail.internet.MimeMessage
Convenience method that sets the given String as this part's content, with a MIME type of "text/plain".

**setText(String, String, String)** - Method in class javax.mail.internet.MimeMessage
Convenience method that sets the given String as this part's content, with a primary MIME type of "text" and the specified MIME subtype.

**setText(String)** - Method in class javax.mail.Part
A convenience method that sets the given String as this part's content with a MIME type of "text/plain".

**setTimeStyle(String)** - Method in class javax.faces.convert.DateTimeConverter
Set the style to be used to format or parse times.

**setTimeToLive(long)** - Method in interface javax.jms.MessageProducer
Sets the default length of time in milliseconds from its dispatch time that a produced message should be retained by the message system.
`setTimeZone(TimeZone)` - Method in class `javax.faces.convert.DateTimeConverter`  
Set the TimeZone used to interpret a time value.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlCommandButton`  
Set the value of the title property.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlCommandLink`  
Set the value of the title property.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlDataTable`  
Set the value of the title property.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlForm`  
Set the value of the title property.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlGraphicImage`  
Set the value of the title property.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlInputSecret`  
Set the value of the title property.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlInputText`  
Set the value of the title property.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlInputTextarea`  
Set the value of the title property.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlMessage`  
Set the value of the title property.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlMessages`  
Set the value of the title property.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlOutputFormat`  
Set the value of the title property.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlOutputLabel`  
Set the value of the title property.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlOutputLink`  
Set the value of the title property.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlOutputText`  
Set the value of the title property.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlPanelGrid`  
Set the value of the title property.

`setTitle(String)` - Method in class `javax.faces.component.html.HtmlSelectBooleanCheckbox`  
Set the value of the title property.
Set the value of the title property.

**setTitle(String)** - Method in class
javax.faces.component.html.HtmlSelectManyCheckbox
Set the value of the title property.

**setTitle(String)** - Method in class
javax.faces.component.html.HtmlSelectManyListbox
Set the value of the title property.

**setTitle(String)** - Method in class
javax.faces.component.html.HtmlSelectManyMenu
Set the value of the title property.

**setTitle(String)** - Method in class
javax.faces.component.html.HtmlSelectOneListbox
Set the value of the title property.

**setTitle(String)** - Method in class
javax.faces.component.html.HtmlSelectOneMenu
Set the value of the title property.

**setTitle(String)** - Method in class
javax.faces.component.html.HtmlSelectOneRadio
Set the value of the title property.

**setTooltip(boolean)** - Method in class
javax.faces.component.html.HtmlMessage
Set the value of the tooltip property.

**setTooltip(boolean)** - Method in class
javax.faces.component.html.HtmlMessages
Set the value of the tooltip property.

**setTransactionTimeout(long)** - Method in class
javax.resource.spi.work.ExecutionContext
Set the transaction timeout value for a imported transaction.

**setTransactionTimeout(int)** - Method in interface
javax.transaction.TransactionManager
Modify the timeout value that is associated with transactions started by the current thread with the begin method.

**setTransactionTimeout(int)** - Method in interface
javax.transaction.UserTransaction
Modify the timeout value that is associated with transactions started by the current thread with the begin method.

**setTransactionTimeout(int)** - Method in interface
javax.transaction.xa.XAResource
Sets the current transaction timeout value for this XAResource instance.

**setTransient(boolean)** - Method in interface
javax.faces.component.StateHolder
Denotes whether or not the Object implementing this interface must or must not participate in state saving or restoring.

**setTransient(boolean)** - Method in class
javax.faces.component.UIComponentBase

**setTransient(boolean)** - Method in class
javax.faces.convert.DateTimeConverter
**setTransient(boolean)** - Method in class
javax.faces.convert.**EnumConverter**

**setTransient(boolean)** - Method in class
javax.faces.convert.**NumberConverter**

**setTransient(boolean)** - Method in class
javax.faces.event.**MethodExpressionActionListener**

**setTransient(boolean)** - Method in class
javax.faces.event.**MethodExpressionValueChangeListener**

**setTransient(boolean)** - Method in class
javax.faces.validator.**DoubleRangeValidator**

**setTransient(boolean)** - Method in class
javax.faces.validator.**LengthValidator**

**setTransient(boolean)** - Method in class
javax.faces.validator.**LongRangeValidator**

**setTransient(boolean)** - Method in class
javax.faces.validator.**MethodExpressionValidator**

**setType(String)** - Method in class
javax.faces.component.html.**HtmlCommandButton**
    Set the value of the type property.

**setType(String)** - Method in class
javax.faces.component.html.**HtmlCommandLink**
    Set the value of the type property.

**setType(String)** - Method in class
javax.faces.component.html.**HtmlOutputLink**
    Set the value of the type property.

**setType(String)** - Method in class
javax.faces.convert.**DateTimeConverter**
    Set the type of value to be formatted or parsed.

**setType(String)** - Method in class
javax.faces.convert.**NumberConverter**
    Set the number type to be used when formatting and parsing numbers.

**setType(String)** - Method in interface
javax.xml.registry.infomodel.**EmailAddress**
    Sets the type for this object.

**setType(String)** - Method in interface
javax.xml.registry.infomodel.**PostalAddress**
    Sets the type of address (for example, "headquarters") as a String.

**setType(String)** - Method in interface
javax.xml.registry.infomodel.**TelephoneNumber**
    Sets the type of telephone number (for example, "fax").
**setType(String)** - Method in interface javax.xml.registry.infomodel.User
Sets the type for this User.

**setupResponseWriter()** - Method in class javax.faces.webapp.UICOMPONENTCLASSICTAGBASE
Set up the ResponseWriter for the current response, if this has not been done already.

**setURL(String)** - Method in class javax.faces.component.UIGRAPHIC
Set the image URL for this UIGraphic.

**setURL(URL)** - Method in class javax.xml.bind.helpers.VALIDATIONEVENTLOCATORIMPL
Set the URL field on this event locator.

**setUrl(String)** - Method in interface javax.xml.registry.infomodel.TELPHONENUMBER
Sets the URL that can dial this number electronically.

**setUrl(URL)** - Method in interface javax.xml.registry.infomodel.USER
Sets the URL to the web page for this User.

**setURLName(URLName)** - Method in class javax.mail.SERVICE
Set the URLName representing this service.

**setUsageDescription(InternationalString)** - Method in interface javax.xml.registry.infomodel.SPECIFICATIONLINK
Sets the description of usage parameters.

**setUsageParameters(Collection)** - Method in interface javax.xml.registry.infomodel.SPECIFICATIONLINK
Sets any usage parameters.

**setUsemap(String)** - Method in class javax.faces.component.html.HTMLGRAPHICIMAGE
Set the value of the usemap property.

**setUserVersion(String)** - Method in interface javax.xml.registry.infomodel.VERSIONABLE
Sets the user specified revision number for this version of the Versionable object.

**setValid(boolean)** - Method in interface javax.faces.component.EDITABLEVALUEHOLDER
Set a flag indicating whether the local value of this component is valid (no conversion error has occurred).

**setValid(boolean)** - Method in class javax.faces.component.UIINPUT

**setValidateURI(boolean)** - Method in interface javax.xml.registry.infomodel.URIVALIDATOR
Sets whether to do URI validation for this object.

**setValidating(boolean)** - Method in class javax.xml.bind.helpers.ABSTRACTUNMARSHALLERIMPL
Specifies whether or not the Unmarshaller should validate during unmarshal operations.

**setValidating(boolean)** - Method in interface javax.xml.bind.UNMARSHALLER
**Deprecated. since JAXB2.0, please see Unmarshaller.setSchema(javax.xml.validation.Schema)**

**setValidator(MethodBinding)** - Method in interface
javax.faces.component.EditableValueHolder

Deprecated. Use EditableValueHolder.addValidator(javax.faces.validator.Validator) instead, obtaining the argument Validator by creating an instance of MethodExpressionValidator.

**setValidator(MethodBinding)** - Method in class javax.faces.component.UIInput

Deprecated. Use UIInput.addValidator(javax.faces.validator.Validator) instead, obtaining the argument Validator by creating an instance of MethodExpressionValidator.

**setValidatorId(String)** - Method in class javax.faces.webapp.ValidatorTag

Deprecated. Set the identifier of the Validator instance to be created.

**setValidatorMessage(String)** - Method in class javax.faces.component.UIInput

Override any ValueExpression set for the "validatorMessage" with the literal argument provided to this method.

**setValue(ELContext, Object, Object, Object)** - Method in class javax.el.ArrayELResolver

If the base object is a Java language array, attempts to set the value at the given index with the given value.

**setValue(ELContext, Object, Object, Object)** - Method in class javax.el.BeanELResolver

If the base object is not null, attempts to set the value of the given property on this bean.

**setValue(ELContext, Object, Object, Object)** - Method in class javax.el.CompositeELResolver

Attempts to set the value of the given property object on the given base object.

**setValue(ELContext, Object, Object, Object)** - Method in class javax.el.EELResolver

Attempts to set the value of the given property object on the given base object.

**setValue(ELContext, Object, Object, Object)** - Method in class javax.el.ListELResolver

If the base object is a list, attempts to set the value at the given index with the given value.

**setValue(ELContext, Object, Object, Object)** - Method in class javax.el.MapELResolver

If the base object is a map, attempts to set the value associated with the given key, as specified by the property argument.

**setValue(ELContext, Object, Object, Object)** - Method in class javax.el.ResourceBundleELResolver

If the base object is a ResourceBundle, throw a PropertyNotWritableException.

**setValue(ELContext, Object)** - Method in class javax.el.ValueExpression
Evaluates the expression relative to the provided context, and sets the result to the provided value.

`setValue(Object)` - Method in class `javax.faces.component.UICommand`  
Sets the value property of the `UICommand`.

`setValue(Object)` - Method in class `javax.faces.component.UIData`  
Set the value of the `UIData`.

`setValue(Object)` - Method in class `javax.faces.component.UIGraphic`  
Sets the value property of the `UIGraphic`.

`setValue(Object)` - Method in class `javax.faces.component.UIInput`  

`setValue(Object)` - Method in class `javax.faces.component.UIOutput`  

`setValue(Object)` - Method in class `javax.faces.component.UIParameter`  
Sets the value property of the `UIParameter`.

`setValue(Object)` - Method in class `javax.faces.component.UISelectItem`  
Sets the value property of the `UISelectItem`.

`setValue(Object)` - Method in class `javax.faces.component.UISelectItems`  
Sets the value property of the `UISelectItems`.

`setValue(Object)` - Method in interface `javax.faces.component.ValueHolder`  
Set the value of this `UIComponent` (if any).

`setValue(Object, Object, Object)` - Method in class `javax.faces.el.PropertyResolver`  
Deprecated. Set the specified value of the specified property on the specified base object.

`setValue(Object, int, Object)` - Method in class `javax.faces.el.PropertyResolver`  
Deprecated. Set the value at the specified index of the specified base object.

`setValue(FacesContext, Object)` - Method in class `javax.faces.el.ValueBinding`  
Deprecated. Set the value of the property represented by this `ValueBinding`, relative to the specified `FacesContext`.

`setValue(Object)` - Method in class `javax.faces.model.SelectItem`  
Set the value of this item, to be delivered to the model if this item is selected by this user.

`setValue(String)` - Method in class `javax.faces.webapp.AttributeTag`  
Deprecated. Set the attribute value.

`setValue(String)` - Method in class `javax.servlet.http.Cookie`  
Assigns a new value to a cookie after the cookie is created.

`setValue(ELContext, Object, Object, Object)` - Method in class `javax.servlet.jsp.el.ImplicitObjectELResolver`  
If the base object is null, and the property matches the name of a JSP implicit object, throws `PropertyNotWritableException` to indicate that implicit objects cannot be overwritten.

`setValue(ELContext, Object, Object, Object)` - Method in class `javax.servlet.jsp.el.ScopedAttributeELResolver`
If the base object is null, sets an existing scoped attribute to the new value, or creates a new scoped attribute if one does not exist by this name.

**setValue(String, Object)** - Method in class
javax.servlet.jsp.tagext.TagSupport
Associate a value with a String key.

**setValue(T)** - Method in class javax.xml.bind.JAXBElem
Set the content model and attributes of this xml element.

**setValue(String)** - Method in interface
javax.xml.registry.infomodel.Classification
Sets the taxonomy value for this external Classification.

**setValue(String)** - Method in interface
javax.xml.registry.infomodel.Concept
Sets the value (usually a taxonomy value) associated with this Concept.

**setValue(String)** - Method in interface
docs.methods.LinkedHashMap
Sets the value for the specified Locale.

**setValue(String)** - Method in interface
javax.xml.soap.Node
If this is a Text node then this method will set its value, otherwise it sets the value of the immediate (Text) child of this node.

**setValueBinding(String, ValueBinding)** - Method in class
javax.faces.component.UIComponent
*Deprecated. This has been replaced by*

**setValueBinding(String, ValueBinding)** - Method in class
javax.faces.component.UIComponentBase
*Deprecated. This has been replaced by*

**setValueBinding(String, ValueBinding)** - Method in class
javax.faces.component.UIData
*Deprecated. This has been replaced by*

**setValueBinding(String, ValueBinding)** - Method in class
javax.faces.component.UIGraphic
*Deprecated. This has been replaced by*

setValueBinding(String, ValueBinding) - Method in class
javax.faces.component.UISelectBoolean

Deprecated. This has been replaced by

setValueBinding(String, ValueBinding) - Method in class
javax.faces.component.UISelectMany

Deprecated. This has been replaced by

setValueChangeListener(MethodBinding) - Method in interface
javax.faces.component.EditableValueHolder

Deprecated. Use
EditableValueHolder.addValueChangeListener(javax.faces.event.ValueChangeListener)
instead, obtaining the argument ValueChangeListener by creating
an instance of MethodExpressionValueChangeListener.

setValueChangeListener(MethodBinding) - Method in class
javax.faces.component.UIInput

Deprecated. Use
UIInput.addValueChangeListener(javax.faces.event.ValueChangeListener)
instead, obtaining the argument ValueChangeListener by creating
an instance of MethodExpressionValueChangeListener.

setValueExpression(String, ValueExpression) - Method in class
javax.faces.component.UICOMPONENT

Set the ValueExpression used to calculate the value for the
specified attribute or property name, if any.

setValueExpression(String, ValueExpression) - Method in class
javax.faces.component.UIData

Set the ValueExpression used to calculate the value for the
specified attribute or property name, if any.

setValueExpression(String, ValueExpression) - Method in class
javax.faces.component.UIGraphic

Store any ValueExpression specified for url under value
instead; otherwise, perform the default superclass processing
for this method.

setValueExpression(String, ValueExpression) - Method in class
javax.faces.component.UISelectBoolean

Store any ValueExpression specified for selected under value
instead; otherwise, perform the default superclass processing
for this method.

setValueExpression(String, ValueExpression) - Method in class
javax.faces.component.UISelectMany

Store any ValueExpression specified for selectedValues under
value instead; otherwise, perform the default superclass processing
for this method.

setValueExpression(String, ValueExpression) - Method in class
javax.faces.component.UIData

Set the values for this Slot.
**setValueType(int)** - Method in interface javax.xml.registry.info.model.ClassificationScheme
Sets the value type for this object.

**setVar(String)** - Method in class javax.faces.component.UIData
Set the request-scope attribute under which the data object for the current row will be exposed when iterating.

**setVariable(String, ValueExpression)** - Method in class javax.el.VariableMapper
Assign a ValueExpression to an EL variable, replacing any previously assignment to the same variable.

**setVariableResolver(VariableResolver)** - Method in class javax.faces.application.Application
**Deprecated.** The recommended way to affect the execution of the EL is to provide an `<el-resolver>` element at the right place in the application configuration resources which will be considered in the normal course of expression evaluation. This method now will cause the argument resolver to be wrapped inside an implementation of `ELResolver` and exposed to the EL resolution system as if the user had called `Application.addELResolver(javax.el.ELResolver)`.

Sets the version of the cookie protocol this cookie complies with.

**setViewHandler(ViewHandler)** - Method in class javax.faces.application.Application
Set the `ViewHandler` instance that will be utilized during the Restore View and Render Response phases of the request processing lifecycle.

**setId(String)** - Method in class javax.faces.component.UIData
Set the view identifier for this view.

**setViewRoot(UIDataViewRoot)** - Method in class javax.faces.context.FacesContext
Set the root component that is associated with this request.

**setWarnClass(String)** - Method in class javax.faces.component.html.HtmlMessage
Set the value of the warnClass property.

**setWarnStyle(String)** - Method in class javax.faces.component.html.HtmlMessage
Set the value of the warnStyle property.

**setWidth(String)** - Method in class javax.faces.component.html.HtmlDataItem
Set the value of the width property.

**setWidth(String)** - Method in class
javax.faces.component.html.HtmlGraphicImage
   Set the value of the width property.

setWidth(String) - Method in class javax.faces.component.html.HtmlPanelGrid
   Set the value of the width property.

setWrappedData(Object) - Method in class javax.faces.model.ArrayDataModel
   Set the object representing the data collection wrapped by this DataModel.

setWrappedData(Object) - Method in class javax.faces.model.ListDataModel

setWrappedData(Object) - Method in class javax.faces.model.ResultSetDataModel

setWrappedData(Object) - Method in class javax.faces.model.ScalarDataModel

setXid(Xid) - Method in class javax.resource.spi.work.ExecutionContext
   set a transaction context.

setXMLReporter(XMLReporter) - Method in class javax.xml.stream.XMLInputFactory
   The reporter that will be set on any XMLStreamReader or XMLEventReader created by this factory instance.

setXMLResolver(XMLResolver) - Method in class javax.xml.stream.XMLInputFactory
   The resolver that will be set on any XMLStreamReader or XMLEventReader created by this factory instance.

SEVERITY_ERROR - Static variable in class javax.faces.application.FacesMessage
   Message severity level indicating that an error has occurred.

SEVERITY_FATAL - Static variable in class javax.faces.application.FacesMessage
   Message severity level indicating that a serious error has occurred.

SEVERITY_INFO - Static variable in class javax.faces.application.FacesMessage
   Message severity level indicating an informational message rather than an error.

SEVERITY_WARN - Static variable in class javax.faces.application.FacesMessage
   Message severity level indicating that an error might have occurred.
**SharedByteArrayInputStream** - Class in `javax.mail.util`
A ByteArrayInputStream that implements the SharedInputStream interface, allowing the underlying byte array to be shared between multiple readers.

**SharedByteArrayInputStream(byte[])** - Constructor for class `javax.mail.util.SharedByteArrayInputStream`
Create a SharedByteArrayInputStream representing the entire byte array.

**SharedByteArrayInputStream(byte[], int, int)** - Constructor for class `javax.mail.util.SharedByteArrayInputStream`
Create a SharedByteArrayInputStream representing the part of the byte array from offset for length bytes.

**SharedFileInputStream** - Class in `javax.mail.util`
A SharedFileInputStream is a BufferedInputStream that buffers data from the file and supports the mark and reset methods.

**SharedFileInputStream(File)** - Constructor for class `javax.mail.util.SharedFileInputStream`
Creates a SharedFileInputStream for the file.

**SharedFileInputStream(String)** - Constructor for class `javax.mail.util.SharedFileInputStream`
Creates a SharedFileInputStream for the named file.

**SharedFileInputStream(File, int)** - Constructor for class `javax.mail.util.SharedFileInputStream`
Creates a SharedFileInputStream with the specified buffer size.

**SharedFileInputStream(String, int)** - Constructor for class `javax.mail.util.SharedFileInputStream`
Creates a SharedFileInputStream with the specified buffer size.

**SharedInputStream** - Interface in `javax.mail.internet`
An InputStream that is backed by data that can be shared by multiple readers may implement this interface.

**SharingViolationException** - Exception in `javax.resource.spi`
This is thrown to indicate a connection sharing violation.

**SharingViolationException()** - Constructor for exception `javax.resource.spi.SharingViolationException`
Constructs a new instance with null as its detail message.

**SharingViolationException(String)** - Constructor for exception `javax.resource.spi.SharingViolationException`
Constructs a new instance with the specified detail message.

**SharingViolationException(Throw)able** - Constructor for exception `javax.resource.spi.SharingViolationException`
Constructs a new throwable with the specified cause.

**SharingViolationException(String, Throwable)** - Constructor for exception `javax.resource.spi.SharingViolationException`
Constructs a new throwable with the specified detail message and cause.

**SharingViolationException(String, String)** - Constructor for exception `javax.resource.spi.SharingViolationException`
Constructs a new throwable with the specified detail message and error code.

**SHORT_ID** - Static variable in class
javax.faces.convert.ShortConverter
The message identifier of the FacesMessage to be created if the conversion to Short fails.

ShortConverter - Class in javax.faces.convert
Converter implementation for java.lang.Short (and short primitive) values.

ShortConverter() - Constructor for class
javax.faces.convert.ShortConverter

ShortHolder - Class in javax.xml.rpc.holders

ShortHolder() - Constructor for class
javax.xml.rpc.holders.ShortHolder

ShortHolder(short) - Constructor for class
javax.xml.rpc.holders.ShortHolder

shortname - Variable in class
javax.servlet.jsp.tagext.TagLibraryInfo
The preferred short name (prefix) as indicated in the TLD.

ShortWrapperHolder - Class in javax.xml.rpc.holders

ShortWrapperHolder() - Constructor for class
javax.xml.rpc.holders.ShortWrapperHolder

ShortWrapperHolder(Short) - Constructor for class
javax.xml.rpc.holders.ShortWrapperHolder

SimpleTag - Interface in javax.servlet.jsp.tagext
Interface for defining Simple Tag Handlers.

SimpleTagSupport - Class in javax.servlet.jsp.tagext
A base class for defining tag handlers implementing SimpleTag.

SimpleTagSupport() - Constructor for class
javax.servlet.jsp.tagext.SimpleTagSupport
Sole constructor.

SimpleThreadModel - Interface in javax.servlet
Deprecated. As of Java Servlet API 2.4, with no direct replacement.

size() - Method in class javax.activation.MimeTypeParameterList
Return the number of name-value pairs in this list.

size() - Method in class javax.mail.internet.ParameterList
Return the number of parameters in this list.

SizeTerm - Class in javax.mail.search
This class implements comparisons for Message sizes.

SizeTerm(int, int) - Constructor for class
javax.mail.search.SizeTerm
Constructor.

skip(long) - Method in class javax.mail.util.SharedFileInputStream
See the general contract of the skip method of InputStream.

SKIP_BODY - Static variable in interface
javax.servlet.jsp.tagext.Tag
Skip body evaluation.

SKIP_PAGE - Static variable in interface
javax.servlet.jsp.tagext.Tag
Skip the rest of the page.

SkipPageException - Exception in javax.servlet.jsp
Exception to indicate the calling page must cease evaluation.

SkipPageException() - Constructor for exception
javax.servlet.jsp.SkipPageException
Creates a SkipPageException with no message.

SkipPageException(String) - Constructor for exception
javax.servlet.jsp.SkipPageException
Creates a SkipPageException with the provided message.

SkipPageException(String, Throwable) - Constructor for exception
javax.servlet.jsp.SkipPageException
Creates a SkipPageException with the provided message and root cause.

SkipPageException( Throwable) - Constructor for exception
javax.servlet.jsp.SkipPageException
Creates a SkipPageException with the provided root cause.

Slot - Interface in javax.xml.registry.infomodel
Slot instances provide a dynamic way to add arbitrary attributes to RegistryObject instances.

SLOT - Static variable in interface
javax.xml.registry.LifeCycleManager

SOAP11HTTP_BINDING - Static variable in interface
javax.xml.ws.soap.SOAPBinding
A constant representing the identity of the SOAP 1.1 over HTTP binding.

SOAP11HTTP_MTOM_BINDING - Static variable in interface
javax.xml.ws.soap.SOAPBinding
A constant representing the identity of the SOAP 1.1 over HTTP binding with MTOM enabled by default.

SOAP12HTTP_BINDING - Static variable in interface
javax.xml.ws.soap.SOAPBinding
A constant representing the identity of the SOAP 1.2 over HTTP binding.

SOAP12HTTP_MTOM_BINDING - Static variable in interface
javax.xml.ws.soap.SOAPBinding
A constant representing the identity of the SOAP 1.2 over HTTP binding with MTOM enabled by default.

SOAP_1_1_CONTENT_TYPE - Static variable in interface
javax.xml.soap.SOAPConstants
The media type of the Content-Type MIME header in SOAP 1.1.

SOAP_1_1_PROTOCOL - Static variable in interface
javax.xml.soap.SOAPConstants
Used to create MessageFactory instances that create SOAPMessages whose behavior supports the SOAP 1.1 specification.
**SOAP 1.2 CONTENT TYPE** - Static variable in interface javax.xml.soap.SOAPOutputProperties
   The media type of the Content-Type MIME header in SOAP 1.2.

**SOAP 1.2 PROTOCOL** - Static variable in interface javax.xml.soap.SOAPOutputProperties
   Used to create MessageFactory instances that create SOAPMessages whose behavior supports the SOAP 1.2 specification.

**SOAP_ARRAY** - Static variable in class javax.xml.rpc.encoding.XMLType
   The name of the SOAP-ENC:Array type.

**SOAP_BASE64** - Static variable in class javax.xml.rpc.encoding.XMLType
   The name of the SOAP-ENC:base64 type.

**SOAP_BOOLEAN** - Static variable in class javax.xml.rpc.encoding.XMLType
   The name of the SOAP-ENC:boolean type.

**SOAP_BYTE** - Static variable in class javax.xml.rpc.encoding.XMLType
   The name of the SOAP-ENC:byte type.

**SOAP_DATAENCODINGUNKNOWN_FAULT** - Static variable in interface javax.xml.soap.SOAPOutputProperties
   SOAP 1.2 DataEncodingUnknown Fault.

**SOAP_DOUBLE** - Static variable in class javax.xml.rpc.encoding.XMLType
   The name of the SOAP-ENC:double type.

**SOAP_ENV_PREFIX** - Static variable in interface javax.xml.soap.SOAPOutputProperties
   The default namespace prefix for http://www.w3.org/2003/05/soap-envelope.

**SOAP_FLOAT** - Static variable in class javax.xml.rpc.encoding.XMLType
   The name of the SOAP-ENC:float type.

**SOAP_INT** - Static variable in class javax.xml.rpc.encoding.XMLType
   The name of the SOAP-ENC:int type.

**SOAP_LONG** - Static variable in class javax.xml.rpc.encoding.XMLType
   The name of the SOAP-ENC:long type.

**SOAP_MUSTUNDERSTAND_FAULT** - Static variable in interface javax.xml.soap.SOAPOutputProperties
   SOAP 1.2 MustUnderstand Fault.

**SOAP_RECEIVER_FAULT** - Static variable in interface javax.xml.soap.SOAPOutputProperties
   SOAP 1.2 Receiver Fault.

**SOAP_SENDER_FAULT** - Static variable in interface javax.xml.soap.SOAPOutputProperties
   SOAP 1.2 Sender Fault.

**SOAP_SHORT** - Static variable in class javax.xml.rpc.encoding.XMLType
   The name of the SOAP-ENC:short type.

**SOAP_STRING** - Static variable in class javax.xml.rpc.encoding.XMLType
   The name of the SOAP-ENC:string type.
SOAP_VERSIONMISMATCH_FAULT - Static variable in interface javax.xml.soap.SOAPConstants
SOAP 1.2 VersionMismatch Fault

SOAPACTION_URI_PROPERTY - Static variable in interface javax.xml.rpc.Call
Standard property for SOAPAction.

SOAPACTION_URI_PROPERTY - Static variable in interface javax.xml.ws.BindingProvider
Standard property for SOAPAction.

SOAPACTION_USE_PROPERTY - Static variable in interface javax.xml.rpc.Call
Standard property for SOAPAction.

SOAPACTION_USE_PROPERTY - Static variable in interface javax.xml.ws.BindingProvider
Standard property for SOAPAction.

SOAPBinding - Annotation Type in javax.jws.soap
Specifies the mapping of the Web Service onto the SOAP message protocol.

SOAPBinding - Interface in javax.xml.ws.soap
The SOAPBinding interface is an abstraction for the SOAP binding.

SOAPBinding.ParameterStyle - Enum in javax.jws.soap
The style of mapping parameters onto SOAP messages

SOAPBinding.Style - Enum in javax.jws.soap
The SOAP binding style

SOAPBinding.Use - Enum in javax.jws.soap
The SOAP binding use

SOAPBody - Interface in javax.xml.soap
An object that represents the contents of the SOAP body element in a SOAP message.

SOAPBodyElement - Interface in javax.xml.soap
A SOAPBodyElement object represents the contents in a SOAPBody object.

SOAPConnection - Class in javax.xml.soap
A point-to-point connection that a client can use for sending messages directly to a remote party (represented by a URL, for instance).

SOAPConnection() - Constructor for class javax.xml.soap.SOAPConnection

SOAPConnectionFactory - Class in javax.xml.soap
A factory for creating SOAPConnection objects.

SOAPConnectionFactory() - Constructor for class javax.xml.soap.SOAPConnectionFactory

SOAPConstants - Interface in javax.xml.soap
The definition of constants pertaining to the SOAP protocol.

SOAPElement - Interface in javax.xml.soap
An object representing an element of a SOAP message that is allowed but not specifically prescribed by a SOAP
**SOAPElementFactory** - Class in *javax.xml.soap*
Deprecated. - Use *javax.xml.soap.SOAPFactory* for creating SOAPElements.

**SOAPEnvelope** - Interface in *javax.xml.soap*
The container for the SOAPHeader and SOAPBody portions of a SOAPPart object.

**SOAPException** - Exception in *javax.xml.soap*
An exception that signals that a SOAP exception has occurred.

**SOAPException()** - Constructor for exception
*javax.xml.soap.SOAPException*
Constructs a SOAPException object with no reason or embedded Throwable object.

**SOAPException(String)** - Constructor for exception
*javax.xml.soap.SOAPException*
Constructs a SOAPException object with the given String as the reason for the exception being thrown.

**SOAPException(String, Throwable)** - Constructor for exception
*javax.xml.soap.SOAPException*
Constructs a SOAPException object with the given String as the reason for the exception being thrown and the given Throwable object as an embedded exception.

**SOAPException(Throwables)** - Constructor for exception
*javax.xml.soap.SOAPException*
Constructs a SOAPException object initialized with the given Throwable object.

**SOAPFactory** - Class in *javax.xml.soap*
SOAPFactory is a factory for creating various objects that exist in the SOAP XML tree.

**SOAPFactory()** - Constructor for class *javax.xml.soap.SOAPFactory*

**SOAPFault** - Interface in *javax.xml.soap*
An element in the SOAPBody object that contains error and/or status information.

**SOAPFaultElement** - Interface in *javax.xml.soap*
A representation of the contents in a SOAPFault object.

**SOAPFaultException** - Exception in *javax.xml.rpc.soap*
The SOAPFaultException exception represents a SOAP fault.

**SOAPFaultException(QName, String, String, Detail)** - Constructor for exception
*javax.xml.rpc.soap.SOAPFaultException*
Constructor for the SOAPFaultException

**SOAPFaultException** - Exception in *javax.xml.ws.soap*
The SOAPFaultException exception represents a SOAP 1.1 or 1.2 fault.

**SOAPFaultException(SOAPFault)** - Constructor for exception
*javax.xml.ws.soap.SOAPFaultException*
Constructor for SOAPFaultException

**SOAPHandler<T extends SOAPMessageContext>** - Interface in *javax.xml.ws.handler.soap*
The SOAPHandler class extends Handler to provide typesafety for...
the message context parameter and add a method to obtain access to the headers that may be processed by the handler.

**SOAPHeader** - Interface in javax.xml.soap
A representation of the SOAP header element.

**SOAPHeaderElement** - Interface in javax.xml.soap
An object representing the contents in the SOAP header part of the SOAP envelope.

**SOAPMessage** - Class in javax.xml.soap
The root class for all SOAP messages.

**SOAPMessage()** - Constructor for class javax.xml.soap.SOAPOperation

**SOAPMessageContext** - Interface in javax.xml.rpc.handler.soap
The interface javax.xml.rpc.soap.SOAPMessageContext provides access to the SOAP message for either RPC request or response.

**SOAPMessageContext** - Interface in javax.xml.ws.handler.soap
The interface SOAPMessageContext provides access to the SOAP message for either RPC request or response.

**SOAPMessageHandler** - Annotation Type in javax.jws.soap
Deprecated. As of JSR-181 2.0 with no replacement.

**SOAPMessageHandlers** - Annotation Type in javax.jws.soap
Deprecated. As of JSR-181 2.0 with no replacement.

**SOAPPart** - Class in javax.xml.soap
The container for the SOAP-specific portion of a SOAPMessage object.

**SOAPPart()** - Constructor for class javax.xml.soap.SOAPOperation

**SORT_BY_DATE_ASC** - Static variable in interface javax.xml.registry.FindQualifier

**SORT_BY_DATE_DESC** - Static variable in interface javax.xml.registry.FindQualifier

**SORT_BY_NAME_ASC** - Static variable in interface javax.xml.registry.FindQualifier

**SORT_BY_NAME_DESC** - Static variable in interface javax.xml.registry.FindQualifier

**SORT_CODE_SLOT** - Static variable in interface javax.xml.registry.infomodel.Slot
Name for pre-defined Slot used in PostalAddress by JAXR UDDI provider.

