Class AbortProcessingException

An exception that may be thrown by event listeners to terminate the processing of the current event.

See Also:
Serialized Form

Constructor Summary

<table>
<thead>
<tr>
<th>Constructor</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AbortProcessingException()</td>
<td>Construct a new exception with no detail message or root cause.</td>
</tr>
<tr>
<td>AbortProcessingException(String message)</td>
<td>Construct a new exception with the specified detail message and no root cause.</td>
</tr>
<tr>
<td>AbortProcessingException(String message, Throwable cause)</td>
<td></td>
</tr>
</tbody>
</table>
Construct a new exception with the specified detail message and root cause.

**AbortProcessingException** *(Throwable cause)*

Construct a new exception with the specified root cause.

### Method Summary

Methods inherited from class `javax.faces.FacesException`

- `getCause`

Methods inherited from class `java.lang.Throwable`

- `fillInStackTrace`, `getLocalizedMessage`, `getMessage`, `getStackTrace`, `initCause`, `printStackTrace`, `printStackTrace`, `printStackTrace`, `setStackTrace`, `toString`

Methods inherited from class `java.lang.Object`

- `clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `wait`, `wait`, `wait`

### Constructor Detail

**public AbortProcessingException()**

**AbortProcessingException**

**public AbortProcessingException()**

Construct a new exception with no detail message or root cause.
public AbortProcessingException(String message)

message

AbortProcessingException

public AbortProcessingException(String message)

Construct a new exception with the specified detail message and no root cause.

Parameters:
message - The detail message for this exception

public AbortProcessingException(Throwable cause)

cause

AbortProcessingException

public AbortProcessingException(Throwable cause)

Construct a new exception with the specified root cause.

Parameters:
cause - The root cause for this exception

public AbortProcessingException(String message, Throwable cause)
AbortProcessingException

public AbortProcessingException(String message, Throwable cause)

Construct a new exception with the specified detail message and root cause.

Parameters:

message - The detail message for this exception
cause - The root cause for this exception

javax.xml.bind.helpers **Class AbstractMarshallerImpl**

**java.lang.Object**  
└── javax.xml.bind.helpers.AbstractMarshallerImpl

**All Implemented Interfaces:**  
Marshaller

---

```java
public abstract class AbstractMarshallerImpl
extends Object
implements Marshaller
```

**Implements:** Marshaller

```java
Marshaller
```

JAXB  
```
marshal(Object, javax.xml.transform.Result)  
marshal(Object, javax.xml.stream.XMLStreamWriter)  
marshal(Object, javax.xml.stream.XMLEventWriter)
```

**version**  
$Revision: 1.7 $ $Date: 2006/03/08 17:00:39$

**since**  
JAXB1.0

**See also**  
javax.xml.bind.Marshaller

---

Partial default Marshaller implementation.

This class provides a partial default implementation for the Marshaller interface.

The only methods that a JAXB Provider has to implement are  
marshal(Object, javax.xml.transform.Result), marshal(Object, javax.xml.stream.XMLStreamWriter), and marshal(Object, javax.xml.stream.XMLEventWriter).
Nested Class Summary

Nested classes/interfaces inherited from interface javax.xml.bind.Marshaller
Marshaller.Listener

Field Summary

Fields inherited from interface javax.xml.bind.Marshaller
JAXB_ENCODING, JAXB_FORMATTED_OUTPUT, JAXB_FRAGMENT,
JAXB_NO_NAMESPACE_SCHEMA_LOCATION, JAXB_SCHEMA_LOCATION

Constructor Summary

AbstractMarshallerImpl()

Method Summary

getAdapter(Class type)
    Gets the adapter associated with the specified type.

AttachmentMarshaller getAttachmentMarshaller()
    protected String getEncoding()
    Convenience method for getting the current output encoding.
ValidationEventHandler getEventHandler()
Return the current event handler or the default event handler if one hasn't been set. protected String getJavaEncoding(String encoding)
Gets the corresponding Java encoding name from an IANA name.
Marshaller.Listener getListener()
Return Marshaller.Listener registered with this Marshaller.

getNode(Object obj)
By default, the getNode method is unsupported and throw an UnsupportedOperationException. protected String getNoNSSchemaLocation()
Convenience method for getting the current noNamespaceSchemaLocation. Object getProperty(String name)
Default implementation of the getProperty method handles the four defined properties in Marshaller. Schema getSchema()
Get the JAXP 1.3 Schema object being used to perform marshal-time validation. protected String getSchemaLocation()
Convenience method for getting the current schemaLocation. protected boolean isFormattedOutput()
Convenience method for getting the formatted output flag. protected boolean isFragment()
Convenience method for getting the fragment flag.

void marshal(Object obj, ContentHandler handler)
Marshal the content tree rooted at jaxbElement into SAX2 events.
void marshal(Object obj, Node node)
Marshal the content tree rooted at jaxbElement into a DOM tree.
void marshal(Object obj, OutputStream os)
Marshal the content tree rooted at jaxbElement into an output stream. void marshal(Object obj, Writer w)
Marshal the content tree rooted at jaxbElement into a Writer.
void marshal(Object obj, XMLEventWriter writer)
Marshal the content tree rooted at jaxbElement into a XMLEventWriter.
void marshal(Object obj, XMLStreamWriter writer)
Marshal the content tree rooted at jaxbElement into a XMLStreamWriter.

void setAdapter(Class<A> type, A adapter)
Associates a configured instance of XmlAdapter with this marshaller.
Associates a configured instance of `XmlAdapter` with this marshaller. void `setAttachmentMarshaller(AttachmentMarshaller am)`
Associate a context that enables binary data within an XML document to be transmitted as XML-binary optimized attachment. protected void `setEncoding(String encoding)`
Convenience method for setting the output encoding. void `setEventHandler(ValidationEventHandler handler)`
Allow an application to register a validation event handler. protected void `setFormattedOutput(boolean v)`
Convenience method for setting the formatted output flag. protected void `setFragment(boolean v)`
Convenience method for setting the fragment flag. void `setListener(Marshaller.Listener listener)`
Register marshal event callback `Marshaller.Listener` with this `Marshaller`. protected void `setNoNSSchemaLocation(String location)`
Convenience method for setting the noNamespaceSchemaLocation. void `setProperty(String name, Object value)`
Default implementation of the setProperty method handles the four defined properties in Marshaller. void `setSchema(Schema schema)`
Specify the JAXP 1.3 `Schema` object that should be used to validate subsequent marshal operations against. protected void `setSchemaLocation(String location)`
Convenience method for setting the schemaLocation.

### Methods inherited from class java.lang.Object

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

### Methods inherited from interface javax.xml.bind.Marshaller

`marshal`

### Constructor Detail

`public AbstractMarshallerImpl()`
AbstractMarshallerImpl

public AbstractMarshallerImpl()

### Method Detail

**final public void marshal(Object obj, java.io.OutputStream os) throws JAXBException**

**marshal**

```java
public final void marshal(Object obj, OutputStream os)
throws JAXBException
```

Description copied from interface: Marshaller

Marshal the content tree rooted at jaxbElement into an output stream.

**Specified by:**

marshaled in interface Marshaller

**Parameters:**

- **obj** - The root of content tree to be marshalled.
- **os** - XML will be added to this stream.

**Throws:**

- **JAXBException** - If any unexpected problem occurs during the marshalling.
- **MarshallerException** - If the ValidationEventHandler returns false from its handleEvent method or the Marshaller is unable to marshal obj (or any object reachable from obj). See Marshalling a JAXB element.

**final public void marshal(Object obj, java.io.Writer w) throws JAXBException**
marshal

```java
public final void marshal(Object obj,
                          Writer w)
    throws JAXBException
```

**Description copied from interface:** Marshaller
Marshal the content tree rooted at jaxbElement into a Writer.

**Specified by:**
- `marshal` in interface Marshaller

**Parameters:**
- `obj` - The root of content tree to be marshalled.
- `w` - XML will be sent to this writer.

**Throws:**
- `JAXBException` - If any unexpected problem occurs during the marshalling.
- `MarshalException` - If the `ValidationEventHandler` returns false from its `handleEvent` method or the `Marshaller` is unable to marshal `obj` (or any object reachable from `obj`). See [Marshalling a JAXB element](https://docs.oracle.com/javase/8/docs/api/javax/xml/bind/Marshalling.html).

---

**final public void marshal(Object obj,**
```java
org.xml.sax.ContentHandler handler)
    throws JAXBException
```

**marshal**

```java
public final void marshal(Object obj,
                          ContentHandler handler)
    throws JAXBException
```

**Description copied from interface:** Marshaller
Marshal the content tree rooted at jaxbElement into SAX2 events.

**Specified by:**
- `marshal` in interface Marshaller
Parameters:
obj - The root of content tree to be marshalled.
handler - XML will be sent to this handler as SAX2 events.

Throws:
JAXBException - If any unexpected problem occurs during the marshalling.
MarshalException - If the ValidationEventHandler returns false from its handleEvent method or the Marshaller is unable to marshal obj (or any object reachable from obj). See Marshalling a JAXB element.

final public void marshal(Object obj, org.w3c.dom.Node node) throws JAXBException

marshal

public final void marshal(Object obj,
Node node)
throws JAXBException

Description copied from interface: Marshaller
Marshal the content tree rooted at jaxbElement into a DOM tree.

Specified by:
marshal in interface Marshaller

Parameters:
obj - The content tree to be marshalled.
node - DOM nodes will be added as children of this node. This parameter must be a Node that accepts children (Document, DocumentFragment, or Element)

Throws:
JAXBException - If any unexpected problem occurs during the marshalling.
MarshalException - If the ValidationEventHandler returns false from its handleEvent method or the Marshaller is unable to marshal jaxbElement (or any object reachable from jaxbElement). See Marshalling a JAXB element.
public org.w3c.dom.Node getNode(Object obj) throws JAXBException
getNode

By default, the getNode method is unsupported and throw an UnsupportedOperationException. Implementations that choose to support this method must override this method.

Specified by: getNode in interface Marshaller
Parameters: obj -- JAXB Java representation of XML content
Returns: the DOM tree view of the contentTree
Throws: JAXBException - If any unexpected problem occurs

protected String getEncoding()

return "UTF-8"

getEncoding

protected String getEncoding()

Convenience method for getting the current output encoding.

Returns: the current encoding or "UTF-8" if it hasn't been set.
protected void setEncoding(String encoding)

    encoding Marshaller

setEncoding

protected void setEncoding(String encoding)

    Convenience method for setting the output encoding.

    Parameters:
    encoding - a valid encoding as specified in the Marshaller class documentation

protected String getSchemaLocation()

    return schemaLocation schemaLocation null

getSchemaLocation

protected String getSchemaLocation()

    Convenience method for getting the current schemaLocation.

    Returns:
    the current schemaLocation or null if it hasn't been set

protected void setSchemaLocation(String location)

    location schemaLocation
setSchemaLocation

protected void setSchemaLocation(String location)

   Convenience method for setting the schemaLocation.

   **Parameters:**
   location - the schemaLocation value

getNoNSSchemaLocation

protected String getNoNSSchemaLocation()

   return noNamespaceSchemaLocation
   noNamespaceSchemaLocation null

getNoNSSchemaLocation

protected String getNoNSSchemaLocation()

   Convenience method for getting the current noNamespaceSchemaLocation.

   **Returns:**
   the current noNamespaceSchemaLocation or null if it hasn't been set

setNoNSSchemaLocation

protected void setNoNSSchemaLocation(String location)

   location noNamespaceSchemaLocation

setNoNSSchemaLocation

protected void setNoNSSchemaLocation(String location)

   Convenience method for setting the noNamespaceSchemaLocation.
protected boolean isFormattedOutput()

    return false

isFormattedOutput

protected boolean isFormattedOutput()

    Convenience method for getting the formatted output flag.

    Returns:
    the current value of the formatted output flag or false if it hasn't been set.

protected void setFormattedOutput(boolean v)

    v

setFormattedOutput

protected void setFormattedOutput(boolean v)

    Convenience method for setting the formatted output flag.

    Parameters:
    v - value of the formatted output flag.
**isFragment**

protected boolean isFragment()

Convenience method for getting the fragment flag.

**Returns:**
the current value of the fragment flag or false if it hasn't been set.

---

**protected void setFragment(boolean v)**

v

**setFragment**

protected void setFragment(boolean v)

Convenience method for setting the fragment flag.

**Parameters:**
v - value of the fragment flag.

---

protected String getJavaEncoding(String encoding) throws java.io.UnsupportedEncodingException
IANA Java helper

Throws java.io.UnsupportedEncodingException: Java

**getJavaEncoding**

protected String getJavaEncoding(String encoding)
throws UnsupportedEncodingException

Gets the corresponding Java encoding name from an IANA name. This method is a helper method for the derived class to convert encoding names.

**Throws:**

UnsupportedEncodingException - If this implementation couldn't find the Java encoding name.

---

```java
public void setProperty(String name, Object value) throws PropertyException

setProperty Marshaller 4
```

**setProperty**

```java
public void setProperty(String name, Object value)
    throws PropertyException
```

Default implementation of the setProperty method handles the four defined properties in Marshaller. If a provider needs to handle additional properties, it should override this method in a derived class.

**Specified by:**

setProperty in interface Marshaller

**Parameters:**

- **name** - the name of the property to be set. This value can either be specified using one of the constant fields or a user supplied string.
- **value** - the value of the property to be set

**Throws:**

PropertyException - when there is an error processing the given property or value
public Object getProperty(String name) throws PropertyException

getProperty

public Object getProperty(String name)
    throws PropertyException

Default implementation of the getProperty method handles the four defined properties in Marshaller. If a provider needs to support additional provider specific properties, it should override this method in a derived class.

Specified by:
    getProperty in interface Marshaller

Parameters:
    name - the name of the property to retrieve

Returns:
    the value of the requested property

Throws:
    PropertyException - when there is an error retrieving the given property or value property name

------------------------------------------------------------------------------

public ValidationEventHandler getEventHandler() throws JAXBException

See also
    getEventHandler()

ggetEventHandler

public ValidationEventHandler getEventHandler()
    throws JAXBException

Description copied from interface: Marshaller
Return the current event handler or the default event handler if one
hasn't been set.

Specified by:
  getEventHandler in interface Marshaller

Returns:
  the current ValidationEventHandler or the default event handler
  if it hasn't been set

Throws:
  JAXBException - if an error was encountered while getting the
  current event handler

See Also:
  Marshaller.getEventHandler()

public void setEventHandler(ValidationEventHandler handler) throws JAXBException
See also  setEventHandler(ValidationEventHandler)

setEventHandler

public void setEventHandler(ValidationEventHandler handler) throws JAXBException

Description copied from interface: Marshaller
Allow an application to register a validation event handler.

The validation event handler will be called by the JAXB Provider if
any validation errors are encountered during calls to any of the
marshal API's. If the client application does not register a validation
event handler before invoking one of the marshal methods, then
validation events will be handled by the default event handler which
will terminate the marshal operation after the first error or fatal error
is encountered.

Calling this method with a null parameter will cause the Marshaller to
revert back to the default default event handler.

Specified by:
**setEventHandler** in interface `Marshaller`

**Parameters:**
- handler - the validation event handler

**Throws:**
- `JAXBException` - if an error was encountered while setting the event handler

**See Also:**
- `Marshaller.setEventHandler(ValidationEventHandler)`

---

```java
public void marshal(Object obj, XMLEventWriter writer) throws JAXBException
```

**marshal**

```java
public void marshal(Object obj,
                    XMLEventWriter writer)
    throws JAXBException
```

**Description copied from interface:** `Marshaller`

Marshal the content tree rooted at `jaxbElement` into a `XMLEventWriter`.

**Specified by:**
- `marshal` in interface `Marshaller`

**Parameters:**
- `obj` - The content tree rooted at `jaxbElement` to be marshalled.
- `writer` - XML will be sent to this writer.

**Throws:**
- `JAXBException` - If any unexpected problem occurs during the marshalling.
- `MarshalException` - If the `ValidationEventHandler` returns false from its `handleEvent` method or the `Marshaller` is unable to marshal `obj` (or any object reachable from `obj`). See [Marshalling a JAXB element](https://docs.oracle.com/javase/8/docs/api/javax/xml/bind/Marshaller.html).

---

```java
public void marshal(Object obj, XMLStreamWriter writer)
```
public void marshal(Object obj, XMLStreamWriter writer) throws JAXBException

Description copied from interface: Marshaller
Marshals the content tree rooted at jaxbElement into a XMLStreamWriter.

Specified by:
marshal in interface Marshaller
Parameters:
   obj - The content tree to be marshalled.
   writer - XML will be sent to this writer.
Throws:
   JAXBException - If any unexpected problem occurs during the marshalling.
   MarshalException - If the ValidationEventHandler returns false from its handleEvent method or the Marshaller is unable to marshal obj (or any object reachable from obj). See Marshalling a JAXB element.

public void setSchema(javax.xml.validation.Schema schema)

setSchema

public void setSchema(Schema schema)

Description copied from interface: Marshaller
Specify the JAXP 1.3 Schema object that should be used to validate subsequent marshal operations against. Passing null into this method will disable validation.
This method allows the caller to validate the marshalled XML as it's marshalled.

Initially this property is set to null.

**Specified by:**

```
setSchema in interface Marshaller
```

**Parameters:**

- `schema` - Schema object to validate marshal operations against or null to disable validation

---

```
public javax.xml.validation.Schema getSchema()
```

**getSchema**

```
public Schema getSchema()
```

**Description copied from interface:** [Marshaller](http://docs.oracle.com/javase/8/docs/api/javax/xml/validation/Schema.html)

Get the JAXP 1.3 [Schema](http://docs.oracle.com/javase/8/docs/api/javax/xml/validation/Schema.html) object being used to perform marshal-time validation. If there is no Schema set on the marshaller, then this method will return null indicating that marshal-time validation will not be performed.

**Specified by:**

```
getSchema in interface Marshaller
```

**Returns:**

- the Schema object being used to perform marshal-time validation or null if not present.

---

```
public void setAdapter("">XmlAdapter adapter)
```

**setAdapter**

```
public void setAdapter(XmlAdapter adapter)
```
Description copied from interface: *Marshaller*
Associates a configured instance of *XmlAdapter* with this marshaller.

This is a convenience method that invokes
setAdapter(adapter.getClass(), adapter);

Specified by:
  *setAdapter* in interface *Marshaller*

See Also:
  *Marshaller.setAdapter(Class,XmlAdapter)*

---

setAdapter

```java
public <A extends XmlAdapter> void setAdapter(Class<A> type, A adapter)
```

Description copied from interface: *Marshaller*
Associates a configured instance of *XmlAdapter* with this marshaller.

Every marshaller internally maintains a *Map<Class,XmlAdapter>*,
which it uses for marshalling classes whose fields/methods are
annotated with *XmlJavaTypeAdapter*.

This method allows applications to use a configured instance of
*XmlAdapter*. When an instance of an adapter is not given, a
marshaller will create one by invoking its default constructor.

Specified by:
  *setAdapter* in interface *Marshaller*

Parameters:
  - type - The type of the adapter. The specified instance will be
  used when *XmlJavaTypeAdapter.value()* refers to this type.
  - adapter - The instance of the adapter to be used. If null, it will
  un-register the current adapter set for this type.
getAdapter

public <A extends XmlAdapter> A getAdapter(Class<A> type)

Description copied from interface: Marshaller
Gets the adapter associated with the specified type. This is the reverse operation of the Marshaller.setAdapter(javax.xml.bind.annotation.adapters.XmlAdapter) method.

Specified by:
getAdapter in interface Marshaller

public void setAttachmentMarshaller(AttachmentMarshaller am)

setAttachmentMarshaller

public void setAttachmentMarshaller(AttachmentMarshaller am)

Description copied from interface: Marshaller
Associate a context that enables binary data within an XML document to be transmitted as XML-binary optimized attachment. The attachment is referenced from the XML document content model by content-id URIs(cid) references stored within the xml document.

Specified by:
setAttachmentMarshaller in interface Marshaller

public AttachmentMarshaller getAttachmentMarshaller()

getAttachmentMarshaller

public AttachmentMarshaller getAttachmentMarshaller()
public void setListener(Marshaller.Listener listener)

setListener

public void setListener(Marshaller.Listener listener)

Description copied from interface: Marshaller

Register marshal event callback Marshaller.Listener with this Marshaller.

There is only one Listener per Marshaller. Setting a Listener replaces the previous set Listener. One can unregister current Listener by setting listener to null.

Specified by:
setListener in interface Marshaller

Parameters:
listener - an instance of a class that implements Marshaller.Listener

public Marshaller.Listener getListener()

getListener

public Marshaller.Listener getListener()

Description copied from interface: Marshaller

Return Marshaller.Listener registered with this Marshaller.

Specified by:
getListener in interface Marshall

Returns:
registered Marshall.Listener or null if no Listener is registered with this Marshaller.
javax.xml.bind.helpers  **Class AbstractUnmarshallerImpl**

**java.lang.Object**  
   - javax.xml.bind.helpers.AbstractUnmarshallerImpl

**All Implemented Interfaces:**  
   - Unmarshaller

---

```java
public abstract class AbstractUnmarshallerImpl
extends Object
implements Unmarshaller

Implements: Unmarshaller

Unmarshaller

javax.xml.bind.Unmarshaller

JAXB 5 getUnmarshallerHandler
unmarshal(Node)
unmarshal(XMLReader, InputSource)
unmarshal(XMLStreamReader)
unmarshal(XMLEventReader)
```

**version**  
$Revision: 1.14 $  
$Date: 2006/03/08 17:01:00 $

**since**  
JAXB1.0

**See also**  
javax.xml.bind.Unmarshaller

---

Partial default Unmarshaller implementation.