**SOUNDEX** - Static variable in interface javax.xml.registry.FindQualifier
Optional qualifier that allows matching strings by their sounds.

**SPACE** - Static variable in interface javax.xml.stream.XMLStreamConstants
The characters are white space (see [XML], 2.10 "White Space Handling").
**SPECIFICATION_LINK** - Static variable in interface
javax.xml.registry.*LifeCycleManager*

**SpecificationLink** - Interface in *javax.xml.registry.infomodel*
A SpecificationLink provides the linkage between a ServiceBinding and one of its technical specifications that describes how to use the service using the ServiceBinding.

**SqlResultSetMapping** - Annotation Type in *javax.persistence*
This annotation is used to specify the mapping of the result of a native SQL query.

**SqlResultSetMappings** - Annotation Type in *javax.persistence*
This annotation is used to define one or more SqlResultSetMapping.

**STABILITY_DYNAMIC** - Static variable in interface
javax.xml.registry.infomodel.*RegistryEntry*
RegistryEntry may change at any time.

**STABILITY_DYNAMIC_COMPATIBLE** - Static variable in interface
javax.xml.registry.infomodel.*RegistryEntry*
RegistryEntry may change at any time, however the changes will be backward compatible.

**STABILITY_STATIC** - Static variable in interface
javax.xml.registry.infomodel.*RegistryEntry*
RegistryEntry will not change.

**standaloneSet()** - Method in interface
javax.xml.stream.events.*StartDocument*
Returns true if the standalone attribute was set in the encoding declaration of the document.

**standaloneSet()** - Method in class
javax.xml.stream.util.*StreamReaderDelegate*

**standaloneSet()** - Method in interface
javax.xml.stream.*XMLStreamReader*
Checks if standalone was set in the document

**START** - Static variable in class
javax.enterprise.deploy.shared.*CommandType*
The DeploymentManger action operation being processed is start.

**start(TargetModuleID[])** - Method in interface
javax.enterprise.deploy.spi.*DeploymentManager*
Start the application running.

**start()** - Method in interface java.jms.*Connection*
Starts (or restarts) a connection's delivery of incoming messages.

**start()** - Method in interface java.jms.*ServerSession*
Cause the Session's run method to be called to process messages that were just assigned to it.

**start** - Variable in class
javax.mail.util.*SharedByteArrayInputStream*
Position within shared buffer that this stream starts at.

**start** - Variable in class java.mail.util.*SharedFileInputStream*
The file offset of the start of data in this subset of the
file.

**start(BootstrapContext)** - Method in interface javax.resource.spi.ResourceAdapter
This is called when a resource adapter instance is bootstrapped.

**start(Xid, int)** - Method in interface javax.transaction.xa.XAResource
Starts work on behalf of a transaction branch specified in xid.

**START DOCUMENT** - Static variable in interface javax.xml.stream.XMLStreamConstants
Indicates an event is a start document

**START ELEMENT** - Static variable in interface javax.xml.stream.XMLStreamConstants
Indicates an event is a start element

**START_TIMED_OUT** - Static variable in exception javax.resource.spi.work.WorkException
Indicates start timeout expiration.

**startDocument()** - Method in class javax.faces.context.ResponseWriter
Write whatever text should begin a response.

**startDocument()** - Method in class javax.faces.context.ResponseWriterWrapper
The default behavior of this method is to call ResponseWriter.startDocument() on the wrapped ResponseWriter object.

**StartDocument** - Interface in javax.xml.stream.events
An interface for the start document event

**startElement(String, UIComponent)** - Method in class javax.faces.context.ResponseWriter
Write the start of an element, up to and including the element name.

**startElement(String, UIComponent)** - Method in class javax.faces.context.ResponseWriterWrapper
The default behavior of this method is to call ResponseWriter.startElement(String, javax.faces.component.UIComponent) on the wrapped ResponseWriter object.

**StartElement** - Interface in javax.xml.stream.events
The StartElement interface provides access to information about start elements.

**startWork(Work)** - Method in interface javax.resource.spi.work.WorkManager
Accepts a Work instance for processing.

**startWork(Work, long, ExecutionContext, WorkListener)** - Method in interface javax.resource.spi.work.WorkManager
Accepts a Work instance for processing.

**STATE_SAVING_METHOD_CLIENT** - Static variable in class javax.faces.application.StateManager
Constant value for the initialization parameter named by the STATE_SAVING_METHOD_PARAM_NAME that indicates state saving
should take place on the client.

**STATE_SAVING_METHOD_PARAM_NAME** - Static variable in class `javax.faces.application.StateManager`

The ServletContext init parameter consulted by the StateManager to tell where the state should be saved.

**STATE_SAVING_METHOD_SERVER** - Static variable in class `javax.faces.application.StateManager`

Constant value for the initialization parameter named by the STATE_SAVING_METHOD_PARAM_NAME that indicates state saving should take place on the server.

**Stateful** - Annotation Type in `javax.ejb`

Component-defining annotation for a stateful session bean.

**StatefulSessionBeanStats** - Interface in `javax.management.j2ee.statistics`

Specifies the statistics provided by a stateful session bean.

**StateHolder** - Interface in `javax.faces.component`

This interface is implemented by classes that need to save their state between requests.

**Stateless** - Annotation Type in `javax.ejb`

Component-defining annotation for a stateless session bean.

**StatelessSessionBeanStats** - Interface in `javax.management.j2ee.statistics`

Specifies the statistics provided by a stateless session bean.

**StateManager** - Class in `javax.faces.application`.

StateManager directs the process of saving and restoring the view between requests.

**StateManager()** - Constructor for class `javax.faces.application.StateManager`

**StateManager.SerializedView** - Class in `javax.faces.application`.

Deprecated. This class was not marked Serializable in the 1.0 version of the spec. It was also not a static inner class, so it can't be made to be Serializable. Therefore, it is being deprecated in version 1.2 of the spec. The replacement is to use an implementation dependent Object.

**StateManager.SerializedView(Object, Object)** - Constructor for class `javax.faces.application.StateManager.SerializedView`

Deprecated.

**StateManagerWrapper** - Class in `javax.faces.application`.

Provides a simple implementation of `StateManager` that can be subclassed by developers wishing to provide specialized behavior to an existing `StateManager` instance.

**StateManagerWrapper()** - Constructor for class `javax.faces.application.StateManagerWrapper`

**StateType** - Class in `javax.enterprise.deploy.shared`.

Class StateTypes defines enumeration values for the DeploymentStatus object.

**StateType(int)** - Constructor for class `javax.enterprise.deploy.shared.StateType`
Construct a new enumeration value with the given integer value.

**Statistic** - Interface in `javax.management.j2ee.statistics`
The Statistic model and its sub-models specify the data models which are required to be used to provide the performance data described by the specific attributes in the Stats models.

**Stats** - Interface in `javax.management.j2ee.statistics`
The Stats model and its submodels specify performance data attributes for each of the specific managed object types.

**Status** - Interface in `javax.transaction`
The Status interface defines static variables used for transaction status codes.

**STATUS_ACTIVE** - Static variable in interface `javax.transaction.Status`
A transaction is associated with the target object and it is in the active state.

**STATUS_APPROVED** - Static variable in interface `javax.xml.registry.infomodel.RegistryEntry`
RegistryEntry has been submitted and approved.

**STATUS_COMMITTED** - Static variable in interface `javax.transaction.Status`
A transaction is associated with the target object and it has been committed.

**STATUS_COMMITTING** - Static variable in interface `javax.transaction.Status`
A transaction is associated with the target object and it is in the process of committing.

**STATUS_DEPRECATED** - Static variable in interface `javax.xml.registry.infomodel.RegistryEntry`
RegistryEntry has been deprecated.

**STATUS_FAILURE** - Static variable in interface `javax.xml.registry.JAXRResponse`
Status indicating a failure response.

**STATUS_MARKED_ROLLBACK** - Static variable in interface `javax.transaction.Status`
A transaction is associated with the target object and it has been marked for rollback, perhaps as a result of a setRollbackOnly operation.

**STATUS_NO_TRANSACTION** - Static variable in interface `javax.transaction.Status`
No transaction is currently associated with the target object.

**STATUS_PREPARED** - Static variable in interface `javax.transaction.Status`
A transaction is associated with the target object and it has been prepared.

**STATUS_PREPARING** - Static variable in interface `javax.transaction.Status`
A transaction is associated with the target object and it is in the process of preparing.

**STATUS_ROLLED_BACK** - Static variable in interface `javax.transaction.Status`
A transaction is associated with the target object and the outcome has been determined to be rollback.

**STATUS_ROLLING_BACK** - Static variable in interface javax.transaction.Status

A transaction is associated with the target object and it is in the process of rolling back.

**STATUS_SUBMITTED** - Static variable in interface javax.xml.registry.infomodel.RegistryEntry

RegistryEntry has been submitted.

**STATUS_SUCCESS** - Static variable in interface javax.xml.registry.JAXRResponse

Status indicating a successful response.

**STATUS_UNAVAILABLE** - Static variable in interface javax.xml.registry.JAXRResponse

Status indicating that the results are currently unavailable.

**STATUS_UNKNOWN** - Static variable in interface javax.transaction.Status

A transaction is associated with the target object but its current status cannot be determined.

**STATUS_WARNING** - Static variable in interface javax.xml.registry.JAXRResponse

Status indicating a successful response that included at least one warning.

**STATUS_WITHDRAWN** - Static variable in interface javax.xml.registry.infomodel.RegistryEntry

RegistryEntry has been withdrawn by the submitter.

**STOP** - Static variable in class javax.enterprise.deploy.shared.ActionType

A stop operation is being preformed on the DeploymentManager action command.

**STOP** - Static variable in class javax.enterprise.deploy.shared.CommandType

The DeploymentManager action operation being processed is stop.

**stop(TargetModuleID[])** - Method in interface javax.enterprise.deploy.spi.DeploymentManager

Stop the application running.

**stop()** - Method in interface javax.enterprise.deploy.spi.status.ProgressObject

(optional) A stop request on an in-process operation allows the operation on the current TargetModuleID to run to completion but does not process any of the remaining unprocessed TargetModuleID objects.

**stop()** - Method in interface javax.jms.Connection

Temporarily stops a connection's delivery of incoming messages.

**stop()** - Method in interface javax.resource.spi.ResourceAdapter

This is called when a resource adapter instance is undeployed or during application server shutdown.

**stop()** - Method in class javax.xml.ws.Endpoint

Stops publishing this endpoint.

**store** - Variable in class javax.mail.Folder
The parent store.

**Store** - Static variable in class javax.mail.**Provider.Type**

**Store** - Class in javax.mail
An abstract class that models a message store and its access protocol, for storing and retrieving messages.

**Store(Store, URLName)** - Constructor for class javax.mail.Store
Constructor.

**StoreClosedException** - Exception in javax.mail
This exception is thrown when a method is invoked on a Messaging object and the Store that owns that object has died due to some reason.

**StoreClosedException(Store)** - Constructor for exception javax.mail.StoreClosedException
Constructor

**StoreClosedException(Store, String)** - Constructor for exception javax.mail.StoreClosedException
Constructor

**StoreEvent** - Class in javax.mail.event
This class models notifications from the Store connection.

**StoreEvent(Store, int, String)** - Constructor for class javax.mail.event.StoreEvent
Constructor.

**StoreListener** - Interface in javax.mail.event
This is the Listener interface for Store Notifications.

**Streamable** - Interface in javax.resource.cci
Streamable interface enables a resource adapter to extract data from an input Record or set data into an output Record as a stream of bytes.

**StreamFilter** - Interface in javax.xml.stream
This interface declares a simple filter interface that one can create to filter XMLStreamReaders

**StreamMessage** - Interface in javax.jms
A StreamMessage object is used to send a stream of primitive types in the Java programming language.

**StreamReaderDelegate** - Class in javax.xml.stream.util
This is the base class for deriving an XMLStreamReader filter
This class is designed to sit between an XMLStreamReader and an application's XMLStreamReader.

**StreamReaderDelegate()** - Constructor for class javax.xml.stream.util.StreamReaderDelegate
Construct an empty filter with no parent.

**StreamReaderDelegate(XMLStreamReader)** - Constructor for class javax.xml.stream.util.StreamReaderDelegate
Construct an filter with the specified parent.

**STRING_ID** - Static variable in class javax.faces.convert.BigDecimalConverter
The message identifier of the FacesMessage to be created if the conversion of the BigDecimal value to String fails.

**STRING_ID** - Static variable in class
BigIntegerConverter
The message identifier of the FacesMessage to be created if the conversion of the BigInteger value to String fails.

STRING_ID - Static variable in class

BooleanConverter
The message identifier of the FacesMessage to be created if the conversion of the Boolean value to String fails.

STRING_ID - Static variable in class

ByteConverter
The message identifier of the FacesMessage to be created if the conversion of the Byte value to String fails.

STRING_ID - Static variable in class

CharacterConverter
The message identifier of the FacesMessage to be created if the conversion of the Character value to String fails.

STRING_ID - Static variable in class

DateTimeConverter
The message identifier of the FacesMessage to be created if the conversion of the DateTime value to String fails.

STRING_ID - Static variable in class

DoubleConverter
The message identifier of the FacesMessage to be created if the conversion of the Double value to String fails.

STRING_ID - Static variable in class

FloatConverter
The message identifier of the FacesMessage to be created if the conversion of the Float value to String fails.

STRING_ID - Static variable in class

IntegerConverter
The message identifier of the FacesMessage to be created if the conversion of the Integer value to String fails.

STRING_ID - Static variable in class

LongConverter
The message identifier of the FacesMessage to be created if the conversion of the Long value to String fails.

STRING_ID - Static variable in class

NumberConverter
The message identifier of the FacesMessage to be created if the conversion of the Number value to String fails.

STRING_ID - Static variable in class

ShortConverter
The message identifier of the FacesMessage to be created if the conversion of the Short value to String fails.

StringHolder - Class in javax.xml.rpc.holders

StringHolder() - Constructor for class

javax.xml.rpc.holders.StringHolder

StringHolder(String) - Constructor for class

javax.xml.rpc.holders.StringHolder
**StringTerm** - Class in [javax.mail.search](https://docs.oracle.com/javaee/7/api/javax/mail/search/)
   This class implements the match method for Strings.

**StringTerm(String)** - Constructor for class
   javax.mail.search.StringTerm

**StringTerm(String, boolean)** - Constructor for class
   javax.mail.search.StringTerm

**Stub** - Interface in [javax.xml.rpc](https://docs.oracle.com/javase/8/docs/api/javax/xml/rpc/)
   The interface javax.xml.rpc.Stub is the common base interface for the stub classes.

**SubjectTerm** - Class in [javax.mail.search](https://docs.oracle.com/javaee/7/api/javax/mail/search/)
   This class implements comparisons for the Message Subject header.

**SubjectTerm(String)** - Constructor for class
   javax.mail.search.SubjectTerm
   Constructor.

**SUPPORT_DTD** - Static variable in class
   javax.xml.stream.XMLInputFactory
   The property that requires the parser to support DTDs

**supports(String)** - Method in interface
   javax.security.jacc.PolicyContextHandler
   This public method returns a boolean result indicating whether or not the handler supports the context object identified by the (case-sensitive) key value.

**supportsExecuteWithInputAndOutputRecord()** - Method in interface
   javax.resource.cci.ResourceAdapterMetaData
   Returns true if the implementation class for the Interaction interface implements public boolean execute(InteractionSpec ispec, Record input, Record output) method; otherwise the method returns false.

**supportsExecuteWithInputRecordOnly()** - Method in interface
   javax.resource.cci.ResourceAdapterMetaData
   Returns true if the implementation class for the Interaction interface implements public Record execute(InteractionSpec ispec, Record input) method; otherwise the method returns false.

**supportsLocalTransactionDemarcation()** - Method in interface
   javax.resource.cci.ResourceAdapterMetaData
   Returns true if the resource adapter implements the LocalTransaction interface and supports local transaction demarcation on the underlying EIS instance through the LocalTransaction interface.

**supportsResultSetType(int)** - Method in interface
   javax.resource.cci.ResultSetInfo
   Indicates whether or not a resource adapter supports a type of ResultSet.

**supportsResultSetTypeConcurrency(int, int)** - Method in interface
   javax.resource.cci.ResultSetInfo
Indicates whether or not a resource adapter supports the concurrency type in combination with the given ResultSet type/

suspend() - Method in interface
javax.transaction. TransactionManager
Suspend the transaction currently associated with the calling thread and return a Transaction object that represents the transaction context being suspended.

SYNC_RECEIVE - Static variable in interface
javax.resource.cci. InteractionSpec
The execution of an Interaction results in a synchronous receive of an output Record.

SYNC_SEND - Static variable in interface
javax.resource.cci. InteractionSpec
Interaction Verb type: The execution of an Interaction does only a send to the target EIS instance.

SYNC_SEND_RECEIVE - Static variable in interface
javax.resource.cci. InteractionSpec
Interaction Verb type: The execution of an Interaction sends a request to the EIS instance and receives response synchronously.

Synchronization - Interface in javax.transaction
The transaction manager supports a synchronization mechanism that allows the interested party to be notified before and after the transaction completes.

SystemException - Exception in javax.transaction
The SystemException is thrown by the transaction manager to indicate that it has encountered an unexpected error condition that prevents future transaction services from proceeding.

SystemException() - Constructor for exception
javax.transaction. SystemException

SystemException(String) - Constructor for exception
javax.transaction. SystemException
Create a SystemException with a given string.

SystemException(int) - Constructor for exception
javax.transaction. SystemException
Create a SystemException with a given error code.
Table - Annotation Type in `javax.persistence`  
This annotation specifies the primary table for the annotated entity.

TableGenerator - Annotation Type in `javax.persistence`  
This annotation defines a primary key generator that may be referenced by name when a generator element is specified for the `GeneratedValue` annotation.

Tag - Interface in `javax.servlet.jsp.tagext`  
The interface of a classic tag handler that does not want to manipulate its body.

TagAdapter - Class in `javax.servlet.jsp.tagext`  
Wraps any SimpleTag and exposes it using a Tag interface.

TagAdapter(SimpleTag) - Constructor for class `javax.servlet.jsp.tagext.TagAdapter`  
Creates a new TagAdapter that wraps the given SimpleTag and returns the parent tag when getParent() is called.

TagAttributeInfo - Class in `javax.servlet.jsp.tagext`  
Information on the attributes of a Tag, available at translation time.

TagAttributeInfo(String, boolean, String, boolean) - Constructor for class `javax.servlet.jsp.tagext.TagAttributeInfo`  
Constructor for TagAttributeInfo.

TagAttributeInfo(String, boolean, String, boolean, boolean) - JSP 2.0 Constructor for TagAttributeInfo.

TagAttributeInfo(String, boolean, String, boolean, boolean, String, boolean, boolean, String, String) - JSP 2.1 Constructor for TagAttributeInfo.

TagData - Class in `javax.servlet.jsp.tagext`  
The (translation-time only) attribute/value information for a tag instance.

TagData(Object[][]) - Constructor for class `javax.servlet.jsp.tagext.TagData`  
Constructor for TagData.

TagData(Hashtable<String, Object>) - Constructor for class `javax.servlet.jsp.tagext.TagData`  
Constructor for a TagData.

TagExtraInfo - Class in `javax.servlet.jsp.tagext`  
Optional class provided by the tag library author to describe additional translation-time information not described in the TLD.

TagExtraInfo() - Constructor for class `javax.servlet.jsp.tagext.TagExtraInfo`  
Sole constructor.

TagFileInfo - Class in `javax.servlet.jsp.tagext`
Tag information for a tag file in a Tag Library; This class is instantiated from the Tag Library Descriptor file (TLD) and is available only at translation time.

**TagFileInfo(String, String, TagInfo)** - Constructor for class
java.servlet.jsp.tagext.TagFileInfo
Constructor for TagFileInfo from data in the JSP 2.0 format for TLD.

tagFiles - Variable in class
java.servlet.jsp.tagext.TagLibraryInfo
An array describing the tag files that are defined in this tag library.

**TagInfo** - Class in java.servlet.jsp.tagext
Tag information for a tag in a Tag Library; This class is instantiated from the Tag Library Descriptor file (TLD) and is available only at translation time.

**TagInfo(String, String, String, TagLibraryInfo, TagExtraInfo, TagAttributeInfo[])** - Constructor for class
java.servlet.jsp.tagext.TagInfo
Constructor for TagInfo from data in the JSP 1.1 format for TLD.

**TagInfo(String, String, String, TagLibraryInfo, TagExtraInfo, TagAttributeInfo[], String, String, TagVariableInfo[])** - Constructor for class
java.servlet.jsp.tagext.TagInfo
Constructor for TagInfo from data in the JSP 1.2 format for TLD.

**TagInfo(String, String, String, TagLibraryInfo, TagExtraInfo, TagAttributeInfo[], boolean)** - Constructor for class
java.servlet.jsp.tagext.TagInfo
Constructor for TagInfo from data in the JSP 2.0 format for TLD.

**TagLibraryInfo** - Class in java.servlet.jsp.tagext
Translation-time information associated with a taglib directive, and its underlying TLD file.

**TagLibraryInfo(String, String)** - Constructor for class
java.servlet.jsp.tagext.TagLibraryInfo
Constructor.

**TagLibraryValidator** - Class in java.servlet.jsp.tagext
Translation-time validator class for a JSP page.

**TagLibraryValidator()** - Constructor for class
java.servlet.jsp.tagext.TagLibraryValidator
Sole constructor.

tags - Variable in class java.servlet.jsp.tagext.TagLibraryInfo
An array describing the tags that are defined in this tag library.

**TagSupport** - Class in java.servlet.jsp.tagext
A base class for defining new tag handlers implementing Tag.

**TagSupport()** - Constructor for class
java.servlet.jsp.tagext.TagSupport
Default constructor, all subclasses are required to define only a public constructor with the same signature, and to call the superclass constructor.

**TagVariableInfo** - Class in `javax.servlet.jsp.tagext`
Variable information for a tag in a Tag Library; This class is instantiated from the Tag Library Descriptor file (TLD) and is available only at translation time.

**TagVariableInfo(String, String, String, boolean, int)** - Constructor for class `javax.servlet.jsp.tagext.TagVariableInfo`
Constructor for TagVariableInfo.

**Target** - Interface in `javax.enterprise.deploy.spi`
A Target interface represents a single logical core server of one instance of a J2EE platform product.

**TargetException** - Exception in `javax.enterprise.deploy.spi.exceptions`
This exception is to report bad target designators.

**TargetException(String)** - Constructor for exception `javax.enterprise.deploy.spi.exceptions.TargetException`
Creates an new TargetException object.

**TargetModuleID** - Interface in `javax.enterprise.deploy.spi`
A TargetModuleID interface represents a unique identifier for a deployed application module.

**TELEPHONE_NUMBER** - Static variable in interface `javax.xml.registry.LifeCycleManager`

**TelephoneNumber** - Interface in `javax.xml.registry.infomodel`
A simple re-usable entity class that defines attributes of a telephone number.

**Temporal** - Annotation Type in `javax.persistence`
This annotation must be specified for persistent fields or properties of type `Date` and `Calendar`.

**TemporalType** - Enum in `javax.persistence`
Type used to indicate a specific mapping of `Date` or `Calendar`.

**TemporaryQueue** - Interface in `javax.jms`
A TemporaryQueue object is a unique Queue object created for the duration of a Connection.

**TemporaryTopic** - Interface in `javax.jms`
A TemporaryTopic object is a unique Topic object created for the duration of a Connection.

**term** - Variable in class `javax.mail.search.NotTerm`
The search term to negate.

**terms** - Variable in class `javax.mail.search.AndTerm`
The array of terms on which the AND operator should be applied.

**terms** - Variable in class `javax.mail.search.OrTerm`
The array of terms on which the OR operator should be applied.

**Text** - Interface in `javax.xml.soap`
A representation of a node whose value is text.

**TextMessage** - Interface in `javax.jms`
A TextMessage object is used to send a message containing a java.lang.String.
**TIME_ID** - Static variable in class `javax.faces.convert.DateTimeConverter`
The message identifier of the `FacesMessage` to be created if the conversion to Time fails.

**TimedObject** - Interface in `javax.ejb`
The TimedObject interface contains the callback method that is used to deliver timer expiration notifications.

**Timeout** - Annotation Type in `javax.ejb`
Designates a method on a stateless session bean class or message driven bean class that should receive EJB timer expirations for that bean.

**Timer** - Interface in `javax.ejb`
The Timer interface contains information about a timer that was created through the EJB Timer Service.

**TimerHandle** - Interface in `javax.ejb`
The TimerHandle interface is implemented by all EJB timer handles.

**TimerService** - Interface in `javax.ejb`
The TimerService interface provides enterprise bean components with access to the container-provided Timer Service.

**TimeStatistic** - Interface in `javax.management.j2ee.statistics`
Specifies standard timing measurements.

**tlibversion** - Variable in class `javax.servlet.jsp.tagext.TagLibraryInfo`
The version of the tag library.

**TMENDRSCAN** - Static variable in interface `javax.transaction.xa.XAResource`
Ends a recovery scan.

**TMFAIL** - Static variable in interface `javax.transaction.xa.XAResource`
Disassociates the caller and marks the transaction branch rollback-only.

**TMJOIN** - Static variable in interface `javax.transaction.xa.XAResource`
Caller is joining existing transaction branch.

**TMNOFLAGS** - Static variable in interface `javax.transaction.xa.XAResource`
Use TMNOFLAGS to indicate no flags value is selected.

**TMONEPHASE** - Static variable in interface `javax.transaction.xa.XAResource`
Caller is using one-phase optimization.

**TMRESUME** - Static variable in interface `javax.transaction.xa.XAResource`
Caller is resuming association with a suspended transaction branch.

**TMSTARTRSCAN** - Static variable in interface `javax.transaction.xa.XAResource`
Starts a recovery scan.

**TMSUCCESS** - Static variable in interface `javax.transaction.xa.XAResource`
Disassociates caller from a transaction branch.

**TMSUSPEND** - Static variable in interface 
javax.transaction.xa.XAResource
Caller is suspending (not ending) its association with a transaction branch.

**TO** - Static variable in class javax.mail.Message.RecipientType
The "To" (primary) recipients.

**Topic** - Interface in javax.jms
A Topic object encapsulates a provider-specific topic name.

**TopicConnection** - Interface in javax.jms
A TopicConnection object is an active connection to a publish/subscribe JMS provider.

**TopicConnectionFactory** - Interface in javax.jms
A client uses a TopicConnectionFactory object to create TopicConnection objects with a publish/subscribe JMS provider.

**TopicPublisher** - Interface in javax.jms
A client uses a TopicPublisher object to publish messages on a topic.

**TopicRequestor** - Class in javax.jms
The TopicRequestor helper class simplifies making service requests.

**TopicRequestor(TopicSession, Topic)** - Constructor for class javax.jms.TopicRequestor
Constructor for the TopicRequestor class.

**TopicSession** - Interface in javax.jms
A TopicSession object provides methods for creating TopicPublisher, TopicSubscriber, and TemporaryTopic objects.

**TopicSubscriber** - Interface in javax.jms
A client uses a TopicSubscriber object to receive messages that have been published to a topic.

**toString()** - Method in class javax.activation.MimeType
Return the String representation of this object.

**toString()** - Method in class javax.activation.MimeTypeParameterList
Return a string representation of this object.

**toString()** - Method in class 
javax.enterprise.deploy.shared.ActionType
Return the string name of this ActionType or the integer value if outside the bounds of the table

**toString()** - Method in class 
javax.enterprise.deploy.shared.CommandType
Return the string name of this CommandType or the integer value if outside the bounds of the table

**toString()** - Method in class 
javax.enterprise.deploy.shared.DConfigBeanVersionType
Return the string name of this DConfigBeanVersionType or the integer value if outside the bounds of the table

**toString()** - Method in class 
javax.enterprise.deploy.shared.ModuleType
Return the string name of this ModuleType or the integer value if outside the bounds of the table
**toString()** - Method in class `javax.enterprise.deploy.shared.StateType`  
Returns the string name of this `StateType` or the integer value  
if outside the bounds of the table.

**toString()** - Method in interface `javax.enterprise.deploy.spi.TargetModuleID`  
Retrieve the identifier representing the deployed module.

**toString()** - Method in class `javax.faces.application.FacesMessage.Severity`  
Return a String representation of this `FacesMessage.Severity`  
instance.

**toString()** - Method in class `javax.faces.event.PhaseId`  
Return a String representation of this `PhaseId` instance.

**toString()** - Method in interface `javax.jms.Queue`  
Returns a string representation of this object.

**toString()** - Method in interface `javax.jms.Topic`  
Returns a string representation of this object.

**toString()** - Method in class `javax.mail.Address`  
Return a String representation of this address object.

**toString()** - Method in class `javax.mail.Folder`  
override the default `toString()`, it will return the String from Folder.getFullName() or if that is null, it will use the  
default `toString()` behavior.

**toString()** - Method in exception `javax.mail.internet.AddressException`  

**toString()** - Method in class `javax.mail.internet.ContentDisposition`  
Retrieve a RFC2045 style string representation of this  
`ContentDisposition`.

**toString()** - Method in class `javax.mail.internet.ContentType`  
Retrieve a RFC2045 style string representation of this `ContentType`.

**toString()** - Method in class `javax.mail.internet.NeWSAddress`  
Convert this address into a RFC 822 / RFC 2047 encoded address.

**toString(Address[])** - Static method in class  
`javax.mail.internet.NeWSAddress`  
Convert the given array of `NeWSAddress` objects into a comma  
separated sequence of address strings.

**toString(Address[], int)** - Static method in class  
`javax.mail.internet.NeWSAddress`  
Convert the given array of `NeWSAddress` objects into a comma  
separated sequence of address strings.

**toString()** - Method in class `javax.mail.internet.NeWSAddress`  
Convert this address into a RFC 1036 address.

**toString(Address[])** - Static method in class  
`javax.mail.internet.NeWSAddress`  
Convert the given array of `NeWSAddress` objects into a comma  
separated sequence of address strings.

**toString()** - Method in class `javax.mail.internet.ParameterList`  
Convert this ParameterList into a MIME String.
**toString(int)** - Method in class `javax.mail.internet.ParameterList`
Convert this ParameterList into a MIME String.

**toString()** - Method in class `javax.mail.Message.RecipientType`

**toString()** - Method in exception `javax.mail.MessagingException`
Override toString method to provide information on nested exceptions.

**toString()** - Method in class `javax.mail.Provider`
Overrides Object.toString()

**toString()** - Method in class `javax.mail.Provider.Type`

**toString()** - Method in class `javax.mail.Service`
Return getURLName.toString() if this service has a URLName, otherwise it will return the default toString.

**toString()** - Method in class `javax.mail.URLName`
Constructs a string representation of this URLName.

**toString()** - Method in class `javax.servlet.jsp.tagext.TagAttributeInfo`
Returns a String representation of this TagAttributeInfo, suitable for debugging purposes.

**toString()** - Method in class `javax.xml.bind.helpers.ValidationEventImpl`
Returns a string representation of this object in a format helpful to debugging.

**toString()** - Method in class `javax.xml.bind.helpers.ValidationEventLocatorImpl`
Returns a string representation of this object in a format helpful to debugging.

**toString()** - Method in exception `javax.xml.bind.JAXBException`
Returns a short description of this JAXBException.

**toString()** - Method in exception `javax.xml.bind.TypeConstraintException`
Returns a short description of this TypeConstraintException.

**toString()** - Method in interface `javax.xml.registry.Query`
Returns the String representing the query.

**toString()** - Method in class `javax.xml.rpc.ParameterMode`
Returns a String describing this ParameterMode object.

**toUnicodeString()** - Method in class `javax.mail.internet.InternetAddress`
Returns a properly formatted address (RFC 822 syntax) of Unicode characters.

**toXML()** - Method in interface `javax.xml.registry.infomodel.RegistryObject`
Returns a registry provider specific XML representation of this Object.

**Transaction** - Interface in `javax.transaction`
The Transaction interface allows operations to be performed against the transaction in the target Transaction object.

**TransactionAttribute** - Annotation Type in `javax.ejb`
When applied at the TYPE-level, designates the default
transaction attribute for all business methods of the session or message driven bean.

**TransactionAttributeType** - Enum in `javax.ejb`

**TransactionInProgressException** - Exception in `javax.jms`
This exception is thrown when an operation is invalid because a transaction is in progress.

**TransactionInProgressException(String, String)** - Constructor for exception `javax.jms.TransactionInProgressException`
Constructs a TransactionInProgressException with the specified reason and error code.

**TransactionInProgressException(String)** - Constructor for exception `javax.jms.TransactionInProgressException`
Constructs a TransactionInProgressException with the specified reason.

**TransactionManagement** - Annotation Type in `javax.ejb`
Declares whether a session bean or message driven bean has container managed transactions or bean managed transactions.

**TransactionManagementType** - Enum in `javax.ejb`

**TransactionManager** - Interface in `javax.transaction`
The TransactionManager interface defines the methods that allow an application server to manage transaction boundaries.

**TransactionRequiredException** - Exception in `javax.persistence`
Thrown by the persistence provider when a transaction is required but is not active.

**TransactionRequiredException()** - Constructor for exception `javax.persistence.TransactionRequiredException`
Constructs a new TransactionRequiredException exception with null as its detail message.

**TransactionRequiredException(String)** - Constructor for exception `javax.persistence.TransactionRequiredException`
Constructs a new TransactionRequiredException exception with the specified detail message.

**TransactionRequiredException** - Exception in `javax.transaction`
This exception indicates that a request carried a null transaction context, but the target object requires an activate transaction.

**TransactionRequiredException()** - Constructor for exception `javax.transaction.TransactionRequiredException`

**TransactionRequiredException(String)** - Constructor for exception `javax.transaction.TransactionRequiredException`

**TransactionRequiredLocalException** - Exception in `javax.ejb`
This exception indicates that a request carried a null transaction context, but the target object requires an active transaction.

**TransactionRequiredLocalException()** - Constructor for exception `javax.ejb.TransactionRequiredLocalException`
Constructs a TransactionRequiredLocalException with no detail message.

**TransactionRequiredLocalException(String)** - Constructor for exception javax.ejb.TransactionRequiredLocalException

Constructs an TransactionRequiredLocalException with the specified detailed message.

**TransactionRolledBackException** - Exception in javax.jms

This exception must be thrown when a call to Session.commit results in a rollback of the current transaction.

**TransactionRolledBackException(String, String)** - Constructor for exception javax.jms.TransactionRolledBackException

Constructs a TransactionRolledBackException with the specified reason and error code.

**TransactionRolledBackException(String)** - Constructor for exception javax.jms.TransactionRolledBackException

Constructs a TransactionRolledBackException with the specified reason.

**TransactionRolledbackException** - Exception in javax.transaction

This exception indicates that the transaction associated with processing of the request has been rolled back, or marked to roll back.

**TransactionRolledbackException()** - Constructor for exception javax.transaction.TransactionRolledbackException

**TransactionRolledbackException(String)** - Constructor for exception javax.transaction.TransactionRolledbackException

**TransactionRolledbackLocalException** - Exception in javax.ejb

This exception indicates that the transaction associated with processing of the request has been rolled back, or marked to roll back.

**TransactionRolledbackLocalException()** - Constructor for exception javax.ejb.TransactionRolledbackLocalException

Constructs a TransactionRolledbackLocalException with no detail message.

**TransactionRolledbackLocalException(String)** - Constructor for exception javax.ejb.TransactionRolledbackLocalException

Constructs a TransactionRolledbackLocalException with the specified detailed message.

**TransactionRolledbackLocalException(String, Exception)** - Constructor for exception javax.ejb.TransactionRolledbackLocalException

Constructs a TransactionRolledbackLocalException with the specified detail message and a nested exception.

**TransactionSynchronizationRegistry** - Interface in javax.transaction

This interface is intended for use by system level application server components such as persistence managers, resource adapters, as well as EJB and Web application components.

**transform(ClassLoader, String, Class<?>, ProtectionDomain, byte[])** - Method in interface javax.persistence.spi.ClassTransformer
Invoked when a class is being loaded or redefined.

**Transient** - Annotation Type in `javax.persistence`
This annotation specifies that the property or field is not persistent.

**TRANSPORT** - Static variable in class `javax.mail.Provider.Type`

**Transport** - Class in `javax.mail`
An abstract class that models a message transport.

**Transport(Session, URLName)** - Constructor for class `javax.mail.Transport`
Constructor.

**TransportAdapter** - Class in `javax.mail.event`
The adapter which receives Transport events.

**TransportAdapter()** - Constructor for class `javax.mail.event.TransportAdapter`

**TransportEvent** - Class in `javax.mail.event`
This class models Transport events.

**TransportEvent(Transport, int, Address[], Address[], Address[], Message)** - Constructor for class `javax.mail.event.TransportEvent`
Constructor.

**TransportListener** - Interface in `javax.mail.event`
This is the listener interface for Transport events

**TryCatchFinally** - Interface in `javax.servlet.jsp.tagext`
The auxiliary interface of a Tag, IterationTag or BodyTag tag handler that wants additional hooks for managing resources.

**TX_CONCURRENT_WORK_DISALLOWED** - Static variable in exception `javax.resource.spi.work.WorkException`
Indicates that concurrent work within a transaction is disallowed.

**TX_RECREATE_FAILED** - Static variable in exception `javax.resource.spi.work.WorkException`
Indicates a failure in recreating the specified transaction context.

**TYPE** - Static variable in class `javax.el.ELResolver`
The attribute name of the named attribute in the FeatureDescriptor that specifies the runtime type of the variable or property.

**type** - Variable in class `javax.mail.event.ConnectionEvent`
The event type.

**type** - Variable in class `javax.mail.event.FolderEvent`
The event type.

**type** - Variable in class `javax.mail.event.MessageChangedEvent`
The event type.

**type** - Variable in class `javax.mail.event.MessageCountEvent`
The event type.

**type** - Variable in class `javax.mail.event.StoreEvent`
The event type.

**type** - Variable in class `javax.mail.event.TransportEvent`
The event type.
**type** - Variable in class `javax.mail.Message.RecipientType`
The type of recipient, usually the name of a corresponding
Internet standard header.

**type** - Variable in class `javax.mail.search.RecipientTerm`
The recipient type.

**TYPE_MESSAGE_ID** - Static variable in class
`javax.faces.validator.DoubleRangeValidator`
The message identifier of the `FacesMessage` to be created if the
current value of this component is not of the correct type.

**TYPE_MESSAGE_ID** - Static variable in class
`javax.faces.validator.LongRangeValidator`
The message identifier of the `FacesMessage` to be created if the
current value of this component is not of the correct type.

**TypeConstraintException** - Exception in `javax.xml.bind`
This exception indicates that a violation of a dynamically
checked type constraint was detected.

**TypeConstraintException(String)** - Constructor for exception
`javax.xml.bind.TypeConstraintException`
Construct a `TypeConstraintException` with the specified detail
message.

**TypeConstraintException(String, String)** - Constructor for exception
`javax.xml.bind.TypeConstraintException`
Construct a `TypeConstraintException` with the specified detail
message and vendor specific errorCode.

**TypeConstraintException(Throwable)** - Constructor for exception
`javax.xml.bind.TypeConstraintException`
Construct a `TypeConstraintException` with a linkedException.

**TypeConstraintException(String, Throwable)** - Constructor for exception
`javax.xml.bind.TypeConstraintException`
Construct a `TypeConstraintException` with the specified detail
message and linkedException.

**TypeConstraintException(String, String, Throwable)** - Constructor
for exception `javax.xml.bind.TypeConstraintException`
Construct a `TypeConstraintException` with the specified detail
message, vendor specific errorCode, and linkedException.

**TypeMapping** - Interface in `javax.xml.rpc.encoding`
The `javax.xml.rpc.encoding.TypeMapping` is the base interface
for the representation of a type mapping.

**TypeMappingRegistry** - Interface in `javax.xml.rpc.encoding`
The interface `javax.xml.rpc.encoding.TypeMappingRegistry`
defines a registry of `TypeMapping` instances for various
encoding styles.
UIColumn - Class in javax.faces.component
UIColumn is a UIComponent that represents a single column of
data within a parent UIData component.
UIColumn() - Constructor for class javax.faces.component.UIColumn
Create a new UIColumn instance with default property values.

UICommand - Class in javax.faces.component
UICommand is a UIComponent that represents a user interface
component which, when activated by the user, triggers an
application specific "command" or "action".
UICommand() - Constructor for class javax.faces.component.UICommand
Create a new UICommand instance with default property values.

UIComponent - Class in javax.faces.component
UIComponent is the base class for all user interface components
in JavaServer Faces.
UIComponent() - Constructor for class
javax.faces.component.UIComponent

UIComponentBase - Class in javax.faces.component
UIComponentBase is a convenience base class that implements the
default concrete behavior of all methods defined by
UIComponent.
UIComponentBase() - Constructor for class
javax.faces.component.UIComponentBase

UIComponentBodyTag - Class in javax.faces.webapp
Deprecated. All component tags now implement BodyTag. This
class has been replaced by UIComponentELTag.
UIComponentBodyTag() - Constructor for class
javax.faces.webapp.UIComponentBodyTag

UIComponentClassicTagBase - Class in javax.faces.webapp
Deprecated. UIComponentClassicTagBase is the base class for all JSP tags that use
the "classic" JSP tag interface that correspond to a
UIComponent instance in the view.
UIComponentClassicTagBase() - Constructor for class
javax.faces.webapp.UIComponentClassicTagBase

UIComponentELTag - Class in javax.faces.webapp
UIComponentELTag specializes its superclass to allow for
properties that take their values from EL API expressions.
UIComponentELTag() - Constructor for class
javax.faces.webapp.UIComponentELTag

UIComponentTag - Class in javax.faces.webapp
Deprecated. Use of this class has been replaced with
UIComponentELTag, which extends UIComponentClassicTagBase to
add properties that use the EL API introduced as part of JSP 2.1.

**UIComponentTag()** - Constructor for class `javax.faces.webapp.UIComponentTag`

*Deprecated.*

**UIComponentTagBase** - Class in `javax.faces.webapp`

*UIComponentTagBase* is the base class for all JSP tags that correspond to a `UIComponent` instance in the view.

**UIComponentTagBase()** - Constructor for class `javax.faces.webapp.UIComponentTagBase`

**UID** - Static variable in class `javax.mail.UIDFolder.FetchProfileItem`

UID is a fetch profile item that can be included in a FetchProfile during a fetch request to a Folder.

**UIData** - Class in `javax.faces.component`

*UIData* is a `UIComponent` that supports data binding to a collection of data objects represented by a `DataModel` instance, which is the current value of this component itself (typically established via a `ValueExpression`).

**UIData()** - Constructor for class `javax.faces.component.UIData`

Create a new `UIData` instance with default property values.

**UIDFolder** - Interface in `javax.mail`

The UIDFolder interface is implemented by Folders that can support the "disconnected" mode of operation, by providing unique-ids for messages in the folder.

**UIDFolder.FetchProfileItem** - Class in `javax.mail`

A fetch profile item for fetching UIDs.

**UIDFolder.FetchProfileItem(String)** - Constructor for class `javax.mail.UIDFolder.FetchProfileItem`

**UIForm** - Class in `javax.faces.component`

*UIForm* is a `UIComponent` that represents an input form to be presented to the user, and whose child components represent (among other things) the input fields to be included when the form is submitted.

**UIForm()** - Constructor for class `javax.faces.component.UIForm`

Create a new `UIForm` instance with default property values.

**UIGraphic** - Class in `javax.faces.component`

*UIGraphic* is a `UIComponent` that displays a graphical image to the user.

**UIGraphic()** - Constructor for class `javax.faces.component.UIGraphic`

Create a new `UIGraphic` instance with default property values.

**UIInput** - Class in `javax.faces.component`

*UIInput* is a `UIComponent` that represents a component that both displays output to the user (like `UIOutput` components do) and processes request parameters on the subsequent request that need to be decoded.

**UIInput()** - Constructor for class `javax.faces.component.UIInput`

Create a new `UIInput` instance with default property values.
**UIMessage** - Class in `javax.faces.component`
This component is responsible for displaying messages for a specific `UIComponent`, identified by a clientId.

**UIMessage()** - Constructor for class `javax.faces.component.UIMessage`
Create a new `UIMessage` instance with default property values.

**UIMessages** - Class in `javax.faces.component`
The renderer for this component is responsible for obtaining the messages from the `FacesContext` and displaying them to the user.

**UIMessages()** - Constructor for class `javax.faces.component.UIMessages`
Create a new `UIMessages` instance with default property values.

**UINamingContainer** - Class in `javax.faces.component`
`UINamingContainer` is a convenience base class for components that wish to implement `NamingContainer` functionality.

**UINamingContainer()** - Constructor for class `javax.faces.component.UINamingContainer`
Create a new `UINamingContainer` instance with default property values.

**UIOutput** - Class in `javax.faces.component`
`UIOutput` is a `UIComponent` that has a value, optionally retrieved from a model tier bean via a value expression, that is displayed to the user.

**UIOutput()** - Constructor for class `javax.faces.component.UIOutput`
Create a new `UIOutput` instance with default property values.

**UIPanel** - Class in `javax.faces.component`
`UIPanel` is a `UIComponent` that manages the layout of its child components.

**UIPanel()** - Constructor for class `javax.faces.component.UIPanel`
Create a new `UIPanel` instance with default property values.

**UIParameter** - Class in `javax.faces.component`
`UIParameter` is a `UIComponent` that represents an optionally named configuration parameter for a parent component.

**UIParameter()** - Constructor for class `javax.faces.component.UIParameter`
Create a new `UIParameter` instance with default property values.

**UISelectBoolean** - Class in `javax.faces.component`
`UISelectBoolean` is a `UIComponent` that represents a single boolean (true or false) value.

**UISelectBoolean()** - Constructor for class `javax.faces.component.UISelectBoolean`
Create a new `UISelectBoolean` instance with default property values.

**UISelectItem** - Class in `javax.faces.component`
`UISelectItem` is a component that may be nested inside a `UISelectMany` or `UISelectOne` component, and causes the addition of a `SelectItem` instance to the list of available options for the parent component.

**UISelectItem()** - Constructor for class `javax.faces.component.UISelectItem`
Create a new **UISelectItem** instance with default property values.

**UISelectItems** - Class in `javax.faces.component`

*UISelectItems* is a component that may be nested inside a **UISelectMany** or **UISelectOne** component, and causes the addition of one or more SelectItem instances to the list of available options in the parent component.

**UISelectItems()** - Constructor for class

`javax.faces.component.UISelectItems`

Create a new **UISelectItems** instance with default property values.

**UISelectMany** - Class in `javax.faces.component`

*UISelectMany* is a **UIComponent** that represents the user's choice of a zero or more items from among a discrete set of available options.

**UISelectMany()** - Constructor for class

`javax.faces.component.UISelectMany`

Create a new **UISelectMany** instance with default property values.

**UISelectOne** - Class in `javax.faces.component`

*UISelectOne* is a **UIComponent** that represents the user's choice of zero or one items from among a discrete set of available options.

**UISelectOne()** - Constructor for class

`javax.faces.component.UISelectOne`

Create a new **UISelectOne** instance with default property values.

**UIViewRoot** - Class in `javax.faces.component`

*UIViewRoot* is the **UIComponent** that represents the root of the **UIComponent** tree.

**UIViewRoot()** - Constructor for class

`javax.faces.component.UIViewRoot`

Create a new **UIViewRoot** instance with default property values.

**UnavailableException** - Exception in `javax.resource.spi`

This is thrown to indicate that a service is unavailable.

**UnavailableException()** - Constructor for exception

`javax.resource.spi.UnavailableException`

Constructs a new instance with null as its detail message.

**UnavailableException(String)** - Constructor for exception

`javax.resource.spi.UnavailableException`

Constructs a new instance with the specified detail message.

**UnavailableException(Throweroble)** - Constructor for exception

`javax.resource.spi.UnavailableException`

Constructs a new throwable with the specified cause.

**UnavailableException(String, Throwable)** - Constructor for exception

`javax.resource.spi.UnavailableException`

Constructs a new throwable with the specified detail message and cause.

**UnavailableException(String, String)** - Constructor for exception

`javax.resource.spi.UnavailableException`

Constructs a new throwable with the specified detail message
and an error code.

**UnavailableException** - Exception in javax.servlet

Defines an exception that a servlet or filter throws to indicate that it is permanently or temporarily unavailable.

**UnavailableException(Servlet, String)** - Constructor for exception javax.servlet.UnavailableException

*Deprecated.* As of Java Servlet API 2.2, use **UnavailableException.UnavailableException(String)** instead.

**UnavailableException(int, Servlet, String)** - Constructor for exception javax.servlet.UnavailableException

*Deprecated.* As of Java Servlet API 2.2, use **UnavailableException.UnavailableException(String, int)** instead.

**UnavailableException(String)** - Constructor for exception javax.servlet.UnavailableException

Constructs a new exception with a descriptive message indicating that the servlet is permanently unavailable.

**UnavailableException(String, int)** - Constructor for exception javax.servlet.UnavailableException

Constructs a new exception with a descriptive message indicating that the servlet is temporarily unavailable and giving an estimate of how long it will be unavailable.

**UNBOUNDED BUFFER** - Static variable in class javaservlet.jsp.JspWriter

Constant indicating that the Writer is buffered and is unbounded; this is used in BodyContent.

Undoes a previous confirmation of this Association by the User associated with the caller.

**UNDEFINED** - Static variable in exception javax.resource.spi.work.WorkException

Undefined error code.

**UNDEPLOY** - Static variable in class javaservlet.enterprise.deploy.shared.CommandType

The DeploymentManager action operation being processed is undeploy.

**undeploy(TargetModuleID[])** - Method in interface javaservlet.enterprise.deploy.spi.DeploymentManager

Remove the application from the target server.

**unDeprecateObjects(Collection)** - Method in interface javax.xml.registry.LifeCycleManager

Undeprecates one or more previously deprecated objects.

**UnexpectedObjectException** - Exception in javax.xml.registry

This exception is thrown when the JAXR provider finds a Object that is out-of-place or of the wrong type within the context of a user request.

**UnexpectedObjectException()** - Constructor for exception javax.xml.registry.UnexpectedObjectException

Constructs a JAXRException object with no reason or embedded Throwable.
**UnexpectedObjectException(String)** - Constructor for exception
javax.xml.registry.**UnexpectedObjectException**
Constructs a JAXRException object with the given String as the reason for the exception being thrown.

**UnexpectedObjectException(String, Throwable)** - Constructor for exception
javax.xml.registry.**UnexpectedObjectException**
Constructs a JAXRException object with the given String as the reason for the exception being thrown and the given Throwable object as an embedded Throwable.

**UnexpectedObjectException(Throwables)** - Constructor for exception
javax.xml.registry.**UnexpectedObjectException**
Constructs a JAXRException object initialized with the given Throwable object.

**unfold(String)** - Static method in class
javax.mail.internet.**MimeUtility**
Unfold a folded header.

**UNIQUE_ID_PREFIX** - Static variable in class
javax.faces.component.**UIViewRoot**
The prefix that will be used for identifiers generated by the createUniqueId() method.

**UNIQUE_ID_PREFIX** - Static variable in class
javax.faces.webapp.**UIComponentClassicTagBase**
Used as the prefix for ids.

**UniqueConstraint** - Annotation Type in **javax.persistence**
This annotation is used to specify that a unique constraint is to be included in the generated DDL for a primary or secondary table.

**UNKNOWN** - Static variable in interface
javax.resource.spi.work.**WorkManager**
A constant to indicate an unknown start delay duration or other unknown values.

**unmarshal(String)** - Method in class
javax.xml.bind.annotation.adapters.**CollapsedStringAdapter**
Removes leading and trailing whitespaces of the string given as the parameter, then truncate any sequence of tab, CR, LF, and SP by a single whitespace character '\'.

**unmarshal(String)** - Method in class
javax.xml.bind.annotation.adapters.**HexBinaryAdapter**

**unmarshal(String)** - Method in class
javax.xml.bind.annotation.adapters.**NormalizedStringAdapter**
Removes leading and trailing whitespaces of the string given as the parameter, then replace any tab, CR, and LF by a whitespace character '\'.

**unmarshal(ValueType)** - Method in class
javax.xml.bind.annotation.adapters.**XmlAdapter**
Convert a value type to a bound type.

**unmarshal(XMLOutput)** - Method in class javax.xml.bind.**Binder**
Unmarshal XML infoset view to a JAXB object tree.

**unmarshal(XMLOutput, Class<T>)** - Method in class
javax.xml.bind.**Binder**  
Unmarshal XML root element by provided declaredType to a JAXB object tree.

**unmarshal(Source)** - Method in class  
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**

**unmarshal(XMLReader, InputSource)** - Method in class  
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**
    Unmarshals an object by using the specified XMLReader and the InputSource.

**unmarshal(InputSource)** - Method in class  
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**

**unmarshal(URL)** - Method in class  
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**

**unmarshal(File)** - Method in class  
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**

**unmarshal(InputStream)** - Method in class  
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**

**unmarshal(Reader)** - Method in class  
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**

**unmarshal(XMLEventReader)** - Method in class  
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**

**unmarshal(XMLStreamReader)** - Method in class  
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**

**unmarshal(Node, Class<T>)** - Method in class  
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**

**unmarshal(Source, Class<T>)** - Method in class  
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**

**unmarshal(XMLStreamReader, Class<T>)** - Method in class  
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**

**unmarshal(XMLEventReader, Class<T>)** - Method in class  
javax.xml.bind.helpers.**AbstractUnmarshallerImpl**

**unmarshal(File)** - Method in interface javax.xml.bind.**Unmarshaller**  
Unmarshal XML data from the specified file and return the resulting content tree.

**unmarshal(InputStream)** - Method in interface  
javax.xml.bind.**Unmarshaller**  
Unmarshal XML data from the specified InputStream and return the resulting content tree.
unmarshal(Reader) - Method in interface javax.xml.bind.Unmarshaller
Unmarshal XML data from the specified Reader and return the resulting content tree.

unmarshal(URL) - Method in interface javax.xml.bind.Unmarshaller
Unmarshal XML data from the specified URL and return the resulting content tree.

unmarshal(InputSource) - Method in interface javax.xml.bind.Unmarshaller
Unmarshal XML data from the specified SAX InputSource and return the resulting content tree.

unmarshal(Node) - Method in interface javax.xml.bind.Unmarshaller
Unmarshal global XML data from the specified DOM tree and return the resulting content tree.

unmarshal(Node, Class<T>) - Method in interface javax.xml.bind.Unmarshaller
Unmarshal XML data by JAXB mapped declaredType and return the resulting content tree.

unmarshal(Source) - Method in interface javax.xml.bind.Unmarshaller
Unmarshal XML data from the specified XML Source and return the resulting content tree.

unmarshal(Source, Class<T>) - Method in interface javax.xml.bind.Unmarshaller
Unmarshal XML data from the specified XML Source by declaredType and return the resulting content tree.

unmarshal(XMLStreamReader) - Method in interface javax.xml.bind.Unmarshaller
Unmarshal XML data from the specified pull parser and return the resulting content tree.

unmarshal(XMLStreamReader, Class<T>) - Method in interface javax.xml.bind.Unmarshaller
Unmarshal root element to JAXB mapped declaredType and return the resulting content tree.

UnmarshalException - Exception in javax.xml.bind
This exception indicates that an error has occurred while performing an unmarshal operation that prevents the JAXB Provider from completing the operation.

UnmarshalException(String) - Constructor for exception javax.xml.bind.UnmarshalException
Construct an UnmarshalException with the specified detail message.

UnmarshalException(String, String) - Constructor for exception javax.xml.bind.UnmarshalException
Construct an UnmarshalException with the specified detail message and vendor specific errorCode.

**UnmarshalException(Throwable)** - Constructor for exception
```
javax.xml.bind.UnmarshalException
```
Construct an UnmarshalException with a linkedException.

**UnmarshalException(String, Throwable)** - Constructor for exception
```
javax.xml.bind.UnmarshalException
```
Construct an UnmarshalException with the specified detail message and linkedException.

**UnmarshalException(String, String, Throwable)** - Constructor for exception
```
javax.xml.bind.UnmarshalException
```
Construct an UnmarshalException with the specified detail message, vendor specific errorCode, and linkedException.

**Unmarshaller** - Interface in **javax.xml.bind**
The Unmarshaller class governs the process of deserializing XML data into newly created Java content trees, optionally validating the XML data as it is unmarshalled.

**Unmarshaller.Listener** - Class in **javax.xml.bind**
Register an instance of an implementation of this class with Unmarshaller to externally listen for unmarshal events.

**Unmarshaller.Listener()** - Constructor for class
```
javax.xml.bind.Unmarshaller.Listener
```

**UnmarshallerEventHandler** - Interface in **javax.xml.bind**
Unmarshaller implemented as SAX ContentHandler.

**unregisterTypeMapping(String)** - Method in interface
```
javax.xml.rpc.encoding.TypeMappingRegistry
```
Unregisters a TypeMapping instance, if present, from the specified encodingStyleURI.

**unsetEntityContext()** - Method in interface **javax.ejb.EntityBean**
Unset the associated entity context.

**unsubscribe(String)** - Method in interface **javax.jms.Session**
Unsubscribes a durable subscription that has been created by a client.

**unsubscribe(String)** - Method in interface **javax.jms.TopicSession**
Unsubscribes a durable subscription that has been created by a client.

**UnsupportedCapabilityException** - Exception in **javax.xml.registry**
This exception must be thrown when a JAXR client attempts to invoke an API method that is not supported by the capability profile that is supported by the JAXR provider.

**UnsupportedCapabilityException()** - Constructor for exception
```
javax.xml.registry.UnsupportedCapabilityException
```
Constructs a JAXRException object with no reason or embedded Throwable.

**UnsupportedCapabilityException(String)** - Constructor for exception
```
javax.xml.registry.UnsupportedCapabilityException
```
Constructs a JAXRException object with the given String as the reason for the exception being thrown.
UnsupportedCapabilityException(String, Throwable) - Constructor for exception javax.xml.registry.UnsupportedCapabilityException
    Constructs a JAXRException object with the given String as the reason for the exception being thrown and the given Throwable object as an embedded Throwable.

UnsupportedCapabilityException(Throwable) - Constructor for exception javax.xml.registry.UnsupportedCapabilityException
    Constructs a JAXRException object initialized with the given Throwable object.

UnsupportedDataTypeException - Exception in javax.activation
    Signals that the requested operation does not support the requested data type.

UnsupportedDataTypeException() - Constructor for exception javax.activation.UnsupportedDataTypeException
    Constructs an UnsupportedDataTypeException with no detail message.

UnsupportedDataTypeException(String) - Constructor for exception javax.activation.UnsupportedDataTypeException
    Constructs an UnsupportedDataTypeException with the specified message.

UPDATE_MESSAGE_ID - Static variable in class javax.faces.component.UIInput
    The message identifier of the FacesMessage to be created if a model update error occurs, and the thrown exception has no message.

UPDATE_MODEL_VALUES - Static variable in class javax.faces.event.PhaseId
    Identifier that indicates an interest in events queued for the Update Model Values phase of the request processing lifecycle.

updateHeaders() - Method in class javax.mail.internet.MimeBodyPart
    Examine the content of this body part and update the appropriate MIME headers.

updateHeaders() - Method in class javax.mail.internet.MimeMessage
    Called by the saveChanges method to actually update the MIME headers.

updateHeaders() - Method in class javax.mail.internet.MimeMultipart
    Update headers.

updateHeaders() - Method in class javax.mail.internet.PreencodedMimeBodyPart
    Force the Content-Transfer-Encoding header to use the encoding that was specified when this object was created.

updateJAXB(XmlNode) - Method in class javax.xml.bind.Binder
    Takes an XML node and updates its associated JAXB object and its descendants.

updateMessageID() - Method in class javax.mail.internet.MimeMessage
    Update the Message-ID header.

updateModel(FacesContext) - Method in class javax.faces.component.UIInput
    Perform the following algorithm to update the model data associated with this UIInput, if any, as appropriate.
**updatesAreDetected(int)** - Method in interface javax.resource.cci.ResultSetInfo
Indicates whether or not a visible row update can be detected by calling the method ResultSet.rowUpdated.

**updateXML(Object)** - Method in class javax.xml.bind.Binder
Takes an JAXB object and updates its associated XML node and its descendants.

**updateXML(Object, XmlNode)** - Method in class javax.xml.bind.Binder
Changes in JAXB object tree are updated in its associated XML parse tree.

**uri** - Variable in class javax.servlet.jsp.tagext.TagLibraryInfo
The value of the uri attribute from the taglib directive for this library.

**URI NS SOAP 1 1 ENVELOPE** - Static variable in interface javax.xml.soap.SOAPConstants
The namespace identifier for the SOAP 1.1 envelope.

**URI NS SOAP 1 2 ENCODING** - Static variable in interface javax.xml.soap.SOAPConstants
The namespace identifier for the SOAP 1.2 encoding.

**URI NS SOAP 1 2 ENVELOPE** - Static variable in interface javax.xml.soap.SOAPConstants
The namespace identifier for the SOAP 1.2 envelope.

**URI NS SOAP ENCODING** - Static variable in interface javax.xml.soap.SOAPConstants
The namespace identifier for the SOAP 1.1 encoding.

**URI NS SOAP ENVELOPE** - Static variable in interface javax.xml.soap.SOAPConstants
The namespace identifier for the SOAP 1.1 envelope, All SOAPElements in this namespace are defined by the SOAP 1.1 specification.

**URI SOAP 1 2 ROLE NEXT** - Static variable in interface javax.xml.soap.SOAPConstants
The URI identifying the next application processing a SOAP request as the intended role for a SOAP 1.2 header entry (see section 2.2 of part 1 of the SOAP 1.2 specification).

**URI SOAP 1 2 ROLE NONE** - Static variable in interface javax.xml.soap.SOAPConstants
The URI specifying the role None in SOAP 1.2.

**URI SOAP 1 2 ROLE ULTIMATE RECEIVER** - Static variable in interface javax.xml.soap.SOAPConstants
The URI identifying the ultimate receiver of the SOAP 1.2 message.

**URI SOAP ACTOR NEXT** - Static variable in interface javax.xml.soap.SOAPConstants
The URI identifying the next application processing a SOAP request as the intended actor for a SOAP 1.1 header entry (see section 4.2.2 of the SOAP 1.1 specification).

**URIVValidator** - Interface in javax.xml.registry.infomodel
Defines common behavior expected of any class that validates URIs.
**url** - Variable in class `javax.mail.Service`  
The URLName of this service.

**URLDataSource** - Class in `javax.activation`  
The URLDataSource class provides an object that wraps a URL object in a DataSource interface.

**URLDataSource(URL)** - Constructor for class `javax.activation.URLDataSource`  
URLDataSource constructor.

**URLName** - Class in `javax.mail`  
The name of a URL.

**URLName(String, String, int, String, String, String)** - Constructor for class `javax.mail.URLName`  
Creates a URLName object from the specified protocol, host, port number, file, username, and password.

**URLName(URL)** - Constructor for class `javax.mail.URLName`  
Construct a URLName from a java.net.URL object.

**URLName(String)** - Constructor for class `javax.mail.URLName`  
Construct a URLName from the string.

**URLStats** - Interface in `javax.management.j2ee.statistics`  
Specifies the statistics provided by a URL resource.

**urn** - Variable in class `javax.servlet.jsp.tagext.TagLibraryInfo`  
The "reliable" URN indicated in the TLD.

**usage** - Variable in class `javax.mail.Quota.Resource`  
The current usage of the resource.

**USER** - Static variable in class `javax.mail.Flags.Flag`  
A special flag that indicates that this folder supports user defined flags.

**User** - Interface in `javax.xml.registry.infomodel`  
User instances are RegistryObjects that are used to provide information about registered users within the registry.

**USER** - Static variable in interface `javax.xml.registry.LifeCycleManager`  

**USERNAME_PROPERTY** - Static variable in interface `javax.xml.rpc.Call`  
Standard property: User name for authentication  
Type: java.lang.String

**USERNAME_PROPERTY** - Static variable in interface `javax.xml.rpc.Stub`  
Standard property: User name for authentication.

**USERNAME_PROPERTY** - Static variable in interface `javax.xml.ws.BindingProvider`  
Standard property: User name for authentication.

**UserTransaction** - Interface in `javax.transaction`  
The UserTransaction interface defines the methods that allow an application to explicitly manage transaction boundaries.
V1_3 - Static variable in class javax.enterprise.deploy.shared.DConfigBeanVersionType
J2EE Platform version 1.3

V1_3_1 - Static variable in class javax.enterprise.deploy.shared.DConfigBeanVersionType
J2EE Platform version 1.3.1
THIS CONSTANT SHOULD NEVER BE USED.