This class provides a partial default implementation for the Unmarshaller interface.

A JAXB Provider has to implement five methods  
(getUnmarshallerHandler, unmarshal(Node),
unmarshal(XMLReader, InputSource), unmarshal(XMLStreamReader),
and unmarshal(XMLEventReader).
## Nested Class Summary

### Nested classes/interfaces inherited from interface javax.xml.bind.Unmarshaller

- Unmarshaller.Listener

## Field Summary

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>protected boolean</td>
<td><code>validating</code></td>
<td>whether or not the unmarshaller will validate</td>
</tr>
</tbody>
</table>

## Constructor Summary

- `AbstractUnmarshallerImpl()`  

## Method Summary

- `createUnmarshalException(SAXException e)`  
  Creates an UnmarshalException from a SAXException.

- `getAdapter(Class<A> type)`  
  Gets the adapter associated with the specified type.

- `getAttachmentUnmarshaller()`  
  AttachmentUnmarshaller
ValidationEventHandler getEventHandler()  
Return the current event handler or the default event handler if one 
hasn't been set. Unmarshaller.Listener getListener()  
Return Unmarshaller.Listener registered with this Unmarshaller.
Object getProperty(String name)  
Default implementation of the getProperty method always throws PropertyException since there are no required properties. Schema
getSchema()  
Get the JAXP 1.3 Schema object being used to perform unmarshal-
time validation. protected XMLReader getXMLReader()  
Obtains a configured XMLReader. boolean isValidating()  
Indicates whether or not the Unmarshaller is configured to validate 
during unmarshal operations.

<A extends XmlAdapter>
void setAdapter(Class<A> type, A adapter)  
Associates a configured instance of XmlAdapter with this
unmarshaller. void setAdapter(XmlAdapter adapter)  
Associates a configured instance of XmlAdapter with this
unmarshaller. void setAttachmentUnmarshaller(AttachmentUnmarshaller au)  
Associate a context that resolves cid's, content-id URIs, to binary
data passed as attachments. void setEventHandler(ValidationEventHandler handler)  
Allow an application to register a validation event handler. void setListener(Unmarshaller.Listener listener)  
Register unmarshal event callback Unmarshaller.Listener with this Unmarshaller. void setProperty(String name, Object value)  
Default implementation of the setProperty method always throws PropertyException since there are no required properties. void setSchema(Schema schema)  
Specify the JAXP 1.3 Schema object that should be used to validate 
subsequent unmarshal operations against. void setValidating(boolean validating)  
Specifies whether or not the Unmarshaller should validate during 
unmarshal operations. Object unmarshal(File f)  
Unmarshal XML data from the specified file and return the resulting content tree. Object unmarshal(InputSource source)
Unmarshal XML data from the specified SAX InputSource and return the resulting content tree. 

Unmarshal XML data from the specified InputStream and return the resulting content tree.

```java
<T> JAXBElement<T> unmarshal(Node node, Class<T> expectedType)
```

Unmarshal XML data by JAXB mapped declaredType and return the resulting content tree.

```java
<T> JAXBElement<T> unmarshal(Reader reader)
```

Unmarshal XML data from the specified Reader and return the resulting content tree.

```java
<T> JAXBElement<T> unmarshal(Source source)
```

Unmarshal XML data from the specified XML Source and return the resulting content tree.

```java
<T> JAXBElement<T> unmarshal(Source source, Class<T> expectedType)
```

Unmarshal XML data from the specified XML Source by declaredType and return the resulting content tree.

```java
URL url
```

Unmarshal XML data from the specified URL and return the resulting content tree.

```java
<T> JAXBElement<T> unmarshal(XMLEventReader reader)
```

Unmarshal XML data from the specified pull parser and return the resulting content tree.

```java
protected abstract Object unmarshal(XMLStreamReader reader, InputSource source)
```

Unmarshals an object by using the specified XMLReader and the InputSource.

```java
<T> JAXBElement<T> unmarshal(XMLStreamReader reader, Class<T> expectedType)
```

Unmarshal root element to JAXB mapped declaredType and return the resulting content tree.

**Methods inherited from class java.lang.Object**

- `clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`

**Methods inherited from interface javax.xml.bind.Unmarshaller**
Field Detail

protected boolean validating

whether or not the unmarshaller will validate

Constructor Detail

public AbstractUnmarshallerImpl()

Method Detail

protected org.xml.sax.XMLReader getXMLReader() throws JAXBException

XMLReader SAXSource XMLReader Unmarshaller XMLReader
Obtains a configured XMLReader. This method is used when the client-specified SAXSource object doesn't have XMLReader. Unmarshaller is not re-entrant, so we will only use one instance of XMLReader.

**Throws:**  
*JAXBException*

```java
public Object unmarshal(javax.xml.transform.Source source) throws JAXBException
```

**unmarshal**

```java
public Object unmarshal(Source source) throws JAXBException
```

**Description copied from interface:** Unmarshaller

Unmarshal XML data from the specified XML Source and return the resulting content tree.

Implements Unmarshal Global Root Element.

**SAX 2.0 Parser Pluggability**

A client application can choose not to use the default parser mechanism supplied with their JAXB provider. Any SAX 2.0 compliant parser can be substituted for the JAXB provider's default mechanism. To do so, the client application must properly configure a SAXSource containing an XMLReader implemented by the SAX 2.0 parser provider. If the XMLReader has an org.xml.sax.ErrorHandler registered on it, it will be replaced by the JAXB Provider so that validation errors can be reported via the ValidationEventHandler mechanism of JAXB. If the SAXSource does not contain an XMLReader, then the JAXB provider's default parser mechanism will be used.

This parser replacement mechanism can also be used to replace the JAXB provider's unmarshal-time validation engine. The client
application must properly configure their SAX 2.0 compliant parser to perform validation (as shown in the example above). Any SAXParserExceptions encountered by the parser during the unmarshal operation will be processed by the JAXB provider and converted into JAXB ValidationEvent objects which will be reported back to the client via the ValidationEventHandler registered with the Unmarshaller. Note: specifying a substitute validating SAX 2.0 parser for unmarshalling does not necessarily replace the validation engine used by the JAXB provider for performing on-demand validation.

The only way for a client application to specify an alternate parser mechanism to be used during unmarshal is via the unmarshal(SAXSource) API. All other forms of the unmarshal method (File, URL, Node, etc) will use the JAXB provider's default parser and validator mechanisms.

Specified by:  
unmarshal in interface Unmarshaller  

Parameters:  
source - the XML Source to unmarshal XML data from (providers are only required to support SAXSource, DOMSource, and StreamSource)

Returns:  
the newly created root object of the java content tree  

Throws:  
JAXBException - If any unexpected errors occur while unmarshalling  
UnmarshallerException - If the ValidationEventHandler returns false from its handleEvent method or the Unmarshaller is unable to perform the XML to Java binding. See Unmarshalling XML Data  

See Also:  
Unmarshaller.unmarshal(javax.xml.transform.Source, Class)  

abstract protected Object  
unmarshal(org.xml.sax.XMLReader reader,  
org.xml.sax.InputSource source) throws JAXBException  
XMLReader  InputSource
Unmarshals an object by using the specified XMLReader and the InputSource. The callee should call the setErrorHandler method of the XMLReader so that errors are passed to the client-specified ValidationEventHandler.

**Throws:**

*JAXBException*
Throws:

- `JAXBException` - If any unexpected errors occur while unmarshalling
- `UnmarshalException` - If the `ValidationEventHandler` returns false from its `handleEvent` method or the `Unmarshaller` is unable to perform the XML to Java binding. See [Unmarshalling XML Data](#).

```java
final public Object unmarshal(java.net.URL url) throws JAXBException
```

**unmarshal**

```java
public final Object unmarshal(URL url)
```

**Description copied from interface: Unmarshaller**

Unmarshal XML data from the specified URL and return the resulting content tree.

Implements [Unmarshal Global Root Element](#).

**Specified by:**

`unmarshal` in interface `Unmarshaller`

**Parameters:**

- `url` - the url to unmarshal XML data from

**Returns:**

the newly created root object of the java content tree

**Throws:**

- `JAXBException` - If any unexpected errors occur while unmarshalling
- `UnmarshalException` - If the `ValidationEventHandler` returns false from its `handleEvent` method or the `Unmarshaller` is unable to perform the XML to Java binding. See [Unmarshalling XML Data](#)

```java
final public Object unmarshal(java.io.File f) throws
```
JAXBException

unmarshal

public final Object unmarshal(File f) throws JAXBException

Description copied from interface: Unmarshaller
Unmarshal XML data from the specified file and return the resulting content tree.

Implements Unmarshal Global Root Element.

Specified by:
unmarshal in interface Unmarshaller

Parameters:
f - the file to unmarshal XML data from

Returns:
the newly created root object of the java content tree

Throws:
JAXBException - If any unexpected errors occur while unmarshalling
UnmarshallerException - If the ValidationEventHandler returns false from its handleEvent method or the Unmarshaller is unable to perform the XML to Java binding. See Unmarshalling XML Data

final public Object unmarshal(java.io.InputStream is) throws JAXBException

unmarshal

public final Object unmarshal(InputStream is) throws JAXBException

Description copied from interface: Unmarshaller
Unmarshal XML data from the specified InputStream and return the
resulting content tree. Validation event location information may be incomplete when using this form of the unmarshal API.

Implements Unmarshal Global Root Element.

**Specified by:**
unmarshal in interface Unmarshaller

**Parameters:**
is - the InputStream to unmarshal XML data from

**Returns:**
the newly created root object of the java content tree

**Throws:**
JAXBException - If any unexpected errors occur while unmarshalling
UnmarshalException - If the ValidationEventHandler returns false from its handleEvent method or the Unmarshaller is unable to perform the XML to Java binding. See Unmarshalling XML Data

final public Object unmarshal(java.io.Reader reader)
throws JAXBException

unmarshal

public final Object unmarshal(Reader reader)
throws JAXBException

Description copied from interface: Unmarshaller
Unmarshal XML data from the specified Reader and return the resulting content tree. Validation event location information may be incomplete when using this form of the unmarshal API, because a Reader does not provide the system ID.

Implements Unmarshal Global Root Element.

Specified by:
unmarshal in interface Unmarshaller

Parameters:
reader - the Reader to unmarshal XML data from

**Returns:**
the newly created root object of the java content tree

**Throws:**
*JAXBException* - If any unexpected errors occur while unmarshalling
*UnmarshallerException* - If the `ValidationEventHandler` returns false from its `handleEvent` method or the `Unmarshaller` is unable to perform the XML to Java binding. See [Unmarshalling XML Data](#)

---

### public boolean isValidating() throws JAXBException

Unmarshaller

```java
JAXP isValidating() getValidating()
```

```java
return Unmarshaller true false
```

**Throws**
*JAXBException*:

---

### isValidating

public boolean `isValidating()`

```java
throws JAXBException
```

Indicates whether or not the Unmarshaller is configured to validate during unmarshal operations.

**Note:** I named this method `isValidating()` to stay in-line with JAXP, as opposed to naming it `getValidating()`.

**Specified by:**
*`isValidating`* in interface `Unmarshaller`

**Returns:**
true if the Unmarshaller is configured to validate during unmarshal operations, false otherwise

**Throws:**
*JAXBException* - if an error occurs while retrieving the validating
public void setEventHandler(ValidationEventHandler handler) throws JAXBException

Allow an application to register a validation event handler.

The validation event handler will be called by the JAXB Provider if any validation errors are encountered during calls to any of the unmarshal methods. If the client application does not register a validation event handler before invoking the unmarshal methods, then all validation events will be silently ignored and may result in unexpected behaviour.

Specified by:
setEventHandler in interface Unmarshaller

Parameters:
handler - the validation event handler

Throws:
JAXBException - if an error was encountered while setting the event handler

public void setValidating(boolean validating) throws JAXBException
Unmarshaller

**validating**  Unmarshaller  true false

**Throws**  JAXBException:

setValidating

```java
public void setValidating(boolean validating)
  throws JAXBException
```

Specifies whether or not the Unmarshaller should validate during unmarshal operations. By default, the Unmarshaller does not validate.

This method may only be invoked before or after calling one of the unmarshal methods.

**Specified by:**

setValidating in interface Unmarshaller

**Parameters:**

validating - true if the Unmarshaller should validate during unmarshal, false otherwise

**Throws:**

JAXBException - if an error occurred while enabling or disabling validation at unmarshal time

---

public **ValidationEventHandler** getEventHandler() throws JAXBException

```java
return ValidationEventHandler
  JAXBException:
```
getEventHandler

public ValidationEventHandler getEventHandler()
    throws JAXBException

    Return the current event handler or the default event handler if one
    hasn't been set.

    Specified by: getEventHandler in interface Unmarshaller

    Returns: the current ValidationEventHandler or the default event handler
    if it hasn't been set

    Throws: JAXBException - if an error was encountered while getting the
    current event handler

protected Unmarshalexception createUnmarshalException(org.xml.sax.SAXException e)
SAXException Unmarshalexception

    ContentHandler JAXBException SAXException unmarshaller JAXBException SAXException
    JAXBException SAXException JAXBException

    SAXException
    return Unmarshalexception

createUnmarshalException

protected Unmarshalexception createUnmarshalException(SAXException e)

    Creates an UnmarshalException from a SAXException. This is an
    utility method provided for the derived classes.
When a provider-implemented ContentHandler wants to throw a JAXBException, it needs to wrap the exception by a SAXException. If the unmarshaller implementation blindly wrap SAXException by JAXBException, such an exception will be a JAXBException wrapped by a SAXException wrapped by another JAXBException. This is silly.

This method checks the nested exception of SAXException and reduce those excessive wrapping.

**Returns:**
the resulting UnmarshalException

```java
public void setProperty(String name, Object value) throws PropertyException
```

**setProperty**

Default implementation of the setProperty method always throws PropertyException since there are no required properties. If a provider needs to handle additional properties, it should override this method in a derived class.

**Specified by:**
setProperty in interface Unmarshalled

**Parameters:**
- `name` - the name of the property to be set. This value can either be specified using one of the constant fields or a user supplied string.
- `value` - the value of the property to be set

**Throws:**
- `PropertyException` - when there is an error processing the given
public Object getProperty(String name) throws PropertyException
getProperty  PropertyException

getProperty

public Object getProperty(String name) throws PropertyException

Default implementation of the getProperty method always throws PropertyException since there are no required properties. If a provider needs to handle additional properties, it should override this method in a derived class.

Specified by:
   getProperty in interface Unmarshaller
Parameters:
   name - the name of the property to retrieve
Returns:
   the value of the requested property
Throws:
   PropertyException - when there is an error retrieving the given property or value property name

public Object unmarshal(XMLEventReader reader) throws JAXBException

unmarshal

public Object unmarshal(XMLEventReader reader) throws JAXBException
Description copied from interface: Unmarshaller
Unmarshal XML data from the specified pull parser and return the resulting content tree.

This method is an Unmarshal Global Root method.

This method assumes that the parser is on a START_DOCUMENT or START_ELEMENT event. Unmarshalling will be done from this start event to the corresponding end event. If this method returns successfully, the reader will be pointing at the token right after the end event.

Specified by:
unmarshal in interface Unmarshaller

Parameters:
reader - The parser to be read.

Returns:
the newly created root object of the java content tree.

Throws:
JAXBException - If any unexpected errors occur while unmarshalling
UnmarshallerException - If the ValidationEventHandler returns false from its handleEvent method or the Unmarshaller is unable to perform the XML to Java binding. See Unmarshalling XML Data

See Also:
Unmarshaller.unmarshal(javax.xml.stream.XMLStreamReader, Class)

public Object unmarshal(XMLStreamReader reader) throws JAXBException

unmarshal

public Object unmarshal(XMLStreamReader reader) throws JAXBException

Description copied from interface: Unmarshaller
Unmarshal XML data from the specified pull parser and return the resulting content tree.

Implements Unmarshal Global Root Element.

This method assumes that the parser is on a START_DOCUMENT or START_ELEMENT event. Unmarshalling will be done from this start event to the corresponding end event. If this method returns successfully, the reader will be pointing at the token right after the end event.

Specified by: unmarshal in interface Unmarshaller

Parameters:
reader - The parser to be read.

Returns:
the newly created root object of the java content tree.

Throws:
JAXBException - If any unexpected errors occur while unmarshalling
UnmarshallerException - If the ValidationEventHandler returns false from its handleEvent method or the Unmarshaller is unable to perform the XML to Java binding. See Unmarshalling XML Data

See Also:
Unmarshaller.unmarshal(javax.xml.stream.XMLStreamReader, Class)

unmarshal

public <T> JAXBElement<T> unmarshal(Node node, Class<T> expectedType)
throws JAXBException

Description copied from interface: Unmarshaller
Unmarshal XML data by JAXB mapped declaredType and return the resulting content tree.
Implements **Unmarshal by Declared Type**

**Specified by:**
*unmarshal* in interface *Unmarshaller*

**Parameters:**
- node - the document/element to unmarshal XML data from. The caller must support at least Document and Element.
- expectedType - appropriate JAXB mapped class to hold node's XML data.

**Returns:**
*JAXB Element* representation of node

**Throws:**
- *JAXBException* - If any unexpected errors occur while unmarshalling
- *UnmarshalException* - If the *ValidationEventHandler* returns false from its *handleEvent* method or the Unmarshaller is unable to perform the XML to Java binding. See **Unmarshalling XML Data**

```java
public <T> JAXBElement<T> unmarshal(Source source, Class<T> expectedType) throws JAXBException
```

**Description copied from interface: Unmarshaller**
Unmarshal XML data from the specified XML Source by declaredType and return the resulting content tree.

**Specified by:** **Unmarshal by Declared Type**

See **SAX 2.0 Parser Pluggability**

**Parameters:**
- source - the XML Source to unmarshal XML data from (providers are only required to support SAXSource, DOMSource, and
StreamSource)

expectedType - appropriate JAXB mapped class to hold source's xml root element

Returns:
Java content rooted by JAXB Element

Throws:
JAXBException - If any unexpected errors occur while unmarshalling
UnmarshallerException - If the ValidationEventHandler returns false from its handleEvent method or the Unmarshaller is unable to perform the XML to Java binding. See Unmarshalling XML Data

unmarshal

public &lt;T&gt; JAXBElement&lt;T&gt; unmarshal(XMLStreamReader reader, Class&lt;T&gt; expectedType)
throws JAXBException

Description copied from interface: Unmarshaller
Unmarshal root element to JAXB mapped declaredType and return the resulting content tree.

This method implements unmarshal by declaredType.

This method assumes that the parser is on a START_DOCUMENT or START_ELEMENT event. Unmarshalling will be done from this start event to the corresponding end event. If this method returns successfully, the reader will be pointing at the token right after the end event.

Specified by:
unmarshal in interface Unmarshaller

Parameters:
reader - The parser to be read.
expectedType - appropriate JAXB mapped class to hold reader's START_ELEMENT XML data.

Returns:
unmarshal

class <T>  JAXBElement< T> unmarshal(XMLEventReader reader, 
                                      Class< T> expectedType)
                                      throws JAXBException

Description copied from interface: Unmarshaller
Unmarshal root element to JAXB mapped declaredType and return 
the resulting content tree.

This method implements unmarshal by declaredType.

This method assumes that the parser is on a START_DOCUMENT 
or START_ELEMENT event. Unmarshalling will be done from this 
start event to the corresponding end event. If this method returns 
successfully, the reader will be pointing at the token right after the 
end event.

Specified by: 
unmarshal in interface Unmarshaller

Parameters:
reader - The parser to be read.
expectedType - appropriate JAXB mapped class to hold reader's 
START_ELEMENT XML data.

Returns:
content tree rooted by JAXB Element representation

Throws:
JAXBException - If any unexpected errors occur while 
unmarshalling
UnmarshalException - If the ValidationEventHandler returns false from its handleEvent method or the Unmarshaller is unable to perform the XML to Java binding. See Unmarshalling XML Data

public void setSchema(javax.xml.validation.Schema schema)

setSchema

public void setSchema(Schema schema)

Description copied from interface: Unmarshaller
Specify the JAXP 1.3 Schema object that should be used to validate subsequent unmarshal operations against. Passing null into this method will disable validation.

This method replaces the deprecated setValidating(boolean) API.

Initially this property is set to null.

Specified by:
setSchema in interface Unmarshaller

Parameters:
schema - Schema object to validate unmarshal operations against or null to disable validation

public javax.xml.validation.Schema getSchema()

getSchema

public Schema getSchema()

Description copied from interface: Unmarshaller
Get the JAXP 1.3 Schema object being used to perform unmarshal-time validation. If there is no Schema set on the unmarshaller, then
this method will return null indicating that unmarshal-time validation will not be performed.