V1_4 - Static variable in class javax.enterprise.deploy.shared.DConfigBeanVersionType
J2EE Platform version 1.4

V5 - Static variable in class javax.enterprise.deploy.shared.DConfigBeanVersionType
Java EE Platform version 5

validate(FacesContext) - Method in class javax.faces.component.UIInput
Perform the following algorithm to validate the local value of this UIInput.

validate(FacesContext, UIComponent, Object) - Method in class javax.faces.validator.DoubleRangeValidator

validate(FacesContext, UIComponent, Object) - Method in class javax.faces.validator.LengthValidator

validate(FacesContext, UIComponent, Object) - Method in class javax.faces.validator.LongRangeValidator

validate(FacesContext, UIComponent, Object) - Method in interface javax.faces.validator.Validator
Perform the correctness checks implemented by this Validator against the specified UIComponent.

validate() - Method in class javax.mail.internet.InternetAddress
Validate that this address conforms to the syntax rules of RFC 822.

validate() - Method in interface javax.resource.spi.ActivationSpec
This method may be called by a deployment tool to validate the overall activation configuration information provided by the endpoint deployer.

validate(TagData) - Method in class javax.servlet.jsp.tagext.TagExtraInfo
Translation-time validation of the attributes.

validate(TagData) - Method in class javax.servlet.jsp.tagext.TagInfo
Translation-time validation of the attributes.

validate(String, String, PageData) - Method in class
javax.servlet.jsp.tagext.**TagLibraryValidator**
Validate a JSP page.

**validate(Object)** - Method in interface javax.xml.bind.**Validator**
Deprecated. since JAXB2.0

**validateRoot(Object)** - Method in interface javax.xml.bind.**Validator**
Deprecated. since JAXB2.0

**validateValue(FacesContext, Object)** - Method in class javax.faces.component.**UIInput**
Set the "valid" property according to the below algorithm.

**validateValue(FacesContext, Object)** - Method in class javax.faces.component.**UISelectMany**
In addition to the standard validation behavior inherited from UIInput, ensure that any specified values are equal to one of the available options.

**validateValue(FacesContext, Object)** - Method in class javax.faces.component.**UISelectOne**
In addition to the standard validation behavior inherited from UIInput, ensure that any specified value is equal to one of the available options.

**validating** - Variable in class javax.xml.bind.helpers.**AbstractUnmarshallerImpl**
whether or not the unmarshaller will validate

**ValidatingManagedConnectionFactory** - Interface in javax.resource.spi
This interface is implemented by a ManagedConnectionFactory instance that supports the ability to validate ManagedConnection objects.

**ValidationEvent** - Interface in javax.xml.bind
This event indicates that a problem was encountered while validating the incoming XML data during an unmarshal operation, while performing on-demand validation of the Java content tree, or while marshalling the Java content tree back to XML data.

**ValidationEventCollector** - Class in javax.xml.bind.util
ValidationEventHandler implementation that collects all events.

**ValidationEventCollector()** - Constructor for class javax.xml.bind.util.**ValidationEventCollector**

**ValidationEventHandler** - Interface in javax.xml.bind
A basic event handler interface for validation errors.

**ValidationEventImpl** - Class in javax.xml.bind.helpers
Default implementation of the ValidationEvent interface.

**ValidationEventImpl(int, String, ValidationEventLocator)** - Constructor for class javax.xml.bind.helpers.**ValidationEventImpl**
Create a new ValidationEventImpl.

**ValidationEventImpl(int, String, ValidationEventLocator, Throwable)** - Constructor for class javax.xml.bind.helpers.**ValidationEventImpl**
Create a new ValidationEventImpl.

**ValidationEventLocator** - Interface in javax.xml.bind
Encapsulate the location of a ValidationEvent.

**ValidationEventLocatorImpl** - Class in javax.xml.bind.helpers
Default implementation of the ValidationEventLocator interface. 

**ValidationEventLocatorImpl()** - Constructor for class `javax.xml.bind.helpers.ValidationEventLocatorImpl`

- Creates an object with all fields unavailable.

**ValidationEventLocatorImpl(Locator)** - Constructor for class `javax.xml.bind.helpers.ValidationEventLocatorImpl`

- Constructs an object from an `org.xml.sax.Locator`.

**ValidationEventLocatorImpl(SAXParseException)** - Constructor for class `javax.xml.bind.helpers.ValidationEventLocatorImpl`

- Constructs an object from the location information of a `SAXParseException`.

**ValidationEventLocatorImpl(Node)** - Constructor for class `javax.xml.bind.helpers.ValidationEventLocatorImpl`

- Constructs an object that points to a DOM Node.

**ValidationEventLocatorImpl(Object)** - Constructor for class `javax.xml.bind.helpers.ValidationEventLocatorImpl`

- Constructs an object that points to a JAXB content object.

**ValidationException** - Exception in `javax.xml.bind`

- This exception indicates that an error has occurred while performing a validate operation.

**ValidationException(String)** - Constructor for exception `javax.xml.bind.ValidationException`

- Construct a `ValidationException` with the specified detail message.

**ValidationException(String, String)** - Constructor for exception `javax.xml.bind.ValidationException`

- Construct a `ValidationException` with the specified detail message and vendor specific errorCode.

**ValidationException(Throwables)** - Constructor for exception `javax.xml.bind.ValidationError`

- Construct a `ValidationException` with a linkedException.

**ValidationException(String, Throwable)** - Constructor for exception `javax.xml.bind.ValidationError`

- Construct a `ValidationException` with the specified detail message and linkedException.

**ValidationMessage** - Class in `javax.servlet.jsp.tagext`

- A validation message from either TagLibraryValidator or TagExtraInfo.

**ValidationMessage(String, String)** - Constructor for class `javax.servlet.jsp.tagext.ValidationError`

- Create a `ValidationMessage`.

**Validator** - Interface in `javax.faces.validator`

- A `Validator` implementation is a class that can perform validation (correctness checks) on a `EditableValueHolder`.

**Validator** - Interface in `javax.xml.bind`

- Deprecated. since JAXB 2.0
**VALIDATOR ID** - Static variable in class `javax.faces.validator.DoubleRangeValidator`
The standard converter id for this converter.

**VALIDATOR ID** - Static variable in class `javax.faces.validator.LengthValidator`
The standard validator id for this validator.

**VALIDATOR ID** - Static variable in class `javax.faces.validator.LongRangeValidator`
The standard converter id for this converter.

**ValidatorELTag** - Class in `javax.faces.webapp`

ValidatorELTag is a base class for all JSP custom actions that create and register a Validator instance on the `EditableValueHolder` associated with our most immediate surrounding instance of a tag whose implementation class is a subclass of `UIComponentTag`.

**ValidatorELTag()** - Constructor for class `javax.faces.webapp.ValidatorELTag`

**ValidatorException** - Exception in `javax.faces.validator`

A `ValidatorException` is an exception thrown by the validate() method of a `Validator` to indicate that validation failed.

**ValidatorException(FacesMessage)** - Constructor for exception `javax.faces.validator.ValidatorException`

Construct a new exception with the specified message and no root cause.

**ValidatorException(FacesMessage, Throwable)** - Constructor for exception `javax.faces.validator.ValidatorException`

Construct a new exception with the specified detail message and root cause.

**ValidatorTag** - Class in `javax.faces.webapp`

Deprecated. This has been partially replaced by `ValidatorELTag`. The remainder of the functionality, namely, the binding facility and the implementation of the `ValidatorTag.createValidator()` method, is now an implementation detail.

**ValidatorTag()** - Constructor for class `javax.faces.webapp.ValidatorTag`

Deprecated.

**validSent** - Variable in class `javax.mail.event.TransportEvent`

**validSent** - Variable in exception `javax.mail.SendFailedException`

**validUnsent** - Variable in class `javax.mail.event.TransportEvent`

**validUnsent** - Variable in exception `javax.mail.SendFailedException`

**value** - Variable in class `javax.mail.Header`
The value of the header.

**value** - Variable in class `javax.xml.bind.JAXBElement` xml element value.
value - Variable in class javax.xml.rpc.holders.BigDecimalHolder
value - Variable in class javax.xml.rpc.holders.BigIntegerHolder
value - Variable in class javax.xml.rpc.holders.BooleanHolder
value - Variable in class javax.xml.rpc.holders.BooleanWrapperHolder
value - Variable in class javax.xml.rpc.holders.ByteArrayHolder
value - Variable in class javax.xml.rpc.holders.ByteHolder
value - Variable in class javax.xml.rpc.holders.ByteWrapperHolder
value - Variable in class javax.xml.rpc.holders.CalendarHolder
value - Variable in class javax.xml.rpc.holders.DoubleHolder
value - Variable in class javax.xml.rpc.holders.DoubleWrapperHolder
value - Variable in class javax.xml.rpc.holders.FloatHolder
value - Variable in class javax.xml.rpc.holders.FloatWrapperHolder
value - Variable in class javax.xml.rpc.holders.IntegerWrapperHolder
value - Variable in class javax.xml.rpc.holders.IntHolder
value - Variable in class javax.xml.rpc.holders.LongHolder
value - Variable in class javax.xml.rpc.holders.LongWrapperHolder
value - Variable in class javax.xml.rpc.holders.ObjectHolder
value - Variable in class javax.xml.rpc.holders.QNameHolder
value - Variable in class javax.xml.rpc.holders.ShortHolder
value - Variable in class javax.xml.rpc.holders.ShortWrapperHolder
value - Variable in class javax.xml.rpc.holders.StringHolder
value - Variable in class javax.xml.ws.Holder

The value contained in the holder.

VALUE_TYPE_EMBEDDED_PATH - Static variable in interface javax.xml.registry.infomodel.ClassificationScheme
Each taxonomy value in ClassificationScheme embeds the full path from scheme to that Concept.
**VALUE TYPE NON UNIQUE** - Static variable in interface javax.xml.registry.infomodel.ClassificationScheme
Taxonomy values in ClassificationScheme may be repeated within the same scheme.

**VALUE TYPE UNIQUE** - Static variable in interface javax.xml.registry.infomodel.ClassificationScheme
Each taxonomy value in ClassificationScheme is unique.

**ValueBinding** - Class in javax.faces.el
Deprecated. This has been replaced by ValueExpression.
**ValueBinding()** - Constructor for class javax.faces.el.ValueBinding
Deprecated.

**valueBound(HttpSessionBindingEvent)** - Method in interface javax.servlet.http.HttpSessionBindingListener
Notifies the object that it is being bound to a session and identifies the session.

**ValueChangeEvent** - Class in javax.faces.event
A ValueChangeEvent is a notification that the local value of the source component has been change as a result of user interface activity.

**ValueChangeEvent(UIComponent, Object, Object)** - Constructor for class javax.faces.event.ValueChangeEvent
Construct a new event object from the specified source component, old value, and new value.

**ValueChangeListener** - Interface in javax.faces.event
A listener interface for receiving ValueChangeEvent s.

**ValueExpression** - Class in javax.el
An Expression that can get or set a value.
**ValueExpression()** - Constructor for class javax.el.ValueExpression

**ValueHolder** - Interface in javax.faces.component
ValueHolder is an interface that may be implemented by any concrete UIComponent that wishes to support a local value, as well as access data in the model tier via a value expression, and support conversion between String and the model tier data's native data type.

**valueOf(String)** - Static method in enum javax.annotation.Resource.AuthenticationType
Returns the enum constant of this type with the specified name.

**valueOf(String)** - Static method in enum javax.ejb.TransactionAttributeType
Returns the enum constant of this type with the specified name.

**valueOf(String)** - Static method in enum javax.ejb.TransactionManagementType
Returns the enum constant of this type with the specified name.

**valueOf(String)** - Static method in enum javax.jws.soap.SOAPBinding.ParameterStyle
Returns the enum constant of this type with the specified name.

**valueOf(String)** - Static method in enum javax.jws.soap.SOAPBinding.Style
Returns the enum constant of this type with the specified name.
valueOf(String) - Static method in enum javax.jws.soap.SOAPBinding.Use
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.jws.WebParam.Mode
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.persistence.CascadeType
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.persistence.DiscriminatorType
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.persistence.EnumType
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.persistence.FetchType
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.persistence.FlushModeType
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.persistence.GenerationType
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.persistence.InheritanceType
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.persistence.LockModeType
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.persistence.PersistenceContextType
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.persistence.spi.PersistenceUnitTransactionType
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.xml.bind.annotation.XmlAccessOrder
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.xml.bind.annotation.XmlAccessType
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.xml.bind.annotation.XmlNsForm
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.xml.ws.handler.MessageContext.Scope
Returns the enum constant of this type with the specified name.

valueOf(String) - Static method in enum javax.xml.ws.Service.Mode
Returns the enum constant of this type with the specified name.
values() - Static method in enum javax.annotation.Resource.AuthenticationType
Returns an array containing the constants of this enum type, in the order they're declared.

values() - Static method in enum javax.ejb.TransactionAttributeType
Returns an array containing the constants of this enum type, in the order they're declared.

values() - Static method in enum javax.ejb.TransactionManagementType
Returns an array containing the constants of this enum type, in the order they're declared.

VALUES - Static variable in class javax.faces.application.FacesMessage
Immutable List of valid FacesMessage.Severity instances, in ascending order of their ordinal value.

VALUES - Static variable in class javax.faces.event.PhaseId
List of valid PhaseId instances, in ascending order of their ordinal value.

values() - Static method in enum javax.jws.soap.SOAPBinding.ParameterStyle
Returns an array containing the constants of this enum type, in the order they're declared.

values() - Static method in enum javax.jws.soap.SOAPBinding.Style
Returns an array containing the constants of this enum type, in the order they're declared.

values() - Static method in enum javax.jws.soap.SOAPBinding.Use
Returns an array containing the constants of this enum type, in the order they're declared.

values() - Static method in enum javax.jws.WebParam.Mode
Returns an array containing the constants of this enum type, in the order they're declared.

values() - Static method in enum javax.persistence.CascadeType
Returns an array containing the constants of this enum type, in the order they're declared.

values() - Static method in enum javax.persistence.DiscriminatorType
Returns an array containing the constants of this enum type, in the order they're declared.

values() - Static method in enum javax.persistence.EnumType
Returns an array containing the constants of this enum type, in the order they're declared.

values() - Static method in enum javax.persistence.FetchType
Returns an array containing the constants of this enum type, in the order they're declared.

values() - Static method in enum javax.persistence.FlushModeType
Returns an array containing the constants of this enum type, in the order they're declared.

values() - Static method in enum javax.persistence.GenerationType
Returns an array containing the constants of this enum type, in the order they're declared.
values() - Static method in enum javax.persistence.InheritanceType
Returns an array containing the constants of this enum type, in
the order they're declared.
values() - Static method in enum javax.persistence.LockModeType
Returns an array containing the constants of this enum type, in
the order they're declared.
values() - Static method in enum javax.persistence.PersistenceContextType
Returns an array containing the constants of this enum type, in
the order they're declared.
values() - Static method in enum javax.persistence.spi.PersistenceUnitTransactionType
Returns an array containing the constants of this enum type, in
the order they're declared.
values() - Static method in enum javax.persistence.TemporalType
Returns an array containing the constants of this enum type, in
the order they're declared.
values() - Static method in enum javax.xml.bind.annotation.XmlAccessOrder
Returns an array containing the constants of this enum type, in
the order they're declared.
values() - Static method in enum javax.xml.bind.annotation.XmlAccessType
Returns an array containing the constants of this enum type, in
the order they're declared.
values() - Static method in enum javax.xml.bind.annotation.XmlNsForm
Returns an array containing the constants of this enum type, in
the order they're declared.
values() - Static method in enum javax.xml.ws.handler.MessageContext.Scope
Returns an array containing the constants of this enum type, in
the order they're declared.
values() - Static method in enum javax.xml.ws.Service.Mode
Returns an array containing the constants of this enum type, in
the order they're declared.
VALUES_MAP - Static variable in class
javax.faces.application.FacesMessage
Immutable Map of valid FacesMessage.Severity instances, keyed
by name.
valueUnbound(HttpSessionBindingEvent) - Method in interface
javax.servlet.http.HttpSessionBindingListener
Notifies the object that it is being unbound from a session and
identifies the session.
VariableInfo - Class in javax.servlet.jsp.tagext
Information on the scripting variables that are
created/modified by a tag (at run-time).
VariableInfo(String, String, boolean, int) - Constructor for class
javax.servlet.jsp.tagext.VariableInfo
Constructor These objects can be created (at translation time)
by the TagExtraInfo instances.

**VariableMapper** - Class in *javax.el*
The interface to a map between EL variables and the EL expressions they are associated with.

**VariableMapper()** - Constructor for class *javax.el.VariableMapper*

**VariableResolver** - Class in *javax.faces.el*
Deprecated. This has been replaced by *ELResolver* when operating with a null base argument.

**VariableResolver()** - Constructor for class *javax.faces.el.VariableResolver*
Deprecated.

**VariableResolver** - Interface in *javax.servlet.jsp.el*
Deprecated. As of JSP 2.1, replaced by *ELResolver*

**Version** - Annotation Type in *javax.persistence*
This annotation specifies the version field or property of an entity class that serves as its optimistic lock value.

**Versionable** - Interface in *javax.xml.registry.infomodel*
The Versionable interface defines the behavior common to classes that are capable of creating versions of their instances.

**VERSIONABLE** - Static variable in interface *javax.xml.registry.LifeCycleManager*

**VIEW_STATE_PARAM** - Static variable in class *javax.faces.render.ResponseStateManager*
Implementations must use this value as the name and id of the client parameter in which to save the state between requests.

**ViewExpiredException** - Exception in *javax.faces.application*
Implementations must throw this *FacesException* when attempting to restore the view

**ViewExpiredException(String)** - Constructor for exception

**ViewExpiredException(String, String)** - Constructor for exception

**ViewExpiredException(Throwable, String)** - Constructor for exception

**ViewExpiredException(String, Throwable, String)** - Constructor for exception

Construct a new exception with no detail message or root cause.
**ViewHandler** - Class in `javax.faces.application`  
*ViewHandler* is the pluggability mechanism for allowing implementations of or applications using the JavaServer Faces specification to provide their own handling of the activities in the *Render Response* and *Restore View* phases of the request processing lifecycle.

**ViewHandler()** - Constructor for class `javax.faces.application.ViewHandler`  

**ViewHandlerWrapper** - Class in `javax.faces.application`  
Provides a simple implementation of *ViewHandler* that can be subclassed by developers wishing to provide specialized behavior to an existing *ViewHandler* instance.

**ViewHandlerWrapper()** - Constructor for class `javax.faces.application.ViewHandlerWrapper`
W3CDomHandler - Class in javax.xml.bind.annotation
   - Default constructor.
   - Constructor for class W3CDomHandler
      Constructor that allows applications to specify which DOM implementation to be used.

WAR - Static variable in class javax.enterprise.deploy.shared.ModuleType
      The module is an Web Application archive.

WARNING - Static variable in interface javax.xml.bind.ValidationEvent
   Conditions that are not errors or fatal errors as defined by the XML 1.0 recommendation

WebEndpoint - Annotation Type in javax.xml.ws
   Used to annotate the getPortName() methods of a generated service interface.

WebFault - Annotation Type in javax.xml.ws
   Used to annotate service specific exception classes to customize to the local and namespace name of the fault element and the name of the fault bean.

WebMethod - Annotation Type in javax.jws
   Customizes a method that is exposed as a Web Service operation.

WebParam - Annotation Type in javax.jws
   Customizes the mapping of an individual parameter to a Web Service message part and XML element.

WebParam.Mode - Enum in javax.jws
   The direction in which the parameter flows

WebResourcePermission - Class in javax.security.jacc
   Class for Servlet web resource permissions.

WebResourcePermission(String, String) - Constructor for class javax.security.jacc.WebResourcePermission
   Creates a new WebResourcePermission with the specified name and actions.

WebResourcePermission(String, String[]) - Constructor for class javax.security.jacc.WebResourcePermission
   Creates a new WebResourcePermission with name corresponding to the URLPatternSpec, and actions composed from the array of HTTP methods.

WebResourcePermission(HttpServletRequest) - Constructor for class javax.security.jacc.WebResourcePermission
   Creates a new WebResourcePermission from the HttpServletRequest object.

WebResult - Annotation Type in javax.jws
Customizes the mapping of the return value to a WSDL part and XML element.

- **WebRoleRefPermission** - Class in `javax.security.jacc`
  - Class for Servlet `isUserInRole (String reference)` permissions.
- **WebRoleRefPermission(String, String)** - Constructor for class `javax.security.jacc.WebRoleRefPermission`
  - Creates a new WebRoleRefPermission with the specified name and actions.

- **WebService** - Annotation Type in `javax.jws`
  - Marks a Java class as implementing a Web Service, or a Java interface as defining a Web Service interface.
- **WebServiceClient** - Annotation Type in `javax.xml.ws`
  - Used to annotate a generated service interface.
- **WebServiceContext** - Interface in `javax.xml.ws`
  - A WebServiceContext makes it possible for a web service endpoint implementation class to access message context and security information relative to a request being served.
- **WebServiceException** - Exception in `javax.xml.ws`
  - The WebServiceException class is the base exception class for all JAX-WS API runtime exceptions.
- **WebServiceException()** - Constructor for exception `javax.xml.ws.WebServiceException`
  - Constructs a new exception with null as its detail message.
- **WebServiceException(String)** - Constructor for exception `javax.xml.ws.WebServiceException`
  - Constructs a new exception with the specified detail message.
- **WebServiceException(String, Throwable)** - Constructor for exception `javax.xml.ws.WebServiceException`
  - Constructs a new exception with the specified detail message and cause.
- **WebServiceException(Throwerable)** - Constructor for exception `javax.xml.ws.WebServiceException`
  - Constructs a new WebServiceException with the specified cause and a detail message of (cause==null ?
- **WebServicePermission** - Class in `javax.xml.ws`
  - This class defines web service permissions.
- **WebServicePermission(String)** - Constructor for class `javax.xml.ws.WebServicePermission`
  - Creates a new permission with the specified name.
- **WebServicePermission(String, String)** - Constructor for class `javax.xml.ws.WebServicePermission`
  - Creates a new permission with the specified name and actions.
- **WebServiceProvider** - Annotation Type in `javax.xml.ws`
  - Used to annotate a Provider implementation class.
- **WebServiceRef** - Annotation Type in `javax.xml.ws`
  - TheWebServiceRef annotation is used to define a reference to a web service and (optionally) an injection target for it.
- **WebServiceRefs** - Annotation Type in `javax.xml.ws`
  - The WebServiceRefs annotation allows multiple web service references to be declared at the class level.
**WebUserDataPermission** - Class in `javax.security.jacc`

Class for Servlet Web user data permissions.

**WebUserDataPermission(String, String)** - Constructor for class `javax.security.jacc.WebUserDataPermission`

Creates a new WebUserDataPermission with the specified name and actions.

**WebUserDataPermission(String, String[], String)** - Constructor for class `javax.security.jacc.WebUserDataPermission`

Creates a new WebUserDataPermission with name corresponding to the URLPatternSpec, and actions composed from the array of HTTP methods and the transport type.

**WebUserDataPermission(HttpServletRequest)** - Constructor for class `javax.security.jacc.WebUserDataPermission`

Creates a new WebUserDataPermission from the HttpServletRequest object.

**Work** - Interface in `javax.resource.spi.work`

This models a Work instance that would be executed by a WorkManager upon submission.

**WORK_ACCEPTED** - Static variable in class `javax.resource.spi.work.WorkEvent`

Indicates Work instance has been accepted.

**WORK_COMPLETED** - Static variable in class `javax.resource.spi.work.WorkEvent`

Indicates Work instance has completed execution.

**WORK_REJECTED** - Static variable in class `javax.resource.spi.work.WorkEvent`

Indicates Work instance has been rejected.

**WORK_STARTED** - Static variable in class `javax.resource.spi.work.WorkEvent`

Indicates Work instance has started execution.

**workAccepted(WorkEvent)** - Method in class `javax.resource.spi.work.WorkAdapter`

Invoked when a Work instance has been accepted.

**workAccepted(WorkEvent)** - Method in interface `javax.resource.spi.work.WorkListener`

Invoked when a Work instance has been accepted.

**WorkAdapter** - Class in `javax.resource.spi.work`

This class is provided as a convenience for easily creating WorkListener instances by extending this class and overriding only those methods of interest.

**WorkAdapter()** - Constructor for class `javax.resource.spi.work.WorkAdapter`

**workCompleted(WorkEvent)** - Method in class `javax.resource.spi.work.WorkAdapter`

Invoked when a Work instance has completed execution.

**workCompleted(WorkEvent)** - Method in interface `javax.resource.spi.work.WorkListener`

Invoked when a Work instance has completed execution.

**WorkCompletedException** - Exception in `javax.resource.spi.work`
This exception is thrown by a WorkManager to indicate that a submitted Work instance has completed with an exception.

**WorkCompletedException()** - Constructor for exception

`javax.resource.spi.work.WorkCompletedException`

Constructs a new instance with null as its detail message.

**WorkCompletedException(String)** - Constructor for exception

`javax.resource.spi.work.WorkCompletedException`

Constructs a new instance with the specified detail message.

**WorkCompletedException(Throwables)** - Constructor for exception

`javax.resource.spi.work.WorkCompletedException`

Constructs a new throwables with the specified cause.

**WorkCompletedException(String, Throwable)** - Constructor for exception

`javax.resource.spi.work.WorkCompletedException`

Constructs a new throwables with the specified detail message and cause.

**WorkCompletedException(String, String)** - Constructor for exception

`javax.resource.spi.work.WorkCompletedException`

Constructs a new throwables with the specified detail message and error code.

**WorkEvent** - Class in `javax.resource.spi.work`

This class models the various events that occur during the processing of a Work instance.

**WorkEvent(Object, int, Work, WorkException)** - Constructor for class

`javax.resource.spi.work.WorkEvent`

Constructor.

**WorkEvent(Object, int, Work, WorkException, long)** - Constructor for class

`javax.resource.spi.work.WorkEvent`

Constructor.

**WorkException** - Exception in `javax.resource.spi.work`

A common base class for all Work processing related exceptions.

**WorkException()** - Constructor for exception

`javax.resource.spi.work.WorkException`

Constructs a new instance with null as its detail message.

**WorkException(String)** - Constructor for exception

`javax.resource.spi.work.WorkException`

Constructs a new instance with the specified detail message.

**WorkException(Throwables)** - Constructor for exception

`javax.resource.spi.work.WorkException`

Constructs a new throwables with the specified cause.

**WorkException(String, Throwable)** - Constructor for exception

`javax.resource.spi.work.WorkException`

Constructs a new throwables with the specified detail message and cause.

**WorkException(String, String)** - Constructor for exception

`javax.resource.spi.work.WorkException`

Constructs a new throwables with the specified detail message and error code.

**WorkListener** - Interface in `javax.resource.spi.work`

This models a WorkListener instance which would be notified by the WorkManager when the various Work processing events (work
accepted, work rejected, work started, work completed) occur.

**WorkManager** - Interface in `javax.resource.spi.work`
This interface models a WorkManager which provides a facility to submit Work instances for execution.

**workRejected(WorkEvent)** - Method in class `javax.resource.spi.work.WorkAdapter`
Invoked when a Work instance has been rejected.

**workRejected(WorkEvent)** - Method in interface `javax.resource.spi.work.WorkListener`
Invoked when a Work instance has been rejected.

**WorkRejectedException** - Exception in `javax.resource.spi.work`
This exception is thrown by a WorkManager to indicate that a submitted Work instance has been rejected.

**WorkRejectedException()** - Constructor for exception
Constructs a new instance with null as its detail message.

**WorkRejectedException(String)** - Constructor for exception
Constructs a new instance with the specified detail message.

**WorkRejectedException(ThrowException)** - Constructor for exception
Constructs a new throwable with the specified cause.

**WorkRejectedException(String, Throwable)** - Constructor for exception
 Constructs a new throwable with the specified detail message and cause.

**WorkRejectedException(String, String)** - Constructor for exception
Constructs a new throwable with the specified detail message and an error code.

**workStarted(WorkEvent)** - Method in class `javax.resource.spi.work.WorkAdapter`
Invoked when a Work instance has started execution.

**write(char[], int, int)** - Method in class `javax.faces.context.ResponseWriterWrapper`
The default behavior of this method is to call `Writer.write(char[], int, int)` on the wrapped `ResponseWriter` object.

**write(OutputStream)** - Method in interface `javax.resource.cci.Streamable`
Write fields of a Streamable object to an OutputStream

**WRITE XML DECLARATION** - Static variable in class `javax.xml.soap.SOAPMessage`
Specifies whether the SOAP Message will contain an XML declaration when it is sent.

**writeAsEncodedUnicode(Writer)** - Method in interface `javax.xml.stream.events.XMLEvent`
This method will write the XMLEvent as per the XML 1.0 specification as Unicode characters.

**writeAttribute(String, Object, String)** - Method in class javax.faces.context.ResponseWriter
Write an attribute name and corresponding value, after converting that text to a String (if necessary), and after performing any escaping appropriate for the markup language being rendered.

**writeAttribute(String, Object, String)** - Method in class javax.faces.context.ResponseWriterWrapper
The default behavior of this method is to call ResponseWriter.writeAttribute(String, Object, String) on the wrapped ResponseWriter object.

**writeAttribute(String, String)** - Method in interface javax.xml.stream.XMLStreamWriter
Writes an attribute to the output stream without a prefix.

**writeAttribute(String, String, String, String)** - Method in interface javax.xml.stream.XMLStreamWriter
Writes an attribute to the output stream

**writeBoolean(boolean)** - Method in interface javax.jms.BytesMessage
Writes a boolean to the bytes message stream as a 1-byte value.

**writeBoolean(boolean)** - Method in interface javax.jms.StreamMessage
Writes a boolean to the stream message.

**writeByte(byte)** - Method in interface javax.jms.BytesMessage
Writes a byte to the bytes message stream as a 1-byte value.

**writeByte(byte)** - Method in interface javax.jms.StreamMessage
Writes a byte to the stream message.

**writeBytes(byte[])** - Method in interface javax.jms.BytesMessage
Writes a byte array to the bytes message stream.

**writeBytes(byte[], int, int)** - Method in interface javax.jms.BytesMessage
Writes a portion of a byte array to the bytes message stream.

**writeBytes(byte[])** - Method in interface javax.jms.StreamMessage
Writes a byte array field to the stream message.

**writeBytes(byte[], int, int)** - Method in interface javax.jms.StreamMessage
Writes a portion of a byte array as a byte array field to the stream message.

**writeCData(String)** - Method in interface javax.xml.stream.XMLStreamWriter
Writes a CData section

**writeChar(char)** - Method in interface javax.jms.BytesMessage
Writes a char to the bytes message stream as a 2-byte value, high byte first.