This method provides replacement functionality for the deprecated Unmarshaller.isValidating() API as well as access to the Schema object. To determine if the Unmarshaller has validation enabled, simply test the return type for null:

```java
boolean is_validating = u.getSchema() != null;
```

**Specified by:**
getSchema in interface Unmarshaller

**Returns:**
the Schema object being used to perform unmarshal-time validation or null if not present

---

```java
public void setAdapter("XmlAdapter adapter)
```

**setAdapter**

```java
public void setAdapter(XmlAdapter adapter)
```

**Description copied from interface:** Unmarshaller
Associates a configured instance of XmlAdapter with this unmarshaller.

This is a convenience method that invokes setAdapter(adapter.getClass(), adapter);

**Specified by:**
setAdapter in interface Unmarshaller

**See Also:**
Unmarshaller.setAdapter(Class, XmlAdapter)
**setAdapter**

```java
public <A extends XmlAdapter> void setAdapter(Class<A> type, A adapter)
```

**Description copied from interface: Unmarshaller**
Associates a configured instance of XmlAdapter with this unmarshaller.

Every unmarshaller internally maintains a `Map<Class, XmlAdapter>`, which it uses for unmarshalling classes whose fields/methods are annotated with `XmlJavaTypeAdapter`.

This method allows applications to use a configured instance of `XmlAdapter`. When an instance of an adapter is not given, an unmarshaller will create one by invoking its default constructor.

**Specified by:**
- `setAdapter` in interface `Unmarshaller`

**Parameters:**
- `type` - The type of the adapter. The specified instance will be used when `XmlJavaTypeAdapter.value()` refers to this type.
- `adapter` - The instance of the adapter to be used. If null, it will un-register the current adapter set for this type.

---

**getAdapter**

```java
public <A extends XmlAdapter> A getAdapter(Class<A> type)
```

**Description copied from interface: Unmarshaller**
Gets the adapter associated with the specified type. This is the reverse operation of the `Unmarshaller.setAdapter(javax.xml.bind.annotation.adapters.XmlAdapter)` method.

**Specified by:**
- `getAdapter` in interface `Unmarshaller`
public void setAttachmentUnmarshaller(AttachmentUnmarshaller au)

setAttachmentUnmarshaller

public void setAttachmentUnmarshaller(AttachmentUnmarshaller au)

Description copied from interface: Unmarshaller

Associate a context that resolves cid's, content-id URIs, to binary data passed as attachments.

Unmarshal time validation, enabled via Unmarshaller.setSchema(Schema), must be supported even when unmarshaller is performing XOP processing.

Specified by:
  setAttachmentUnmarshaller in interface Unmarshaller

public AttachmentUnmarshaller getAttachmentUnmarshaller()

getAttachmentUnmarshaller

public AttachmentUnmarshaller getAttachmentUnmarshaller()

  Specified by:
    getAttachmentUnmarshaller in interface Unmarshaller

public void setListener(Unmarshaller.Listener listener)

setListener
public void setListener(Unmarshaller.Listener listener)

Description copied from interface: Unmarshaller

Register unmarshal event callback Unmarshaller.Listener with this Unmarshaller.

There is only one Listener per Unmarshaller. Setting a Listener replaces the previous set Listener. One can unregister current Listener by setting listener to null.

Specified by:

setListener in interface Unmarshaller

Parameters:

listener - provides unmarshal event callbacks for this Unmarshaller

public Unmarshaller.Listener getListener()

getListener

public Unmarshaller.Listener getListener()

Description copied from interface: Unmarshaller

Return Unmarshaller.Listener registered with this Unmarshaller.

Specified by:

getListener in interface Unmarshaller

Returns:

registered Unmarshaller.Listener or null if no Listener is registered with this Unmarshaller.

Methods inherited from class `javax.faces.event.FacesEvent`:
- `getComponent`, `getPhaseId`, `queue`, `setPhaseId`

Methods inherited from class `java.util.EventObject`:
- `getSource`, `toString`

Methods inherited from class `java.lang.Object`:
- `clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `wait`, `wait`, `wait`

Constructor Detail

```java
public ActionEvent(UIComponent component)
```

**Throws**
- `IllegalArgumentException`: `component` null

ActionEvent

```java
public ActionEvent(UIComponent component)
```
Construct a new event object from the specified source component and action command.

**Parameters:**
- **component** - Source `UIComponent` for this event

**Throws:**
- `IllegalArgumentException` - if component is null

### Method Detail

```java
public boolean isAppropriateListener(FacesListener listener)
```

**isAppropriateListener**

```java
public boolean isAppropriateListener(FacesListener listener)
```

**Description copied from class:** [FacesEvent](#)

Return true if this `FacesListener` is an instance of a listener class that this event supports. Typically, this will be accomplished by an "instanceof" check on the listener class.

**Specified by:**
- `isAppropriateListener` in class [FacesEvent](#)

**Parameters:**
- **listener** - `FacesListener` to evaluate

```java
public void processListener(FacesListener listener)
```

**Throws**
- `AbortProcessingException`: NotSupportedException  JavaServer Face

**processListener**
public void processListener(FacesListener listener)

Description copied from class: FacesEvent

Broadcast this FacesEvent to the specified FacesListener, by whatever mechanism is appropriate. Typically, this will be accomplished by calling an event processing method, and passing this FacesEvent as a parameter.

Specified by:  
processListener in class FacesEvent

Parameters:
- listener - FacesListener to send this FacesEvent to

Throws:
- AbortProcessingException - Signal the JavaServer Faces implementation that no further processing on the current event should be performed

Copyright 2007 Sun Microsystems, Inc. All rights reserved. Use is subject to license terms.
javax.faces.event Interface ActionListener

All Superinterfaces:
   EventListener, FacesListener

All Known Implementing Classes:
   MethodExpressionActionListener

public interface ActionListener
extends FacesListener

Implements: FacesListener
Implemented by: MethodExpressionActionListener

ActionEvent addActionListener()
UIComponent

A listener interface for receiving ActionEvents. A class that is interested in receiving such events implements this interface, and then registers itself with the source UIComponent of interest, by calling addActionListener().

Method Summary

<table>
<thead>
<tr>
<th>processAction</th>
<th>(ActionEvent event)</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Invoked when the action described by the specified(ActionEvent occurs.</td>
</tr>
</tbody>
</table>

Method Detail

public void processAction(ActionEvent event) throws AbortProcessingException
**ActionEvent**

```java
void processAction(ActionEvent event)
```

Invoked when the action described by the specified `ActionEvent` occurs.

**Parameters:**
- `event` - The `ActionEvent` that has occurred

**Throws:**
- `AbortProcessingException` - Signal the JavaServer Faces implementation that no further processing on the current event should be performed

---

**Copyright 2007 Sun Microsystems, Inc. All rights reserved. Use is subject to license terms.**

**PS:**
javax.faces.component Interface ActionSource

All Known Subinterfaces:  

ActionSource2

All Known Implementing Classes:  

HtmlCommandButton, HtmlCommandLink, UICommand

public interface ActionSource

Implemented by: ActionSource2

ActionSource is an interface that may be implemented by any concrete UIComponent that wishes to be a source of ActionEvent s, including the ability to invoke application actions via the default ActionListener mechanism.

Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void addActionListener(ActionListener listener)</td>
<td>Add a new ActionListener to the set of listeners interested in being notified when ActionEvent s occur.</td>
</tr>
<tr>
<td>MethodBinding getAction()</td>
<td>Deprecated. This has been replaced by ActionSource2.getActionExpression().</td>
</tr>
<tr>
<td>MethodBinding getActionListener()</td>
<td>Deprecated. Use getActionListeners() instead.</td>
</tr>
<tr>
<td>ActionListener[] getActionListeners()</td>
<td>Return the set of registered ActionListeners for this</td>
</tr>
</tbody>
</table>
boolean isImmediate()  
Return a flag indicating that the default ActionListener provided by the JavaServer Faces implementation should be executed immediately (that is, during Apply Request Value phase of the request processing lifecycle), rather than wait until the Invoke Application phase.

void removeActionListener(ActionListener listener)  
Remove an existing ActionListener (if any) from the listeners interested in being notified when ActionEvents occur.

void setAction(MethodBinding action)  
**Deprecated. This has been replaced by ActionSource2.setActionExpression(javax.el.MethodExpression)**

void setActionListener(MethodBinding actionListener)  
**Deprecated. This has been replaced by addActionListener(javax.faces.event.ActionListener).**

void setImmediate(boolean immediate)  
Set the "immediate execution" flag for this UIComponent.

---

**Method Detail**

public MethodBinding getAction()

```
ActionSource2    ActionSource2#getActionExpression
#setAction       MethodBinding     MethodBinding
javax.el.MethodExpression

ActionSource2    MethodBinding    MethodBinding
UIComponent      immediate

deprecated       ActionSource2#getActionExpression
```

getAction
MethodBinding  getAction()

**Deprecated.** This has been replaced by 
*ActionSource2.getActionExpression()*.

If the implementing class also implements *ActionSource2*, the implementation of this method must call through to 
*ActionSource2.getActionExpression()* and examine the result. If the result came from a previous call to 
*setAction(javax.faces.el.MethodBinding)*, extract the MethodBinding from it and return it. Otherwise, wrap the returned *MethodExpression* in a MethodBinding implementation, and return it.

If the implementing class does not implement *ActionSource2*, return the MethodBinding pointing at the application action to be invoked, if this *UIComponent* is activated by the user, during the *Apply Request Values* or *Invoke Application* phase of the request processing lifecycle, depending on the value of the *immediate* property.

```
public void setAction(*MethodBinding* action)

    *ActionSource2*    *javax.el.MethodExpression*  action
    *ActionSource2#setActionExpression*  action

    *ActionSource2*    *MethodBinding*    *MethodBinding*
    *UIComponent*        immediate

    String

    action  MethodBinding
    deprecated  *setActionExpression(javax.el.MethodExpression)*
```

**setAction**

```
void setAction(*MethodBinding* action)
```
Deprecated. This has been replaced by `ActionSource2.setActionExpression(javax.el.MethodExpression)`.

If the implementing class also implements `ActionSource2`, the implementation of this method must wrap the argument `action` in a class that implements `MethodExpression` and call through to `ActionSource2.setActionExpression(javax.el.MethodExpression)`, passing the wrapped `action`.

If the implementing class does not implement `ActionSource2`, set the `MethodBinding` pointing at the application action to be invoked, if this `UIComponent` is activated by the user, during the `Apply Request Values` or `Invoke Application` phase of the request processing lifecycle, depending on the value of the `immediate` property.

Any method referenced by such an expression must be public, with a return type of `String`, and accept no parameters.

**Parameters:**

- `action` - The new `MethodBinding` expression

```java
public MethodBinding getActionListener()

#setActionListener null #setActionListener
#setActionListener MethodBinding

UIComponent immediate

deprecated #getActionListeners

g fåActionListener

MethodBinding getActionListener()

Deprecatd. Use `getActionListeners()` instead.

If `setActionListener(javax.faces.el.MethodBinding)` was not
previously called for this instance, this method must return `null`. If it was called, this method must return the exact `MethodBinding` instance that was passed to

```java
setActionListener(javax.faces.el.MethodBinding).
```

The method to be invoked, if this `UIComponent` is activated by the user, will be called during the `Apply Request Values` or `Invoke Application` phase of the request processing lifecycle, depending upon the value of the `immediate` property.

```java
public void setActionListener(MethodBinding actionListener)
```

- `ActionListener actionListener` #getActionListeners
- `setActionListener` #addActionListener(javax.faces.event.ActionListener)

```java
setActionListener
```

```java
void ActionEvent
```

- `actionListener` #addActionListener(javax.faces.event.ActionListener)
- `deprecated`

```java
setActionListener
```

```java
void setActionListener(MethodBinding actionListener)
```

**Deprecated.** This has been replaced by `addActionListener(javax.faces.event.ActionListener).

Wrap the argument `actionListener` in an implementation of `ActionListener` and store it in the internal data structure that backs the `getActionListeners()` method, taking care to over-write any instance that was stored by a previous call to `setActionListener`.

Any method referenced by such an expression must be public, with a return type of `void`, and accept a single parameter of type
Parameters:

- `actionListener` - The new method binding expression

---

**public boolean isImmediate()**

**JavaServer Faces**

- `ActionListener`

- `false`

**isImmediate**

**boolean isImmediate()**

Return a flag indicating that the default `ActionListener` provided by the JavaServer Faces implementation should be executed immediately (that is, during *Apply Request Values* phase of the request processing lifecycle), rather than waiting until the *Invoke Application* phase. The default value for this property must be `false`.

---

**public void setImmediate(boolean immediate)**

**UIComponent**

"immediate execution"

**boolean immediate**

**setImmediate**

**void setImmediate(boolean immediate)**

Set the "immediate execution" flag for this `UIComponent`.

**Parameters:**
The new immediate execution flag

**public void addActionListener(ActionListener listener)**

ActionEvent ActionListener

listener ActionListener

**Throws**

NullPointerException: listener null

**addActionListener**

void addActionListener(ActionListener listener)

Add a new ActionListener to the set of listeners interested in being notified when ActionEvents occur.

**Parameters:**

listener - The ActionListener to be added

**Throws:**

NullPointerException - if listener is null

**public ActionListener[] getActionListeners()**

ActionSource ActionListener 0

**getActionListeners**

ActionListener[] getActionListeners()

Return the set of registered ActionListeners for this ActionSource instance. If there are no registered listeners, a zero-length array is returned.
public void removeActionListener(ActionListener listener)

removeActionListener
void removeActionListener(ActionListener listener)

Remove an existing ActionListener (if any) from the set of listeners interested in being notified when ActionEvent s occur.

Parameters:
listener - The ActionListener to be removed

Throws:
NullPointerException - if listener is null

PS:
public interface ActionSource2
extends ActionSource

Implements: ActionSource
Implemented by: UICommand

ActionSource2 extends ActionSource and provides a JavaBeans property analogous to the "action" property on ActionSource. The difference is the type of this property is a MethodExpression rather than a MethodBinding. This allows the ActionSource concept to leverage the new Unified EL API.

Since: 1.2

**Method Summary**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getActionExpression()</td>
<td>Return the MethodExpression pointing at the</td>
</tr>
</tbody>
</table>
application action to be invoked, if this `UIComponent` is activated by the user, during the `Apply Request Values` or `Invoke Application` phase of the request processing lifecycle, depending on the value of the `immediate` property.

```java
void setActionExpression(MethodExpression action)
```

Set the `MethodExpression` pointing at the application action to be invoked, if this `UIComponent` is activated by the user, during the `Apply Request Values` or `Invoke Application` phase of the request processing lifecycle, depending on the value of the `immediate` property.

Methods inherited from interface `javax.faces.component.ActionSource`:
- `addActionListener`, `getAction`, `getActionListener`, `getActionListeners`, `isImmediate`, `removeActionListener`, `setAction`, `setActionListener`, `setImmediate`

**Method Detail**

```java
public MethodExpression getActionExpression()
```

```java
MethodExpression MethodExpression UIComponent
immediate
```

```java
MethodExpression ActionSource#setAction
MethodBinding ActionListener
```

**getActionExpression**

```java
MethodExpression getActionExpression()
```

Return the `MethodExpression` pointing at the application action to be
invoked, if this UIComponent is activated by the user, during the Apply Request Values or Invoke Application phase of the request processing lifecycle, depending on the value of the immediate property.

Note that it's possible that the returned MethodExpression is just a wrapper around a MethodBinding instance wihch was set by a call to ActionSource.setAction(javax.faces.el.MethodBinding). This makes it possible for the default ActionListener to continue to work properly with older components.

---

```java
public void setActionExpression(MethodExpression action)
```

```
MethodExpression   MethodExpression   UIComponent
immediate

String

action
```

**setActionExpression**

```java
void setActionExpression(MethodExpression action)
```

Set the MethodExpression pointing at the application action to be invoked, if this UIComponent is activated by the user, during the Apply Request Values or Invoke Application phase of the request processing lifecycle, depending on the value of the immediate property.

Any method referenced by such an expression must be public, with a return type of String, and accept no parameters.

**Parameters:**

- **action** - The new method expression

### Field Detail

**EXECUTE**

public static final ActionType EXECUTE

The DeploymentManager action command is executing.
CANCEL

public static final ActionType CANCEL

   A cancel operation is being preformed on the DeploymentManager action command.

STOP

public static final ActionType STOP

   A stop operation is being preformed on the DeploymentManager action command.

Constructor Detail

protected ActionType(int value)

   value

ActionType

protected ActionType(int value)

   Construct a new enumeration value with the given integer value.

   Parameters:
   value - Integer value.

Method Detail

public int getValue()
getValue

public int getValue()

    Returns this enumeration value's integer value.

    Returns: the value

protected String[] getStringTable()

getStringTable

protected String[] getStringTable()

    Returns the string table for class ActionType

protected ActionType[] getEnumValueTable()

getEnumValueTable

protected ActionType[] getEnumValueTable()

    Returns the enumeration value table for class ActionType

public static ActionType getActionType(int value)

value
getActionType

public static ActionType getActionType(int value)

    Return an object of the specified value.

    Parameters:
    value - a designator for the object.

public String toString()

ActionType

toString

public String toString()

    Return the string name of this ActionType or the integer value if outside the bounds of the table

    Overrides:
    toString in class Object

protected int getOffset()

    0
    return

g Moffet

protected int getOffset()
Returns the lowest integer value used by this enumeration value's enumeration class.

The default implementation returns 0.

**Returns:**
the offset of the lowest enumeration value.

**Extends:**  
java.awt.datatransfer.DataFlavor

ActivationDataFlavor  
java.awt.datatransfer.DataFlavor  
JAF  
DataFlavor  
equals MIME  
JDél

The ActivationDataFlavor class is a special subclass of  
java.awt.datatransfer.DataFlavor. It allows the JAF to set all three  
values stored by the DataFlavor class via a new constructor. It also  
contains improved MIME parsing in the equals method. Except for the  
improved parsing, its semantics are identical to that of the JDK's  
DataFlavor class.

**See Also:**

public ActivationDataFlavor(Class<T> representationClass, String mimeType, String humanPresentableName)

Java DataFlavor JDK DataFlavor DataFlavor

representationClass = representationClass
mimeType = mimeType
humanName = humanName

ActivationDataFlavor

public ActivationDataFlavor(Class representationClass, String mimeType, String humanPresentableName)
Construct a DataFlavor that represents an arbitrary Java object. This constructor is an extension of the JDK’s DataFlavor in that it allows the explicit setting of all three DataFlavor attributes.

The returned DataFlavor will have the following characteristics:

representationClass = representationClass
mimeType = mimeType
humanName = humanName

**Parameters:**
- representationClass - the class used in this DataFlavor
- mimeType - the MIME type of the data represented by this class
- humanPresentableName - the human presentable name of the flavor

```java
public ActivationDataFlavor(Class<T> representationClass, String humanPresentableName)
```

DataFlavor

mimeType "application/x-java-serialized-object;
class=" DataFlavor(Class:forName())

representationClass = InputStream

mimeType = mimeType

<table>
<thead>
<tr>
<th>representationClass</th>
<th>DataFlavor</th>
</tr>
</thead>
<tbody>
<tr>
<td>humanPresentableName</td>
<td>flavor</td>
</tr>
</tbody>
</table>
ActivationDataFlavor

```
public ActivationDataFlavor(Class representationClass,
                             String humanPresentableName)
```

Construct a DataFlavor that represents a MimeType.

The returned DataFlavor will have the following characteristics:

If the mimeType is "application/x-java-serialized-object; class="", the result is the same as calling new DataFlavor(Class.forName()) as above.

otherwise:

representationClass = InputStream

mimeType = mimeType

**Parameters:**
- representationClass - the class used in this DataFlavor
- humanPresentableName - the human presentable name of the flavor

```
public ActivationDataFlavor(String mimeType, String humanPresentableName)
MimeType DataFlavor