**writeChar(char)** - Method in interface javax.jms.StreamMessage
Writes a char to the stream message.

**writeCharacters(String)** - Method in interface
javax.xml.stream.XMLStreamWriter
Write text to the output
writeCharacters(char[], int, int) - Method in interface
class javax.xml.stream.XMLStreamWriter
Write text to the output
writeComment(Object) - Method in class
class javax.faces.context.ResponseWriter
Write a comment containing the specified text, after converting
that text to a String (if necessary), and after performing any
escaping appropriate for the markup language being rendered.
writeComment(Object) - Method in class
class javax.faces.context.ResponseWriterWrapper
The default behavior of this method is to call
ResponseWriter.writeComment(Object) on the wrapped
ResponseWriter object.
writeComment(String) - Method in interface
class javax.xml.stream.XMLStreamWriter
Writes an xml comment with the data enclosed
writeDefaultNamespace(String) - Method in interface
class javax.xml.stream.XMLStreamWriter
Writes the default namespace to the stream
writeDouble(double) - Method in interface class javax.jms.BytesMessage
Converts the double argument to a long using the
doubleToLongBits method in class Double, and then writes that
long value to the bytes message stream as an 8-byte quantity,
high byte first.
writeDouble(double) - Method in interface class javax.jms.StreamMessage
Writes a double to the stream message.
writeDTD(String) - Method in interface
class javax.xml.stream.XMLStreamWriter
Write a DTD section.
writeEJBHome(EJBHome, ObjectOutputStream) - Method in interface
class java.ejb.spi.HandleDelegate
Serialize the EJBHome reference corresponding to a HomeHandle.
writeEJBOBJECT(EJBObject, ObjectOutputStream) - Method in interface
class java.ejb.spi.HandleDelegate
Serialize the EJBObject reference corresponding to a Handle.
writeEmptyElement(String, String) - Method in interface
class javax.xml.stream.XMLStreamWriter
Writes an empty element tag to the output
writeEmptyElement(String, String, String) - Method in interface
class javax.xml.stream.XMLStreamWriter
Writes an empty element tag to the output
writeEmptyElement(String) - Method in interface
class javax.xml.stream.XMLStreamWriter
Writes an empty element tag to the output
writeEndElement() - Method in interface
javax.xml.stream.XMLStreamWriter
  Writes an end tag to the output relying on the internal state of the writer to determine the prefix and local name of the event.

writeEntityRef(String) - Method in interface javax.xml.stream.XMLStreamWriter
  Writes an entity reference

writeExternal(ObjectOutput) - Method in class javax.activation.MimeType
  The object implements the writeExternal method to save its contents by calling the methods of DataOutput for its primitive values or calling the writeObject method of ObjectOutputStream for objects, strings and arrays.

writeFloat(float) - Method in interface javax.jms.BytesMessage
  Converts the float argument to an int using the floatToIntBits method in class Float, and then writes that int value to the bytes message stream as a 4-byte quantity, high byte first.

writeFloat(float) - Method in interface javax.jms.StreamMessage
  Writes a float to the stream message.

writeInt(int) - Method in interface javax.jms.BytesMessage
  Writes an int to the bytes message stream as four bytes, high byte first.

writeInt(int) - Method in interface javax.jms.StreamMessage
  Writes an int to the stream message.

writeLong(long) - Method in interface javax.jms.BytesMessage
  Writes a long to the bytes message stream as eight bytes, high byte first.

writeLong(long) - Method in interface javax.jms.StreamMessage
  Writes a long to the stream message.

writeNamespace(String, String) - Method in interface javax.xml.stream.XMLStreamWriter
  Writes a namespace to the output stream If the prefix argument to this method is the empty string, "xmlns", or null this method will delegate to writeDefaultNamespace

writeObject(Object) - Method in interface javax.jms.BytesMessage
  Writes an object to the bytes message stream.

writeObject(Object) - Method in interface javax.jms.StreamMessage
  Writes an object to the stream message.

writeOut(Writer) - Method in class javax.servlet.jsp.tagext.BodyContent
  Write the contents of this BodyContent into a Writer.

writeProcessingInstruction(String) - Method in interface javax.xml.stream.XMLStreamWriter
  Writes a processing instruction

writeProcessingInstruction(String, String) - Method in interface javax.xml.stream.XMLStreamWriter
  Writes a processing instruction

writeShort(short) - Method in interface javax.jms.BytesMessage
  Writes a short to the bytes message stream as two bytes, high byte first.
writeShort(short) - Method in interface javax.jms.StreamMessage
  Writes a short to the stream message.
writeStartDocument() - Method in interface javax.xml.stream.XMLStreamWriter
  Write the XML Declaration.
writeStartDocument(String) - Method in interface javax.xml.stream.XMLStreamWriter
  Write the XML Declaration.
writeStartDocument(String, String) - Method in interface javax.xml.stream.XMLStreamWriter
  Write the XML Declaration.
writeStartElement(String) - Method in interface javax.xml.stream.XMLStreamWriter
  Writes a start tag to the output.
writeStartElement(String, String) - Method in interface javax.xml.stream.XMLStreamWriter
  Writes a start tag to the output.
writeStartElement(String, String, String) - Method in interface javax.xml.stream.XMLStreamWriter
  Writes a start tag to the output.
writeState(FacesContext, Object) - Method in class javax.faces.application.StateManager
  Save the state represented in the specified state Object instance, in an implementation dependent manner.
writeState(FacesContext, StateManager.SerializedView) - Method in class javax.faces.application.StateManager
  Deprecated. This method has been replaced by
  StateManager.writeState(javax.faces.context.FacesContext, java.lang.Object)
  The default implementation of this method does nothing.
writeState(FacesContext, Object) - Method in class javax.faces.application.StateManagerWrapper
  The default behavior of this method is to call
  StateManager.writeState(javax.faces.context.FacesContext, java.lang.Object) on the wrapped StateManager object.
writeState(FacesContext, StateManager.SerializedView) - Method in class javax.faces.application.StateManagerWrapper
  The default behavior of this method is to call
  StateManager.writeState(javax.faces.context.FacesContext, java.lang.Object) on the wrapped StateManager object.
writeState(FacesContext) - Method in class javax.faces.application.ViewHandler
  Take any appropriate action to either immediately write out the current state information (by calling
  StateManager.writeState(javax.faces.context.FacesContext, java.lang.Object), or noting where state information should
  later be written.
writeState(FacesContext) - Method in class javax.faces.application.ViewHandlerWrapper
  The default behavior of this method is to call
ViewHandler.writeState(javax.faces.context.FacesContext) on the wrapped ViewHandler object.
writeState(FacesContext, Object) - Method in class javax.faces.render.ResponseStateManager
writeState(FacesContext, StateManager.SerializedView) - Method in class javax.faces.render.ResponseStateManager
   Deprecated. This method has been replaced by ResponseStateManager.writeState(javax.faces.context.FacesContext, java.lang.Object)
   The default implementation of this method does nothing.
writeString(String) - Method in interface javax.jms.StreamMessage
   Writes a String to the stream message.
writeText(Object, String) - Method in class javax.faces.context.ResponseWriter
   Write an object, after converting it to a String (if necessary), and after performing any escaping appropriate for the markup language being rendered.
writeText(Object, UIComponent, String) - Method in class javax.faces.context.ResponseWriter
   Write an object, after converting it to a String (if necessary), and after performing any escaping appropriate for the markup language being rendered.
writeText(char[], int, int) - Method in class javax.faces.context.ResponseWriter
   Write text from a character array, after any performing any escaping appropriate for the markup language being rendered.
writeText(Object, String) - Method in class javax.faces.context.ResponseWriterWrapper
   The default behavior of this method is to call ResponseWriter.writeText(Object, String) on the wrapped ResponseWriter object.
writeText(Object, UIComponent, String) - Method in class javax.faces.context.ResponseWriterWrapper
   The default behavior of this method is to call ResponseWriter.writeText(Object, UIComponent, String) on the wrapped ResponseWriter object.
writeText(char[], int, int) - Method in class javax.faces.context.ResponseWriterWrapper
   The default behavior of this method is to call ResponseWriter.writeText(char[], int, int) on the wrapped ResponseWriter object.
writeTo(Object, String, OutputStream) - Method in interface javax.activation.DataContentHandler
   Convert the object to a byte stream of the specified MIME type and write it to the output stream.
writeTo(OutputStream) - Method in class javax.activation.DataHandler
   Write the data to an OutputStream.
writeTo(OutputStream) - Method in class javax.mail.internet.MimeBodyPart
Output the body part as an RFC 822 format stream.
writeTo(OutputStream) - Method in class javax.mail.internet.MimeMessage
Output the message as an RFC 822 format stream.
writeTo(OutputStream, String[]) - Method in class javax.mail.internet.MimeMessage
Output the message as an RFC 822 format stream, without specified headers.
writeTo(OutputStream) - Method in class javax.mail.internet.MimeMultipart
Iterates through all the parts and outputs each MIME part separated by a boundary.
writeTo(OutputStream) - Method in class javax.mail.internet.PreencodedMimeBodyPart
Output the body part as an RFC 822 format stream.
writeTo(OutputStream) - Method in class javax.mail.Multipart
Output an appropriately encoded bytestream to the given OutputStream.
writeTo(OutputStream) - Method in interface javax.mail.Part
Output a bytestream for this Part.
writeTo(OutputStream) - Method in class javax.xml.soap.SOAPMessage
Writes this SOAPMessage object to the given output stream.
writeURIAttribute(String, Object, String) - Method in class javax.faces.context.ResponseWriter
Write a URI attribute name and corresponding value, after converting that text to a String (if necessary), and after performing any encoding appropriate to the markup language being rendered.
writeURIAttribute(String, Object, String) - Method in class javax.faces.context.ResponseWriterWrapper
The default behavior of this method is to call
ResponseWriter.writeURIAttribute(String, Object, String) on the wrapped ResponseWriter object.
writeUTF(String) - Method in interface javax.jms.BytesMessage
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner.
WSDL_DESCRIPTION - Static variable in interface javax.xml.ws.handler.MessageContext
WSDL_INTERFACE - Static variable in interface javax.xml.ws.handler.MessageContext
Standard property: name of wsdl interface (2.0) or port type (1.1).
WSDL_OPERATION - Static variable in interface javax.xml.ws.handler.MessageContext
Standard property: name of WSDL operation.
WSDL_PORT - Static variable in class javax.xml.ws.Endpoint
Standard property: name of WSDL port.
WSDL_PORT - Static variable in interface javax.xml.ws.handler.MessageContext
Standard property: name of WSDL port.

**WSDL_SERVICE** - Static variable in class `javax.xml.ws.Endpoint`
Standard property: name of WSDL service.

**WSDL_SERVICE** - Static variable in interface `javax.xml.ws.handler.MessageContext`
Standard property: name of WSDL service.
XA_HEURCOM - Static variable in exception
javax.transaction.xa.XAException
   The transaction branch has been heuristically committed.
XA_HEURHAZ - Static variable in exception
javax.transaction.xa.XAException
   The transaction branch may have been heuristically completed.
XA_HEURMIX - Static variable in exception
javax.transaction.xa.XAException
   The transaction branch has been heuristically committed and rolled back.
XA_HEURRRB - Static variable in exception
javax.transaction.xa.XAException
   The transaction branch has been heuristically rolled back.
XA NOMIGRATE - Static variable in exception
javax.transaction.xa.XAException
   Resumption must occur where the suspension occurred.
XA_OK - Static variable in interface
javax.transaction.xa.XAResource
   The transaction work has been prepared normally.
XA_RBBASE - Static variable in exception
javax.transaction.xa.XAException
   The inclusive lower bound of the rollback codes.
XA_RBCOMMFAIL - Static variable in exception
javax.transaction.xa.XAException
   Indicates that the rollback was caused by a communication failure.
XA_RBDDEADLOCK - Static variable in exception
javax.transaction.xa.XAException
   A deadlock was detected.
XA_RBEND - Static variable in exception
javax.transaction.xa.XAException
   The inclusive upper bound of the rollback error code.
XA_RBINTEGRITY - Static variable in exception
javax.transaction.xa.XAException
   A condition that violates the integrity of the resource was detected.
XA_RBOOTHER - Static variable in exception
javax.transaction.xa.XAException
   The resource manager rolled back the transaction branch for a reason not on this list.
XA_RBPROTO - Static variable in exception
javax.transaction.xa.XAException
   A protocol error occurred in the resource manager.
XA_RBBROLLBACK - Static variable in exception
javax.transaction.xa.XAException
   Indicates that the rollback was caused by an unspecified
reason.

**XA_RBTIMEOUT** - Static variable in exception
javax.transaction.xa.XAException
A transaction branch took too long.

**XA_RBTRANSIENT** - Static variable in exception
javax.transaction.xa.XAException
May retry the transaction branch.

**XA_RDONLY** - Static variable in exception
javax.transaction.xa.XAException
The transaction branch was read-only and has been committed.

**XA_RDONLY** - Static variable in interface
javax.transaction.xa.XAResource
The transaction branch has been read-only and has been committed.

**XA_RETRY** - Static variable in exception
javax.transaction.xa.XAException
Routine returned with no effect and may be reissued.

**XACoNnection** - Interface in *javax.jms*
The XACoNnection interface extends the capability of Connection by providing an XASession (optional).

**XACoNnectionFactory** - Interface in *javax.jms*
The XACoNNECTIONFactory interface is a base interface for the XAQueueConnectionFactory and XATopicConnectionFactory interfaces.

**XAER_ASYNC** - Static variable in exception
javax.transaction.xa.XAException
There is an asynchronous operation already outstanding.

**XAER_DUPID** - Static variable in exception
javax.transaction.xa.XAException
The XID already exists.

**XAER_INVAL** - Static variable in exception
javax.transaction.xa.XAException
Invalid arguments were given.

**XAER_NOTA** - Static variable in exception
javax.transaction.xa.XAException
The XID is not valid.

**XAER_OUTSIDE** - Static variable in exception
javax.transaction.xa.XAException
The resource manager is doing work outside a global transaction.

**XAER_PROTO** - Static variable in exception
javax.transaction.xa.XAException
Routine was invoked in an improper context.

**XAER_RMFAIL** - Static variable in exception
javax.transaction.xa.XAException
A resource manager error has occurred in the transaction branch.

**XAER_RMFAIL** - Static variable in exception
javax.transaction.xa.XAException
Resource manager is unavailable.
**XAException** - Exception in *javax.transaction.xa*

The XAException is thrown by the Resource Manager (RM) to inform the Transaction Manager of an error encountered by the involved transaction.

**XAException()** - Constructor for exception

`javax.transaction.xa.XAException`

Create an XAException.

**XAException(String)** - Constructor for exception

`javax.transaction.xa.XAException`

Create an XAException with a given string.

**XAException(int)** - Constructor for exception

`javax.transaction.xa.XAException`

Create an XAException with a given error code.

**XAQueueConnection** - Interface in *javax.jms*

An XAQueueConnection provides the same create options as QueueConnection (optional).

**XAQueueConnectionFactory** - Interface in *javax.jms*

An XAQueueConnectionFactory provides the same create options as a QueueConnectionFactory (optional).

**XAQueueSession** - Interface in *javax.jms*

An XAQueueSession provides a regular QueueSession, which can be used to create QueueReceiver, QueueSender, and QueueBrowser objects (optional).

**XAResource** - Interface in *javax.transaction.xa*

The XAResource interface is a Java mapping of the industry standard XA interface based on the X/Open CAE Specification (Distributed Transaction Processing: The XA Specification).

**XASession** - Interface in *javax.jms*

The XASession interface extends the capability of Session by adding access to a JMS provider's support for the Java Transaction API (JTA) (optional).

**XATerminator** - Interface in *javax.resource.spi*

The XATerminator interface is used for transaction completion and crash recovery flows.

**XATopicConnection** - Interface in *javax.jms*

An XATopicConnection provides the same create options as TopicConnection (optional).

**XATopicConnectionFactory** - Interface in *javax.jms*

An XATopicConnectionFactory provides the same create options as a TopicConnectionFactory (optional).

**XATopicSession** - Interface in *javax.jms*

An XATopicSession provides a regular TopicSession.

**Xid** - Interface in *javax.transaction.xa*

The Xid interface is a Java mapping of the X/Open transaction identifier XID structure.

**XmlAccessOrder** - Enum in *javax.xml.bind.annotation*

Used by XmlAccessorOrder to control the ordering of properties and fields in a JAXB bound class.

**XmlAccessorOrder** - Annotation Type in *javax.xml.bind.annotation*

Controls the ordering of fields and properties in a class.
**XmlAccessorType** - Annotation Type in `javax.xml.bind.annotation`
Controls whether fields or JavaBean properties are serialized by default.

**XmlAccessType** - Enum in `javax.xml.bind.annotation`
Used by XmlAccessorType to control serialization of fields or properties.

**XmlAdapter<ValueType,BoundType>** - Class in `javax.xml.bind.annotation.adapters`
Adapts a Java type for custom marshaling.

**XmlAdapter()** - Constructor for class `javax.xml.bind.annotation.adapters.XmlAdapter`
Do-nothing constructor for the derived classes.

**XmlAnyAttribute** - Annotation Type in `javax.xml.bind.annotation`
Maps a JavaBean property to a map of wildcard attributes.

**XmlAnyElement** - Annotation Type in `javax.xml.bind.annotation`
Maps a JavaBean property to XML infoset representation and/or JAXB element.

**XmlAttachmentRef** - Annotation Type in `javax.xml.bind.annotation`
Marks a field/property that its XML form is a uri reference to mime content.

**XmlAttribute** - Annotation Type in `javax.xml.bind.annotation`
Maps a JavaBean property to a XML attribute.

**XmlElement** - Annotation Type in `javax.xml.bind.annotation`
Maps a JavaBean property to a XML element derived from property name.

**XmlElement.DEFAULT** - Class in `javax.xml.bind.annotation`
Used in `XmlElement.type()` to signal that the type be inferred from the signature of the property.

**XmlElement.DEFAULT()** - Constructor for class `javax.xml.bind.annotation.XmlElement.DEFAULT`

**XmlElementDecl** - Annotation Type in `javax.xml.bind.annotation`
Maps a factory method to a XML element.

**XmlElementDecl.GLOBAL** - Class in `javax.xml.bind.annotation`
Used in `XmlElementDecl.scope()` to signal that the declaration is in the global scope.

**XmlElementDecl.GLOBAL()** - Constructor for class `javax.xml.bind.annotation.XmlElementDecl.GLOBAL`

**XmlElementRef** - Annotation Type in `javax.xml.bind.annotation`
Maps a JavaBean property to a XML element derived from property's type.

**XmlElementRef.DEFAULT** - Class in `javax.xml.bind.annotation`
Used in `XmlElementRef.type()` to signal that the type be inferred from the signature of the property.

**XmlElementRef.DEFAULT()** - Constructor for class `javax.xml.bind.annotation.XmlElementRef.DEFAULT`

**XmlElementRefs** - Annotation Type in `javax.xml.bind.annotation`
Marks a property that refers to classes with **XmlElement** or
JAXBElement.

**XmlElements** - Annotation Type in **javax.xml.bind.annotation**
A container for multiple `@XmlElement` annotations.

**XmlElementWrapper** - Annotation Type in **javax.xml.bind.annotation**
Generates a wrapper element around XML representation.

**XmlEnum** - Annotation Type in **javax.xml.bind.annotation**
Maps an enum type `Enum` to XML representation.

**XmlEnumValue** - Annotation Type in **javax.xml.bind.annotation**
Maps an enum constant in `Enum` type to XML representation.

**XmlEvent** - Interface in **javax.xml.stream.events**
This is the base event interface for handling markup events.

**XmlEventAllocator** - Interface in **javax.xml.stream.util**
This interface defines a class that allows a user to register a way to allocate events given an XMLStreamReader.

**XmlEventConsumer** - Interface in **javax.xml.stream.util**
This interface defines an event consumer interface.

**XmlEventFactory** - Class in **javax.xml.stream**
This interface defines a utility class for creating instances of XMLEvents.

**XmlEventFactory()** - Constructor for class
`javax.xml.stream.XMLEventFactory`.

**XMLEventReader** - Interface in **javax.xml.stream**
This is the top level interface for parsing XML Events.

**XMLEventWriter** - Interface in **javax.xml.stream**
This is the top level interface for writing XML documents.

**XmlID** - Annotation Type in **javax.xml.bind.annotation**
Maps a JavaBean property to XML ID.

**XmlIDREF** - Annotation Type in **javax.xml.bind.annotation**
Maps a JavaBean property to XML IDREF.

**XmlInlineBinaryData** - Annotation Type in **javax.xml.bind.annotation**
Disable consideration of XOP encoding for datatypes that are bound to base64-encoded binary data in XML.

**XMLInputFactory** - Class in **javax.xml.stream**
Defines an abstract implementation of a factory for getting streams.

**XMLInputFactory()** - Constructor for class
`javax.xml.stream.XMLInputFactory`.

**XmlJavaTypeAdapter** - Annotation Type in **javax.xml.bind.annotation.adapters**
Use an adapter that implements `XmlAdapter` for custom marshaling.

**XmlJavaTypeAdapter.DEFAULT** - Class in **javax.xml.bind.annotation.adapters**
Used in `XmlJavaTypeAdapter.type()` to signal that the type be inferred from the signature of the field, property, parameter or the class.

**XmlJavaTypeAdapter.DEFAULT()** - Constructor for class
`javax.xml.bind.annotation.adapters.XmlJavaTypeAdapter.DEFAULT`
XmlJavaTypeAdapters - Annotation Type in javax.xml.bind.annotation.adapters
A container for multiple @XmlJavaTypeAdapter annotations.

XmlList - Annotation Type in javax.xml.bind.annotation
Used to map a property to a list simple type.

XmlMimeType - Annotation Type in javax.xml.bind.annotation
Associates the MIME type that controls the XML representation of the property.

XmlMixed - Annotation Type in javax.xml.bind.annotation
Annotate a JavaBean multi-valued property to support mixed content.

XmlNs - Annotation Type in javax.xml.bind.annotation
Associates a namespace prefix with a XML namespace URI.

XmlNsForm - Enum in javax.xml.bind.annotation
Enumeration of XML Schema namespace qualifications.

XMLOutputFactory - Class in javax.xml.stream
Defines an abstract implementation of a factory for getting XMLEventWriters and XMLStreamWriter.

XMLOutputFactory() - Constructor for class javax.xml.stream.XMLOutputFactory

XmlRegistry - Annotation Type in javax.xml.bind.annotation
Marks a class that has XmlElementDecl.

XMLReporter - Interface in javax.xml.stream
This interface is used to report non-fatal errors.

XMLResolver - Interface in javax.xml.stream
This interface is used to resolve resources during an XML parse.

XmlRootElement - Annotation Type in javax.xml.bind.annotation
Maps a class or an enum type to an XML element.

XmlSchema - Annotation Type in javax.xml.bind.annotation
Maps a package name to a XML namespace.

XmlSchemaType - Annotation Type in javax.xml.bind.annotation
Maps a Java type to a simple schema built-in type.

XmlSchemaType.DEFAULT - Class in javax.xml.bind.annotation
Used in XmlSchemaType.type() to signal that the type be inferred from the signature of the property.

XmlSchemaType.DEFAULT() - Constructor for class javax.xml.bind.annotation.XmlSchemaType.DEFAULT

XmlSchemaTypes - Annotation Type in javax.xml.bind.annotation
A container for multiple @XmlSchemaType annotations.

XMLStreamConstants - Interface in javax.xml.stream
This interface declares the constants used in this API.

XMLStreamException - Exception in javax.xml.stream
The base exception for unexpected processing errors.

XMLStreamException() - Constructor for exception javax.xml.stream.XMLStreamException
Default constructor
**XMLStreamException(String)** - Constructor for exception

`javax.xml.stream.XMLStreamException`  
Construct an exception with the associated message.

**XMLStreamException(throwable)** - Constructor for exception

`javax.xml.stream.XMLStreamException`  
Construct an exception with the associated exception.

**XMLStreamException(String, Throwable)** - Constructor for exception

`javax.xml.stream.XMLStreamException`  
Construct an exception with the associated message and exception.

**XMLStreamException(String, Location, Throwable)** - Constructor for exception

`javax.xml.stream.XMLStreamException`  
Construct an exception with the associated message, exception and location.

**XMLStreamReader** - Interface in `javax.xml.stream`

The `XMLStreamReader` interface allows forward, read-only access to XML.

**XMLStreamWriter** - Interface in `javax.xml.stream`

The `XMLStreamWriter` interface specifies how to write XML.

**XmlTransient** - Annotation Type in `javax.xml.bind.annotation`

Prevents the mapping of a JavaBean property to XML representation.

**XmlType** - Annotation Type in `javax.xml.bind.annotation`

Maps a class or an enum type to a XML Schema type.

**XMLType** - Class in `javax.xml.rpc.encoding`

Constants for common XML Schema and SOAP 1.1 types.

**XMLType()** - Constructor for class `javax.xml.rpc.encoding.XMLType`

**XmlType.DEFAULT** - Class in `javax.xml.bind.annotation`

Used in `XmlType.factoryClass()` to signal that either factory method is not used or that it’s in the class with this `XmlType` itself.

**XmlType.DEFAULT()** - Constructor for class `javax.xml.bind.annotation.XmlType.DEFAULT`

**XmlValue** - Annotation Type in `javax.xml.bind.annotation`

Enables mapping a class to a XML Schema complex type with a simpleContent or a XML Schema simple type.

**XpathEvent** - Class in `javax.enterprise.deploy.model`

An Event class describing ConfigBeans being added/subtracted from a server configuration.

**XpathEvent(DDBean, Object)** - Constructor for class `javax.enterprise.deploy.model.XpathEvent`

A description of a change in the ConfigBean tree.

**XpathListener** - Interface in `javax.enterprise.deploy.model`

The listener interface for receiving XpathEvents

**XSD_BASE64** - Static variable in class
javax.xml.rpc.encoding.XMLType
   The name of the xsd:base64Binary type.
 XSD_BOOLEAN - Static variable in class
class javax.xml.rpc.encoding.XMLType
   The name of the xsd:boolean type.
 XSD_BYTE - Static variable in class
class javax.xml.rpc.encoding.XMLType
   The name of the xsd:byte type.
 XSD_DATETIME - Static variable in class
class javax.xml.rpc.encoding.XMLType
   The name of the xsd:dateTime type.
 XSD_DECIMAL - Static variable in class
class javax.xml.rpc.encoding.XMLType
   The name of the xsd:decimal type.
 XSD_DOUBLE - Static variable in class
class javax.xml.rpc.encoding.XMLType
   The name of the xsd:double type.
 XSD_FLOAT - Static variable in class
class javax.xml.rpc.encoding.XMLType
   The name of the xsd:float type.
 XSD_HEX_BINARY - Static variable in class
class javax.xml.rpc.encoding.XMLType
   The name of the xsd:hexBinary type.
 XSD_INT - Static variable in class
class javax.xml.rpc.encoding.XMLType
   The name of the xsd:int type.
 XSD_INTEGER - Static variable in class
class javax.xml.rpc.encoding.XMLType
   The name of the xsd:integer type.
 XSD_LONG - Static variable in class
class javax.xml.rpc.encoding.XMLType
   The name of the xsd:long type.
 XSD_QNAME - Static variable in class
class javax.xml.rpc.encoding.XMLType
   The name of the xsd:QName type.
 XSD_SHORT - Static variable in class
class javax.xml.rpc.encoding.XMLType
   The name of the xsd:short type.
 XSD_STRING - Static variable in class
class javax.xml.rpc.encoding.XMLType
   The name of the xsd:string type.
getProperty(String) - Method in interface javax.xml.rpc.Stub
 Gets the value of a specific configuration property.

getPropertyNames() - Method in interface javax.xml.rpc.Stub
 Returns an Iterator view of the names of the properties that can be configured on this stub instance.

_jspService(HttpServletRequest, HttpServletResponse) - Method in interface javax.servlet.jsp.HttpJspPage
 The _jspService() method corresponds to the body of the JSP page.

_setProperty(String, Object) - Method in interface javax.xml.rpc.Stub
 Sets the name and value of a configuration property for this Stub instance.
How This API Document Is Organized

This API (Application Programming Interface) document has pages corresponding to the items in the navigation bar, described as follows.

Overview

The Overview page is the front page of this API document and provides a list of all packages with a summary for each. This page can also contain an overall description of the set of packages.

Package

Each package has a page that contains a list of its classes and interfaces, with a summary for each. This page can contain four categories:

- Interfaces (italic)
- Classes
- Enums
- Exceptions
- Errors
- Annotation Types

Class/Interface

Each class, interface, nested class and nested interface has its own separate page. Each of these pages has three sections consisting of a class/interface description, summary tables, and detailed member descriptions:

- Class inheritance diagram
- Direct Subclasses
- All Known Subinterfaces
- All Known Implementing Classes
• Class/interface declaration
• Class/interface description

• Nested Class Summary
• Field Summary
• Constructor Summary
• Method Summary

• Field Detail
• Constructor Detail
• Method Detail

Each summary entry contains the first sentence from the detailed description for that item. The summary entries are alphabetical, while the detailed descriptions are in the order they appear in the source code. This preserves the logical groupings established by the programmer.

Annotation Type

Each annotation type has its own separate page with the following sections:

• Annotation Type declaration
• Annotation Type description
• Required Element Summary
• Optional Element Summary
• Element Detail

Enum

Each enum has its own separate page with the following sections:

• Enum declaration
• Enum description
• Enum Constant Summary
• Enum Constant Detail

Tree (Class Hierarchy)
There is a [Class Hierarchy](#) page for all packages, plus a hierarchy for each package. Each hierarchy page contains a list of classes and a list of interfaces. The classes are organized by inheritance structure starting with `java.lang.Object`. The interfaces do not inherit from `java.lang.Object`.

- When viewing the Overview page, clicking on "Tree" displays the hierarchy for all packages.
- When viewing a particular package, class or interface page, clicking "Tree" displays the hierarchy for only that package.

**Deprecated API**

The [Deprecated API](#) page lists all of the API that have been deprecated. A deprecated API is not recommended for use, generally due to improvements, and a replacement API is usually given. Deprecated APIs may be removed in future implementations.

**Index**

The [Index](#) contains an alphabetic list of all classes, interfaces, constructors, methods, and fields.

**Prev/Next**

These links take you to the next or previous class, interface, package, or related page.

**Frames/No Frames**

These links show and hide the HTML frames. All pages are available with or without frames.

**Serialized Form**

Each serializable or externalizable class has a description of its serialization fields and methods. This information is of interest to re-implementors, not to developers using the API. While there is no link in
the navigation bar, you can get to this information by going to any serialized class and clicking "Serialized Form" in the "See also" section of the class description.

**Constant Field Values**

The [Constant Field Values](#) page lists the static final fields and their values.

*This help file applies to API documentation generated using the standard doclet.*
### Serialized Form

**Package** javax.activation

**Class**

javax.activation.ActivationDataFlavor

extends DataFlavor

implements Serializable

### Serialization Methods

**readExternal**

```java
default void readExternal(ObjectInput arg0)
throws IOException,
ClassNotFoundException
```

**Throws:**

IOException

ClassNotFoundException

**writeExternal**

```java
default void writeExternal(ObjectOutput arg0)
throws IOException
```

**Throws:**

IOException

**Class**

javax.activation.MimeType
extends Object implements Serializable

Serialization Methods

readExternal

```java
public void readExternal(ObjectInput in)
    throws IOException,
        ClassNotFoundException
```

The object implements the readExternal method to restore its contents by calling the methods of DataInput for primitive types and readObject for objects, strings and arrays. The readExternal method must read the values in the same sequence and with the same types as were written by writeExternal.

Throws:

- ClassNotFoundException - If the class for an object being restored cannot be found.
- IOException

writeExternal

```java
public void writeExternal(ObjectOutput out)
    throws IOException
```

The object implements the writeExternal method to save its contents by calling the methods of DataOutput for its primitive values or calling the writeObject method of ObjectOutput for objects, strings and arrays.

Throws:

- IOException - Includes any I/O exceptions that may occur

Class

javax.activation.MimeTypeParseException
extends Exception implements Serializable

Class
javax.activation.UnsupportedDataTypeException
extends IOException implements Serializable

Package javax.ejb

Class javax.ejb.AccessLocalException
extends EJBException implements Serializable

Class javax.ejb.ConcurrentAccessException
extends EJBException implements Serializable

Class javax.ejb.CreateException
extends Exception implements Serializable

Class javax.ejb.DuplicateKeyException

**Package javax.faces.validator**

**Class**

```java
javax.faces.validator.ValidatorException
extends FacesException
implements Serializable
```

**Serialized Fields**

- `message` (FacesMessage)

**Package javax.faces.webapp**

**Class**

```java
javax.faces.webapp.AttributeTag
extends TagSupport
implements Serializable
```

**serialVersionUID**: `-7782950243436672334L`

**Serialized Fields**

- `name` (String)
Deprecated.

The name of the attribute to be created, if not already present.

value

String value

 Deprecated.

The value to be associated with this attribute, if it is created.

Class `javax.faces.webapp.ConverterELTag` extends `TagSupport` implements `Serializable`

Class `javax.faces.webapp.ConverterTag` extends `TagSupport` implements `Serializable`

`serialVersionUID`: -5909792518081427720L

Serialized Fields

`converterId`

String `converterId`

 Deprecated.

The identifier of the `Converter` instance to be created.
String binding

Deprecated.

The ValueExpression that evaluates to an object that implements Converter.

Class javax.faces.webapp.FacetTag extends TagSupport implements Serializable

Serialized Fields

name

String name

The name of this facet. This will be used as the facet name for our UIComponentTag child in our UIComponentTag parent's facet list.

Class javax.faces.webapp.ValidatorELTag extends TagSupport implements Serializable

Class javax.faces.webapp.ValidatorTag extends TagSupport implements Serializable
Serializable

SerialVersionUID: -5562623615418158868L

Serialized Fields

validatorId

String validatorId

Deprecated.

The identifier of the Validator instance to be created.

binding

String binding

Deprecated.

The ValueExpression that evaluates to an object that implements Validator.

Package javax.jms

Class javax.jms.IllegalStateException extends JMSException implements Serializable

Class javax.jms.InvalidClientIDException
`extends JMSException` implements `Serializable`

Class javax.mail.Message.RecipientType extends Object implements Serializable

serialVersionUID: -7479791750606340008L

Serialization Methods

readResolve

protected Object readResolve() throws ObjectStreamException

When deserializing a RecipientType, we need to make sure to return only one of the known static final instances defined in this class. Subclasses must implement their own readResolve method that checks for their known instances before calling this super method.

Throws: ObjectStreamException

Serialized Fields

type
String type

The type of recipient, usually the name of a corresponding Internet standard header.

Class `javax.mail.MessageRemovedException`
extends `MessagingException` implements Serializable

serialVersionUID: 1951292550679528690L

Class `javax.mail.MessagingException`
extends `Exception` implements Serializable

serialVersionUID: -7569192289819959253L

Serialized Fields

next

`Exception` next

The next exception in the chain.

```

The event type.
javax.mail.event.MessageCountEvent extends MailEvent implements Serializable

serialVersionUID: -7447022340837897369L

Serialized Fields

type

int type

The event type.

removed

boolean removed

If true, this event is the result of an explicit expunge by this client, and the messages in this folder have been renumbered to account for this. If false, this event is the result of an expunge by external sources.

Class javax.mail.event.StoreEvent extends MailEvent implements Serializable

serialVersionUID: 1938704919992515330L
Serialized Fields

type

```java
int type
```

The event type.

message

```java
String message
```

The message text to be presented to the user.

Class `javax.mail.event.TransportEvent` extends `MailEvent` implements `Serializable`

Package `javax.mail.internet`

Class `javax.mail.internet.AddressException` extends `ParseException` implements `Serializable`

Serialization UID: 9134583443539323120L

Serialized Fields

- `ref`: String
  - The string being parsed.

- `pos`: int
  - The index in the string where the error occurred, or -1 if not known.

Class `javax.mail.internet.InternetAddress` extends `Address` implements `Serializable`
Serialized Fields

address

String address

personal

String personal

The personal name.

encodedPersonal

String encodedPersonal

The RFC 2047 encoded version of the personal name.

This field and the personal field track each other, so if a subclass sets one of these fields directly, it should set the other to null, so that it is suitably recomputed.

Class

javax.mail.internet.MailDateFormat

extends SimpleDateFormat

implements Serializable

serialVersionUID: -8148227605210628779L
Class `javax.mail.internet.MimeMessage.RecipientType` extends `Message.RecipientType` implements `Serializable`

Class javax.mail.search.AddressTerm extends SearchTerm implements Serializable

serialVersionUID: 2005405551929769980L

Serialized Fields

address
The address.

Class `javax.mail.search.AndTerm` extends `SearchTerm` implements `Serializable`

`serialVersionUID`: -3583274505380989582L

**Serialized Fields**

`terms`

`SearchTerm[] terms`

The array of terms on which the AND operator should be applied.

Class `javax.mail.search.BodyTerm` extends `StringTerm` implements `Serializable`

`serialVersionUID`: -488862527916911385L

Class `javax.mail.search.ComparisonTerm` extends `SearchTerm` implements
Serializable

serialVersionUID: 1456646953666474308L

Serialized Fields

comparison

int comparison

The comparison.

Class **javax.mail.search.DateTerm** extends **ComparisonTerm** implements **Serializable**

serialVersionUID: 4818873430063720043L

Serialized Fields

date

**Date** date

The date.

Class **javax.mail.search.FlagTerm** extends **SearchTerm** implements **Serializable**
### Serializable

**serialVersionUID**: -142991500302030647L

### Serialized Fields

**set**

```java
boolean set
```

Indicates whether to test for the presence or absence of the specified Flag. If `true`, then test whether all the specified flags are present, else test whether all the specified flags are absent.

**flags**

```java
Flags flags
```

Flags object containing the flags to test.

serialVersionUID: 1L

**Serialization Methods**

readObject

```java
private void readObject(ObjectInputStream s) throws IOException, ClassNotFoundException {
    // Implementation
}
```
readObject reads the serialized fields from the input stream and uses them to restore the permission. This method need not be implemented if establishing the values of the serialized fields (as is done by defaultReadObject) is sufficient to initialize the permission.

**Throws:**
- `IOException`
- `ClassNotFoundException`

### writeObject

```java
private void writeObject(ObjectOutputStream s) throws IOException
```

writeObject is used to establish the values of the serialized fields before they are written to the output stream and need not be implemented if the values of the serialized fields are always available and up to date. The serialized fields are written to the output stream in the same form as they would be written by defaultWriteObject.

**Throws:**
- `IOException`

### Serialization Overview

The serialized fields of this permission are defined below. Whether or not the serialized fields correspond to actual (private) fields is an implementation decision.

### Serialized Fields

**actions**

```java
String actions
```

the canonicalized actions string (as returned by getActions).
Class
javax.security.jacc.EJBRoleRefPermission

### Serialized Fields

#### name

**QName** name

xml element tag name

#### declaredType

**Class<T>** declaredType

Java datatype binding for xml element declaration's type.

#### scope

**Class<T>** scope

Scope of xml element declaration representing this xml element
instance. Can be one of the following values: -
[JAXBElement.GlobalScope](https://javaeespecs.org/jakarta-ee/8/JAX-WS/jax-ws-impl/impl-api-spec.html#GlobalScope) for global xml element declaration. - local element declaration has a scope set to the Java class representation of complex type defintion containing xml element declaration.

---

**value**

[Object](https://docs.oracle.com/javase/8/docs/api/java/lang/Object.html) value

xml element value. Represents content model and attributes of an xml element instance.

---

**nil**

[boolean](https://docs.oracle.com/javase/8/docs/api/java/lang/Boolean.html) nil

true iff the xml element instance has xsi:nil="true".

## Package javax.ejb

The javax.ejb package contains the Enterprise JavaBeans classes and interfaces that define the contracts between the enterprise bean and its clients and between the enterprise bean and the EJB container.

See: [Description](#)

### Interface Summary

<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>EJBContext</strong></td>
<td>The EJBContext interface provides an instance with access to the container-provided runtime context of an enterprise Bean instance.</td>
</tr>
<tr>
<td><strong>EJBHome</strong></td>
<td>The EJBHome interface must be extended by all enterprise Beans' remote home interfaces.</td>
</tr>
<tr>
<td><strong>EJBLocalHome</strong></td>
<td>The EJBLocalHome interface must be extended by all enterprise Beans' local home interfaces.</td>
</tr>
<tr>
<td><strong>EJBLocalObject</strong></td>
<td>The EJBLocalObject interface must be extended by all enterprise Beans' local interfaces.</td>
</tr>
<tr>
<td><strong>EJBMetaData</strong></td>
<td>The EJBMetaData interface allows a client to obtain the enterprise Bean's meta-data information.</td>
</tr>
<tr>
<td><strong>EJBOBJECT</strong></td>
<td>The EJBOBJECT interface is extended by all enterprise Beans' remote interfaces.</td>
</tr>
<tr>
<td><strong>EnterpriseBean</strong></td>
<td>The EnterpriseBean interface must be implemented by every enterprise Bean class.</td>
</tr>
<tr>
<td><strong>EntityBean</strong></td>
<td>The EntityBean interface is implemented by every entity enterprise Bean class.</td>
</tr>
<tr>
<td><strong>EntityContext</strong></td>
<td>The EntityContext interface provides an instance with access to the container-provided runtime context of an entity</td>
</tr>
<tr>
<td>Interface</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Handle</strong></td>
<td>The Handle interface is implemented by all EJB object handles.</td>
</tr>
<tr>
<td><strong>HomeHandle</strong></td>
<td>The HomeHandle interface is implemented by all home object handles.</td>
</tr>
<tr>
<td><strong>MessageDrivenBean</strong></td>
<td>The MessageDrivenBean interface is implemented by every message-driven enterprise Bean class.</td>
</tr>
<tr>
<td><strong>MessageDrivenContext</strong></td>
<td>The MessageDrivenContext interface provides access to the runtime message-driven context that the container provides for a message-driven enterprise Bean instance.</td>
</tr>
<tr>
<td><strong>SessionBean</strong></td>
<td>The SessionBean interface is implemented by every session enterprise Bean class.</td>
</tr>
<tr>
<td><strong>SessionContext</strong></td>
<td>The SessionContext interface provides access to the runtime session context that the container provides for a session enterprise Bean instance.</td>
</tr>
<tr>
<td><strong>SessionSynchronization</strong></td>
<td>The SessionSynchronization interface allows a session Bean instance to be notified by its container of transaction boundaries.</td>
</tr>
<tr>
<td><strong>TimedObject</strong></td>
<td>The TimedObject interface contains the callback method that is used to deliver timer expiration notifications.</td>
</tr>
<tr>
<td><strong>Timer</strong></td>
<td>The Timer interface contains information about a timer that was created through the EJB Timer Service.</td>
</tr>
<tr>
<td><strong>TimerHandle</strong></td>
<td>The TimerHandle interface is implemented by all EJB timer handles.</td>
</tr>
<tr>
<td><strong>TimerService</strong></td>
<td>The TimerService interface provides enterprise bean components with access to the container-provided Timer Service.</td>
</tr>
</tbody>
</table>

**Annotation Types Summary**

<table>
<thead>
<tr>
<th>Annotation Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ActivationConfigProperty</strong></td>
<td>Applied to an exception to denote that it is an application exception and should be reported to the client directly (i.e., unwrapped).</td>
</tr>
<tr>
<td><strong>ApplicationException</strong></td>
<td>Indicates a dependency on the local or JNDI namespace.</td>
</tr>
<tr>
<td><strong>EJB</strong></td>
<td>Indicates a dependency on the local or JNDI namespace.</td>
</tr>
</tbody>
</table>
A remote view of an Enterprise Java Bean.

<table>
<thead>
<tr>
<th><strong>EJBs</strong></th>
<th>Declares multiple TYPE-level @EJB annotations.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Init</strong></td>
<td>Designates a method of a session bean that corresponds to the create method of an adapted Home interface or an adapted Local Home interface.</td>
</tr>
<tr>
<td><strong>Local</strong></td>
<td>When used on the bean class, declares the local business interface(s) for a session bean.</td>
</tr>
<tr>
<td><strong>LocalHome</strong></td>
<td>Declares the Local Home or adapted Local Home interface for a session bean.</td>
</tr>
<tr>
<td><strong>MessageDriven</strong></td>
<td>Component-defining annotation for a message driven bean.</td>
</tr>
<tr>
<td><strong>PostActivate</strong></td>
<td>Designates a method to receive a callback after a stateful session bean has been activated.</td>
</tr>
<tr>
<td><strong>PrePassivate</strong></td>
<td>Designates a method to receive a callback before a stateful session bean is passivated.</td>
</tr>
<tr>
<td><strong>Remote</strong></td>
<td>Declares the remote business interface(s) for a session bean.</td>
</tr>
<tr>
<td><strong>RemoteHome</strong></td>
<td>Declares the Remote Home or adapted Remote Home interface for a session bean.</td>
</tr>
<tr>
<td><strong>Remove</strong></td>
<td>Applied to a business method of a stateful session bean class.</td>
</tr>
<tr>
<td><strong>Stateful</strong></td>
<td>Component-defining annotation for a stateful session bean.</td>
</tr>
<tr>
<td><strong>Stateless</strong></td>
<td>Component-defining annotation for a stateless session bean.</td>
</tr>
<tr>
<td><strong>Timeout</strong></td>
<td>Designates a method on a stateless session bean class or message driven bean class that should receive EJB timer expirations for that bean.</td>
</tr>
</tbody>
</table>

When applied at the TYPE-level, designates
<table>
<thead>
<tr>
<th><strong>TransactionAttribute</strong></th>
<th>The default transaction attribute for all business methods of the session or message driven bean.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TransactionManagement</strong></td>
<td>Declares whether a session bean or message driven bean has container managed transactions or bean managed transactions.</td>
</tr>
</tbody>
</table>
The `javax.ejb` package contains the Enterprise JavaBeans classes and interfaces that define the contracts between the enterprise bean and its clients and between the enterprise bean and the EJB container.

<td>The ManagedConnectionMetaData interface provides information about the underlying EIS instance associated with a</td>
</tr>
</tbody>
</table>
### ManagedConnection instance.

**ResourceAdapter**

This represents a resource adapter instance and contains operations for lifecycle management and message endpoint setup.

**ResourceAdapterAssociation**

This interface specifies the methods to associate a ResourceAdapter object with other objects that implement this interface like ManagedConnectionFactory and ActivationSpec.

**ValidatingManagedConnectionFactory**

This interface is implemented by a ManagedConnectionFactory instance that supports the ability to validate ManagedConnection objects.

**XATerminator**

The XATerminator interface is used for transaction completion and crash recovery flows.

### Class Summary

**ConnectionEvent**

The ConnectionEvent class provides information about the source of a connection related event. A ConnectionEvent instance contains the following information: Type of the connection event ManagedConnection instance that generated the connection event.

### Exception Summary
<table>
<thead>
<tr>
<th>Exception Name</th>
<th>Description</th>

</tr>
<tr>
<td>CommException</td>
<td>This indicates errors related to failed or interrupted communication with an EIS instance.</td>
</tr>
<tr>
<td>EISSystemException</td>
<td>An EISSystemException is used to indicate any EIS specific system-level error conditions.</td>
</tr>
<tr>
<td>IllegalStateException</td>
<td>An IllegalStateException is thrown from a method if the callee (resource adapter or application server for system contracts) is in an illegal or inappropriate state for the method invocation.</td>
</tr>
<tr>
<td>InvalidPropertyException</td>
<td>This exception is thrown to indicate invalid configuration property settings.</td>
</tr>
<tr>
<td>LocalTransactionException</td>
<td>A LocalTransactionException represents various error conditions related to the local transaction management contract.</td>
</tr>
<tr>
<td>ResourceAdapterInternalException</td>
<td>A ResourceAdapterInternalException indicates any system-level error conditions related to a resource adapter.</td>
</tr>
<tr>
<td>ResourceAllocationException</td>
<td>A ResourceAllocationException can be thrown by an application server or resource adapter to indicate any failure to allocate system resources (example: threads, physical connections).</td>
</tr>
<tr>
<td>SecurityException</td>
<td>A SecurityException indicates error conditions related to the security contract between an application</td>
</tr>
</tbody>
</table>
SharingViolationException

This is thrown to indicate a connection sharing violation.

UnavailableException

This is thrown to indicate that a service is unavailable.
The `javax.resource.spi` package contains APIs for the system contracts defined in the J2EE Connector Architecture specification.

Package `javax.mail`

The JavaMail™ API provides classes that model a mail system.

See:  

### Interface Summary

<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MessageAware</strong></td>
<td>An interface optionally implemented by DataSources to supply information to a DataContentHandler about the message context in which the data content object is operating.</td>
</tr>
<tr>
<td><strong>MultipartDataSource</strong></td>
<td>MultipartDataSource is a DataSource that contains body parts.</td>
</tr>
<tr>
<td><strong>Part</strong></td>
<td>The Part interface is the common base interface for Messages and BodyParts.</td>
</tr>
<tr>
<td><strong>QuotaAwareStore</strong></td>
<td>An interface implemented by Stores that support quotas.</td>
</tr>
<tr>
<td><strong>UIDFolder</strong></td>
<td>The UIDFolder interface is implemented by Folders that can support the &quot;disconnected&quot; mode of operation, by providing unique-ids for messages in the folder.</td>
</tr>
</tbody>
</table>

### Class Summary

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Address</strong></td>
<td>This abstract class models the addresses in a message.</td>
</tr>
<tr>
<td><strong>Authenticator</strong></td>
<td>The class Authenticator represents an object that knows how to obtain authentication for a network connection.</td>
</tr>
<tr>
<td><strong>BodyPart</strong></td>
<td>This class models a Part that is contained within a Multipart.</td>
</tr>
<tr>
<td></td>
<td>Clients use a FetchProfile to list the Message attributes that it wishes to</td>
</tr>
<tr>
<td>Class</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>FetchProfile</td>
<td>prefetch from the server for a range of messages.</td>
</tr>
<tr>
<td>FetchProfile.Item</td>
<td>This inner class is the base class of all items that can be requested in a FetchProfile.</td>
</tr>
<tr>
<td>Flags</td>
<td>The Flags class represents the set of flags on a Message.</td>
</tr>
<tr>
<td>Flags.Flag</td>
<td>This inner class represents an individual system flag.</td>
</tr>
<tr>
<td>Folder</td>
<td>Folder is an abstract class that represents a folder for mail messages.</td>
</tr>
<tr>
<td>Header</td>
<td>The Header class stores a name/value pair to represent headers.</td>
</tr>
<tr>
<td>Message</td>
<td>This class models an email message.</td>
</tr>
<tr>
<td>Message.RecipientType</td>
<td>This inner class defines the types of recipients allowed by the Message class.</td>
</tr>
<tr>
<td>MessageContext</td>
<td>The context in which a piece of Message content is contained.</td>
</tr>
<tr>
<td>Multipart</td>
<td>Multipart is a container that holds multiple body parts.</td>
</tr>
<tr>
<td>PasswordAuthentication</td>
<td>The class PasswordAuthentication is a data holder that is used by Authenticator.</td>
</tr>
<tr>
<td>Provider</td>
<td>The Provider is a class that describes a protocol implementation.</td>
</tr>
<tr>
<td>Provider.Type</td>
<td>This inner class defines the Provider type.</td>
</tr>
<tr>
<td>Quota</td>
<td>This class represents a set of quotas for a given quota root.</td>
</tr>
<tr>
<td>Quota.Resource</td>
<td>An individual resource in a quota root.</td>
</tr>
<tr>
<td>Service</td>
<td>An abstract class that contains the functionality common to messaging services, such as stores and transports.</td>
</tr>
<tr>
<td>Session</td>
<td>The Session class represents a mail session and is not subclassed.</td>
</tr>
<tr>
<td><strong>Store</strong></td>
<td>An abstract class that models a message store and its access protocol, for storing and retrieving messages.</td>
</tr>
<tr>
<td>------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Transport</strong></td>
<td>An abstract class that models a message transport.</td>
</tr>
<tr>
<td><strong>UIDFolder.FetchProfileItem</strong></td>
<td>A fetch profile item for fetching UIDs.</td>
</tr>
<tr>
<td><strong>URLName</strong></td>
<td>The name of a URL.</td>
</tr>
</tbody>
</table>

### Exception Summary

<td>This exception is thrown when an attempt is made to open a folder read-write access when the folder is marked read-only.</td>
</tr>
<tr>
<td><strong>SendFailedException</strong></td>
<td>This exception is thrown when the message cannot be sent.</td>
</tr>
<tr>
<td><strong>StoreClosedException</strong></td>
<td>This exception is thrown when a method is invoked on a Messaging object and the Store that owns that object has died due to some reason.</td>
</tr>
</tbody>
</table>
The JavaMail™ API provides classes that model a mail system. The javax.mail package defines classes that are common to all mail systems. The javax.mail.internet package defines classes that are specific to mail systems based on internet standards such as MIME, SMTP, POP3, and IMAP. The JavaMail API includes the javax.mail package and subpackages.

For an overview of the JavaMail API, read the JavaMail specification [included in the download bundle](https://developers.jre.com/jre/downloads) or [available on the JavaMail web site](https://mail.on.java.com).

The code to send a plain text message can be as simple as the following:

```java
Properties props = new Properties();
props.put("mail.smtp.host", "my-mail-server");
props.put("mail.from", "me@example.com");
Session session = Session.getInstance(props, null);
try {
    MimeMessage msg = new MimeMessage(session);
    msg.setFrom();
    msg.setRecipients(Message.RecipientType.TO, "you@example.com");
    msg.setSubject("JavaMail hello world example");
    msg.setSentDate(new Date());
    msg.setText("Hello, world!\n");
    Transport.send(msg);
} catch (MessagingException mex) {
    System.out.println("send failed, exception: " + mex);
}
```

The JavaMail download bundle contains many more complete examples in the "demo" directory.

Don't forget to see the JavaMail API FAQ for answers to the most common questions. The JavaMail web site contains many additional resources.

The JavaMail API supports the following standard properties, which may be set in the Session object, or in the Properties object used to create the Session object. The properties are always set as strings; the Type column
describes how the string is interpreted. For example, use

```java
props.put("mail.debug", "true");
```

to set the `mail.debug` property, which is of type boolean.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mail.debug</td>
<td>boolean</td>
<td>The initial debug mode. Default is false.</td>
</tr>
<tr>
<td>mail.from</td>
<td>String</td>
<td>The return email address of the current user, used by the <code>InternetAddress</code> method <code>getLocalAddress</code>.</td>
</tr>
<tr>
<td>mail.mime.address.strict</td>
<td>boolean</td>
<td>The MimeMessage class uses the <code>InternetAddress</code> method <code>parseHeader</code> to parse headers in messages. This property controls the strict flag passed to the <code>parseHeader</code> method. The default is true.</td>
</tr>
<tr>
<td>mail.host</td>
<td>String</td>
<td>The default host name of the mail server for both Stores and Transports. Used if the <code>mail.protocol.host</code> property isn't set.</td>
</tr>
<tr>
<td>mail.store.protocol</td>
<td>String</td>
<td>Specifies the default message access protocol. The <code>Session</code> method <code>getStore()</code> returns a Store object that implements this protocol. By default the first Store provider in the configuration files is returned.</td>
</tr>
<tr>
<td>mail.transport.protocol</td>
<td>String</td>
<td>Specifies the default message access protocol. The <code>Session</code> method <code>getTransport()</code> returns a Transport object that implements this protocol. By default the first Transport provider in the configuration files is returned.</td>
</tr>
<tr>
<td>mail.user</td>
<td>String</td>
<td>The default user name to use when connecting to the mail server. Used if</td>
</tr>
</tbody>
</table>
The mail.protocol.user property isn't set.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mail.protocol.class</td>
<td>String</td>
<td>Specifies the fully qualified class name of the provider for the specified protocol. Used in cases where more than one provider for a given protocol exists; this property can be used to specify which provider to use by default. The provider must still be listed in a configuration file.</td>
</tr>
<tr>
<td>mail.protocol.host</td>
<td>String</td>
<td>The host name of the mail server for the specified protocol. Overrides the mail.host property.</td>
</tr>
<tr>
<td>mail.protocol.port</td>
<td>int</td>
<td>The port number of the mail server for the specified protocol. If not specified the protocol's default port number is used.</td>
</tr>
<tr>
<td>mail.protocol.user</td>
<td>String</td>
<td>The user name to use when connecting to mail servers using the specified protocol. Overrides the mail.user property.</td>
</tr>
</tbody>
</table>

The JavaMail API also supports several System properties; see the javax.mail.internet package documentation for details.

The JavaMail reference implementation from Sun includes protocol providers in subpackages of com.sun.mail. Note that the APIs to these protocol providers are not part of the standard JavaMail API. Portable programs will not use these APIs.

Nonportable programs may use the APIs of the Sun protocol providers by (for example) casting a returned Folder object to a com.sun.mail.imap.IMAPFolder object. Similarly for Store and Message objects returned from the standard JavaMail APIs.

The Sun protocol providers also support properties that are specific to those providers. The package documentation for the IMAP, POP3, and SMTP packages provide details.

Package javax.mail.internet

Classes specific to Internet mail systems.

See: Description

### Interface Summary

<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MimePart</td>
<td>The MimePart interface models an Entity as defined by MIME (RFC2045, Section 2.4).</td>
</tr>
<tr>
<td>SharedInputStream</td>
<td>An InputStream that is backed by data that can be shared by multiple readers may implement this interface.</td>
</tr>
</tbody>
</table>

### Class Summary

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContentDisposition</td>
<td>This class represents a MIME ContentDisposition value.</td>
</tr>
<tr>
<td>ContentType</td>
<td>This class represents a MIME ContentType value.</td>
</tr>
<tr>
<td>HeaderTokenizer</td>
<td>This class tokenizes RFC822 and MIME headers into the basic symbols specified by RFC822 and MIME.</td>
</tr>
<tr>
<td>HeaderTokenizer.Token</td>
<td>The Token class represents tokens returned by the HeaderTokenizer.</td>
</tr>
<tr>
<td>InternetAddress</td>
<td>This class represents an Internet email address using the syntax of RFC822.</td>
</tr>
<tr>
<td>InternetHeaders</td>
<td>InternetHeaders is a utility class that manages RFC822 style headers.</td>
</tr>
<tr>
<td>InternetHeaders.InternetHeader</td>
<td>An individual internet header.</td>
</tr>
<tr>
<td>MailDateFormat</td>
<td>Formats and parses date specification based on the draft-ietf-drums-msg-fmt-08 dated January 26,</td>

<tr>
<td>MimeBodyPart</td>
<td>This class represents a MIME body part.</td>
</tr>
<tr>
<td>MimeMessage</td>
<td>This class represents a MIME style email message.</td>
</tr>
<tr>
<td>MimeMessage.RecipientType</td>
<td>This inner class extends the javax.mail.Message.RecipientType class to add additional RecipientTypes.</td>
</tr>
<tr>
<td>MimeMultipart</td>
<td>The MimeMultipart class is an implementation of the abstract Multipart class that uses MIME conventions for the multipart data.</td>
</tr>
<tr>
<td>MimePartDataSource</td>
<td>A utility class that implements a DataSource out of a MimePart.</td>
</tr>
<tr>
<td>MimeUtility</td>
<td>This is a utility class that provides various MIME related functionality.</td>
</tr>
<tr>
<td>NewsAddress</td>
<td>This class models an RFC1036 newsgroup address.</td>
</tr>
<tr>
<td>ParameterList</td>
<td>This class holds MIME parameters (attribute-value pairs).</td>
</tr>
<tr>
<td>PreencodedMimeBodyPart</td>
<td>A MimeBodyPart that handles data that has already been encoded.</td>
</tr>
</tbody>
</table>

### Exception Summary

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AddressException</td>
<td>The exception thrown when a wrongly formatted address is encountered.</td>
</tr>
<tr>
<td>ParseException</td>
<td>The exception thrown due to an error in parsing RFC822 or MIME headers.</td>
</tr>
</tbody>
</table>
Classes specific to Internet mail systems. This package supports features that are specific to Internet mail systems based on the MIME standard (RFC 2045, RFC 2046, and RFC 2047). The IMAP, SMTP, and POP3 protocols use MimeMessages.

The JavaMail API specification requires support for the following properties, which must be set in the system properties. The properties are always set as strings; the Type column describes how the string is interpreted. For example, use (in J2SE 1.2 and newer)

```
System.setProperty("mail.mime.address.strict", "false");
```
to set the mail.mime.address.strict property, which is of type boolean.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mail.mime.address.strict</td>
<td>boolean</td>
<td>The mail.mime.address.strict controls the parsing of address headers. The default, strict parsing of address headers is done. If this property is set to &quot;false&quot;, parsing is not done and many addresses that sometimes occur in real messages are allowed. See the InternetAddress details.</td>
</tr>
<tr>
<td>mail.mime.charset</td>
<td>String</td>
<td>The mail.mime.charset System property can be used to specify the default MIME charset to use for encoded words and text parts that do not otherwise specify a charset. The default MIME charset is derived from the default Java charset, as specified in file.encoding System property. Applications will have no need to specify the default MIME charset. In cases where the default MIME charset to be used for mail messages is different than the default for files stored on the system, this property should be set.</td>
</tr>
</tbody>
</table>
### mail.mime.decodetext.strict

**Type:** boolean  
**Default:** true

The `mail.mime.decodetext.strict` property controls decoding of MIME encoded words. The MIME spec requires that encoded words start at the beginning of a whitespace-separated word. Some mailers may incorrectly include encoded words in the middle of a word. If the `mail.mime.decodetext.strict` property is set to "false", an attempt will be made to decode these illegal encoded words. The default is true.

### mail.mime.encodeeol.strict

**Type:** boolean  
**Default:** false

The `mail.mime.encodeeol.strict` property controls the choice of Content-Transfer-Encoding for MIME parts that are not of type "text". Often such parts will contain textual data for which an encoding that allows normal end-of-line conventions is appropriate, but such a part will appear to contain only textual data, but will require an encoding that preserves CR and LF characters without change. If the `mail.mime.encodeeol.strict` System property is set to "true", the appropriate encoding will be used when necessary. The default is false.

### mail.mime.decodefilename

**Type:** boolean  
**Default:** false

If set to "true", the `getFileName` method of the MimeUtility method decodes any non-ASCII characters in the filename that this decoding violates the MIME specification, but is useful for interoperating with some mail clients that use this convention. The default is false.

### mail.mime.encodefilename

**Type:** boolean  
**Default:** false

If set to "true", the `setFileName` method of the MimeUtility method encodes any non-ASCII characters in the filename that this encoding violates the MIME specification, but is useful for interoperating with some mail clients that use this convention. The default is false.
mail.mime.decodeparameters  boolean  If set to "true", non-ASCII parameters in a ParameterList, e.g., in a Content-Type header, will be encoded as specified by default is false.

mail.mime.encodeparameters  boolean  If set to "true", non-ASCII parameters in a ParameterList, e.g., in a Content-Type header, will be decoded as specified by default is false.

mail.mime.multipart.ignoremissingendboundary  boolean  Normally, when parsing a multipart message, a message that is missing the final end boundary line is not considered an error. The data simply ends at the end boundary line. Note that messages of this form violate the MIME specification. If the property mail.mime.multipart.ignoremissingendboundary is set to false, such messages are considered an error and a MessagingException will be thrown when parsing such a message.

mail.mime.multipart.ignoremissingboundaryparameter  boolean  If the Content-Type header for a multipart content does not have a boundary parameter, the multipart parsing code will find the first line in the content that looks like a boundary line and extract the boundary parameter from the line. If this property is set to true, a MessagingException will be thrown if the Content-Type header doesn't contain a boundary parameter. The default is false.

The following properties are supported by Sun's implementation of JavaMail, but are not currently a required part of the specification. As above, these must be set as System properties. The names, types, defaults, and semantics of these properties may change in future releases.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mail.mime.decodetextoptions</td>
<td></td>
<td>If set to &quot;true&quot;, the BASE64 decoder will ignore errors in Base64 encoding</td>
</tr>
<tr>
<td>mail.mime.encoderoptions</td>
<td></td>
<td>If set to &quot;true&quot;, the encoder will not encode non-ASCII characters</td>
</tr>
<tr>
<td>mail.mime.multipart.ignoremissingendboundary</td>
<td></td>
<td>If set to false, multipart messages that are missing the final end boundary line are considered an error</td>
</tr>
<tr>
<td>mail.mime.multipart.ignoremissingboundaryparameter</td>
<td></td>
<td>If set to false, multipart messages that lack a boundary parameter are considered an error</td>
</tr>
<tr>
<td>mail.mime.multipart.ignoremissingtextoptions</td>
<td></td>
<td>If set to false, multipart messages that are missing the final text boundary line are considered an error</td>
</tr>
</tbody>
</table>

The following properties are supported by Sun's implementation of JavaMail, but are not currently a required part of the specification. As above, these must be set as System properties. The names, types, defaults, and semantics of these properties may change in future releases.
<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mail.mime.base64.ignoreerrors</td>
<td>boolean</td>
<td>The encoded data, returning EOF. This may be useful when dealing with improperly encoded messages that contain extraneous data at the end of the encoded stream. Note however that errors anywhere in the stream will cause the decoder to stop decoding so this should be used with extreme caution. The default is false.</td>
</tr>
<tr>
<td>mail.mime.foldtext</td>
<td>boolean</td>
<td>If set to &quot;true&quot;, header fields containing just text such as the Subject and Content-Description header fields, and long parameter values in structured headers such as Content-Type will be folded (broken into 76 character lines) when set and unfolded when read. The default is true.</td>
</tr>
<tr>
<td>mail.mime.setcontenttypefilename</td>
<td>boolean</td>
<td>If set to &quot;true&quot;, the setFileName method will also set the name parameter on the Content-Type header to the specified filename. This supports interoperability with some old mail clients. The default is true.</td>
</tr>
<tr>
<td>mail.mime.setdefaulttextcharset</td>
<td>boolean</td>
<td>When updating the headers of a message, a body part with a text content type but no charset parameter will have a charset parameter.</td>
</tr>
<tr>
<td>Property</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>mail.mime.applefilenames</td>
<td>boolean</td>
<td>Apple Mail incorrectly encodes filenames that contain spaces, forgetting to quote the parameter value. If this property is set to &quot;true&quot;, JavaMail will try to detect this situation when parsing parameters and work around it. The default is false.</td>
</tr>
<tr>
<td>mail.alternates</td>
<td>String</td>
<td>A string containing other email addresses that the current user is known by. The MimeMessage reply method will eliminate any of these addresses from the recipient list in the message it constructs, to avoid sending the reply back to the sender.</td>
</tr>
<tr>
<td>mail.replyallcc</td>
<td>boolean</td>
<td>If set to &quot;true&quot;, the MimeMessage reply method will put all recipients except the original sender in the cc list of the newly constructed message. Normally, recipients in the To header of the original message will also appear in the To list of the newly constructed message.</td>
</tr>
</tbody>

</table>
Package javax.el Description

Provides the API for the **Unified Expression Language** shared by the JSP 2.1 and JSF 1.2 technologies.

The Expression Language (EL) is a simple language designed to satisfy the specific needs of web application developers. It is currently defined in its own specification document within the JavaServer Pages (tm) (JSP) 2.1 specification, but does not have any dependencies on any portion of the JSP 2.1 specification. It is intended for general use outside of the JSP and JSF specifications as well.

This package contains the classes and interfaces that describe and define the programmatic access to the Expression Language engine. The API is logically partitioned as follows:

- EL Context
- Expression Objects
- Creation of Expressions
- Resolution of Model Objects and their Properties
- EL Functions
- EL Variables

**EL Context**

An important goal of the EL is to ensure it can be used in a variety of environments. It must therefore provide enough flexibility to adapt to the specific requirements of the environment where it is being used.

Class **ELContext** is what links the EL with the specific environment where it is being used. It provides the mechanism through which all relevant context for creating or evaluating an expression is specified.

Creation of **ELContext** objects is controlled through the underlying technology. For example, in JSP, the `JspContext.getELContext()` factory method is used.

Some technologies provide the ability to add an **ELContextListener** so
that applications and frameworks can ensure their own context objects are attached to any newly created ELContext.

Expression Objects

At the core of the Expression Language is the notion of an expression that gets parsed according to the grammar defined by the Expression Language.

There are two types of expressions defined by the EL: value expressions and method expressions. A ValueExpression such as "${customer.name}" can be used either as an rvalue (return the value associated with property name of the model object customer) or as an lvalue (set the value of the property name of the model object customer).

A MethodExpression such as "${handler.process}" makes it possible to invoke a method (process) on a specific model object (handler).

All expression classes extend the base class Expression, making them serializable and forcing them to implement equals() and hashCode(). Moreover, each method on these expression classes that actually evaluates an expression receives a parameter of class ELContext, which provides the context required to evaluate the expression.

Creation of Expressions

An expression is created through the ExpressionFactory class. The factory provides two creation methods; one for each type of expression supported by the EL.

To create an expression, one must provide an ELContext, a string representing the expression, and the expected type (ValueExpression) or signature (MethodExpression). The ELContext provides the context necessary to parse an expression. Specifically, if the expression uses an EL function (for example ${fn:toUpperCase(customer.name)}) or an EL variable, then FunctionMapper and VariableMapper objects must be available within the ELContext so that EL functions and EL variables are properly mapped.
Resolution of Model Objects and their Properties

Through the `ELResolver` base class, the EL features a pluggable mechanism to resolve model object references as well as properties of these objects.

The EL API provides implementations of `ELResolver` supporting property resolution for common data types which include arrays (`ArrayELResolver`), JavaBeans (`BeanELResolver`), Lists (`ListELResolver`), Maps (`MapELResolver`), and Resource Bundles (`ResourceBundleELResolver`).

Tools can easily obtain more information about resolvable model objects and their resolvable properties by calling method `getFeatureDescriptors` on the `ELResolver`. This method exposes objects of type `java.beans.FeatureDescriptor`, providing all information of interest on top-level model objects as well as their properties.

EL Functions

If an EL expression uses a function (for example `${fn:toUpperCase(customer.name)}`), then a `FunctionMapper` object must also be specified within the ELContext. The `FunctionMapper` is responsible to map `${prefix:name()}` style functions to static methods that can execute the specified functions.

EL Variables

Just like `FunctionMapper` provides a flexible mechanism to add functions to the EL, `VariableMapper` provides a flexible mechanism to support the notion of EL variables.

An EL variable does not directly refer to a model object that can then be resolved by an `ELResolver`. Instead, it refers to an EL expression. The evaluation of that EL expression gives the EL variable its value.

For example, in the following code snippet