DataFlavor

mimeType "application/x-java-serialized-object; class=" DataFlavor(Class.forName())

representationClass = InputStream

mimeType = mimeType
```
ActivationDataFlavor

public ActivationDataFlavor(String mimeType, String humanPresentableName)

Construct a DataFlavor that represents a MimeType.

The returned DataFlavor will have the following characteristics:

If the mimeType is "application/x-java-serialized-object; class=", the result is the same as calling new DataFlavor(Class.forName()) as above, otherwise:

representationClass = InputStream
mimeType = mimeType

Parameters:
  mimeType - the MIME type of the data represented by this class
  humanPresentableName - the human presentable name of the flavor

Method Detail

public String getMimeType()

  DataFlavor MIME
  return MIME

getMimeType

public String getMimeType()

  Return the MIME type for this DataFlavor.
Overrides:
getMimeType in class DataFlavor

Returns:
the MIME type

public Class<T> getRepresentationClass()
    return

getRepresentationClass

public Class getRepresentationClass()
    Return the representation class.

Overrides:
getRepresentationClass in class DataFlavor

Returns:
the representation class

public String getHumanPresentableName()
    return

getHumanPresentableName

public String getHumanPresentableName()
    Return the Human Presentable name.

Overrides:
getHumanPresentableName in class DataFlavor

Returns:
the human presentable name
public void setHumanPresentableName(String humanPresentableName)

    humanPresentableName

setHumanPresentableName

public void setHumanPresentableName(String humanPresentableName)

    Set the human presentable name.

    Overrides:
    setHumanPresentableName in class DataFlavor

    Parameters:
    humanPresentableName - the name to set

public boolean equals(java.awt.datatransfer.DataFlavor dataFlavor)

    DataFlavor DataFlavor

        isMimeTypeEqual

        dataFlavor DataFlavor

        return MIME true

equals

public boolean equals(DataFlavor dataFlavor)

    Compares the DataFlavor passed in with this DataFlavor; calls the
    isMimeTypeEqual method.

    Overrides:
    equals in class DataFlavor

    Parameters:
    dataFlavor - the DataFlavor to compare with
public boolean isMimeTypeEqual(String mimeType)

MIME  DataFlavor  MIME

ActivationDataFlavor  MIME  JavaBeans Activation Framework  MimeType  DataFlavor

mimeType

return

MIME  true

isMimeTypeEqual

public boolean isMimeTypeEqual(String mimeType)

Is the string representation of the MIME type passed in equivalent to the MIME type of this DataFlavor.

ActivationDataFlavor delegates the comparison of MIME types to the MimeType class included as part of the JavaBeans Activation Framework. This provides a more robust comparison than is normally available in the DataFlavor class.

Overrides:

isMimeTypeEqual in class DataFlavor

Parameters:

mimeType - the MIME type

Returns:

true if the same MIME type

protected String normalizeMimeTypeParameter(String parameterName, String parameterValue)

MIME  DataFlavor  DataFlavor / charset
normalizeMimeTypeParameter

protected String normalizeMimeTypeParameter(String mimeType)

Deprecated.

Called on DataFlavor for every MIME Type parameter to allow DataFlavor subclasses to handle special parameters like the text/plain charset parameters, whose values are case insensitive. (MIME type parameter values are supposed to be case sensitive).

This method is called for each parameter name/value pair and should return the normalized representation of the parameter value.

This method is never invoked by this implementation.

Overrides: normalizeMimeTypeParameter in class DataFlavor

Parameters:
  parameterName - the parameter name
  parameterValue - the parameter value

Returns:
  the normalized parameter value
normalizeMimeType

protected String normalizeMimeType(String mimeType)

Deprecated.

Called for each MIME type string to give DataFlavor subtypes the opportunity to change how the normalization of MIME types is accomplished. One possible use would be to add default parameter/value pairs in cases where none are present in the MIME type string passed in. This method is never invoked by this implementation.

Overrides:
    normalizeMimeType in class DataFlavor

Parameters:
    mimeType - the MIME type

Returns:
    the normalized MIME type
javax.resource.spi  Interface ActivationSpec

All Superinterfaces:  
   ResourceAdapterAssociation

public interface ActivationSpec  
extends ResourceAdapterAssociation

Implements: ResourceAdapterAssociation

ActivationSpec  JavaBean  
   version  1.0

This interface serves as a marker. An instance of an ActivationSpec must be a JavaBean and must be serializable. This holds the activation configuration information for a message endpoint.

Version:  
   1.0

Author:  
   Ram Jeyaraman

<table>
<thead>
<tr>
<th>Method Summary</th>
</tr>
</thead>
</table>
| void validate()  
   This method may be called by a deployment tool to validate the overall activation configuration information provided by the endpoint deployer. |

Methods inherited from interface javax.resource.spi.ResourceAdapterAssociation  
getResourceAdapter, setResourceAdapter
public void validate() throws InvalidPropertyException

Throws

InvalidPropertyException:

validate

void validate()
throws InvalidPropertyException

This method may be called by a deployment tool to validate the overall activation configuration information provided by the endpoint deployer. This helps to catch activation configuration errors earlier on without having to wait until endpoint activation time for configuration validation. The implementation of this self-validation check behavior is optional.

Throws:

InvalidPropertyException - indicates invalid configuration property settings.

InvalidPropertyException

javax.mail Class Address

java.lang.Object
   \- javax.mail.Address

All Implemented Interfaces:
   Serializable

Direct Known Subclasses:
   InternetAddress, NewsAddress

public abstract class Address

extends Object
implements Serializable

Implements: java.io.Serializable
Extended by: InternetAddress, NewsAddress

Address

This abstract class models the addresses in a message. Subclasses provide specific implementations. Subclasses will typically be serializable so that (for example) the use of Address objects in search terms can be serialized along with the search terms.

### Constructor Detail

**public Address()**

**Address**

**public Address()**

### Method Detail

**abstract public String getType()**

```java
    return
```

See also  

```
javax.mail.internet.InternetAddress
```

**getType**

**public abstract String getType()**
Return a type string that identifies this address type.

**Returns:**
address type

**See Also:**
[InternetAddress](#)

---

```java
abstract public String toString()
Address String
    return
```

### toString

```java
generic method java lang Object
toString() String
```

**toString**

```
public abstract String toString()
```

Return a String representation of this address object.

**Overrides:**
`toString` in class [Object](#)

**Returns:**
String representation of this address

---

```java
abstract public boolean equals(Object address)
Address hashCode - hashCode
    address Address
```

### equals

```
public abstract boolean equals(Object address)
```

The equality operator. Subclasses should provide an implementation of this method that supports value equality (do the two Address objects represent the same destination?), not object reference...
equality. A subclass must also provide a corresponding implementation of the `hashCode` method that preserves the general contract of `equals` and `hashCode` - objects that compare as equal must have the same `hashCode`.

**Overrides:**

`equals` in class `Object`

**Parameters:**

`address` - Address object
public class AddressException

extends ParseException

Extends: Throwable > Exception > MessagingException > ParseException

The exception thrown when a wrongly formatted address is encountered.

Author: Bill Shannon, Max Spivak

Field Detail

ref

protected String ref

The string being parsed.

pos

protected int pos

The index in the string where the error occurred, or -1 if not known.

Constructor Detail

public AddressException()

AddressException

AddressException

public AddressException()

Constructs an AddressException with no detail message.

public AddressException(String s)

AddressException
AddressException

public AddressException(String s)

Constructs an AddressException with the specified detail message.

Parameters:
   s - the detail message

public AddressException(String s, String ref)

AddressException

public AddressException(String s, String ref, int pos)

AddressException

public AddressException(String s,
Constructs an AddressException with the specified detail message and reference info.

**Parameters:**
- s - the detail message

### Method Detail

#### public String getRef()

```java
String getRef()
null
```

**getRef**

```java
public String getRef()
```

Get the string that was being parsed when the error was detected (null if not relevant).

#### public int getPos()

```java
int getPos()
-1
```

**getPos**

```java
public int getPos()
```

Get the position with the reference string where the error was detected (-1 if not relevant).

#### public String toString()
public String toString()

Description copied from class: MessagingException
Override toString method to provide information on nested exceptions.

Overrides:
<code>toString</code> in class MessagingException

### Constructor Detail

protected `AddressStringTerm(String pattern)`
protected AddressStringTerm(String pattern)

Constructor.

Parameters:
  pattern - the address pattern to be compared.

Method Detail

protected boolean match(Address a)

Check whether the address pattern specified in the constructor is a substring of the string representation of the given Address object.

Note that if the string representation of the given Address object contains charset or transfer encodings, the encodings must be accounted for, during the match process.

Parameters:
The comparison is applied to this Address object.

**Returns:**
true if the match succeeds, otherwise false.

**public boolean equals(Object obj)**

equals

public boolean equals(Object obj)

Equality comparison.

**Overrides:**
equals in class `StringTerm`

\( t1 \)

\( t2 \)
AndTerm

class AndTerm/SearchTerm(t1, SearchTerm t2)

Constructor that takes two terms.

Parameters:
- t1 - first term
- t2 - second term

public AndTerm/SearchTerm[] t)

SearchTerm

Constructor that takes an array of SearchTerms.

Parameters:
- t - array of terms

Method Detail

public SearchTerm[] getTerms()
public boolean match(Message msg)

AND

AND

msg SearchTerm MessageAND

return AND true false

match

public boolean match(Message msg)

The AND operation.

The terms specified in the constructor are applied to the given object and the AND operator is applied to their results.

Specified by:

match in class SearchTerm

Parameters:

msg - The specified SearchTerms are applied to this Message and the AND operator is applied to their results.

Returns:

true if the AND succeeds, otherwise false

equals

public boolean equals(Object obj)
Equality comparison.

**Overrides:**

equals in class Object

```java
public int hashCode()
```

**hashCode**

```java
public int hashCode()
```

Compute a hashCode for this object.

**Overrides:**

hashCode in class Object

PS:
javax.faces.application Class Application

java.lang.Object
   \javax.faces.application.Application

public abstract class Application
extends Object

Application  Web  JavaServer Faces  JavaServer Faces

   ApplicationFactory  getApplication()  Application

Faces  Object
Application#createComponentApplication#createConverter
Application#createValidator

Application represents a per-web-application singleton object where applications based on JavaServer Faces (or implementations wishing to provide extended functionality) can register application-wide singletons that provide functionality required by JavaServer Faces. Default implementations of each object are provided for cases where the application does not choose to customize the behavior.

The instance of Application is created by calling the getApplication() method of ApplicationFactory. Because this instance is shared, it must be implemented in a thread-safe manner.

The application also acts as a factory for several types of Objects specified in the Faces Configuration file. Please see createComponent(java.lang.String), createConverter(java.lang.String), and createValidator(java.lang.String).
## Method Summary

<table>
<thead>
<tr>
<th>Method</th>

</table>
abstract String getMessageBundle()  
Return the fully qualified class name of the ResourceBundle messages for this application.

abstract NavigationHandler getNavigationHandler()  
Return the NavigationHandler instance that will be invoked application action for this web application.

abstract PropertyResolver getPropertyResolver()  
Deprecated. This has been replaced by getELResolver()

ResourceBundle getResourceBundle(FacesContext ctx, String name)  
Find a ResourceBundle as defined in the application configuration resources under the specified name.

abstract StateManager getStateManager()  
Return the StateManager instance that will be utilized for Response phases of the request processing lifecycle.

abstract Iterator<Locale> getSupportedLocales()  
Return an Iterator over the supported Locales for this application.

abstract Iterator<String> getValidatorIds()  
Return an Iterator over the set of currently registered validators.

abstract VariableResolver getVariableResolver()  
Deprecated. This has been replaced by getELResolver()

abstract ViewHandler getViewHandler()  
Return the ViewHandler instance that will be utilized for Response phases of the request processing lifecycle.

void removeELContextListener(ELContextListener listener)  
Remove the argument listener from the list of ELContextListener.

abstract void setActionListener(ActionListener listener)  
Set the default ActionListener to be registered for all actions.

abstract void setDefaultLocale(Locale locale)  
Set the default Locale for this application.

abstract void setDefaultRenderKitId(String renderKitId)  
Set the renderKitId to be used to render this application.

abstract void setMessageBundle(String bundle)  
Set the fully qualified class name of the ResourceBundle messages for this application.

abstract void setNavigationHandler(NavigationHandler handler)
<table>

**Methods inherited from class java.lang.Object**

- `clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`

**Constructor Detail**

**public Application()**

**Application**

**public Application()**
abstract public **ActionListener** getActionListener()  

```java
javax.faces.component.ActionSource  ActionListener
```

- `processAction()`  `FacesContext.renderResponse()`
- `processAction()`
  - null `action`  `MethodBinding`  `invoke()`  `String`
  - null
- `processAction()`  `NavigationHandler`  `NavigationHandler#handleNavigation`
  - `FacesContext`
  - `action`  `MethodBinding`
    - `MethodBinding#getExpressionString`  `null`
  - `null`

```java
ActionListener ( action) ( MethodBinding)
ActionListener  javax.faces.component.ActionSource2
javax.faces.component.ActionSource
```

**getActionListener**

public abstract **ActionListener** getActionListener()  

Return the default **ActionListener** to be registered for all **ActionSource** components in this application. If not explicitly set, a default implementation must be provided that performs the following functions:

- The `processAction()` method must first call  
  `FacesContext.renderResponse()` in order to bypass any
The processAction() method must next determine the logical outcome of this event, as follows:

- If the originating component has a non-null action property, retrieve the MethodBinding from the property, and call invoke() on it. Convert the returned value (if any) to a String, and use it as the logical outcome.
- Otherwise, the logical outcome is null.

The processAction() method must finally retrieve the NavigationHandler instance for this application and call NavigationHandler.handleNavigation(javax.faces.context.FacesContext, java.lang.String, java.lang.String) passing:

- the FacesContext for the current request
- If there is a MethodBinding instance for the action property of this component, the result of calling MethodBinding.getExpressionString() on it, null otherwise
- the logical outcome as determined above

Note that the specification for the default ActionListener continues to call for the use of a deprecated property (action) and class (MethodBinding). Unfortunately, this is necessary because the default ActionListener must continue to work with components that do not implement ActionSource2, and only implement ActionSource.

---

abstract public void setActionListener(ActionListener listener)

javax.faces.component.ActionSource ActionListener

listener ActionListener

.Throws NullPointerException: listener null

setActionListener

public abstract void setActionListener(ActionListener listener)

Set the default ActionListener to be registered for all ActionSource
components.

**Parameters:**
- listener - The new default `ActionListener`

**Throws:**
- `NullPointerException` - if listener is null

```
abstract public java.util.Locale getDefaultLocale()
```

```
Locale null
```

### `getDefaultLocale`

```
public abstract Locale getDefaultLocale()
```

Return the default `Locale` for this application. If not explicitly set, `null` is returned.

```
abstract public void setDefaultLocale(java.util.Locale locale)
```

```
Locale
locale

Throws
Locale
NullPointerException: locale null
```

### `setDefaultLocale`

```
public abstract void setDefaultLocale(Locale locale)
```

Set the default `Locale` for this application.

**Parameters:**
locale - The new default Locale

Throws:

NullPointerException - if locale is null

abstract public String getDefaultRenderKitId()

renderKitId null

getDefaultRenderKitId

public abstract String getDefaultRenderKitId()

Return the renderKitId to be used for rendering this application. If not explicitly set, null is returned.

abstract public void setDefaultRenderKitId(String renderKitId)

renderKitId javax.faces.render.RenderKit ViewHandler Faces

setDefaultRenderKitId

public abstract void setDefaultRenderKitId(String renderKitId)

Set the renderKitId to be used to render this application. Unless the client has provided a custom ViewHandler that supports the use of multiple RenderKit instances in the same application, this method must only be called at application startup, before any Faces requests have been processed. This is a limitation of the current Specification, and may be lifted in a future release.
abstract public String getMessageBundle()

JavaServer Faces ResourceBundle null

getMessageBundle

public abstract String getMessageBundle()

Return the fully qualified class name of the ResourceBundle to be used for JavaServer Faces messages for this application. If not explicitly set, null is returned.

abstract public void setMessageBundle(String bundle)

JavaServer Faces ResourceBundle java.util.ResourceBundle JavaDocs

bundle

Throws NullPointerException: bundle null

setMessageBundle

public abstract void setMessageBundle(String bundle)

Set the fully qualified class name of the ResourceBundle to be used for JavaServer Faces messages for this application. See the JavaDocs for the java.util.ResourceBundle class for more information about the syntax for resource bundle names.

Parameters:
    bundle - Base name of the resource bundle to be used

Throws:
    NullPointerException - if bundle is null
abstract public NavigationHandler getNavigationHandler()

getNavigationHandler

public abstract NavigationHandler getNavigationHandler()

Return the NavigationHandler instance that will be passed the outcome returned by any invoked application action for this web application. If not explicitly set, a default implementation must be provided that performs the functions described in the NavigationHandler class description.

abstract public void setNavigationHandler(NavigationHandler handler)

setNavigationHandler

public abstract void setNavigationHandler(NavigationHandler handler)

Set the NavigationHandler instance that will be passed the outcome returned by any invoked application action for this web application.

Parameters:
	handler - The new NavigationHandler instance

Throws:

NullPointerException - if handler is null
abstract public PropertyResolver getPropertyResolver()

 ELResolver  PropertyResolver  Faces  ELResolver
 EL

 PropertyResolver  PropertyResolver  EL  (no-op)

 deprecated

getPropertyResolver

public abstract PropertyResolver getPropertyResolver()

 Deprecated. This has been replaced by getELResolver().

Return a PropertyResolver instance that wraps the ELResolver instance that Faces provides to the unified EL for the resolution of expressions that appear programmatically in an application.

Note that this no longer returns the default PropertyResolver since that class is now a no-op that aids in allowing custom PropertyResolverS to affect the EL resolution process.

abstract public void setPropertyResolver(PropertyResolver resolver)

PropertyResolver

 resolver

Throws

NullPointerException: resolver null
setPropertyResolver

public abstract void setPropertyResolver(PropertyResolver resolver)

**Deprecated.** The recommended way to affect the execution of the EL is to provide an `<el-resolver>` element at the right place in the application configuration resources which will be considered in the normal course of expression evaluation. This method now will cause the argument resolver to be wrapped inside an implementation of `ELResolver` and exposed to the EL resolution system as if the user had called `addELResolver(javax.el.ELResolver)`.

Set the `PropertyResolver` instance that will be utilized to resolve method and value bindings.

This method is now deprecated but the implementation must cause the argument to be set as the head of the legacy `PropertyResolver` chain, replacing any existing value that was set from the application configuration resources.

It is illegal to call this method after the application has received any requests from the client. If an attempt is made to register a listener after that time it must have no effect.

**Parameters:**
- resolver - The new `PropertyResolver` instance

**Throws:**
- `NullPointerException` - if resolver is null
- `IllegalStateException` - if called after the first request to the `FacesServlet` has been serviced.
getResourceBundle(FacesContext ctx, String name)

ResourceBundle ResourceBundle
javax.faces.component.UIViewRoot

UnsupportedOperationException

return UIViewRoot ResourceBundle null
Throws FacesException:
Throws NullPointerException: ctx == null || name == null
since 1.2

getResourceBundle

public ResourceBundle getResourceBundle(FacesContext ctx,
                                        String name)

Find a ResourceBundle as defined in the application configuration
resources under the specified name. If a ResourceBundle was defined
for the name, return an instance that uses the locale of the current
UIViewRoot.

The default implementation throws UnsupportedOperationException
and is provided for the sole purpose of not breaking existing
applications that extend this class.

Returns:
    ResourceBundle for the current UIViewRoot, otherwise null
Throws:
    FacesException - if a bundle was defined, but not resolvable
    NullPointerException - if ctx == null || name == null
Since:
    1.2

abstract public VariableResolver getVariableResolver()
getVariableResolver

public abstract VariableResolver getVariableResolver()

Deprecated. This has been replaced by getELResolver().

Return the VariableResolver that wraps the ELResolver instance that Faces provides to the unified EL for the resolution of expressions that appear programmatically in an application. The implementation of the VariableResolver must pass null as the base argument for any methods invoked on the underlying ELResolver.

Note that this method no longer returns the default VariableResolver, since that class now is a no-op that aids in allowing custom VariableResolvers to affect the EL resolution process.

abstract public void setVariableResolver(VariableResolver resolver)

Throws NullPointerException: resolver null

<el-resolver>
deprecated

```java
public abstract void setVariableResolver(VariableResolver resolver)
```

**Deprecated.** The recommended way to affect the execution of the EL is to provide an `<el-resolver>` element at the right place in the application configuration resources which will be considered in the normal course of expression evaluation. This method now will cause the argument `resolver` to be wrapped inside an implementation of `ELResolver` and exposed to the EL resolution system as if the user had called `addELResolver(javax.el.ELResolver)`.

Set the `VariableResolver` instance that will be consulted to resolve method and value bindings.

This method is now deprecated but the implementation must cause the argument to be set as the head of the legacy `VariableResolver` chain, replacing any existing value that was set from the application configuration resources.

It is illegal to call this method after the application has received any requests from the client. If an attempt is made to register a listener after that time it must have no effect.

**Parameters:**
- `resolver` - The new `VariableResolver` instance

**Throws:**
- `NullPointerException` - if `resolver` is `null`
- `IllegalStateException` - if called after the first request to the `FacesServlet` has been serviced.