```xml
<h:inputText value="#{handler.customer.name}"/>
```
handler refers to a model object that can be resolved by an EL Resolver.

However, in this other example:

```xml
<c:forEach var="item" items="#{model.list}"
    <h:inputText value="#{item.name}"/>
</c:forEach>
```

`item` is an EL variable because it does not refer directly to a model object. Instead, it refers to another EL expression, namely a specific item in the collection referred to by the EL expression `#{model.list}`.

Assuming that there are three elements in `#{model.list}`, this means that for each invocation of `<h:inputText>`, the following information about `item` must be preserved in the `VariableMapper`:

- first invocation: `item` maps to first element in `#{model.list}`
- second invocation: `item` maps to second element in `#{model.list}`
- third invocation: `item` maps to third element in `#{model.list}`

`VariableMapper` provides the mechanisms required to allow the mapping of an EL variable to the EL expression from which it gets its value.

</tr>
</tbody>
</table>

## Exception Summary

<p>| <strong>EntityExistsException</strong> | Thrown by the persistence provider when <code>EntityManager.persist(Object)</code> is called and the entity already exists. |
| <strong>EntityNotFoundException</strong> | Thrown by the persistence provider when an entity reference obtained by <code>EntityManager.getReference(Class, Object)</code> is accessed but the entity does not exist. |
| <strong>NonUniqueResultException</strong> | Thrown by the persistence provider when <code>getSingleResult()</code> is executed on a query and there is more than one result from the query. |
| <strong>NoResultException</strong> | Thrown by the persistence provider when <code>getSingleResult()</code> is executed on a query and there is no result to return. |
| <strong>OptimisticLockException</strong> | Thrown by the persistence provider when an optimistic locking conflict occurs. |
| <strong>PersistenceException</strong> | Thrown by the persistence provider when a problem occurs. |
| <strong>RollbackException</strong> | Thrown by the persistence provider when the <code>EntityTransaction.commit()</code> fails. |</p>
<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>TransactionRequiredException</strong></td>
<td>Thrown by the persistence provider when a transaction is required but is not active.</td>
</tr>
<tr>
<td><strong>AssociationOverride</strong></td>
<td>This annotation is used to override a many-to-one or one-to-one mapping of property or field for an entity relationship.</td>
</tr>
<tr>
<td><strong>AssociationOverrides</strong></td>
<td>This annotation is used to override mappings of multiple many-to-one or one-to-one relationship properties or fields.</td>
</tr>
<tr>
<td><strong>AttributeOverride</strong></td>
<td>The <strong>AttributeOverride</strong> annotation is used to override the mapping of a <strong>Basic</strong> (whether explicit or default) property or field or <strong>Id</strong> property or field.</td>
</tr>
<tr>
<td><strong>AttributeOverrides</strong></td>
<td>Is used to override mappings of multiple properties or fields.</td>
</tr>
<tr>
<td><strong>Basic</strong></td>
<td>The <strong>Basic</strong> annotation is the simplest type of mapping to a database column.</td>
</tr>
<tr>
<td><strong>Column</strong></td>
<td>Is used to specify a mapped column for a persistent property or field.</td>
</tr>
<tr>
<td><strong>ColumnResult</strong></td>
<td>References name of a column in the SELECT clause of a SQL query - i.e., column alias, if applicable.</td>
</tr>
<tr>
<td><strong>DiscriminatorColumn</strong></td>
<td>Is used to define the discriminator column for the <strong>SINGLE_TABLE</strong> and <strong>JOINED</strong> inheritance mapping strategies.</td>
</tr>
<tr>
<td><strong>DiscriminatorValue</strong></td>
<td>Is used to specify the value of the discriminator column for entities of the given type.</td>
</tr>
<tr>
<td><strong>Embeddable</strong></td>
<td>Defines a class whose instances are stored as an intrinsic part of an owning entity and share the identity of the entity.</td>
</tr>
<tr>
<td><strong>Embedded</strong></td>
<td>Defines a persistent field or property of an entity whose value is an instance of an embeddable class.</td>
</tr>
<tr>
<td><strong>EmbeddedId</strong></td>
<td>Is applied to a persistent field or property of an entity class or mapped superclass to denote a composite primary key that is an embeddable class.</td>
</tr>
<tr>
<td><strong>Entity</strong></td>
<td>Specifies that the class is an entity.</td>
</tr>
<tr>
<td><strong>EntityListeners</strong></td>
<td>Specifies the callback listener classes to be used for an entity or mapped superclass.</td>
</tr>
<tr>
<td><strong>EntityResult</strong></td>
<td>References an entity in the SELECT clause of a SQL query.</td>
</tr>
<tr>
<td><strong>Enumerated</strong></td>
<td>Specifies that a persistent property or field should be persisted as a enumerated type.</td>
</tr>
<tr>
<td><strong>ExcludeDefaultListeners</strong></td>
<td>Specifies that the invocation of default listeners is to be excluded for the entity class (or mapped superclass) and its subclasses.</td>
</tr>
<tr>
<td><strong>ExcludeSuperclassListeners</strong></td>
<td>Specifies that the invocation of superclass listeners is to be excluded for the entity class (or mapped superclass) and its subclasses.</td>
</tr>
<tr>
<td><strong>FieldResult</strong></td>
<td>Is used to map the columns specified in the SELECT list of the query to the properties or fields of the entity class.</td>
</tr>
<tr>
<td><strong>GeneratedValue</strong></td>
<td>Provides for the specification of generation strategies for the values of primary keys.</td>
</tr>
<tr>
<td><strong>Id</strong></td>
<td>Specifies the primary key property or field of an entity.</td>

</tr>
</tbody>
</table>
Package javax.xml.bind.attachment Description

This package is implemented by a MIME-based package processor that enables the interpretation and creation of optimized binary data within an MIME-based package format.

Soap MTOM[1], XOP([2][3]) and WS-I AP[4] standardize approaches to optimized transmission of binary datatypes as an attachment. To optimally support these standards within a message passing environment, this package enables an integrated solution between a MIME-based package processor and JAXB unmarshall/marshal processes.
Package Specification

</tbody>
</table>
Package javax.xml.soap Description

Provides the API for creating and building SOAP messages. This package is defined in the SOAP with Attachments API for Java™ (SAAJ) 1.3 specification.

The API in the javax.xml.soap package allows you to do the following:

- create a point-to-point connection to a specified endpoint
- create a SOAP message
- create an XML fragment
- add content to the header of a SOAP message
- add content to the body of a SOAP message
- create attachment parts and add content to them
- access/add/modify parts of a SOAP message
- create/add/modify SOAP fault information
- extract content from a SOAP message
- send a SOAP request-response message

In addition the APIs in the javax.xml.soap package extend their counterparts in the org.w3c.dom package. This means that the SOAPPart of a SOAPMessage is also a DOM Level 2 Document, and can be manipulated as such by applications, tools and libraries that use DOM (see http://www.w3.org/DOM/ for more information). It is important to note that, while it is possible to use DOM APIs to add ordinary DOM nodes to a SAAJ tree, the SAAJ APIs are still required to return SAAJ types when examining or manipulating the tree. In order to accomplish this the SAAJ APIs (specifically SOAPElement.getChildElements()) are allowed to silently replace objects that are incorrectly typed relative to SAAJ requirements with equivalent objects of the required type. These replacements must never cause the logical structure of the tree to change, so from the perspective of the DOM APIs the tree will remain unchanged. However, the physical composition of the tree will have changed so that references to the nodes that were replaced will refer to nodes that are no longer a part of the tree. The SAAJ APIs are not allowed to make these replacements if they are not required so the replacement objects will never subsequently be silently replaced by future calls to the SAAJ API.
What this means in practical terms is that an application that starts to use SAAJ APIs on a tree after manipulating it using DOM APIs must assume that the tree has been translated into an all SAAJ tree and that any references to objects within the tree that were obtained using DOM APIs are no longer valid. Switching from SAAJ APIs to DOM APIs is not allowed to cause invalid references and neither is using SAAJ APIs exclusively. It is only switching from using DOM APIs on a particular SAAJ tree to using SAAJ APIs that causes the risk of invalid references.

# Interface Summary

<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Attribute</strong></td>
<td>An interface that contains information about an attribute.</td>
</tr>
<tr>
<td><strong>Characters</strong></td>
<td>This describes the interface to Characters events.</td>
</tr>
<tr>
<td><strong>Comment</strong></td>
<td>An interface for comment events</td>
</tr>
<tr>
<td><strong>DTD</strong></td>
<td>This is the top level interface for events dealing with DTDs</td>
</tr>
<tr>
<td><strong>EndDocument</strong></td>
<td>A marker interface for the end of the document</td>
</tr>
<tr>
<td><strong>EndElement</strong></td>
<td>An interface for the end element event</td>
</tr>
<tr>
<td><strong>EntityDeclaration</strong></td>
<td>An interface for handling Entity Declarations</td>
</tr>
<tr>
<td></td>
<td>This interface is used to record and report unparsed entity declarations.</td>
</tr>
<tr>
<td><strong>EntityReference</strong></td>
<td>An interface for handling Entity events</td>
</tr>
<tr>
<td><strong>Namespace</strong></td>
<td>An interface that contains information about a namespace.</td>
</tr>
<tr>
<td><strong>NotationDeclaration</strong></td>
<td>An interface for handling Notation Declarations</td>
</tr>
<tr>
<td></td>
<td>Receive notification of a notation declaration event.</td>
</tr>
<tr>
<td><strong>ProcessingInstruction</strong></td>
<td>An interface that describes the data found in processing instructions</td>
</tr>
<tr>
<td><strong>StartDocument</strong></td>
<td>An interface for the start document event</td>
</tr>
<tr>
<td><strong>StartElement</strong></td>
<td>The StartElement interface provides access to information about start elements.</td>
</tr>
<tr>
<td><strong>XMLEvent</strong></td>
<td>This is the base event interface for handling markup events.</td>
</tr>

Package javax.xml.bind

Provides a runtime binding framework for client applications including unmarshalling, marshalling, and validation capabilities.

See: Description

### Interface Summary

<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DatatypeConverterInterface</td>
<td>The DatatypeConverterInterface is for JAXB provider use only.</td>
</tr>
<tr>
<td>Element</td>
<td>This is an element marker interface.</td>
</tr>
<tr>
<td>Marshaller</td>
<td>The Marshaller class is responsible for governing the process of serializing Java content trees back into XML data.</td>
</tr>
<tr>
<td>NotIdentifiableEvent</td>
<td>This event indicates that a problem was encountered resolving an ID/IDREF.</td>
</tr>
<tr>
<td>ParseConversionEvent</td>
<td>This event indicates that a problem was encountered while converting a string from the XML data into a value of the target Java data type.</td>
</tr>
<tr>
<td>PrintConversionEvent</td>
<td>This event indicates that a problem was encountered while converting data from the Java content tree into its lexical representation.</td>
</tr>
<tr>
<td>Unmarshaller</td>
<td>The Unmarshaller class governs the process of deserializing XML data into newly created Java content trees, optionally validating the XML data as it is unmarshalled.</td>
</tr>
<tr>
<td>UnmarshallerHandler</td>
<td>Unmarshaller implemented as SAX ContentHandler.</td>
</tr>
<tr>
<td></td>
<td>This event indicates that a problem was encountered while validating the incoming XML data during an unmarshal operation,</td>
</tr>
</tbody>
</table>
### ValidationEvent
while performing on-demand validation of the Java content tree, or while marshalling the Java content tree back to XML data.

### ValidationEventHandler
A basic event handler interface for validation errors.

### ValidationEventLocator
Encapsulate the location of a ValidationEvent.

### Validator
**Deprecated. since JAXB 2.0**

---

## Class Summary

<table>

Package `javax.servlet.jsp.tagext`

Classes and interfaces for the definition of JavaServer Pages Tag Libraries.

See: [Description](#)

### Interface Summary

<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>BodyTag</strong></td>
<td>The BodyTag interface extends IterationTag by defining additional methods that let a tag handler manipulate the content of evaluating its body.</td>
</tr>
<tr>
<td><strong>DynamicAttributes</strong></td>
<td>For a tag to declare that it accepts dynamic attributes, it must implement this interface.</td>
</tr>
<tr>
<td><strong>IterationTag</strong></td>
<td>The IterationTag interface extends Tag by defining one additional method that controls the reevaluation of its body.</td>
</tr>
<tr>
<td><strong>JspIdConsumer</strong></td>
<td>This interface indicates to the container that a tag handler wishes to be provided with a compiler generated ID.</td>
</tr>
<tr>
<td><strong>JspTag</strong></td>
<td>Serves as a base class for Tag and SimpleTag.</td>
</tr>
<tr>
<td><strong>SimpleTag</strong></td>
<td>Interface for defining Simple Tag Handlers.</td>
</tr>
<tr>
<td><strong>Tag</strong></td>
<td>The interface of a classic tag handler that does not want to manipulate its body.</td>
</tr>
<tr>
<td><strong>TryCatchFinally</strong></td>
<td>The auxiliary interface of a Tag, IterationTag or BodyTag tag handler that wants additional hooks for managing resources.</td>
</tr>
</tbody>
</table>

### Class Summary

<table>

Package javax.servlet.jsp.tagext Description

Classes and interfaces for the definition of JavaServer Pages Tag Libraries.

Custom actions can be used by JSP authors and authoring tools to simplify writing JSP pages. A custom action can be either an empty or a non-empty action.

An empty tag has no body. There are two equivalent syntaxes, one with separate start and end tags, and one where the start and end tags are combined. The two following examples are identical:

```xml
<x:foo att="myObject"></foo>
<x:foo att="myObject"/>
```

A non-empty tag has a start tag, a body, and an end tag. A prototypical example is of the form:

```xml
<x:foo att="myObject">
    BODY
</x:foo/>
```

The JavaServer Pages(tm) (JSP) specification provides a portable mechanism for the description of tag libraries.

A JSP tag library contains

- A Tag Library Descriptor
- A number of Tag Files or Tag handler classes defining request-time behavior
- Additional classes and resources used at runtime
- Possibly some additional classes to provide extra translation information

This API is described in the following sections:

1. Classic Tag Handlers
2. Tag Handlers that want to access their Body Content
3. Dynamic Attributes
4. Annotated Tag Handler Management Example
5. Cooperating Actions
6. Simple Tag Handlers
7. JSP Fragments
8. Example Simple Tag Handler Scenario
9. Translation-time Classes
1. Classic Tag Handlers

This section introduces the notion of a tag handler and describes the classic types of tag handler.

JSP 2.0 introduces a new type of Tag Handler called a Simple Tag Handler, which is described in a later section. The protocol for Simple Tag handlers is much more straightforward.

Tag Handler

A tag handler is a run-time, container-managed object that evaluates custom actions during the execution of a JSP page. A tag handler supports a protocol that allows the JSP container to provide good integration of the server-side actions within a JSP page.

A tag handler is created initially using a zero argument constructor on its corresponding class; the method `java.beans.Beans.instantiate()` is not used.

A tag handler has some properties that are exposed to the page as attributes on an action; these properties are managed by the JSP container (via generated code). The setter methods used to set the properties are discovered using the JavaBeans introspector machinery.

The protocol supported by a tag handler provides for passing of parameters, the evaluation and reevaluation of the body of the action, and for getting access to objects and other tag handlers in the JSP page.

A tag handler instance is responsible for processing one request at a time. It is the responsibility of the JSP container to enforce this.

Additional translation time information associated with the action indicates the name of any scripting variables it may introduce, their types and their scope. At specific moments, the JSP container will automatically synchronize the `PageContext` information with variables in the scripting language so they can be made available directly through the scripting elements.
Properties

A tag handler has some properties. All tag handlers have a `pageContext` property for the JSP page where the tag is located, and a `parent` property for the tag handler to the closest enclosing action. Specific tag handler classes may have additional properties.

All attributes of a custom action must be JavaBeans component properties, although some properties may not be exposed as attributes. The attributes that are visible to the JSP translator are exactly those listed in the Tag Library Descriptor (TLD).

All properties of a tag handler instance exposed as attributes will be initialized by the container using the appropriate setter methods before the instance can be used to perform the action methods. It is the responsibility of the JSP container to invoke the appropriate setter methods to initialize these properties. It is the responsibility of user code, be it scriptlets, JavaBeans code, or code inside custom tags, to not invoke these setter methods, as doing otherwise would interfere with the container knowledge.

The setter methods that should be used when assigning a value to an attribute of a custom action are determined by using the JavaBeans introspector on the tag handler class, then use the setter method associated with the property that has the same name as the attribute in question. An implication (unclear in the JavaBeans specification) is that there is only one setter per property.

Unspecified attributes/properties should not be set (using a setter method).

Once properly set, all properties are expected to be persistent, so that if the JSP container ascertains that a property has already been set on a given tag handler instance, it must not set it again.

The JSP container may reuse classic tag handler instances for multiple occurrences of the corresponding custom action, in the same page or in different pages, but only if the same set of attributes are used for all occurrences. If a tag handler is used for more than one occurrence, the
container must reset all attributes where the values differ between the custom action occurrences. Attributes with the same value in all occurrences must not be reset. If an attribute value is set as a request-time attribute value (using a scripting or an EL expression), the container must reset the attribute between all reuses of the tag handler instance.

User code can access property information and access and modify tag handler internal state starting with the first action method (doStartTag) up until the last action method (doEndTag or doFinally for tag handlers implementing TryCatchFinally).

**Tag Handler as a Container-Managed Object**

Since a tag handler is a container managed object, the container needs to maintain its references; specifically, user code should not keep references to a tag handler except between the start of the first action method (doStartTag()) and the end of the last action method (doEndTag() or doFinally() for those tags that implement TryCatchFinally).

The restrictions on references to tag handler objects and on modifying attribute properties gives the JSP container substantial freedom in effectively managing tag handler objects to achieve different goals. For example, a container may implementing different pooling strategies to minimize creation cost, or may hoist setting of properties to reduce cost when a tag handler is inside another iterative tag.

**Conversions**

A tag handler implements an action; the JSP container must follow the type conversions described in Section 2.13.2 when assigning values to the attributes of an action.

**Empty and Non-Empty Actions**

An empty action has no body; it may use one of two syntaxes: either <foo/> or <foo/></foo>. Since empty actions have no body the methods related to body manipulation are not invoked. There is a mechanism in the Tag Library Descriptor to indicate that a tag can only be used to write empty actions; when used, non-empty actions using that tag will produce
a translation error.

A non-empty action has a body.

**The Tag Interface**

A Tag handler that does not want to process its body can implement just the Tag interface. A tag handler may not want to process its body because it is an empty tag or because the body is just to be "passed through".

The Tag interface includes methods to provide page context information to the Tag Handler instance, methods to handle the life-cycle of tag handlers, and two main methods for performing actions on a tag: `doStartTag()` and `doEndTag()`. The method `doStartTag()` is invoked when encountering the start tag and its return value indicates whether the body (if there is any) should be skipped, or evaluated and passed through to the current response stream. The method `doEndTag()` is invoked when encountering the end tag; its return value indicates whether the rest of the page should continue to be evaluated or not.

If an exception is encountered during the evaluation of the body of a tag, its `doEndTag` method will not be evaluated. See the TryCatchFinally tag for methods that are guaranteed to be evaluated.

**The IterationTag Interface**

The IterationTag interface is used to repeatedly reevaluate the body of a custom action. The interface has one method: `doAfterBody()` which is invoked after each evaluation of the body to determine whether to reevaluate or not.

Reevaluation is requested with the value 2, which in JSP 1.1 is defined to be `BodyTag.EVAL_BODY_TAG`. That constant value is still kept in JSP 1.2 (for full backwards compatibility) but, to improve clarity, a new name is also available: `IterationTag.EVAL_BODY_AGAIN`. To stop iterating, the returned value should be 0, which is `Tag.SKIP_BODY`.

**The JspIdConsumer Interface**
This interface indicates to the container that a tag handler wishes to be provided with a compiler generated ID that is unique within the page.

The **TagSupport Base Class**

The TagSupport class is a base class that can be used when implementing the Tag or IterationTag interfaces.
2. Tag Handlers that want Access to their Body Content

The evaluation of a body is delivered into a BodyContent object. This is then made available to tag handlers that implement the BodyTag interface. The BodyTagSupport class provides a useful base class to simplify writing these handlers.

If a Tag handler wants to have access to the content of its body then it must implement the BodyTag interface. This interface extends IterationTag, provides two additional methods setBodyContent(BodyContent) and doInitBody() and refers to an object of type BodyContent.

A BodyContent is a subclass of JspWriter that has a few additional methods to convert its contents into a String, insert the contents into another JspWriter, to get a Reader into its contents, and to clear the contents. Its semantics also assure that buffer size will never be exceeded.

The JSP page implementation will create a BodyContent if the doStartTag() method returns a EVAL_BODY_BUFFERED. This object will be passed to doInitBody(); then the body of the tag will be evaluated, and during that evaluation out will be bound to the BodyContent just passed to the BodyTag handler. Then doAfterBody() will be evaluated. If that method returns SKIP_BODY, no more evaluations of the body will be done; if the method returns EVAL_BODY_AGAIN, then the body will be evaluated, and doAfterBody() will be invoked again.

The content of a BodyContent instance remains available until after the invocation of its associated doEndTag() method.

A common use of the BodyContent is to extract its contents into a String and then use the String as a value for some operation. Another common use is to take its contents and push it into the out Stream that was valid when the start tag was encountered (that is available from the PageContext object passed to the handler in setPageContext).
3. Dynamic Attributes

Any tag handler can optionally extend the DynamicAttributes interface to indicate that it supports dynamic attributes. In addition to implementing the DynamicAttributes interface, tag handlers that support dynamic attributes must declare that they do so in the Tag Library Descriptor.

The TLD is what ultimately determines whether a tag handler accepts dynamic attributes or not. If a tag handler declares that it supports dynamic attributes in the TLD but it does not implement the DynamicAttributes interface, the tag handler must be considered invalid by the container.

If the dynamic-attributes element for a tag being invoked contains the value "true", the following requirements apply:

- For each attribute specified in the tag invocation that does not have a corresponding attribute element in the TLD for this tag, a call must be made to setDynamicAttribute(), passing in the namespace of the attribute (or null if the attribute does not have a namespace or prefix), the name of the attribute without the namespace prefix, and the final value of the attribute.
- Dynamic attributes must be considered to accept request-time expression values as well as deferred expressions.
- Dynamic attributes must be treated as though they were of type java.lang.Object. If a ValueExpression is passed as a dynamic attribute, the default value for the expected return type is assumed to be java.lang.Object. If a MethodExpression is passed as a dynamic attribute, the default method signature is assumed to be void method().
- Note that passing a String literal as a dynamic attribute will never be considered as a deferred expression.
- The JSP container must recognize dynamic attributes that are passed to the tag handler using the <jsp:attribute> standard action.
- If the setDynamicAttribute() method throws JspException, the doStartTag() or doTag() method is not invoked for this tag, and the exception must be treated in the same manner as if it came from a regular attribute setter method.
For a JSP document in either standard or XML syntax, if a dynamic attribute has a prefix that doesn't map to a namespace, a translation error must occur. In standard syntax, only namespaces defined using taglib directives are recognized.

In the following example, assume attributes a and b are declared using the attribute element in the TLD, attributes d1 and d2 are not declared, and the dynamic-attributes element is set to "true". The attributes are set using the calls:

- setA( "1" ),
- setDynamicAttribute( null, "d1", "2" ),
- setB( "4" ),
- setDynamicAttribute( null, "d3", "5" ), and

<jsp:root xmlns:mytag="http://www.foo.com/jsp/taglib/mytag.tld" version="2.0">
  <mytag:invokeDynamic a="1" d1="2" mytag:d2="3">
    <jsp:attribute name="b">4</jsp:attribute>
    <jsp:attribute name="d3">5</jsp:attribute>
    <jsp:attribute name="mytag:d4">6</jsp:attribute>
  </mytag:invokeDynamic>
</jsp:root>
4. Annotated Tag Handler Management Example

Below is a somewhat complete example of the way one JSP container could choose to do some tag handler management. There are many other strategies that could be followed, with different pay offs.

In this example, we are assuming that x:iterate is an iterative tag, while x:doit and x:foobar are simple tag. We will also assume that x:iterate and x:foobar implement the TryCatchFinally interface, while x:doit does not.

```xml
<x:iterate src="foo">
  <x:doit att1="one" att2="<%= 1 + 1 %>">
  </x:doit>
  <x:foobar />
  <x:doit att1="one" att2="<%= 2 + 2 %>">
  </x:doit>
</x:iterate>
<x:doit att1="one" att2="<%= 3 + 3 %>">
</x:doit>
```

The particular code shown below assumes there is some pool of tag handlers that are managed (details not described, although pool managing is simpler when there are no optional attributes), and attempts to reuse tag handlers if possible. The code also "hoists" setting of properties to reduce the cost when appropriate, e.g. inside an iteration.

```java
boolean b1, b2;
IterationTag i; // for x:iterate
Tag d; // for x:doit
Tag d; // for x:foobar

page: // label to end of page...

// initialize iteration tag
i = get tag from pool or new();

i.setPageContext(pc);
i.setParent(null);
i.setSrc("foo");

// x:iterate implements TryCatchFinally
try {
  if ((b1 = i.doStartTag()) == EVAL_BODY_INCLUDE) {
    // initialize doit tag
```
// code has been moved out of the loop for show
d = get tag from pool or new();

d.setPageContext(pc);
d.setParent(i);
d.setAtt1("one");

loop:
  while (1) do {
    // I'm ignoring newlines...

    // two invocations, fused together

    // first invocation of x:doit
d.setAtt2(1+1);
    if ((b2 = d.doStartTag()) == EVAL_BODY_INCLUDE) {
      // nothing
    } else if (b2 != SKIP_BODY) {
      // Q? protocol error ...
    }
  if ((b2 = d.doEndTag()) == SKIP_PAGE) {
      break page; // be done with it.
    } else if (b2 != EVAL_PAGE) {
      // Q? protocol error
    }

    // x:foobar invocation
f = get tag from pool or new();
f.setPageContext(pc);
f.setParent(i);

    // x:foobar implements TryCatchFinally
try {
  if ((b2 = f.doStartTag()) == EVAL_BODY_INCLUDE) {
    // nothing
  } else if (b2 != SKIP_BODY) {
    // Q? protocol error
  }
  if ((b2 = f.doEndTag()) == SKIP_PAGE) {
    break page; // be done with it.
  } else if (b2 != EVAL_PAGE) {
    // Q? protocol error
  }
} catch (Throwable t) {
  f.doCatch(t); // caught, may been rethrown!
} finally {
  f.doFinally();
}
// put f back to pool

// second invocation of x:doit
d.setAtt2(2+2);
if ((b2 = d.doStartTag()) == EVAL_BODY_INCLUDE) {
    // nothing
} else if (b2 != SKIP_BODY) {
    // Q? protocol error
}
if ((b2 = d.doEndTag()) == SKIP_PAGE) {
    break page; // be done with it.
} else if (b2 != EVAL_PAGE) {
    // Q? protocol error
}

if ((b2 = i.doAfterBody()) == EVAL_BODY_AGAIN) {
    break loop;
} else if (b2 != SKIP_BODY) {
    // Q? protocol error
}

// loop
}

} else if (b1 != SKIP_BODY) {
    // Q? protocol error
}

// tail end of the IteratorTag ...

if ((b1 = i.doEndTag()) == SKIP_PAGE) {
    break page; // be done with it.
} else if (b1 != EVAL_PAGE) {
    // Q? protocol error
}

// third invocation
// this tag handler could be reused from the previous ones.
d = get tag from pool or new();
d setPageContext(pc);
d.setParent(null);
d.setAtt1("one");
d.setAtt2(3+3);
if ((b1 = d.doStartTag()) == EVAL_BODY_INCLUDE) {
    // nothing
} else if (b1 != SKIP_BODY) {
    // Q? protocol error
if ((b1 = d.doEndTag()) == SKIP_PAGE) {
    break page; // be done with it.
} else if (b1 != EVAL_PAGE) {
    // Q? protocol error
}

catch (Throwable t) {
    i.doCatch(t); // caught, may been rethrown!
} finally {
    i.doFinally();
}
5. Cooperating Actions

Actions can cooperate with other actions and with scripting code in a number of ways.

PageContext

Often two actions in a JSP page will want to cooperate, perhaps by one action creating some server-side object that needs to be accessed by another. One mechanism for doing this is by giving the object a name within the JSP page; the first action will create the object and associate the name to it while the second action will use the name to retrieve the object.

For example, in the following JSP segment the foo action might create a server-side object and give it the name "myObject". Then the bar action might access that server-side object and take some action.