```java
public void addELResolver(ELResolver resolver)
```
addELResolver

public void addELResolver(ELResolver resolver)

Cause an the argument resolver to be added to the resolver chain as specified in section 5.5.1 of the JavaServer Faces Specification.

It is not possible to remove an ELResolver registered with this method, once it has been registered.

It is illegal to register an ELResolver after the application has received any requests from the client. If an attempt is made to register a listener after that time, an IllegalStateException must be thrown. This restriction is in place to allow the JSP container to optimize for the common case where no additional ELResolverS are in the chain, aside from the standard ones. It is permissible to add ELResolverS before or after initialization to a CompositeELResolver that is already in the chain.

The default implementation throws UnsupportedOperationException and is provided for the sole purpose of not breaking existing applications that extend Application.

Since:

1.2
public ELResolver getELResolver()

EL ELResolver javax.el.CompositeELResolver
ELResolver

1. <el-resolver> ELResolver

2. 5 VariableResolver ChainWrapper
VariableResolver implementation

3. 5 PropertyResolver ChainWrapper
PropertyResolver implementation

4. #addELResolver ELResolver

UnsupportedOperationException Application

since 1.2

getELResolver

public ELResolver getELResolver()

Return the singleton ELResolver instance to be used for all EL resolution. This is actually an instance of CompositeELResolver that must contain the following ELResolver instances in the following order:

1. ELResolver instances declared using the <el-resolver> element in the application configuration resources.

2. An implementation that wraps the head of the legacy VariableResolver chain, as per section VariableResolver ChainWrapper in Chapter 5 in the spec document.
3. An implementation that wraps the head of the legacy PropertyResolver chain, as per section PropertyResolver ChainWrapper in Chapter 5 in the spec document.

4. Any ELResolver instances added by calls to addELResolver(javax.el.ELResolver).

The default implementation throws UnsupportedOperationException and is provided for the sole purpose of not breaking existing applications that extend Application.

Since:
1.2

abstract public ViewHandler getViewHandler()

getViewHandler

public abstract ViewHandler getViewHandler()

Return the ViewHandler instance that will be utilized during the Restore View and Render Response phases of the request processing lifecycle. If not explicitly set, a default implementation must be provided that performs the functions described in the ViewHandler description in the JavaServer Faces Specification.

abstract public void setViewHandler(ViewHandler handler)

setDefaultHandler
**setViewHandler**

```java
public abstract void setViewHandler(ViewHandler handler)
```

Set the `ViewHandler` instance that will be utilized during the `Restore View` and `Render Response` phases of the request processing lifecycle.

**Parameters:**
- `handler` - The new `ViewHandler` instance

**Throws:**
- `IllegalStateException` - if this method is called after at least one request has been processed by the `Lifecycle` instance for this application.
- `NullPointerException` - if `handler` is null

---

**abstract public StateManager getStateManager()**

```java
StateManager JavaServer Faces
```

**getStateManager**

```java
public abstract StateManager getStateManager()
```

Return the `StateManager` instance that will be utilized during the `Restore View` and `Render Response` phases of the request processing lifecycle. If not explicitly set, a default implementation must be provided that performs the functions described in the `StateManager` description in the JavaServer Faces Specification.
abstract public void setStateManager(StateManager manager)

StateManager

manager
Throws  IllegalArgumentException: Lifecycle
Throws  NullPointerException: manager null

setStateManager

public abstract void setStateManager(StateManager manager)

Set the StateManager instance that will be utilized during the Restore View and Render Response phases of the request processing lifecycle.

Parameters:
manager - The new StateManager instance

Throws:
IllegalArgumentException - if this method is called after at least one request has been processed by the Lifecycle instance for this application.
NullPointerException - if manager is null

abstract public void addComponent(String componentType, String componentClass)

UIComponent

createComponent()

UIComponent

componentType
componentClass
Throws
NullPointerException: componentType
NullPointerException: componentClass null
addComponent

public abstract void addComponent(String componentType, String componentClass)

Register a new mapping of component type to the name of the corresponding UIComponent class. This allows subsequent calls to createComponent() to serve as a factory for UIComponent instances.

Parameters:
componentType - The component type to be registered
componentClass - The fully qualified class name of the corresponding UIComponent implementation

Throws:
NullPointerException - if componentType or componentClass is null

abstract public UIComponent createComponent(String componentType) throws FacesException

UIComponent addComponent()

Throws
FacesException: UIComponent

Throws
NullPointerException: componentType null

createComponent

public abstract UIComponent createComponent(String componentType) throws FacesException

Instantiate and return a new UIComponent instance of the class specified by a previous call to addComponent() for the specified component type.

Parameters:
componentType - The component type for which to create and
return a new `UIComponent` instance

**Throws:**
- `FacesException` - if a `UIComponent` of the specified type cannot be created
- `NullPointerException` - if `componentType` is null

```java
abstract public UIComponent createComponent(ValueBinding componentBinding,
                                              FacesContext context,
                                              String componentType)
throws FacesException
```

```java
ValueExpression componentBinding
#createComponent(javax.el.ValueExpression, javax.faces.context.FacesContext, java.lang.String)
```

```java
componentBinding
context
componentType
Throws
Throws
FacesException: UIComponent
NullPointerException:
```

deprecated `#createComponent(javax.el.ValueExpression, javax.faces.context.FacesContext, java.lang.String)`

---

**createComponent**

```java
public abstract UIComponent createComponent(ValueBinding componentBinding,
                                             FacesContext context,
                                             String componentType)
throws FacesException
```

**Deprecated. This has been replaced by**

```java
createComponent(javax.el.ValueExpression, javax.faces.context.FacesContext, java.lang.String)
```

Wrap the argument `componentBinding` in an implementation of `ValueExpression` and call through to

```java
createComponent(javax.el.ValueExpression, javax.faces.context.FacesContext, java.lang.String)
```
Parameters:

- `componentBinding` - ValueBinding representing a component value binding expression (typically specified by the component attribute of a custom tag)
- `context` - FacesContext for the current request
- `componentType` - Component type to create if the ValueBinding does not return a component instance

Throws:

- FacesException - if a UIComponent cannot be created
- NullPointerException - if any parameter is null

```java
public UIComponent createComponent(ValueExpression componentExpression, FacesContext context, String componentType) throws FacesException
```

<table>
<thead>
<tr>
<th>ValueExpression</th>
<th>getValue()</th>
<th>UIComponent</th>
<th>setValue()</th>
</tr>
</thead>
<tbody>
<tr>
<td>UIComponent</td>
<td>UIComponent</td>
<td>ValueExpression</td>
<td></td>
</tr>
</tbody>
</table>

Throws

- FacesException: component
- UnsupportedOperationException: Application
- NullPointerException: null

since 1.2

createComponent

```java
public UIComponent createComponent(ValueExpression componentExpression, FacesContext context, String componentType)
```
Call the `getValue()` method on the specified `ValueExpression`. If it returns a `UIComponent` instance, return it as the value of this method. If it does not, instantiate a new `UIComponent` instance of the specified component type, pass the new component to the `setValue()` method of the specified `ValueExpression`, and return it.

**Parameters:**
- `componentExpression` - `ValueExpression` representing a component value expression (typically specified by the component attribute of a custom tag)
- `context` - `FacesContext` for the current request
- `componentType` - Component type to create if the `ValueExpression` does not return a component instance

**Throws:**
- `FacesException` - if a `UIComponent` cannot be created
- `NullPointerException` - if any parameter is null

A default implementation is provided that throws `UnsupportedOperationException` so that users that decorate `Application` can continue to function.

Since: 1.2

```java
abstract public java.util.Iterator<E> getComponentTypes()

Application  Iterator

gGetComponentTypes

public abstract Iterator<String> getComponentTypes()

Return an `Iterator` over the set of currently defined component
types for this Application.

abstract public void addConverter(String converterId, String converterClass)

ID Converter createConverter() Converter

converterId converterClass
converterClass

Throws NullPointerException: converterId converterClass null

addConverter

public abstract void addConverter(String converterId, String converterClass)

Register a new mapping of converter id to the name of the corresponding Converter class. This allows subsequent calls to createConverter() to serve as a factory for Converter instances.

Parameters:
converterId - The converter id to be registered
converterClass - The fully qualified class name of the corresponding Converter implementation

Throws:
NullPointerException - if converterId or converterClass is null

abstract public void addConverter(Class<T> targetClass, String converterClass)

targetClass
addConverter

public abstract void addConverter(Class targetClass, String converterClass)

Register a new converter class that is capable of performing conversions for the specified target class.

Parameters:
  targetClass - The class for which this converter is registered
  converterClass - The fully qualified class name of the corresponding Converter implementation

Throws:
  NullPointerException - if targetClass or converterClass is null

abstract public Converter createConverter(String converterId)

   Converter ID addConverter() ID
null

createConverter

public abstract Converter createConverter(String converterId)

Instantiate and return a new Converter instance of the class specified by a previous call to addConverter() for the specified
converter id. If there is no such registration for this converter id, return null.

**Parameters:**
- `converterId` - The converter id for which to create and return a new `Converter` instance

**Throws:**
- `FacesException` - if the `Converter` cannot be created
- `NullPointerException` - if `converterId` is null

```java
abstract public Converter createConverter(Class<T> targetClass)
```

- `Converter`
- `Converter`
- `Converter`

Instantiate and return a new `Converter` instance of the class that has registered itself as capable of performing conversions for objects of the specified type. If no such `Converter` class can be identified,
return null.

To locate an appropriate Converter class, the following algorithm is performed, stopping as soon as an appropriate Converter class is found:

- Locate a Converter registered for the target class itself.
- Locate a Converter registered for interfaces that are implemented by the target class (directly or indirectly).
- Locate a Converter registered for the superclass (if any) of the target class, recursively working up the inheritance hierarchy.

If the Converter has a single argument constructor that accepts a Class, instantiate the Converter using that constructor, passing the argument targetClass as the sole argument. Otherwise, simply use the zero-argument constructor.

**Parameters:**

- targetClass - Target class for which to return a Converter

**Throws:**

- FacesException - if the Converter cannot be created
- NullPointerException - if targetClass is null

---

abstract public java.util.Iterator<E> getConverterIds()

**getConverterIds**

public abstract Iterator<String> getConverterIds()

Return an Iterator over the set of currently registered converter ids for this Application.

---

abstract public java.util.Iterator<E> getConverterTypes()
getConverterTypes

public abstract Iterator<Class> getConverterTypes()

Return an Iterator over the set of Class instances for which Converter classes have been explicitly registered.

public ExpressionFactory getExpressionFactory()

ExpressionFactory #evaluateExpressionGet

JspFactory.getDefaultFactory().getJspApplicationContext(servletContext).getExpressionFactory()

UnsupportedOperationException Application since 1.2

getExpressionFactory

public ExpressionFactory getExpressionFactory()

Return the ExpressionFactory instance for this application. This instance is used by the convenience method 

The implementation must return the ExpressionFactory from the JSP container by calling

JspFactory.getDefaultFactory().getJspApplicationContext(servletContext).getExpressionFactory()
An implementation is provided that throws UnsupportedOperationException so that users that decorate the Application continue to work.

Since:
1.2

```java
public Object evaluateExpressionGet(FacesContext context, String expression, Class<T> expectedType) throws ELException
```

```java
getExpressionFactory
ExpressionFactory#createValueExpression expression
expectedType FacesContext#getELContext
ValueExpression#getValue

UnsupportedOperationException Application
```

evaluateExpressionGet

```java
public Object evaluateExpressionGet(FacesContext context, String expression, Class<T> expectedType) throws ELException
```

Get a value by evaluating an expression.

Call `getExpressionFactory()` then call `ExpressionFactory#createValueExpression(javax.el.ELContext, java.lang.String, java.lang.Class)` passing the argument `expression` and `expectedType`. Call `FacesContext#getELContext()` and pass it to `ValueExpression#getValue(javax.el.ELContext)`, returning the result.
An implementation is provided that throws 
UnsupportedOperationException so that users that decorate the 
Application continue to work.

**Throws:**
- `ELException`

abstract public `MethodBinding` createMethodBinding(String ref, Class<T>[] params)
throws `ReferenceSyntaxException`

```java
#getExpressionFactory
ExpressionFactory#createMethodExpression
```

```java
ref
params 0
Throws NullPointerException: ref null
Throws ReferenceSyntaxException: ref
```  

deprecated
```java
ExpressionFactory#createMethodExpression
```

createMethodBinding

public abstract `MethodBinding` createMethodBinding(String ref, Class[] params)
throws `ReferenceSyntaxException`

**Deprecated. This has been replaced by calling**
```java
getExpressionFactory() then
ExpressionFactory#createMethodExpression(javax.el.ELContext,
java.lang.String, java.lang.Class, java.lang.Class[]).
```

Call `getExpressionFactory()` then call
```java
ExpressionFactory#createMethodExpression(javax.el.ELContext,
java.lang.String, java.lang.Class, java.lang.Class[]),
```  
passing the given arguments, and wrap the result in a `MethodBinding`
implementation, returning it.

**Parameters:**
- `ref` - Method binding expression for which to return a `MethodBinding` instance
- `params` - Parameter signatures that must be compatible with those of the method to be invoked, or a zero-length array or `null` for a method that takes no parameters

**Throws:**
- `NullPointerException` - if `ref` is `null`
- `ReferenceSyntaxException` - if the specified `ref` has invalid syntax

```
abstract public java.util.Iterator<E> getSupportedLocales()

Locale    Iterator
```

**getSupportedLocales**

```
public abstract Iterator<Locale> getSupportedLocales()

Return an Iterator over the supported `Locale` instances for this application.
```

```
setSupportedLocales

public abstract void setSupportedLocales(Collection<Locale> locales)

Set the `Locale` instances representing the supported `Locale` instances for this application.

**Parameters:**
- `locales` - The set of supported `Locale` instances for this application

**Throws:**
NullPointerException - if the argument newLocales is null.

**public void addELContextListener(ELContextListener listener)**

<table>
<thead>
<tr>
<th>Faces</th>
<th>ELContextListener</th>
<th>ELContext</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>UnsupportedOperationException</td>
<td>Application</td>
</tr>
<tr>
<td></td>
<td>since</td>
<td>1.2</td>
</tr>
</tbody>
</table>

**addELContextListener**

public void addELContextListener(ELContextListener listener)

Provide a way for Faces applications to register an ELContextListener that will be notified on creation of ELContext instances. This listener will be called once per request.

An implementation is provided that throws UnsupportedOperationException so that users that decorate the Application continue to work.

**Since:**

1.2

**public void removeELContextListener(ELContextListener listener)**

ELContextListener listener listener null

UnsupportedOperationException Application

since 1.2
removeELContextListener

public void removeELContextListener(ELContextListener listener)

Remove the argument listener from the list of ELContextListenerS. If listener is null, no exception is thrown and no action is performed. If listener is not in the list, no exception is thrown and no action is performed.

An implementation is provided that throws
UnsupportedOperationException so that users that decorate the Application continue to work.

Since:
1.2

getELContextListeners

public ELContextListener[] getELContextListeners()

If no calls have been made to addELContextListener(javax.el.ELContextListener), this method must return an empty array.
Otherwise, return an array representing the list of listeners added by calls to `addELContextListener(javax.el.ELContextListener)`.

An implementation is provided that throws `UnsupportedOperationException` so that users that decorate the Application continue to work.

**Since:**
1.2

---

**abstract public void addValidator(String validatorId, String validatorClass)**

<table>
<thead>
<tr>
<th>ID</th>
<th><strong>Validator</strong></th>
<th>createValidator()</th>
<th><strong>Validator</strong></th>
</tr>
</thead>
</table>

`validatorId`  
`validatorClass`  

**Throws**  
`NullPointerException: validatorId or validatorClass is null`

**addValidator**

```
public abstract void addValidator(String validatorId, String validatorClass)
```

Register a new mapping of validator id to the name of the corresponding **Validator** class. This allows subsequent calls to `createValidator()` to serve as a factory for **Validator** instances.

**Parameters:**
- `validatorId` - The validator id to be registered
- `validatorClass` - The fully qualified class name of the corresponding **Validator** implementation

**Throws:**
- `NullPointerException` - If `validatorId` or `validatorClass` is null
abstract public **Validator** createValidator(String validatorId) throws **FacesException**

<table>
<thead>
<tr>
<th><strong>Validator</strong></th>
<th>ID</th>
<th>addValidator()</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>validatorId</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Throws</td>
<td><strong>FacesException</strong>: ID</td>
<td></td>
</tr>
<tr>
<td>Throws</td>
<td><strong>NullPointerException</strong>: validatorId null</td>
<td></td>
</tr>
</tbody>
</table>

**createValidator**

public abstract **Validator** createValidator(String validatorId) throws **FacesException**

Instantiate and return a new **validator** instance of the class specified by a previous call to addValidator() for the specified validator id.

**Parameters:**
validatorId - The validator id for which to create and return a new **Validator** instance

**Throws:**
**FacesException** - if a **Validator** of the specified id cannot be created
**NullPointerException** - if validatorId is null

**abstract public java.util.Iterator<E> getValidatorIds()**

<table>
<thead>
<tr>
<th>Application ID</th>
<th>Iterator</th>
</tr>
</thead>
</table>

**getValidatorIds**

public abstract **Iterator<String>** getValidatorIds()
Return an Iterator over the set of currently registered validator ids for this Application.

abstract public ValueBinding createValueBinding(String ref) throws ReferenceSyntaxException

#getExpressionFactory
ExpressionFactory#createValueExpression ref
expectedType Object.class fnMapper null

createValueBinding

public abstract ValueBinding createValueBinding(String ref) throws ReferenceSyntaxException

Deprecated. This has been replaced by calling
getExpressionFactory() then
ExpressionFactory#createValueExpression(javax.el.ELContext,
java.lang.String, java.lang.Class).

Call getExpressionFactory() then call
ExpressionFactory#createValueExpression(javax.el.ELContext,
java.lang.String, java.lang.Class), passing the argument ref, Object.class for the expectedType, and null, for the fnMapper.

Parameters:
ref - Value binding expression for which to return a ValueBinding instance

Throws:
NullPointerException - if ref is null
ReferenceSyntaxException - if the specified ref has invalid syntax

PS:
javax.ejb  

**Annotation Type ApplicationException**

@Target(value=TYPE)  
@Retention(value=RUNTIME)  

public interface ApplicationException

**Implements**: Annotation  
@Target(value=TYPE)  
@Retention(value=RUNTIME)

Applied to an exception to denote that it is an application exception and should be reported to the client directly (i.e., unwrapped).

### Optional Element Summary

<table>
<thead>
<tr>
<th>boolean</th>
<th>rollback</th>
</tr>
</thead>
</table>

Indicates whether the container should cause the transaction to rollback when the exception is thrown.

**abstract public boolean rollback()**

**rollback**

public abstract boolean rollback

Indicates whether the container should cause the transaction to rollback when the exception is thrown.

**Default:**

false
javax.faces.application Class ApplicationFactory

java.lang.Object
   \ javax.faces.application.ApplicationFactory

public abstract class ApplicationFactory
    extends Object

ApplicationFactory Application JavaServer Faces

Application ApplicationFactory

JavaServer Faces  Web ApplicationFactory

ApplicationFactory factory = (ApplicationFactory)
FactoryFinder.getFactory(FactoryFinder.APPLICATION_FACTORY);

ApplicationFactory is a factory object that creates (if needed) and returns Application instances. Implementations of JavaServer Faces must provide at least a default implementation of Application.

There must be one ApplicationFactory instance per web application that is utilizing JavaServer Faces. This instance can be acquired, in a portable manner, by calling:

    ApplicationFactory factory = (ApplicationFactory)
        FactoryFinder.getFactory(FactoryFinder.APPLICATION_FACTORY);

Constructor Summary

Constructor Detail

public ApplicationFactory()

ApplicationFactory

public ApplicationFactory()

Method Detail

abstract public Application getApplication()

Web Application

getApplication

public abstract Application getApplication()
Create (if needed) and return an Application instance for this web application.

abstract public void setApplication(Application application)

Web Application

Throws NullPointerException: application null

setApplication

public abstract void setApplication(Application application)

Replace the Application instance that will be returned for this web application.

Parameters:
  application - The replacement Application instance

Throws:
  NullPointerException - if application is null.
javax.resource.spi  Class
ApplicationServerInternalException

java.lang.Object
  ↓ java.lang.Throwable
      ↓ java.lang.Exception
          ↓ javax.resource.ResourceException
              ↓ javax.resource.spi.ApplicationServerInternalException

All Implemented Interfaces:
  Serializable

public class ApplicationServerInternalException
  extends ResourceException

Extends: Throwable > Exception > ResourceException

ApplicationServerInternalException
  version 1.0

An ApplicationServerInternalException is thrown by an application server to indicate error conditions specific to an application server. These error conditions can be related to either configuration related errors or implementation of mechanisms internal to an application server (example: connection pooling, thread management).

Version:
  1.0

Author:
  Rahul Sharma, Ram Jeyaraman

-------------------

Constructor Summary

**ApplicationServerInternalException()**

Constructs a new instance with null as its detail message.

**ApplicationServerInternalException(String message)**

Constructs a new instance with the specified detail message.

**ApplicationServerInternalException(String message, String errorCode)**

Constructs a new throwable with the specified detail message and an error code.

**ApplicationServerInternalException(String message, Throwable cause)**

Constructs a new throwable with the specified detail message and cause.

**ApplicationServerInternalException(Throwable cause)**

Constructs a new throwable with the specified cause.

---

**Method Summary**

**Constructor Detail**

public ApplicationServerInternalException()
null
public ApplicationServerInternalException()
    Constructs a new instance with null as its detail message.

public ApplicationServerInternalException(String message)
    Constructs a new instance with the specified detail message.
    Parameters:
    message - the detail message.

public ApplicationServerInternalException(Throwable cause)
    Constructs a new throwable with the specified cause.
    Parameters:
public ApplicationServerInternalException(String message, Throwable cause)
\hspace{1cm} cause \hspace{1cm} throwable

message
cause

ApplicationServerInternalException

public ApplicationServerInternalException(String message, Throwable cause)

Constructs a new throwable with the specified detail message and cause.

Parameters:
message - the detail message.
cause - a chained exception of type Throwable.

public ApplicationServerInternalException(String message, String errorCode)
\hspace{1cm} throwable

message
errorCode

ApplicationServerInternalException

public ApplicationServerInternalException(String message, String errorCode)

Constructs a new throwable with the specified detail message and an error code.
Parameters:

message - a description of the exception.
errorCode - a string specifying the vendor specific error code.

**Constructor Detail**

```java
public ArrayDataModel()
```

ArrayDataModel
public ArrayDataModel()

Construct a new ArrayDataModel with no specified wrapped data.

public ArrayDataModel(Object[] array)

ArrayDataModel

array

ArrayDataModel

public ArrayDataModel(Object[] array)

Construct a new ArrayDataModel wrapping the specified array.

Parameters:
array - Array to be wrapped (if any)

Method Detail

public boolean isRowAvailable()

wrappedData rowIndex 0 true false

Throws FacesException:

isRowAvailable

public boolean isRowAvailable()

Return true if there is wrappedData available, and the current value of rowIndex is greater than or equal to zero, and less than the length of the array. Otherwise, return false.
public int getRowCount()

wrappedData  wrappedData -1

Throws: FacesException

getRowCount

public int getRowCount()

If there is wrappedData available, return the length of the array. If no wrappedData is available, return -1.

Specified by: getRowCount in class DataModel
Throws: FacesException - if an error occurs getting the row count

public Object getRowData()

rowIndex  null

Throws: FacesException
Throws: IllegalArgumentException:

getRowData

public Object getRowData()
If row data is available, return the array element at the index specified by `rowIndex`. If no wrapped data is available, return `null`.

**Specified by:**

`getRowData` in class `DataModel`

**Throws:**

- `FacesException` - if an error occurs getting the row data
- `IllegalArgumentException` - if now row data is available at the currently specified row index

---

```java
public int getRowIndex()

Throws  FacesException: NullPointerException
```

**getRowIndex**

```java
public int getRowIndex()

Description copied from class: `DataModel`

Return the zero-relative index of the currently selected row. If we are not currently positioned on a row, or no `wrappedData` is available, return `-1`.