```xml
<x:foo id="myObject" />
<x:bar ref="myObject" />
```

In a JSP implementation, the mapping "name"->value is kept by the implicit object `pageContext`. This object is passed around through the Tag handler instances so it can be used to communicate information: all it is needed is to know the name under which the information is stored into the `pageContext`.

The Runtime Stack

An alternative to explicit communication of information through a named object is implicit coordination based on syntactic scoping.

For example, in the following JSP segment the foo action might create a server-side object; later the nested bar action might access that server-side object. The object is not named within the `pageContext`: it is found because the specific foo element is the closest enclosing instance of a known element type.
This functionality is supported through the
TagSupport.findAncestorWithClass(Tag, Class), which uses a reference
to parent tag kept by each Tag instance, which effectively provides a run-
time execution stack.
6. Simple Tag Handlers

This section presents the API to implement Simple Tag Handlers. Simple Tag Handlers present a much simpler invocation protocol than do Classic Tag Handlers.

The Tag Library Descriptor maps tag library declarations to their physical underlying implementations. A Simple Tag Handler is represented in Java by a class which implements the SimpleTag interface.

Unlike classic tag handlers, the SimpleTag interface does not extend Tag. Instead of supporting doStartTag() and doEndTag(), the SimpleTag interface provides a simple doTag() method, which is called once and only once for any given tag invocation. All tag logic, iteration, body evaluations, etc. are to be performed in this single method. Thus, simple tag handlers have the equivalent power of BodyTag, but with a much simpler lifecycle and interface.

To support body content, the setJspBody() method is provided. The container invokes the setJspBody() method with a JspFragment object encapsulating the body of the tag. The tag handler implementation can call invoke() on that fragment to evaluate the body. The SimpleTagSupport convenience class provides getJspBody() and other useful methods to make this even easier.

Lifecycle of Simple Tag Handlers

This section describes the lifecycle of simple tag handlers, from creation to invocation. For all semantics left unspecified by this section, the semantics default to that of a classic tag handler.

When a simple tag handler is invoked, the following steps occur (in order):

1. Simple tag handlers are created initially using a zero argument constructor on the corresponding implementation class. Unlike classic tag handlers, this instance must never be pooled by the container. A new instance must be created for each tag invocation.
2. The setJspContext() and setParent() methods are invoked on the tag handler. The setParent() method need not be called if the value being passed in is null. In the case of tag files, a JspContext wrapper is created so that the tag file can appear to have its own page scope. Calling getJspContext() must return the wrapped JspContext.

3. The attributes specified as XML element attributes (if any) are evaluated next, in the order in which they are declared, according to the following rules (referred to as "evaluating an XML element attribute" below). The appropriate bean property setter is invoked for each. If no setter is defined for the specified attribute but the tag accepts dynamic attributes, the setDynamicAttribute() method is invoked as the setter.
   - If the attribute is a scripting expression (e.g. "<%= 1+1 %>" in JSP syntax, or "%= 1+1 %" in XML syntax), the expression is evaluated, and the result is converted as per the rules in "Type Conversions", and passed to the setter.
   - Otherwise, if the attribute contains any Expression Language expressions (e.g. "Hello ${name}"), the expression is evaluated, and the result is converted and passed to the setter.
   - Otherwise, the attribute value is taken verbatim, converted, and passed to the setter.

4. The value for each <jsp:attribute> element is evaluated, and the corresponding bean property setter methods are invoked for each, in the order in which they appear in the body of the tag. If no setter is defined for the specified attribute but the tag accepts dynamic attributes, the setDynamicAttribute() method is invoked as the setter.
   - Otherwise, if the attribute is not of type JspFragment, the container evaluates the body of the <jsp:attribute> element. This evaluation can be done in a container-specific manner. Container implementors should note that in the process of evaluating this body, other custom actions may be invoked.
   - Otherwise, if the attribute is of type JspFragment, an instance of a JspFragment object is created and passed in.

5. The value for the body of the tag is determined, and if a body exists the setJspBody() method is called on the tag handler.
   - If the tag is declared to have a body-content of "empty" or no body or an empty body is passed for this invocation, then
setJspBody() is not called.

- Otherwise, the body of the tag is either the body of the 
  &lt;jsp:body&gt; element, or the body of the custom action invocation 
  if no &lt;jsp:body&gt; or &lt;jsp:attribute&gt; elements are present. In this 
  case, an instance of a JspFragment object is created as per the 
  lifecycle described in the JSP Fragments section and it is 
  passed to the setter. If the tag is declared to have a body- 
  content of "tagdependent" the JspFragment must echo the body's 
  contents verbatim. Otherwise, if the tag is declared to have a 
  body-content of type "scriptless", the JspFragment must 
  evaluate the body's contents as a JSP scriptless body.

6. The doTag() method is invoked.
7. The implementation of doTag() performs its function, potentially 
   calling other tag handlers (if the tag handler is implemented as a tag 
   file) and invoking fragments.
8. The doTag() method returns, and the tag handler instance is 
   discarded. If SkipPageException is thrown, the rest of the page is not 
   evaluated and the request is completed. If this request was 
   forwarded or included from another page (or Servlet), only the 
   current page evaluation stops.
9. For each tag scripting variable declared with scopes AT_BEGIN or 
   AT_END, the appropriate scripting variables and scoped attributes are 
   declared, as with classic tag handlers.
7. JSP Fragments

JSP Fragments are represented in Java by an instance of the
javax.servlet.jsp.tagext.JspFragment abstract class. Pieces of JSP
code are translated into JSP fragments in the context of a tag invocation.
JSP Fragments are created when providing the body of a <jsp:attribute>
standard action for an attribute that is defined as a fragment or of type
JspFragment, or when providing the body of a tag invocation handled by
a Simple Tag Handler.

Before being passed to a tag handler, the JspFragment instance is
associated with the JspContext of the surrounding page in an
implementation-dependent manner. In addition, it is associated with the
parent Tag or SimpleTag instance for collaboration purposes, so that when
a custom action is invoked from within the fragment, setParent() can be
called with the appropriate value. The fragment implementation must
keep these associations for the duration of the tag invocation in which it
is used.

The invoke() method executes the body and directs all output to either
the passed in java.io.Writer or the JspWriter returned by the getOut()
method of the JspContext associated with the fragment.

The implementation of each method can optionally throw a JspException,
which must be handled by the invoker. Note that tag library developers
and page authors should not generate JspFragment implementations
manually.

The following sections specify the creation and invocation lifecycles of a
JSP Fragment in detail, from the JSP Container's perspective.

Creation of a JSP Fragment

When a JSP fragment is created, the following steps occur (in order):

1. An instance of a class implementing the JspFragment abstract class
   is obtained (may either be created or can optionally be cached) each
time the tag is invoked. This instance must be configured to produce
the contents of the body of the fragment when invoked. If the fragment is defining the body of a `<jsp:attribute>`, the fragment must evaluate the body each time it is invoked. Otherwise, if the fragment is defining the body of a simple tag, the behavior of the fragment when invoked varies depending on the `body-content` declared for the tag:

- If the `body-content` is "tagdependent", then the fragment must echo the contents of the body verbatim when invoked.
- If the `body-content` is "scriptless", then the fragment must evaluate the body each time it is invoked.

2. The `JspFragment` instance is passed a reference to the current `JspContext`. Whenever the fragment invokes a tag handler, it must use this value when calling `setJspContext()`.

3. The `JspFragment` instance is associated with an instance of the tag handler of the nearest enclosing tag invocation, or with `null` if there is no enclosing tag. Whenever the fragment invokes a tag handler, the fragment must use this value when calling `setParent()`.

**Invocation of a JSP Fragment**

After a JSP fragment is created, it is passed to a tag handler for later invocation. JSP fragments can be invoked either programmatically from a tag handler written in Java, or from a tag file using the `<jsp:invoke>` or `<jsp:doBody>` standard action.

JSP fragments are passed to tag handlers using a bean property of type `JspFragment`. These fragments can be invoked by calling the `invoke()` method in the `JspFragment` abstract class. Note that it is legal (and possible) for a fragment to recursively invoke itself, indirectly.

The following steps are followed when invoking a JSP fragment:

1. The tag handler invoking the fragment is responsible for setting the values of all declared `AT_BEGIN` and `NESTED` variables in the `JspContext` of the calling page/tag, before invoking the fragment. Note that this is not always the same as the `JspContext` of the fragment being invoked, as fragments can be passed from one tag to another. In the case of tag files, for each variable declared in scope `AT_BEGIN` or `NESTED`, if a page scoped attribute exists with the
provided name in the tag file, the JSP container must generate code to create/update the page scoped attribute of the provided name in the calling page/tag. If a page scoped attribute with the provided name does not exist in the calling page, and a page scoped attribute of the provided name is present in the tag file, the scoped attribute is removed from the tag file's page scope. See the chapter on Tag Files for details.

2. If `<jsp:invoke>` or `<jsp:doBody>` is being used to invoke a fragment, if the var attribute is specified, a custom java.io.Writer is created that can expose the result of the invocation as a java.lang.String object. If the varReader attribute is specified, a custom java.io.Writer object is created that can expose the resulting invocation as a java.io.Reader object.

3. The `invoke()` method of the fragment is invoked, passing in an optional Writer.

4. Before executing the body of the fragment, if a non-null value is provided for the writer parameter, then the value of JspContext.getOut() and the implicit "out" object must be updated to send output to that writer. To accomplish this, the container must call pushBody( writer ) on the current JspContext, where writer is the instance of java.io.Writer passed to the fragment upon invocation.

5. The body of the fragment is then evaluated by executing the generated code. The body of the fragment may execute other standard or custom actions. If a classic Custom Tag Handler is invoked and returns SKIP_PAGE, or if a Simple Tag Handler is invoked and throws SkipPageException, the JspFragment must throw SkipPageException to signal that the calling page is to be skipped.

6. Once the fragment has completed its evaluation, even if an exception is thrown, the value of JspContext.getOut() must be restored via a call to popBody() on the current JspContext.

7. The fragment returns from invoke()

8. If `<jsp:invoke>` or `<jsp:doBody>` is being used to invoke a fragment, if the var or varReader attribute is specified, a scoped variable with a name equal to the value of the var or varReader attribute is created (or modified) in the page scope, and the value is set to a java.lang.String or java.io.Reader respectively that can produce the results of the fragment invocation.

9. The `invoke()` method can be called again, zero or more times. When the tag invocation defining the fragment is complete, the tag must
discard the fragment instance since it might be reused by the container.
8. Example Simple Tag Handler Scenario

The following non-normative example is intended to help solidify some of the concepts relating to Tag Files, JSP Fragments and Simple Tag Handlers. In the first section, two sample input files are presented, a JSP (my.jsp), and a simple tag handler implemented using a tag file (simpletag.tag). One possible output of the translation process is presented in the second section.

Although short, the example shows all concepts, including the variable directive. In practice most uses of tags will be much simpler, but probably longer.

The sample generated code is annotated with comments that point to lifecycle steps presented in various sections. The notation is as follows:

- "Step T.x" = Annotated step x from "Lifecycle of Simple Tag Handlers" earlier in this Chapter.
- "Step C.x" = Annotated step x from "Creation of a JSP Fragment" earlier in this Chapter.
- "Step F.x" = Annotated step x from "Invocation of a JSP Fragment" earlier in this Chapter.

Sample Source Files

This section presents the sample source files in this scenario, from which the output files are generated.

Original JSP (my.jsp)

```jsp
<%@ taglib prefix="my" tagdir="/WEB-INF/tags" %>

<my:simpleTag x="10">
    <jsp:attribute name="y">20</jsp:attribute>
    <jsp:attribute name="nonfragment">
        Nonfragment Template Text
    </jsp:attribute>
    <jsp:attribute name="frag">
        Fragment Template Text ${var1}
    </jsp:attribute>
</my:simpleTag>
```
Original Tag File (/WEB-INF/tags/simpletag.tag)

<!-- /WEB-INF/tags/simpletag.tag -->
<%@ attribute name="x" %>
<%@ attribute name="y" %>
<%@ attribute name="nonfragment" %>
<%@ attribute name="frag" fragment="true" %>
<%@ variable name-given="var1" scope="AT_BEGIN" %>
<%@ taglib prefix="c" uri="http://java.sun.com/jsp/jstl/core" %>

Some template text.
<c:set var="var1" value="${x+y}"/>
<jsp:invoke fragment="frag" varReader="var1"/>

Invoke the body:
<jsp:doBody/>

Sample Generated Files

This section presents sample output files that might be generated by a JSP compiler, from the source files presented in the previous section.

Helper class for JspFragment (JspFragmentBase.java)

```
public abstract class JspFragmentBase
    implements javax.servlet.jsp.tagext.JspFragment
{
    protected javax.servlet.jsp.JspContext jspContext;
    protected javax.servlet.jsp.tagext.JspTag parentTag;
    public void JspFragmentBase(
        javax.servlet.jsp.JspContext jspContext,
        javax.servlet.jsp.tagext.JspTag parentTag )
    {
        this.jspContext = jspContext;
        this.parentTag = parentTag;
    }
}
```
Relevant Portion of JSP Service Method

// Step T.1 - Initial creation
MySimpleTag _jsp_mySimpleTag = new MySimpleTag();
// Step T.2 - Set page context and parent (since parent is null,
// no need to call setParent() in this case)
_jsp_mySimpleTag.setJspContext( jspContext );
// Step T.3 - XML element attributes evaluated and set
_jsp.mySimpleTag.setX( "10" );
// Step T.4 - <jsp:attribute> elements evaluated and set
// - parameter y
// (using PageContext.pushBody() is one possible implementation -
// one limitation is that this code will only work for Servlet-based
out = ((PageContext)jspContext).pushBody();
out.write( "20" );

    _jsp_parentContext.removeAttribute("var1",
        JspContext.PAGE_SCOPE);
}
9. Translation-time Classes

The following classes are used at translation time.

**Tag mapping, Tag name**

A taglib directive introduces a tag library and associates a prefix to it. The TLD associated with the library associates Tag handler classes (plus other information) with tag names. This information is used to associate a Tag class, a prefix, and a name with each custom action element appearing in a JSP page.

At execution time the implementation of a JSP page will use an available Tag instance with the appropriate property settings and then follow the protocol described by the interfaces Tag, IterationTag, BodyTag, SimpleTag, and TryCatchFinally. The implementation guarantees that all tag handler instances are initialized and all are released, but the implementation can assume that previous settings are preserved by a tag handler, to reduce run-time costs.

**Scripting Variables**

JSP supports scripting variables that can be declared within a scriptlet and can be used in another. JSP actions also can be used to define scripting variables so they can used in scripting elements, or in other actions. This is very useful in some cases; for example, the `jsp:useBean` standard action may define an object which can later be used through a scripting variable.

In some cases the information on scripting variables can be described directly into the TLD using elements. A special case is typical interpretation of the "id" attribute. In other cases the logic that decides whether an action instance will define a scripting variable may be quite complex and the name of a `TagExtraInfo` class is instead given in the TLD. The `getVariableInfo` method of this class is used at translation time to obtain information on each variable that will be created at request time when this action is executed. The method is passed a `TagData` instance
that contains the translation-time attribute values.

Validation

The TLD file contains several pieces of information that is used to do syntactic validation at translation-time. It also contains two extensible validation mechanisms: a TagLibraryValidator class can be used to validate a complete JSP page, and a TagExtraInfo class can be used to validate a specific action. In some cases, additional request-time validation will be done dynamically within the methods in the Tag instance. If an error is discovered, an instance of JspTagException can be thrown. If uncaught, this object will invoke the errorpage mechanism of JSP.

The TagLibraryValidator is an addition to the JSP 1.2 specification and is very open ended, being strictly more powerful than the TagExtraInfo mechanism. A JSP page is presented via the PageData object, which abstracts the XML view of the JSP page.

A PageData instance will provides an InputStream (read-only) on the page. Later specifications may add other views on the page (DOM, SAX, JDOM are all candidates), for now these views can be generated from the InputStream and perhaps can be cached for improved performance (recall the view of the page is just read-only).

As of JSP 2.0, the JSP container must support a jsp:id attribute to provide higher quality validation errors. The container will track the JSP pages as passed to the container, and will assign to each element a unique "id", which is passed as the value of the jsp:id attribute. Each XML element in the XML view will be extended with this attribute. The TagLibraryValidator can use the attribute in one or more ValidationMessage objects. The container then, in turn, can use these values to provide more precise information on the location of an error.

The prefix for the id attribute need not be "jsp" but it must map to the namespace http://java.sun.com/JSP/Page. In the case where the user has redefined the jsp prefix, an alternative prefix must be used by the container.
Validation Details

In detail, validation is done as follows:

**First**, the JSP page is parsed using the information in the TLD. At this stage valid mandatory and optional attributes are checked.

**Second**, for each unique tag library in the page as determined by the tag library URI, and in the lexical order in which they appear, their associated validator class (if any) is invoked. This involves several substeps.

The first substep is to obtain an initialized validator instance by either:

- construct a new instance and invoke setInitParameters() on it, or
- obtain an existing instance that is not being used, invoke release() on it, and then invoke setInitParameters() on it, or
- locate an existing instance that is not being used on which the desired setInitParameters() has already been invoked

The class name is as indicated in the `<validator-class>` element, and the Map passed through setInitParameters() is as described in the `<init-params>` element. All TagLibraryValidator classes are supposed to keep their initParameters until new ones are set, or until release() is invoked on them.

The second substep is to perform the actual validation. This is done by invoking the validate() method with a prefix, uri, and PageData that correspond to the taglib directive instance being validated and the PageData representing the page. In the case where a single URI is mapped to more than one prefix, the prefix of the first URI must be used.

The last substep is to invoke the release() method on the validator tag when it is no longer needed. This method releases all resources.

**Finally**, after checking all the tag library validator classes, the TagExtraInfo classes for all tags will be consulted by invoking their validate method. The order of invocation of this methods is undefined.

Package `javax.xml.registry` Description

This package and its sub-packages describe the API classes and interfaces for the JAXR API. In this package are the high-level interfaces and classes that a client uses to interact with a registry via a JAXR provider.

Figure 1 shows the primary interfaces in the JAXR API.

![Figure 1. Primary Interfaces in the JAXR API](image)

Figure 2 shows the response and exception classes in the JAXR API.

![Figure 2. Response and Exception Classes in the JAXR API](image)

</tbody>
</table>
Package javax.jms Description

The Java Message Service (JMS) API provides a common way for Java programs to create, send, receive and read an enterprise messaging system's messages.

JMS Applications

A JMS application is composed of the following parts:

- JMS Provider - a messaging system that implements the JMS API in addition to the other administrative and control functionality required of a full-featured messaging product
- JMS Clients - the Java language programs that send and receive messages
- Messages - objects that are used to communicate information between the clients of an application
- Administered Objects - provider-specific objects that clients look up and use to interact portably with a JMS provider
- Non-JMS Clients - clients that use a message system's native client API instead of the JMS API. If the application predated the availability of the JMS API, it is likely that it will include both JMS clients and non-JMS clients.

Administration

JMS providers differ significantly in their implementations of underlying messaging technology. There are also major differences in how a JMS provider's system is installed and administered.

For JMS clients to be portable, they must be isolated from these proprietary aspects of a provider. This is done by defining JMS administered objects that are created and customized by a provider's administrator and later used by clients. The client uses them through JMS interfaces that are portable. The administrator creates them using provider-specific facilities.
There are two types of JMS administered objects:

- ConnectionFactory - the object a client uses to create a connection with a JMS provider
- Destination - the object a client uses to specify the destination of messages it is sending and the source of messages it receives

Administered objects are placed in a Java Naming and Directory Interface™ (JNDI) namespace by an administrator. A JMS client typically notes in its documentation the JMS administered objects it requires and how the JNDI names of these objects should be provided to it.

**Two Messaging Styles**

The JMS specification defines two styles of messaging: the point-to-point (PTP) or the publish-and-subscribe (Pub/Sub). These styles can be combined in a single application, or a given application can use just one of these styles.

The JMS API defines these two styles because they represent two of the dominant approaches to messaging currently in use. While the domains have many similarities, they also have some differences. JMS provides a unified programming interface to allow the client programmer to easily send and receive message using either domain, but the client programmer must also be aware of the differences between the domains. The key differences relate to how message persistence is handled, and the meaning of certain message attributes.

**JMS Interfaces**

When programming an application client, the programmer may either program using the domain specific interfaces, or may use the common interfaces. The key interfaces are listed in the table below. The preferred model is to use the common interfaces. The advantage to using the common interfaces is that both point-to-point and pub/sub tasks can be combined in one session, allowing transactions to operate over both domains.

In earlier versions of JMS, there were separate class hierarchies for the
pub/sub and point-to-point programming models that had to be used. These class hierarchies are retained to support backward compatibility with earlier versions of the JMS API, but client developers are encouraged to use the common interfaces.

### Relationship of PTP and Pub/Sub interfaces

<table>
<thead>
<tr>
<th>JMS Common</th>
<th>PTP Domain</th>
<th>Pub/Sub Domain</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectionFactory</td>
<td>QueueConnectionFactory</td>
<td>TopicConnectionFactory</td>
</tr>
<tr>
<td>Connection</td>
<td>QueueConnection</td>
<td>TopicConnection</td>
</tr>
<tr>
<td>Destination</td>
<td>Queue</td>
<td>Topic</td>
</tr>
<tr>
<td>Session</td>
<td>QueueSession</td>
<td>TopicSession</td>
</tr>
<tr>
<td>MessageProducer</td>
<td>QueueSender</td>
<td>TopicPublisher</td>
</tr>
<tr>
<td>MessageConsumer</td>
<td>QueueReceiver</td>
<td>TopicSubscriber</td>
</tr>
</tbody>
</table>

The following provides a brief definition of these JMS concepts. See the PTP and Pub/Sub chapters of the JMS specification for more information.

- ConnectionFactory - an administered object used by a client to create a Connection
- Connection - an active connection to a JMS provider
- Destination - an administered object that encapsulates the identity of a message destination
- Session - a single-threaded context for sending and receiving messages
- MessageProducer - an object created by a Session that is used for sending messages to a destination
- MessageConsumer - an object created by a Session that is used for receiving messages sent to a destination

The term *consume* is used in this document to mean the receipt of a message by a JMS client; that is, a JMS provider has received a message and has given it to its client. Since the JMS API supports both synchronous and asynchronous receipt of messages, the term *consume* is used when there is no need to make a distinction between them.

The term *produce* is used as the most general term for sending a message. It means giving a message to a JMS provider for delivery to a
Developing a JMS Application

Broadly speaking, a JMS application is one or more JMS clients that exchange messages. The application may also involve non-JMS clients; however, these clients use the JMS provider's native API in place of the JMS API.

A JMS application can be architected and deployed as a unit. In many cases, JMS clients are added incrementally to an existing application.

The message definitions used by an application may originate with JMS, or they may have been defined by the non-JMS part of the application.

Developing a JMS Client

A typical JMS client executes the following setup procedure:

- Use JNDI to find a ConnectionFactory object
- Use JNDI to find one or more Destination objects
- Use the ConnectionFactory to create a JMS Connection. At this point, message delivery is inhibited
- Use the Connection to create one or more JMS Sessions
- Use a Session and the Destinations to create the MessageProducers and MessageConsumers needed
- Start message delivery for the Connection. Messages will be delivered to MessageConsumers

At this point a client has the basic setup needed to produce and consume messages.

Package javax.xml.bind.annotation.adapters

XmlAdapter and its spec-defined sub-classes to allow arbitrary Java classes to be used with JAXB.

See: [Description](#)

### Class Summary

<table>
<thead>
<tr>
<th>Class Summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CollapsedStringAdapter</td>
<td>Built-in XmlAdapter to handle xs:token and its derived types.</td>
</tr>
<tr>
<td>HexBinaryAdapter</td>
<td>XmlAdapter for xs:hexBinary.</td>
</tr>
<tr>
<td>NormalizedStringAdapter</td>
<td>XmlAdapter to handle xs:normalizedString.</td>
</tr>
<tr>
<td>XmlAdapter&lt; ValueType, BoundType &gt;</td>
<td>Adapts a Java type for custom marshaling.</td>
</tr>
<tr>
<td>XmlJavaTypeAdapter.DEFAULT</td>
<td>Used in XmlJavaTypeAdapter.type() to signal that the type be inferred from the signature of the field, property, parameter or the class.</td>
</tr>
</tbody>
</table>

### Annotation Types Summary

<table>
<thead>
<tr>
<th>Annotation Types Summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XmlJavaTypeAdapter</td>
<td>Use an adapter that implements XmlAdapter for custom marshaling.</td>
</tr>
<tr>
<td>XmlJavaTypeAdapters</td>
<td>A container for multiple @XmlJavaTypeAdapter annotations.</td>
</tr>
</tbody>
</table>
Package javax.xml.bind.annotation.adapters

Description

XmlAdapter and its spec-defined sub-classes to allow arbitrary Java classes to be used with JAXB.

## Package javax.resource.cci

The javax.resource.cci package contains API specification for the Common Client Interface (CCI).

See: [Description](#)

### Interface Summary

<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>A Connection represents an application-level handle that is used by a client to access the underlying physical connection.</td>
</tr>
<tr>
<td>ConnectionFactory</td>
<td>ConnectionFactory provides an interface for getting connection to an EIS instance.</td>
</tr>
<tr>
<td>ConnectionMetaData</td>
<td>The interface ConnectionMetaData provides information about an EIS instance connected through a Connection instance.</td>
</tr>
<tr>
<td>ConnectionSpec</td>
<td>ConnectionSpec is used by an application component to pass connection request-specific properties to the ConnectionFactory.</td>
</tr>
<tr>
<td>IndexedRecord</td>
<td>IndexedRecord represents an ordered collection of record elements based on the java.util.List interface.</td>
</tr>
<tr>
<td>Interaction</td>
<td>The javax.resource.cci.Interaction enables a component to execute EIS functions.</td>
</tr>
<tr>
<td>InteractionSpec</td>
<td>An InteractionSpec holds properties for driving an Interaction with an EIS instance.</td>
</tr>
<tr>
<td>LocalTransaction</td>
<td>The LocalTransaction defines a transaction demarcation interface for resource manager local transactions.</td>
</tr>
<tr>
<td>MappedRecord</td>
<td>The interface javax.resource.cci.MappedRecord is used for key-value map based representation of record elements.</td>
</tr>
<tr>
<td><strong>MessageListener</strong></td>
<td>This serves as a request-response message listener type that message endpoints (message-driven beans) may implement.</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Record</strong></td>
<td>The <code>javax.resource.cci.Record</code> interface is the base interface for the representation of an input or output to the execute methods defined on an Interaction.</td>
</tr>
<tr>
<td><strong>RecordFactory</strong></td>
<td>The <code>RecordFactory</code> interface is used for creating <code>MappedRecord</code> and <code>IndexedRecord</code> instances.</td>
</tr>
<tr>
<td><strong>ResultSet</strong></td>
<td>A <code>ResultSet</code> represents tabular data that is retrieved from an EIS instance by the execution of an Interaction..</td>
</tr>
<tr>
<td><strong>ResultSetInfo</strong></td>
<td>The interface <code>javax.resource.cci.ResultSetInfo</code> provides information on the support provided for <code>ResultSet</code> by a connected EIS instance.</td>
</tr>
<tr>
<td><strong>Streamable</strong></td>
<td>Streamable interface enables a resource adapter to extract data from an input Record or set data into an output Record as a stream of bytes.</td>
</tr>
</tbody>
</table>

### Exception Summary

| **ResourceWarning** | A `ResourceWarning` provides information on warnings related to execution of an interaction with an EIS. |
Package javax.resource.cci Description

Package javax.servlet.http

The javax.servlet.http package contains a number of classes and interfaces that describe and define the contracts between a servlet class running under the HTTP protocol and the runtime environment provided for an instance of such a class by a conforming servlet container.

See:  

<table>
<thead>
<tr>
<th>Interface Summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HttpServletRequest</td>
<td>Extends the ServletRequest interface to provide request information for HTTP servlets.</td>
</tr>
<tr>
<td>HttpServletResponse</td>
<td>Extends the ServletResponse interface to provide HTTP-specific functionality in sending a response.</td>
</tr>
<tr>
<td>HttpSession</td>
<td>Provides a way to identify a user across more than one page request or visit to a Web site and to store information about that user.</td>
</tr>
<tr>
<td>HttpSessionActivationListener</td>
<td>Objects that are bound to a session may listen to container events notifying them that sessions will be passivated and that session will be activated.</td>
</tr>
<tr>
<td>HttpSessionAttributeListener</td>
<td>This listener interface can be implemented in order to get notifications of changes to the attribute lists of sessions within this web application.</td>
</tr>
<tr>
<td>HttpSessionBindingListener</td>
<td>Causes an object to be notified when it is bound to or unbound from a session.</td>
</tr>
<tr>
<td>HttpSessionContext</td>
<td>Deprecated. As of Java(tm) Servlet API 2.1 for security reasons, with no</td>
</tr>
<tr>
<td>Class Name</td>
<td>Description</td>

**Terminology**

**JavaBean property and field:** For the purposes of mapping, there is no semantic difference between a field and a JavaBean property. Thus, an annotation that can be applied to a JavaBean property can always be applied to a field. Hence in the Javadoc documentation, for brevity, the term JavaBean property or property is used to mean either JavaBean property or a field. Where required, both are explicitly mentioned.

**top level class:** For the purpose of mapping, there is no semantic difference between a top level class and a static nested class. Thus, an annotation that can be applied to a top level class, can always be applied to a nested static class. Hence in the Javadoc documentation, for brevity, the term "top level class" or just class is used to mean either a top level class or a nested static class.

**mapping annotation:** A JAXB 2.0 defined program annotation based on the JSR 175 programming annotation facility.
Common Usage Constraints

The following usage constraints are defined here since they apply to more than annotation:

- For a property, a given annotation can be applied to either read or write property but not both.
- A property name must be different from any other property name in any of the super classes of the class being mapped.
- A mapped field name or the decapitalized name of a mapped property must be unique within a class.

Notations

Namespace prefixes

The following namespace prefixes are used in the XML Schema fragments in this package.

Package javax.servlet.jsp.el Description

Provides the ELResolver classes that define the object resolution rules that must be supported by a JSP container with the new unified Expression Language.

The package also defines programmatic access to the old Expression Language evaluator (pre JSP 2.1).

Please note that as of JSP 2.1, all classes and interfaces that were in package javax.servlet.jsp.el have been deprecated in favor of the new unified Expression Language APIs (javax.el). See the Expression Language specification document for more details.

While a JSP container must still support the deprecated APIs defined in javax.servlet.jsp.el, developers should only rely on the new javax.el APIs for new development work.

Two ELResolver classes have been added in JSP 2.1 to implement object resolution rules that must be supported by a JSP container with the new unified Expression Language: ImplicitObjectELResolver and ScopedAttributeELResolver.
Documentation on the old and deprecated API

The JavaServer Pages(tm) (JSP) 2.0 specification provides a portable API for evaluating "EL Expressions". As of JSP 2.0, EL expressions can be placed directly in the template text of JSP pages and tag files.

This package contains a number of classes and interfaces that describe and define programmatic access to the Expression Language evaluator. This API can also be used by an implementation of JSP to evaluate the expressions, but other implementations, like open-coding into Java bytecodes, are allowed. This package is intended to have no dependencies on other portions of the JSP 2.0 specification.

Expression Evaluator

Programmatic access to the EL Expression Evaluator is provided through the following types:

- ExpressionEvaluator
- Expression
- FunctionMapper
- VariableResolver

An ExpressionEvaluator object can be obtained from a JspContext object through the getExpressionEvaluator method. An ExpressionEvaluator encapsulates the EL processor. An EL expression provided as a String can then be evaluated directly, or it can be parsed first into an Expression object. The parse step, can be used to factor out the cost of parsing the expression, or even the cost of optimizing the implementation.

The parsing of an expression string is done against a target type, a default prefix (that applies when a function has no prefix), and a FunctionMapper. The FunctionMapper object maps a prefix and a local name part into a java.lang.reflect.Method object.

The interpretation or evaluation of a parsed expression is done using a VariableResolver object. This object resolves top level object names into Objects. A VariableResolver can be obtained from a JspContext object.
through the getVariableResolver method.

Exceptions

The ELException exception is used by the expression language to denote any exception that may arise during the parsing or evaluation of an expression. The ELParseException exception is a subclass of ELException that corresponds to parsing errors.

Parsing errors are conveyed as exceptions to simplify the API. It is expected that many JSP containers will use additional mechanisms to parse EL expressions and report their errors - a run-time API cannot provide accurate line-error numbers without additional machinery.

Code Fragment

Below is a non-normative code fragment outlining how the APIs can be used.

```java
// Get an instance of an ExpressionEvaluator

ExpressionEvaluator ee = myJspContext.getExpressionEvaluator();
VariableResolver vr = myJspContext.getVariableResolver();

FunctionMapper fm; // we don't have a portable implementation yet

// Example of compiling an expression. See [ISSUE-2]
// Errors detected this way may have higher quality than those
// found with a simple validate() invocation.

ExpressionCompilation ce;

try {
    ce = ee.prepareExpression(expr,
                               targetClass,
                               fm,
                               null // no prefixes
                          );
} catch (ELParseException e) {
    log (e.getMessage());
}

try {
```
ce.evaluate(vr);
} catch (E1Exception e) {
    log (e);
}

</table>
Package javax.servlet.jsp Description

Classes and interfaces for the Core JSP 2.1 API.

The javax.servlet.jsp package contains a number of classes and interfaces that describe and define the contracts between a JSP page implementation class and the runtime environment provided for an instance of such a class by a conforming JSP container.
JSP Page Implementation Object Contract

This section describes the basic contract between a JSP Page implementation object and its container.

The main contract is defined by the classes `JspPage` and `HttpJspPage`. The `JspFactory` class describes the mechanism to portably instantiate all needed runtime objects, and `JspEngineInfo` provides basic information on the current JSP container. Class `JspApplicationContext` stores application-scoped information relevant to JSP containers. It was added in JSP 2.1 to support the integration of the unified Expression Language.

None of these classes are intended to be used by JSP page authors; an example of how these classes may be used is included below.
Implicit Objects

The PageContext object and the JspWriter are available by default as implicit objects.
Exceptions

The `JspException` class is the base class for all JSP exceptions. The `JspTagException` and `SkipPageException` exceptions are used by the tag extension mechanism.

For JSP error pages, the `ErrorData` class encapsulates information about the error.
An Implementation Example

An instance of an implementation dependent subclass of the `PageContext` abstract base class can be created by a JSP implementation class at the beginning of it's `_jspService()` method via an implementation default `JspFactory`.

Here is one example of how to use these classes

```java
public class foo implements Servlet {

    // ...

    public void _jspService(HttpServletRequest request,
        HttpServletResponse response)
        throws IOException, ServletException {

        JspFactory factory = JspFactory.getDefaultFactory();
        PageContext pageContext = factory.getPageContext(
            this, request, response,
            null, // errorPageURL
            false, // needsSession
            JspWriter.DEFAULT_BUFFER,
            true   // autoFlush
        );

        // initialize implicit variables for scripting env ...

        HttpSession session = pageContext.getSession();
        JspWriter out = pageContext.getOut();
        Object page = this;

        try {
            // body of translated JSP here ...
            } catch (Exception e) {
                out.clear();
                pageContext.handlePageException(e);
            } finally {
                out.close();
                factory.releasePageContext(pageContext);
            }
        }
    }
}