**Specified by:**

`getRowIndex` in class `DataModel`

**Throws:**

- `FacesException` - if an error occurs getting the row index

---

```java
public void setRowIndex(int rowIndex)

Throws  FacesException: NullPointerException
        IllegalArgumentException: NullPointerException rowIndex
```

**setRowIndex**

```java
public void setRowIndex(int rowIndex)

Throws  FacesException: NullPointerException
        IllegalArgumentException: NullPointerException rowIndex
```
public void setRowIndex(int rowIndex)

Description copied from class: DataModel

Set the zero-relative index of the currently selected row, or -1 to indicate that we are not positioned on a row. It is possible to set the row index at a value for which the underlying data collection does not contain any row data. Therefore, callers may use the isRowAvailable() method to detect whether row data will be available for use by the getRowData() method.

If there is no wrappedData available when this method is called, the specified rowIndex is stored (and may be retrieved by a subsequent call to getRowData()), but no event is sent. Otherwise, if the currently selected row index is changed by this call, a DataModelEvent will be sent to the rowSelected() method of all registered DataModelListeners.

Specified by:
setRowIndex in class DataModel

Parameters:
   rowIndex - The new zero-relative index (must be non-negative)

Throws:
   FacesException - if an error occurs setting the row index
   IllegalArgumentException - if rowIndex is less than -1

---

public Object getWrappedData()

getWrappedData

public Object getWrappedData()

Description copied from class: DataModel

Return the object representing the data wrapped by this DataModel, if any.
public void setWrappedData(Object data)

Throws  ClassCastException:  data null Java

setWrappedData

Descripion copied from class: DataModel

Set the object representing the data collection wrapped by this DataModel. If the specified data is null, detach this DataModel from any previously wrapped data collection instead.

If data is non-null, the currently selected row index must be set to zero, and a DataModelEvent must be sent to the rowSelected() method of all registered DataModelListener indicating that this row is now selected.

Specified by:
  setWrappedData in class DataModel

Parameters:
  data - Data collection to be wrapped, or null to detach from any previous data collection

Throws:
  ClassCastException - if data is non-null and is not an array of Java objects.

PS:
javax.el Class ArrayELResolver

java.lang.Object
  └─javax.el.ELResolver
      └─javax.el.ArrayELResolver

public class ArrayELResolver
  extends ELResolver

Extends: ELResolver

Java base

#isReadOnly   true#setValue   PropertyNotWritableException

ELResolver    CompositeELResolver    ELResolver
javadoc

since    JSP 2.1
See also  javax.el.CompositeELResolver, javax.el.ELResolver

Defines property resolution behavior on arrays.

This resolver handles base objects that are Java language arrays. It accepts any object as a property and coerces that object into an integer index into the array. The resulting value is the value in the array at that index.

This resolver can be constructed in read-only mode, which means that #isReadOnly will always return true and setValue(javax.el.ELContext, java.lang.Object, java.lang.Object, java.lang.Object) will always throw PropertyNotWritableException.

ELResolvers are combined together using CompositeELResolver, to
define rich semantics for evaluating an expression. See the javadocs for
ELResolver for details.

Since:
JSP 2.1

Constructor Detail

public ArrayELResolver()

/  

ArrayELResolver

public ArrayELResolver()

Creates a new read/write ArrayELResolver.

public ArrayELResolver(boolean isReadOnly)
ArrayELResolver

```
ArrayELResolver

isReadOnly
true  false
```

ArrayELResolver

public ArrayELResolver(boolean isReadOnly)

Creates a new ArrayELResolver whose read-only status is determined by the given parameter.

Parameters:
- isReadOnly - true if this resolver cannot modify arrays; false otherwise.

Method Detail

public Class<T> getType(ELContext context, Object base, Object property)

```
base
array  ELContext  propertyResolved  true
true

base  array  base.getClass().getComponentType()
context  Java  base
property
return  ELContext  propertyResolved  true

Throws  PropertyNotFoundException:
Throws  NullPointerException: context null
Throws  ELException: cause
```
getType

public Class<?〉 getType(ELContext context, Object base, Object property)

If the base object is an array, returns the most general acceptable type for a value in this array.

If the base is an array, the propertyResolved property of the ELContext object must be set to true by this resolver, before returning. If this property is not true after this method is called, the caller should ignore the return value.

Assuming the base is an array, this method will always return base.getClass().getComponentType(), which is the most general type of component that can be stored at any given index in the array.

Specified by:
   getType in class ELResolver
Parameters:
   context - The context of this evaluation.
   base - The array to analyze. Only bases that are Java language arrays are handled by this resolver.
   property - The index of the element in the array to return the acceptable type for. Will be coerced into an integer, but otherwise ignored by this resolver.
Returns:
   If the propertyResolved property of ELContext was set to true, then the most general acceptable type; otherwise undefined.
Throws:
   PropertyNotFoundException - if the given index is out of bounds for this array.
   NullPointerException - if context is null
   ELException - if an exception was thrown while performing the property or variable resolution. The thrown exception must be included as the cause property of this exception, if available.
public Object getValue(ELContext context, Object base, Object property)

base  Java  property
IllegalArgumentException  null

base  Java  ELContext  propertyResolved
true  true

collection  context
base  Java  base
property
return  ELContext  propertyResolved  true  null
Threws  IllegalArgumentException:
Threws  NullPointerException:  context  null
Threws  ELException:  cause

getValue

public Object getValue(ELContext context, Object base, Object property)

If the base object is a Java language array, returns the value at the given index. The index is specified by the property argument, and coerced into an integer. If the coercion could not be performed, an IllegalArgumentException is thrown. If the index is out of bounds, null is returned.

If the base is a Java language array, the propertyResolved property of the ELContext object must be set to true by this resolver, before returning. If this property is not true after this method is called, the caller should ignore the return value.

Specified by:
getValue in class ELResolver

Parameters:
context - The context of this evaluation.
base - The array to analyze. Only bases that are Java language arrays are handled by this resolver.

property - The index of the value to be returned. Will be coerced into an integer.

Returns:
If the propertyResolved property of ELContext was set to true, then the value at the given index or null if the index was out of bounds. Otherwise, undefined.

Throws:
- `IllegalArgumentException` - if the property could not be coerced into an integer.
- `NullPointerException` - if context is null.
- `ELException` - if an exception was thrown while performing the property or variable resolution. The thrown exception must be included as the cause property of this exception, if available.

```java
public void setValue(ELContext context, Object base, Object property, Object val) {
    base - Java
    propertyResolved - true
    ELContext - true
    propertyNotWritableException

    context - Java base
    property - val

    Throws: ClassCastException:
    Throws: NullPointerException: context null
    Throws: IllegalArgumentException:
    Throws: PropertyNotWritableException:
    Throws: PropertyNotFoundException:
    Throws: ELException: cause
```
setValue

public void setValue(ELContext context,
    Object base,
    Object property,
    Object val)

If the base object is a Java language array, attempts to set the value at the given index with the given value. The index is specified by the property argument, and coerced into an integer. If the coercion could not be performed, an IllegalArgumentException is thrown. If the index is out of bounds, a PropertyNotFoundException is thrown.

If the base is a Java language array, the propertyResolved property of the ELContext object must be set to true by this resolver, before returning. If this property is not true after this method is called, the caller can safely assume no value was set.

If this resolver was constructed in read-only mode, this method will always throw PropertyNotWritableException.

Specified by: setValue in class ELResolver

Parameters:
    context - The context of this evaluation.
    base - The array to be modified. Only bases that are Java language arrays are handled by this resolver.
    property - The index of the value to be set. Will be coerced into an integer.
    val - The value to be set at the given index.

Throws:
    ClassCastException - if the class of the specified element prevents it from being added to this array.
    NullPointerException - if context is null.
    IllegalArgumentException - if the property could not be coerced into an integer, or if some aspect of the specified element prevents it from being added to this array.
    PropertyNotWritableException - if this resolver was constructed
in read-only mode.

*PropertyNotFoundException* - if the given index is out of bounds for this array.

*ELException* - if an exception was thrown while performing the property or variable resolution. The thrown exception must be included as the cause property of this exception, if available.

```java
public boolean isReadOnly(ELContext context, Object base, Object property)
```

If the base object is a Java language array, returns whether a call to `setValue(javax.el.ELContext, java.lang.Object, java.lang.Object, java.lang.Object)` will always fail.

If the base is a Java language array, the `propertyResolved` property
of the ELContext object must be set to true by this resolver, before returning. If this property is not true after this method is called, the caller should ignore the return value.

If this resolver was constructed in read-only mode, this method will always return true. Otherwise, it returns false.

Specified by:
   isReadOnly in class ELResolver

Parameters:
   context - The context of this evaluation.
   base - The array to analyze. Only bases that are a Java language array are handled by this resolver.
   property - The index of the element in the array to return the acceptable type for. Will be coerced into an integer, but otherwise ignored by this resolver.

Returns:
   If the propertyResolved property of ELContext was set to true, then true if calling the setValue method will always fail or false if it is possible that such a call may succeed; otherwise undefined.

Throws:
   PropertyNotFoundException - if the given index is out of bounds for this array.
   NullPointerException - if context is null
   ELException - if an exception was thrown while performing the property or variable resolution. The thrown exception must be included as the cause property of this exception, if available.

public java.util.Iterator<E>
getFeatureDescriptors(ELContext context, Object base)
null

#getCommonPropertyType

context
base Java base
getFeatureDescriptors

public Iterator<FeatureDescriptor> getFeatureDescriptors(ELContext context, Object base)

Always returns null, since there is no reason to iterate through set of all integers.

The getCommonPropertyType(javax.el.ELContext, java.lang.Object) method returns sufficient information about what properties this resolver accepts.

Specified by:
   getFeatureDescriptors in class ELResolver

Parameters:
   context - The context of this evaluation.
   base - The array to analyze. Only bases that are a Java language array are handled by this resolver.

Returns:
   null.

See Also:
   FeatureDescriptor

public Class<T> getCommonPropertyType(ELContext context, Object base)

<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>null</td>
<td>Integer.class</td>
</tr>
</tbody>
</table>
getCommonPropertyType

public Class<?>
getCommonPropertyType(ELContext context, Object base)

If the base object is a Java language array, returns the most general type that this resolver accepts for the property argument. Otherwise, returns null.

Assuming the base is an array, this method will always return Integer.class. This is because arrays accept integers for their index.

Specified by:
getCommonPropertyType in class ELResolver

Parameters:
context - The context of this evaluation.
base - The array to analyze. Only bases that are a Java language array are handled by this resolver.

Returns:
null if base is not a Java language array; otherwise Integer.class.

Association

Association  Association  Association
A RegistryObject instance may be associated with zero or more RegistryObject instances. The information model defines an Association interface, an instance of which may be used to associate any two RegistryObject instances.
Example of an Association

One example of such an association is between two ClassificationScheme instances, where one ClassificationScheme supersedes the other ClassificationScheme as shown in Figure 1. This may be the case when a new version of a ClassificationScheme is submitted. In Figure 1, we see how an Association is defined between a new version of the NAICS ClassificationScheme and an older version of the NAICS ClassificationScheme.

Figure 1. Example of RegistryObject Association
Source and Target Objects

An Association instance represents an association between a source RegistryObject and a target RegistryObject. These are referred to as sourceObject and targetObject for the Association instance. It is important which object is the sourceObject and which is the targetObject as it determines the directional semantics of an Association. In the example in Figure 1, it is important to make the newer version of NAICS ClassificationScheme be the sourceObject and the older version of NAICS be the targetObject because the associationType implies that the sourceObject supersedes the targetObject (and not the other way around).
Association Types

Each Association must have an associationType attribute that identifies the type of that association. The associationType attribute is a reference to an enumeration Concept as defined by the predefined associationType ClassificationScheme in the JAXR specification. Our example uses the pre-defined associationType Concept named Supersedes.
Intramural Associations

A common use case for the Association interface is when a User "u" creates an Association "a" between two RegistryObjects "o1" and "o2" where association "a" and RegistryObjects "o1" and "o2" are objects that were created by the same User "u". This is the simplest use case where the association is between two objects that are owned by same User that is defining the Association. Such associations are referred to as intramural associations. Figure 2 extends the previous example in Figure 1 for the intramural association case.

Figure 2. Example of Intramural Association
Extramural Association

The information model also allows a more sophisticated use case where a User "u1" creates an Association "a" between two RegistryObjects "o1" and "o2" where association "a" is owned by User "u1", but RegistryObjects "o1" and "o2" are owned by User "u2" and User "u3" respectively. In this use case the Association is being defined where either or both objects that are being associated are owned by a User different from the User defining the Association. Such associations are referred to as extramural associations. The Association interface provides a convenience method called isExtramural that returns true if the Association instance is an extramural Association. Figure 3 extends the previous example in Figure 1 for the extramural association case. Note that it is possible for an extramural association to have two distinct Users rather than three distinct Users as shown in Figure 3. In such case, one of the two users owns two of the three objects involved (Association, sourceObject and targetObject).

Figure 3. Example of Extramural Association
Confirmation of an Association

An association may need to be confirmed by the parties whose objects are involved in that Association. This section describes the semantics of confirmation of an association by the parties involved.

Confirmation of Intramural Associations

Intramural associations may be viewed as declarations of truth and do not require any explicit steps to confirm that Association as being true. In other words, intramural associations are implicitly considered be confirmed.

Confirmation of Extramural Associations

Extramural associations may be viewed as a unilateral assertion that may not be viewed as truth until it has been confirmed by the other (extramural) parties (Users "u2" and "u3" in example). The confirmAssociation method on the BusinessLifeCycleManager interface may be called by the extramural parties that own the sourceObject or targetObject.
Visibility of Unconfirmed Associations

Extramural associations require each extramural party to confirm the assertion being made by the extramural Association before the Association is visible to 3rd parties that are not involved in the Association. This ensures that unconfirmed Associations are not visible to 3rd party registry clients.
Possible Confirmation States

Assume the most general case where there are three distinct User instances as shown in Figure 23 for an extramural Association. The extramural Association needs to be confirmed by both the other (extramural) parties (Users "u2" and "u3" in example) in order to be fully confirmed. The methods `isConfirmedBySourceOwner` and `isConfirmedByTargetOwner` in the Association interface provide access to confirmation state for both the `sourceObject` and `targetObject`. A third convenience method called `isConfirmed` provides a way to determine whether the Association is fully confirmed or not. So there are the following four possibilities related to confirmation state of an extramural Association:

- The Association is confirmed neither by the owner of the `sourceObject` nor is it confirmed by owner of `targetObject`.
- The Association is confirmed by the owner of the `sourceObject` but it is not confirmed by owner of `targetObject`.
- The Association is not confirmed by the owner of the `sourceObject` but it is confirmed by owner of `targetObject`.
- The Association is confirmed by the owner of the `sourceObject` and it is confirmed by owner of `targetObject`. This is the only state where the Association is fully confirmed.

**public void setSourceObject(RegistryObject srcObject) throws JAXRException**

**Association Object**

0

```java
    srcObject Association RegistryObject
```

**setSourceObject**

**RegistryObject setSourceObject(RegistryObject srcObject) throws JAXRException**

**Association Object**

0

```java
    srcObject Association RegistryObject
```
setSourceObject

```java
void setSourceObject(RegistryObject srcObject)
throws JAXRException
```

Sets the Object that is the source of this Association.

**Capability Level: 0**

**Parameters:**
- `srcObject` - the RegistryObject that is the source object of this Association

**Throws:**
- `JAXRException` - If the JAXR provider encounters an internal error

---

```java
public RegistryObject getTargetObject() throws JAXRException
```

**Association Object**

```java
return Association RegistryObject
```

**Throws**
- `JAXRException`: JAXR

---

getTargetObject

```java
RegistryObject getTargetObject()
throws JAXRException
```

Gets the Object that is the target of this Association.

**Capability Level: 0**
Returns:
The RegistryObject that is the target object of this Association

Throws:
JAXRException - If the JAXR provider encounters an internal error

public void setTargetObject(RegistryObject targetObject)
throws JAXRException

Association Object

0

targetObject Association RegistryObject
Throws JAXRException: JAXR

setTargetObject

void setTargetObject(RegistryObject targetObject)
throws JAXRException

Sets the Object that is the target of this Association.

Capability Level: 0

Parameters:
targetObject - the RegistryObject that is the target object of this Association

Throws:
JAXRException - If the JAXR provider encounters an internal error

public Concept getAssociationType() throws JAXRException

Association
getAssociationType

Concept getAssociationType()
throws JAXRException

Gets the association type for this Association.

Capability Level: 0

Returns:
The association type for this Association which is a Concept in
the AssociationType ClassificationScheme

Throws:
JAXRException - If the JAXR provider encounters an internal
error

public void setAssociationType(Concept associationType)
throws JAXRException

setAssociationType
Sets the association type for this Association.

**Capability Level: 0**

**Parameters:**

- `associationType` - the association type for this Association which is a Concept in the AssociationType ClassificationScheme

**Throws:**

- `JAXRException` - If the JAXR provider encounters an internal error

---

```java
public boolean isExtramural() throws JAXRException {
    Association sourceObject = User / targetObject
    Association targetObject = User

    return sourceObject / targetObject
```

**Determines whether an Association is extramural or not.**

An Extramural Association must be confirmed by the User(s) that own the source and/or target object, if they are different from the User who creates this extramural association. Both the sourceObject and targetObject owners must confirm an extramural Association, in order for it to be visible to third parties.
Capability Level: 0

Returns:
true if the sourceObject and/or the targetObject are owned by a User that is different from the User that created the Association;
false otherwise

Throws:
JAXRException - If the JAXR provider encounters an internal error

public boolean isConfirmedBySourceOwner() throws JAXRException

Determines whether an Association has been confirmed by the owner of the source object.

Capability Level: 0

Returns:
true if the association has been confirmed by the owner of the sourceObject; false otherwise. For intramural Associations always return true

Throws:
JAXRException - If the JAXR provider encounters an internal error
public boolean isConfirmedByTargetOwner() throws JAXRException

Determines whether an Association has been confirmed by the owner of the target object.

**Capability Level:** 0

**Returns:**
- `true` if the association has been confirmed by the owner of the targetObject; `false` otherwise. For intramural Associations always return `true`

**Throws:**
- `JAXRException` - If the JAXR provider encounters an internal error

---

public boolean isConfirmed() throws JAXRException

isConfirmed  true Association

0
isConfirmed

boolean isConfirmed()

throws JAXRException

Determines whether an Association has been confirmed completely.

An association should only be visible to third parties (not involved with the Association) if isConfirmed returns true.

Capability Level: 0

Returns:
true if the isConfirmedBySourceOwner and isConfirmedByTargetOwner methods both return true; false otherwise. For intramural Associations always return true

Throws:
JAXRException - If the JAXR provider encounters an internal error

See Also:
isConfirmedBySourceOwner(), isConfirmedByTargetOwner()
PS:
javax.persistence Annotation Type AssociationOverride

@Target(value={TYPE, METHOD, FIELD})
@Retention(value=RUNTIME)
public @interface AssociationOverride

This annotation is used to override a many-to-one or one-to-one mapping of property or field for an entity relationship.

The AssociationOverride annotation may be applied to an entity that extends a mapped superclass to override a many-to-one or one-to-one mapping defined by the mapped superclass. If the AssociationOverride annotation is not specified, the join column is mapped the same as in the original mapping.

Example:
@MappedSuperclass
public class Employee {
    ...
    @ManyToOne
    protected Address address;
    ...
}

@Entity
@AssociationOverride(name="address",
    joinColumns=@JoinColumn(name="ADDR_ID"))
// address field mapping overridden to ADDR_ID fk
public class PartTimeEmployee extends Employee {
    ...
}

Since:
Java Persistence 1.0

See Also:
OneToOne, ManyToOne, MappedSuperclass
### joinColumns

The join column that is being mapped to the persistent attribute.

### name

The name of the relationship property whose mapping is being overridden if property-based access is being used, or the name of the relationship field if field-based access is used.

---

#### Element Detail

**name**

public abstract `String` name

The name of the relationship property whose mapping is being overridden if property-based access is being used, or the name of the relationship field if field-based access is used.

#### joinColumns

public abstract `JoinColumn[]` joinColumns

The join column that is being mapped to the persistent attribute. The mapping type will remain the same as is defined in the mapped superclass.
javax.persistence Annotation Type AssociationOverrides

Method Detail

handleResponse

void **handleResponse**(Response<T> res)

  Called when the response to an asynchronous operation is available.

  **Parameters:**
  
  res - The response to the operation invocation.
public abstract class AttachmentMarshaller
extends Object

JAXB

API JAXB MIME JAXB MIME MIME MIME

#isXOPPackage() true XOP
#addMtomAttachment(DataHandler, String, String)

#addSwaRefAttachment(DataHandler) WS-I Attachment Profile 1.0
{http://ws-i.org/profiles/basic/1.1/xsd}swaRef JAXB

since JAXB 2.0

See also setAttachmentMarshaller(AttachmentMarshaller), XML-binary Optimized Packaging, WS-I Attachments Profile Version 1.0.

Enable JAXB marshalling to optimize storage of binary data.

This API enables an efficient cooperative creation of optimized binary data formats between a JAXB marshalling process and a MIME-based package processor. A JAXB implementation marshals the root body of a MIME-based package, delegating the creation of referenceable MIME parts to the MIME-based package processor that implements this abstraction.

XOP processing is enabled when isXOPPackage() is true. See
addMtomAttachment(DataHandler, String, String) for details.

WS-I Attachment Profile 1.0 is supported by addSwaRefAttachment(DataHandler) being called by the marshaller for each JAXB property related to {http://ws-i.org/profiles/basic/1.1/xsd}swaRef.

Since:
    JAXB 2.0
Author:
    Marc Hadley, Kohsuke Kawaguchi, Joseph Fialli

### Constructor Detail

**public AttachmentMarshaller()**

### Method Detail

**abstract public String addMtomAttachment(DataHandler data, String elementNamespace, String elementLocalName)**

```
MIME data

Creating XOP Packages 3
true JAXB "base64Binary"

id cid MIME MIME cidcid JAXB
cid XOP null JAXB
base64binary

/ MIME
```

```
data infoset xmime:
data MIMI
```

```
data.getContentType() MIMI
```
Consider MIME content data for optimized binary storage as an attachment.

This method is called by JAXB marshal process when isXOPPackage() is true, for each element whose datatype is "base64Binary", as described in Step 3 in Creating XOP Packages.

The method implementor determines whether data shall be attached separately or inlined as base64Binary data. If the implementation chooses to optimize the storage of the binary data as a MIME part, it is responsible for attaching data to the MIME-based package, and then assigning an unique content-id, cid, that identifies the MIME part within the MIME message. This method returns the cid, which enables the JAXB marshaller to marshal a XOP element that refers to that cid in place of marshalling the binary data. When the method returns null, the JAXB marshaller inlines data as base64binary data.

The caller of this method is required to meet the following constraint. If the element infoset item containing data has the attribute xmime:contentType or if the JAXB property/field representing data is annotated with a known MIME type, data.getContentType() should be set to that MIME type.
The `elementNamespace` and `elementLocalName` parameters provide the context that contains the binary data. This information could be used by the MIME-based package processor to determine if the binary data should be inlined or optimized as an attachment.

**Parameters:**
- `data` - represents the data to be attached. Must be non-null.
- `elementNamespace` - the namespace URI of the element that encloses the base64Binary data. Can be empty but never null.
- `elementLocalName` - The local name of the element. Always a non-null valid string.

**Returns:**
- a valid content-id URI (see RFC 2387) that identifies the attachment containing `data`. Otherwise, null if the attachment was not added and should instead be inlined in the message.

**See Also:**
- XML-binary Optimized Packaging, Describing Media Content of Binary Data in XML

```java
abstract public String addMtomAttachment(byte[] data, int offset, int length, String mimeType, String elementNamespace, String elementLocalName)

data

MIME “application/octet-stream”

<table>
<thead>
<tr>
<th>elementNamespace</th>
<th>elementLocalName</th>
<th>MIME</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>data</code></td>
<td>null</td>
<td>(data,offset,length)</td>
</tr>
<tr>
<td><code>offset</code></td>
<td>array.length</td>
<td></td>
</tr>
<tr>
<td><code>length</code></td>
<td>array.length</td>
<td></td>
</tr>
<tr>
<td><code>mimeType</code></td>
<td>JAXB MIME “application/octet-stream” null</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>elementNamespace</th>
<th>elementLocalName</th>
<th>MIME</th>
</tr>
</thead>
<tbody>
<tr>
<td>base64Binary</td>
<td>URI</td>
<td>null</td>
</tr>
</tbody>
</table>

| return           | data, id, URI, cid | null |
```
See also addMtomAttachment(DataHandler, String, String)

**addMtomAttachment**

```java
public abstract String addMtomAttachment(byte[] data,
                                          int offset,
                                          int length,
                                          String mimeType,
                                          String elementNamespace,
                                          String elementLocalName)
```

Consider binary data for optimized binary storage as an attachment.

Since content type is not known, the attachment's MIME content type must be set to "application/octet-stream".

The `elementNamespace` and `elementLocalName` parameters provide the context that contains the binary data. This information could be used by the MIME-based package processor to determine if the binary data should be inlined or optimized as an attachment.

**Parameters:**
- `data` - represents the data to be attached. Must be non-null. The actual data region is specified by `(data,offset,length)` tuple. 
- `offset` - The offset within the array of the first byte to be read; must be non-negative and no larger than array.length 
- `length` - The number of bytes to be read from the given array; must be non-negative and no larger than array.length 
- `mimeType` - If the data has an associated MIME type known to JAXB, that is passed as this parameter. If none is known, "application/octet-stream". This parameter may never be null. 
- `elementNamespace` - the namespace URI of the element that encloses the base64Binary data. Can be empty but never null. 
- `elementLocalName` - The local name of the element. Always a non-null valid string.

**Returns:**
- content-id URI, cid, to the attachment containing data or null if data should be inlined.
public boolean isXOPPackage()

JAXB XOP true

true addMtomAttachment(...)

true XML Creating XOP Packages

http://www.w3.org/TR/2005/REC-xop10-20050125/#creating_xop_packages

Marshaller.marshal() IllegalStateException

"Ensure the Original XML Infoset contains no element information item with a [namespace name] of "http://www.w3.org/2004/08/xop/include" and a [local name] of Include"

true addMtomAttachment(...) id Creating XOP Packages 5 MIME application/xop+xml

return MIME XOP true

isXOPPackage

public boolean isXOPPackage()

Read-only property that returns true if JAXB marshaller should enable XOP creation.

This value must not change during the marshalling process. When this value is true, the addMtomAttachment(...) method is invoked when the appropriate binary datatypes are encountered by the marshal process.
Marshaller.marshal() must throw IllegalStateException if this value is true and the XML content to be marshalled violates Step 1 in Creating XOP Packages http://www.w3.org/TR/2005/REC-xop10-20050125/#creating_xop_packages. "Ensure the Original XML Infoset contains no element information item with a [namespace name] of "http://www.w3.org/2004/08/xop/include" and a [local name] of Include"

When this method returns true and during the marshal process at least one call to addMtomAttachment(...) returns a content-id, the MIME-based package processor must label the root part with the application/xop+xml media type as described in Step 5 of Creating XOP Packages.

Returns:
true when MIME context is a XOP Package.

abstract public String addSwaRefAttachment(DataHandler data)

MIME data id cid

JAXB {http://ws-i.org/profiles/basic/1.1/xsd}swaRef /
MIME MIME id cid MIME

id cid XML

data null

return cid URI

WS-I Attachments Profile Version 1.0
R2928

addSwaRefAttachment

public abstract String addSwaRefAttachment(DataHandler data)

Add MIME data as an attachment and return attachment's content-id,
This method is called by JAXB marshal process for each element/attribute typed as {http://ws-i.org/profiles/basic/1.1/xsd}swaRef. The MIME-based package processor implementing this method is responsible for attaching the specified data to a MIME attachment, and generating a content-id, cid, that uniquely identifies the attachment within the MIME-based package.

Caller inserts the returned content-id, cid, into the XML content being marshalled.

**Parameters:**
- `data` - represents the data to be attached. Must be non-null.

**Returns:**
- must be a valid URI used as cid. Must satisfy Conformance Requirement R2928 from [WS-I Attachments Profile Version 1.0](http://ws-i.org).
javax.xml.soap  Class AttachmentPart

java.lang.Object
- javax.xml.soap.AttachmentPart

public abstract class AttachmentPart
extends Object

SOAPMessage  SOAPMessage 0 1 AttachmentPart
AttachmentPart MIME MIME /

AttachmentPart

1. MIME [RFC2045]
2.
3.  
   - Content-Type
      AttachmentPart [RFC2045] Content-Type
      Content-Type: application/xml

AttachmentPart  AttachmentPart  SOAPMessage

AttachmentPart ap1 = m.createAttachmentPart();
ap1.setContent(contentString1, "text/plain");
m.addAttachmentPart(ap1);
AttachmentPart jpegData jpeg

AttachmentPart ap2 = m.createAttachmentPart();
byte[] jpegData = ...;
ap2.setContent(new ByteArrayInputStream(jpegData), "image/jpeg");
m.addAttachmentPart(ap2);

getContent AttachmentPart DataContentHandler Object
MIME Java

String content1 = ap1.getContent();
java.io.InputStream content2 = ap2.getContent();

clearContent AttachmentPart
ap1.clearContent();

A single attachment to a SOAPMessage object. A SOAPMessage object may contain zero, one, or many AttachmentPart objects. Each AttachmentPart object consists of two parts, application-specific content and associated MIME headers. The MIME headers consists of name/value pairs that can be used to identify and describe the content.

An AttachmentPart object must conform to certain standards.

1. It must conform to MIME [RFC2045] standards
2. It MUST contain content
3. The header portion MUST include the following header:
   - Content-Type
     This header identifies the type of data in the content of an AttachmentPart object and MUST conform to [RFC2045]. The following is an example of a Content-Type header:
     
     Content-Type: application/xml

     The following line of code, in which ap is an AttachmentPart object, sets the header shown in the previous example.
ap.setMimeHeader("Content-Type", "application/xml");

There are no restrictions on the content portion of an AttachmentPart object. The content may be anything from a simple plain text object to a complex XML document or image file.

An AttachmentPart object is created with the method SOAPMessage.createAttachmentPart. After setting its MIME headers, the AttachmentPart object is added to the message that created it with the method SOAPMessage.addAttachmentPart.

The following code fragment, in which m is a SOAPMessage object and contentString1 is a String, creates an instance of AttachmentPart, sets the AttachmentPart object with some content and header information, and adds the AttachmentPart object to the SOAPMessage object.

```java
AttachmentPart ap1 = m.createAttachmentPart();
ap1.setContent(contentString1, "text/plain");
m.addAttachmentPart(ap1);
```

The following code fragment creates and adds a second AttachmentPart instance to the same message. jpegData is a binary byte buffer representing the jpeg file.

```java
AttachmentPart ap2 = m.createAttachmentPart();
byte[] jpegData = ...;
ap2.setContent(new ByteArrayInputStream(jpegData), "image/jpeg");
m.addAttachmentPart(ap2);
```

The getContent method retrieves the contents and header from an AttachmentPart object. Depending on the DataContentHandler objects present, the returned Object can either be a typed Java object corresponding to the MIME type or an InputStream object that contains the content as bytes.

```java
String content1 = ap1.getContent();
java.io.InputStream content2 = ap2.getContent();
```

The method clearContent removes all the content from an
AttachmentPart object but does not affect its header information.

    ap1.clearContent();

Throws SOAPException: AttachmentPart

getContent

public abstract Object getContent() throws SOAPException

Gets the content of this AttachmentPart object as a Java object. The type of the returned Java object depends on (1) the DataContentHandler object that is used to interpret the bytes and (2)
the Content-Type given in the header.

For the MIME content types "text/plain", "text/html" and "text/xml", the DataContentHandler object does the conversions to and from the Java types corresponding to the MIME types. For other MIME types, the DataContentHandler object can return an InputStream object that contains the content data as raw bytes.

A SAAJ-compliant implementation must, as a minimum, return a java.lang.String object corresponding to any content stream with a Content-Type value of text/plain, a javax.xml.transform.stream.StreamSource object corresponding to a content stream with a Content-Type value of text/xml, a java.awt.Image object corresponding to a content stream with a Content-Type value of image/gif or image/jpeg. For those content types that an installed DataContentHandler object does not understand, the DataContentHandler object is required to return a java.io.InputStream object with the raw bytes.

Returns:
a Java object with the content of this AttachmentPart object

Throws:
SOAPException - if there is no content set into this AttachmentPart object or if there was a data transformation error

abstract public java.io.InputStream getRawContent() throws SOAPException
InputStream AttachmentPart getContent
AttachmentPart content-type DataContentHandler

InputStream  Subsequent API  InputStream
#getRawContentBytes  API
return InputStream AttachmentPart
Throws SOAPException: AttachmentPart
since SAAJ 1.3
See also getRawContentBytes
getRawContent

public abstract InputStream getRawContent() throws SOAPException

Gets the content of this AttachmentPart object as an InputStream as if a call had been made to getContent and no DataContentHandler had been registered for the content-type of this AttachmentPart.

Note that reading from the returned InputStream would result in consuming the data in the stream. It is the responsibility of the caller to reset the InputStream appropriately before calling a subsequent API. If a copy of the raw attachment content is required then the getRawContentBytes() API should be used instead.

Returns:

an InputStream from which the raw data contained by the AttachmentPart can be accessed.

Throws:

SOAPException - if there is no content set into this AttachmentPart object or if there was a data transformation error.

Since:

SAAJ 1.3

See Also:

getRawContentBytes()

abstract public byte[] getRawContentBytes() throws SOAPException

byte[] AttachmentPart getContent
AttachmentPart content-type DataContentHandler
return AttachmentPart byte[]

Throws SOAPException: AttachmentPart

since SAAJ 1.3
getRawContentBytes

public abstract byte[] getRawContentBytes()
throws SOAPException

Gets the content of this AttachmentPart object as a byte[] array as if a call had been made to getContent and no DataContentHandler had been registered for the content-type of this AttachmentPart.

Returns:
   a byte[] array containing the raw data of the AttachmentPart.

Throws:
   SOAPException - if there is no content set into this AttachmentPart object or if there was a data transformation error.

Since:
   SAAJ 1.3

abstract public java.io.InputStream getBase64Content()
throws SOAPException

Base64

return InputStream Base64 AttachmentPart

Throws
   SOAPException: AttachmentPart

since
   SAAJ 1.3

getBase64Content

public abstract InputStream getBase64Content()
throws SOAPException

Returns an InputStream which can be used to obtain the content of AttachmentPart as Base64 encoded character data, this method would base64 encode the raw bytes of the attachment and return.

Returns:
   an InputStream from which the Base64 encoded AttachmentPart can be read.
abstract public void setContent(Object object, String contentType)

Sets the content of this attachment part to that of the given Object and sets the value of the Content-Type header to the given type. The type of the Object should correspond to the value given for the Content-Type. This depends on the particular set of DataContentHandler objects in use.

Parameters:
- object - the Java object that makes up the content for this attachment part
- contentType - the MIME string that specifies the type of the content

Throws:
- IllegalArgumentException - may be thrown if the contentType does not match the type of the content object, or if there was no DataContentHandler object for this content object
abstract public void setRawContent(InputStream content, String contentType) throws SOAPException

Sets the content of this attachment part to that contained by the InputStream content and sets the value of the Content-Type header to the value contained in contentType.

A subsequent call to getSize() may not be an exact measure of the content size.

Parameters:
- content - the raw data to add to the attachment part
- contentType - the value to set into the Content-Type header

Throws:
- SOAPException - if an there is an error in setting the content
- NullPointerException - if content is null

Since:
abstract public void setRawContentBytes(byte[] content, int offset, int len, String contentType) throws SOAPException

Sets the content of this attachment part to that contained by the byte[] array content and sets the value of the Content-Type header to the value contained in contentType.

Parameters:
- content - the raw data to add to the attachment part
- contentType - the value to set into the Content-Type header
- offset - the offset in the byte array of the content
- len - the number of bytes that form the content

Throws:
- SOAPException - if an there is an error in setting the content or content is null

Since:
- SAAJ 1.3
abstract public void setBase64Content(java.io.InputStream content, String contentType) throws SOAPException

Base64 InputStream Content-Type contentType base64

getSize()

content Base64
contentType Content-Type

Throws SOAPException:

Throws NullPointerException: content null

since SAAJ 1.3

setSize()

content Base64
contentType Content-Type

Sets the content of this attachment part from the Base64 source InputStream and sets the value of the Content-Type header to the value contained in contentType. This method would first decode the base64 input and write the resulting raw bytes to the attachment.

A subsequent call to getSize() may not be an exact measure of the content size.

Parameters:

content - the base64 encoded data to add to the attachment part
contentType - the value to set into the Content-Type header

Throws:

SOAPException - if an there is an error in setting the content

NullPointerException - if content is null

Since:

SAAJ 1.3
abstract public **DataHandler** getDataHandler() throws **SOAPException**

<table>
<thead>
<tr>
<th>AttachmentPart</th>
<th>DataHandler</th>
</tr>
</thead>
<tbody>
<tr>
<td>return</td>
<td>AttachmentPart</td>
</tr>
<tr>
<td>Throws</td>
<td><strong>SOAPException</strong>: AttachmentPart</td>
</tr>
</tbody>
</table>

**getDataHandler**

public abstract **DataHandler** getDataHandler() throws **SOAPException**

Gets the DataHandler object for this AttachmentPart object.

**Returns:**
the DataHandler object associated with this AttachmentPart object

**Throws:**
**SOAPException** - if there is no data in this AttachmentPart object

---

abstract public void **setDataHandler**(**DataHandler** dataHandler)

<table>
<thead>
<tr>
<th>DataHandler</th>
<th>AttachmentPart</th>
</tr>
</thead>
<tbody>
<tr>
<td>setDataHandler</td>
<td>dataHandler</td>
</tr>
<tr>
<td>Throws</td>
<td><strong>IllegalArgumentException</strong>: DataHandler</td>
</tr>
</tbody>
</table>

**setDataHandler**

public abstract void **setDataHandler**(**DataHandler** dataHandler)

Sets the given DataHandler object as the data handler for this AttachmentPart object. Typically, on an incoming message, the data handler is automatically set. When a message is being created and populated with content, the **setDataHandler** method can be used to
get data from various data sources into the message.

Parameters:

dataHandler - the DataHandler object to be set

Throws:

IllegalArgumentException - if there was a problem with the specified DataHandler object

---

```java
public String getContentId()

"Content-ID" MIME

return "Content-ID" String null

See also

setContentId
```

getContentId

public String getContentId()

    Gets the value of the MIME header whose name is "Content-ID".

    Returns:

    a String giving the value of the "Content-ID" header or null if there is none

    See Also:

    `setContentId(java.lang.String)`

---

```java
public String getContentLocation()

"Content-Location" MIME

return "Content-Location" String null

getContentLocation

public String getContentLocation()

    Gets the value of the MIME header whose name is "Content-
```
Location".

Returns:
a String giving the value of the "Content-Location" header or
null if there is none

---

```java
public String getContentType()

"Content-Type" MIME

getContentType
```

```java
public String getContentType()

Gets the value of the MIME header whose name is "Content-Type".

Returns:
a String giving the value of the "Content-Type" header or null if
there is none
```

---

```java
public void setContentId(String contentId)

"Content-ID" MIME

setContentId
```

```java
public void setContentId(String contentId)

Sets the MIME header whose name is "Content-ID" with the given
value.

Parameters:
```
public void setContentLocation(String contentLocation)
"Content-Location" MIME

Sets the MIME header whose name is "Content-Location" with the given value.

Parameters:
contentLocation - a String giving the value of the "Content-Location" header

Throws:
IllegalArgumentException - if there was a problem with the specified content location

public void setContentType(String contentType)
"Content-Type" MIME

Sets the MIME header whose name is "Content-Type" with the given value.

Parameters:
contentType - a String giving the value of the "Content-Type" header

Throws:
IllegalArgumentException - if there was a problem with the specified content location
Sets the MIME header whose name is "Content-Type" with the given value.

**Parameters:**

- contentType - a String giving the value of the "Content-Type" header

**Throws:**

- IllegalArgumentException - if there was a problem with the specified content type

---

```java
abstract public void removeMimeHeader(String header)
```

**MIME**

- `header` - the string name of the MIME header/s to be removed

---

```java
public abstract void removeMimeHeader(String header)
```

Removes all MIME headers that match the given name.

**Parameters:**

- header - the string name of the MIME header/s to be removed

---

```java
abstract public void removeAllMimeHeaders()
```

**MIME**

---

```java
public abstract void removeAllMimeHeaders()
```

Removes all the MIME header entries.

---

```java
abstract public String[] getMimeHeader(String name)
```
public abstract String[] getMimeHeader(String name)

Gets all the values of the header identified by the given string.

Parameters:
name - the name of the header; example: "Content-Type"

Returns:
a String array giving the value for the specified header

See Also:
setMimeHeader(java.lang.String, java.lang.String)

abstract public void setMimeHeader(String name, String value)

Changes the first header entry that matches the given name to the given value, adding a new header if no existing header matches.
This method also removes all matching headers but the first.

Note that RFC822 headers can only contain US-ASCII characters.

**Parameters:**

- `name` - a `String` giving the name of the header for which to search
- `value` - a `String` giving the value to be set for the header whose name matches the given name

**Throws:**

- `IllegalArgumentException` - if there was a problem with the specified mime header name or value

---

```java
abstract public void addMimeHeader(String name, String value)
```

**MIME AttachmentPart**

**RFC822 US-ASCII**

```java
name  String
value String
```

**Throws** IllegalArgumentException: MIME

---

**addMimeHeader**

```java
public abstract void addMimeHeader(String name, String value)
```

Adds a MIME header with the specified name and value to this `AttachmentPart` object.

Note that RFC822 headers can contain only US-ASCII characters.

**Parameters:**

- `name` - a `String` giving the name of the header to be added
- `value` - a `String` giving the value of the header to be added
abstract public java.util.Iterator<E> getAllMimeHeaders()

MimeHeader AttachmentPart
return AttachmentPart MIME Iterator

getAllMimeHeaders

public abstract Iterator getAllMimeHeaders()

Retrieves all the headers for this AttachmentPart object as an iterator over the MimeHeader objects.

Returns:
   an Iterator object with all of the Mime headers for this AttachmentPart object

abstract public java.util.Iterator<E>
getMatchingMimeHeaders(String[] names)

MimeHeader
return MIME Iterator

getMatchingMimeHeaders

public abstract Iterator getMatchingMimeHeaders(String[] names)

Retrieves all MimeHeader objects that match a name in the given array.

Parameters:
   names - a String array with the name(s) of the MIME headers to

Throws:
   IllegalArgumentException - if there was a problem with the specified mime header name or value
Returns: all of the MIME headers that match one of the names in the given array as an Iterator object.

abstract public java.util.Iterator<E> getNonMatchingMimeHeaders(String[] names)

getNonMatchingMimeHeaders

public abstract Iterator getNonMatchingMimeHeaders(String[] names)

Retrieves all MimeHeader objects whose name does not match a name in the given array.

Parameters:
   names - a String array with the name(s) of the MIME headers not to be returned

Returns: all of the MIME headers in this AttachmentPart object except those that match one of the names in the given array. The nonmatching MIME headers are returned as an Iterator object.
PS:
public abstract class AttachmentUnmarshaller
extends Object

JAXB

API  JAXB 2.0  MIME  MTOM/XOP  WS-I AP 1.0
JAXB  MIME

XOP  #isXOPPackage()  id
getAttachment*(String cid) id cid

- XOP cid
- WS-I AP 1.0cid

See XML-binary Optimized Packaging, WS-I Attachments
also Profile Version 1.0, Describing Media Content of Binary Data in XML

since JAXB 2.0

This API enables an efficient cooperative processing of optimized binary data formats between a JAXB 2.0 implementation and MIME-based package processor (MTOM/XOP and WS-I AP 1.0). JAXB unmarshals the body of a package, delegating the understanding of the packaging format being used to a MIME-based package processor that implements this abstract class.

This abstract class identifies if a package requires XOP processing, isXOPPackage() and provides retrieval of binary content stored as attachments by content-id.
Identifying the content-id, cid, to pass to getAttachment*(String cid)

- For XOP processing, the infoset representation of the cid is described in step 2a in Section 3.2 Interpreting XOP Packages
- For WS-I AP 1.0, the cid is identified as an element or attribute of type ref:swaRef specified in Section 4.4 Referencing Attachments from the SOAP Envelope

Since:
JAXB 2.0

Author:
Marc Hadley, Kohsuke Kawaguchi, Joseph Fialli

\hline
\end{tabular}
getAttachmentAsDataHandler

public abstract DataHandler getAttachmentAsDataHandler(String cid)

Lookup MIME content by content-id, cid, and return as a DataHandler.

The returned DataHandler instance must be configured to meet the following required mapping constraint.

<table>
<thead>
<tr>
<th>MIME Type</th>
<th>Java Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>DataHandler.getContentType()</td>
<td>instanceof DataHandler.getContent()</td>
</tr>
<tr>
<td>image/gif</td>
<td>java.awt.Image</td>
</tr>
<tr>
<td>image/jpeg</td>
<td>java.awt.Image</td>
</tr>
<tr>
<td>text/xml or application/xml</td>
<td>javax.xml.transform.Source</td>
</tr>
</tbody>
</table>

Note that it is allowable to support additional mappings.

**Parameters:**

cid - It is expected to be a valid lexical form of the XML Schema xs:anyURI datatype. If isXOPPackage() == true, it must be a valid URI per the cid: URI scheme (see RFC 2387)

**Returns:**
a DataHandler that represents the MIME attachment.

**Throws:**

IllegalArgumentException - if the attachment for the given cid is not found.

abstract public byte[] getAttachmentAsByteArray(String cid)

byte[] id cid
getAttachmentAsByteArray

public abstract byte[] getAttachmentAsByteArray(String cid)

Retrieve the attachment identified by content-id, cid, as a byte[].

Parameters:
  cid - It is expected to be a valid lexical form of the XML Schema xs:anyURI datatype. If isXOPPackage() == true, it must be a valid URI per the cid: URI scheme (see RFC 2387)

Returns:
  byte[] representation of attachment identified by cid.

Throws:
  IllegalArgumentException - if the attachment for the given cid is not found.
Read-only property that returns true if JAXB unmarshaller needs to perform XOP processing.

This method returns true when the constraints specified in Identifying XOP Documents are met. This value must not change during the unmarshalling process.

**Returns:**
true when MIME context is a XOP Document.
public interface Attribute
extends XMLEvent

Implements: XMLEvent
Implemented by: Namespace

StartElement
  version 1.0
  See also javax.xml.stream.events.StartElement

An interface that contains information about an attribute. Attributes are reported as a set of events accessible from a StartElement. Other applications may report Attributes as first-order events, for example as the results of an XPath expression.

Version:
  1.0

Author:
  Copyright (c) 2003 by BEA Systems. All Rights Reserved.

Method Detail

public javax.xml.namespace.QName getName()

QName

getName
**QName getName()**

Returns the QName for this attribute

**public String getValue()**

**getValue**

**String getValue()**

Gets the normalized value of this attribute

**public String getDTDType()**

"CDATA"

```java
return "CDATA"
```

**getDTDType**

**String getDTDType()**

Gets the type of this attribute, default is the String "CDATA"

**Returns:**

the type as a String, default is "CDATA"

**public boolean isSpecified()**

```java
return true
```

**isSpecified**
boolean isSpecified()

A flag indicating whether this attribute was actually specified in the start-tag of its element, or was defaulted from the schema.

**Returns:**
returns true if this was specified in the start element
javax.persistence Annotation Type AttributeOverride

@Target(value={TYPE, METHOD, FIELD})
@Retention(value=RUNTIME)
public @interface AttributeOverride

Implements: Annotation
@Target(value={TYPE, METHOD, FIELD})
@Retention(value=RUNTIME)

AttributeOverride Basic Id

AttributeOverride AttributeOverride

@MappedSuperclass
public class Employee {
    @Id protected Integer id;
    @Version protected Integer version;
    protected String address;
    public Integer getId() { ... }
    public void setId(Integer id) { ... }
    public String getAddress() { ... }
    public void setAddress(String address) { ... }
}

@Entity
@AttributeOverride(name="address", column=@Column(name="ADDR"))
public class PartTimeEmployee extends Employee {
    // address field mapping overridden to ADDR
    protected Float wage();
    public Float getHourlyWage() { ... }
    public void setHourlyWage(Float wage) { ... }
}

since Java Persistence 1.0

See javax.persistence.Embedded, javax.persistence.Embeddable, javax.persistence.MappedSuperclass

also
The `AttributeOverride` annotation is used to override the mapping of a Basic (whether explicit or default) property or field or Id property or field.

The `AttributeOverride` annotation may be applied to an entity that extends a mapped superclass or to an embedded field or property to override a basic mapping defined by the mapped superclass or embeddable class. If the `AttributeOverride` annotation is not specified, the column is mapped the same as in the original mapping.

Example:

```java
@MappedSuperclass
public class Employee {
    @Id protected Integer id;
    @Version protected Integer version;
    protected String address;
    public Integer getId() { ... }
    public void setId(Integer id) { ... }
    public String getAddress() { ... }
    public void setAddress(String address) { ... }
}

@Entity
@AttributeOverride(name="address", column=@Column(name="ADDR"))
public class PartTimeEmployee extends Employee {
    // address field mapping overridden to ADDR
    protected Float wage();
    public Float getHourlyWage() { ... }
    public void setHourlyWage(Float wage) { ... }
}
```

Since:
Java Persistence 1.0

**Required Element Summary**
### Element Detail

**abstract public String name()**

**name**

```java
public abstract String name
```

(Required) The name of the property whose mapping is being overridden if property-based access is being used, or the name of the field if field-based access is being used.

---

**abstract public Column column()**

**column**

```java
public abstract Column column
```

(Required) The column that is being mapped to the persistent attribute. The mapping type will remain the same as is defined in the embeddable class or mapped superclass.

Constructor Detail

public AttributeTag()

AttributeTag

public AttributeTag()

Deprecated.

Method Detail

public void setName(String name)

setName

public void setName(String name)

Deprecated.

Set the attribute name.

Parameters:

name - The new attribute name

public void setValue(String value)
setValue

```java
public void setValue(String value)
```

Deprecated.

Set the attribute value.

**Parameters:**

value - The new attribute value

---

doStartTag

```java
public int doStartTag() throws JspException
```

**UIComponentTag**  **UIComponent**  **UIComponent**

Throws

JspException: JSP

---

doStartTag

```java
public int doStartTag() throws JspException
```

Deprecated.

Register the specified attribute name and value with the **UIComponent** instance associated with our most immediately surrounding **UIComponentTag** instance, if this **UIComponent** does not already have a value for the specified attribute name.

**Specified by:**

doStartTag in interface Tag

**Overrides:**
**doStartTag** in class `TagSupport`

Returns: SKIP_BODY

Throws: `JspException` - if a JSP error occurs

See Also: `Tag.doStartTag()`

---

**public int doEndTag() throws `JspException`**

### doEndTag

**public int** `doEndTag()`

throws `JspException`

**Deprecated.**

**Description copied from class: `TagSupport`**

Default processing of the end tag returning EVAL_PAGE.

**Specified by:**

`doEndTag` in interface `Tag`

**Overrides:**

`doEndTag` in class `TagSupport`

Returns: EVAL_PAGE

**Throws:**

`JspException` - if an error occurs while processing this tag

See Also: `Tag.doEndTag()`

---

**public void release()**
public void release()

    Deprecated.

    Release references to any acquired resources.

    Specified by:
    release in interface Tag

    Overrides:
    release in class TagSupport

    See Also:
    Tag.release()
javax.xml.registry.infomodel  Interface AuditableEvent

All Superinterfaces: ExtensibleObject, RegistryObject

public interface AuditableEvent

extends RegistryObject

Implements: RegistryObject

AuditableEvent  RegistryObject AuditableEvent

RegistryObject RegistryObject CreateUpdate
Deprecate Delete RegistryObject AuditableEvent
AuditableEvent RegistryObject  Package Object
AuditableEvent

RegistryObject AuditableEvent Collection Object

See also  javax.xml.registry.infomodel.RegistryObject

AuditableEvent instances provide a long term record of events that effect a change of state in a RegistryObject. Such events are usually a result of a client initiated request. AuditableEvent instances are generated by the registry service to log such events.

Often such events effect a change in the life cycle of a RegistryObject. For example a client request could Create, Update, Deprecate or Delete a RegistryObject. No AuditableEvent is created for requests that do not alter the state of a RegistryObject. Specifically, read-only requests do not generate an AuditableEvent. No AuditableEvent is generated for a RegistryObject when it is classified, assigned to a Package or associated with another Object.

A RegistryObject is associated with an ordered Collection of
AuditableEvent instances that provide a complete audit trail for that Object.

 Method Detail

public User getUser() throws JAXRException

User

1

return AuditableEvent User null

Throws JAXRException: JAXR

label

requestor

supplierCardinality 1

directed

associates <{User}>
the User that sent the request that generated this this AuditableEvent. Must not be null

Throws:

`JAXRException` - If the JAXR provider encounters an internal error

```java
public java.sql.Timestamp getTimestamp() throws JAXRException
    Timestamp

1

    return
    Throws                      JAXRException: JAXR

getTimestamp

    Timestamp getTimestamp() throws JAXRException

    Gets the Timestamp for when this event occurred.

    Capability Level: 1

    Returns:
        the timestamp that records the time the event occurred
    Throws:
        JAXRException - If the JAXR provider encounters an internal error

public int getEventType() throws JAXRException

1
getEventType

int getEventType() throws JAXRException

Gets the type of this event.

Capability Level: 1

Returns: 
the type of this event

Throws:

JAXRException - If the JAXR provider encounters an internal error

See Also:
EVENT_TYPE_CREATED

getRegistryObject

public RegistryObject getRegistryObject() throws JAXRException

AuditableEvent RegistryObject

1

return RegistryObject

Throws JAXRException: JAXR

getRegistryObject

RegistryObject getRegistryObject() throws JAXRException
Gets the RegistryObject associated with this AuditableEvent.

**Capability Level: 1**

**Returns:**
the RegistryObject that was the focus of this event

**Throws:**
`JAXRException` - If the JAXR provider encounters an internal error
javax.mail Class AuthenticationFailedException

java.lang.Object
   ▼ java.lang.Throwable
      ◀ java.lang.Exception

Class Authenticator

public abstract class Authenticator
extends Object

getPasswordAuthentication (getRequestingXXX())

version 1.9, 05/04/07
java.net.Authenticator, getInstance(java.util.Properties, javax.mail.Authenticator),
getDefaultInstance(java.util.Properties, javax.mail.Authenticator),
requestPasswordAuthentication, javax.mail.PasswordAuthentication

The class Authenticator represents an object that knows how to obtain authentication for a network connection. Usually, it will do this by prompting the user for information.

Applications use this class by creating a subclass, and registering an instance of that subclass with the session when it is created. When authentication is required, the system will invoke a method on the subclass (like getPasswordAuthentication). The subclass's method can query about the authentication being requested with a number of inherited methods (getRequestingXXX()), and form an appropriate message for the user.
All methods that request authentication have a default implementation that fails.

**Version:**
1.9, 05/04/07

</tbody>
</table>
Constructor Detail

public Authenticator()

Authenticator

public Authenticator()

Method Detail

final protected java.net.InetAddress getRequestedSite()

    return InetAddress null

getRequestingSite

protected final InetAddress getRequestedSite()

    Returns:
    the InetAddress of the site requesting authorization, or null if it's not available.

final protected int getRequestedPort()

    return
protected final int getRequestingPort()

Returns:
the port for the requested connection

final protected String getRequestedProtocol()

returns

See also getProtocol

generatedProtocol

protected final String getRequestedProtocol()

Give the protocol that's requesting the connection. Often this will be based on a URLName.

Returns:
the protocol

See Also:
URLName.getProtocol()

generatedPrompt

final protected String getRequestedPrompt()

return

generatedUserName

protected final String getRequestedPrompt()

Returns:
the prompt string given by the requestor

final protected String getDefaultUserName()
getDefaultUserName

```java
protected final String getDefaultUserName()

Returns:
the default user name given by the requestor
```

getPasswordAuthentication

```java
protected PasswordAuthentication getPasswordAuthentication()
null

return PasswordAuthentication null
```

getPasswordAuthentication

```java
protected PasswordAuthentication getPasswordAuthentication()

Called when password authentication is needed. Subclasses should override the default implementation, which returns null.

Note that if this method uses a dialog to prompt the user for this information, the dialog needs to block until the user supplies the information. This method can not simply return after showing the dialog.

Returns:
The PasswordAuthentication collected from the user, or null if none is provided.

PS:
javax.persistence  Annotation Type Basic

@Target(value={METHOD, FIELD})
@Retention(value=RUNTIME)
public @interface Basic

Implements: Annotation
@Target(value={METHOD, FIELD})
@Retention(value=RUNTIME)

Basic  Basic Java
    String, java.math.BigInteger, java.math.BigDecimal, java.util.Date, java.util.Calendar,
    Byte[], char[], Character[]  Serializable

Basic  Java Persistence 1.0  en

The Basic annotation is the simplest type of mapping to a database column. The Basic annotation can be applied to a persistent property or instance variable of any of the following types: Java primitive types, wrappers of the primitive types, String, java.math.BigInteger, java.math.BigDecimal, java.util.Date, java.util.Calendar, java.sql.Date, java.sql.Time, java.sql.Timestamp, byte[], Byte[], char[], Character[], enums, and any other type that implements Serializable.

The use of the Basic annotation is optional for persistent fields and properties of these types.

Since:
    Java Persistence 1.0
### fetch

**Abstract public** `FetchType` **fetch()**

(Optional) Defines whether the value of the field or property should be lazily loaded or must be eagerly fetched. The **EAGER** strategy is a requirement on the persistence provider runtime that the value must be eagerly fetched. The **LAZY** strategy is a hint to the persistence provider runtime. If not specified, defaults to **EAGER**.

**Default:**

**EAGER**

### optional

**Abstract public** `boolean` **optional()**

**null**

(Optional) Defines whether the value of the field or property may be null. This is a hint and is disregarded for primitive types; it may be used in schema generation. If not specified, defaults to **true**.
Default:
   true

PS:
**javax.el Class BeanELResolver**

```java
public class BeanELResolver extends ELResolver
```

**Extends:** ELResolver  
**Inner classes:** BeanELResolver.BeanProperty, BeanELResolver.BeanProperties

JavaBean

```java
base base null base JavaBean
JavaBean
```

```java
#isReadOnly true#setValue PropertyNotWritableException
```

ELResolver CompositeELResolver ELResolver

**javadoc**

```java
since JSP 2.1
See also javax.el.CompositeELResolver, javax.el.ELResolver
```

Defines property resolution behavior on objects using the JavaBeans component architecture.

This resolver handles base objects of any type, as long as the base is not null. It accepts any object as a property, and coerces it to a string. That string is then used to find a JavaBeans compliant property on the base object. The value is accessed using JavaBeans getters and setters.
This resolver can be constructed in read-only mode, which means that `isReadOnly` will always return `true` and `setValue(javax.el.ELContext, javax.lang.Object, javax.lang.Object, javax.lang.Object)` will always throw `PropertyNotWritableException`.

ELResolvers are combined together using `CompositeELResolvers`, to define rich semantics for evaluating an expression. See the javadocs for `ELResolver` for details.

Because this resolver handles base objects of any type, it should be placed near the end of a composite resolver. Otherwise, it will claim to have resolved a property before any resolvers that come after it get a chance to test if they can do so as well.

**Since:**
- JSP 2.1

**See Also:**
- `CompositeELResolver`, `ELResolver`
BeanELResolver(boolean isReadOnly)

Creates a new BeanELResolver whose read-only status is determined by the given parameter.

**Methods inherited from class java.lang.Object**
close, equals, finalize, getClass, hashCode, notify, notifyAll,
Constructor Detail

public BeanELResolver()
/* BeanELResolver */

BeanELResolver

public BeanELResolver()

    Creates a new read/write BeanELResolver.

public BeanELResolver(boolean isReadOnly)

    BeanELResolver
        isReadOnly    Bean     true    false

BeanELResolver

public BeanELResolver(boolean isReadOnly)

    Creates a new BeanELResolver whose read-only status is determined by the given parameter.

    Parameters:
    isReadOnly - true if this resolver cannot modify beans; false otherwise.

Method Detail

public Class<T> getType(ELContext context, Object base, Object property)
**getType**

```java
public Class<?> getType(ELContext context,
                         Object base,
                         Object property)
```

If the base object is not `null`, returns the most general acceptable type that can be set on this bean property.

If the base is not `null`, the `propertyResolved` property of the `ELContext` object must be set to `true` by this resolver, before returning. If this property is not `true` after this method is called, the caller should ignore the return value.

The provided property will first be coerced to a `String`. If there is a `BeanInfoProperty` for this property and there were no errors retrieving it, the `propertyType` of the `propertyDescriptor` is returned. Otherwise, a `PropertyNotFoundException` is thrown.

**Specified by:**

`getType` in class `ELResolver`
Parameters:
context - The context of this evaluation.
base - The bean to analyze.
property - The name of the property to analyze. Will be coerced to a String.

Returns:
If the propertyResolved property of ELContext was set to true, then the most general acceptable type; otherwise undefined.

Throws:
NullPointerException - if context is null
PropertyNotFoundException - if base is not null and the specified property does not exist or is not readable.
ELException - if an exception was thrown while performing the property or variable resolution. The thrown exception must be included as the cause property of this exception, if available.

public Object getValue(ELContext context, Object base, Object property)
    base null Bean
    base null ELContext propertyResolved true
    true

String JavaBean base
PropertyNotFoundException
getValue

```java
public Object getValue(ELContext context,
                         Object base,
                         Object property)
```

If the base object is not `null`, returns the current value of the given property on this bean.

If the base is not `null`, the `propertyResolved` property of the `ELContext` object must be set to `true` by this resolver, before returning. If this property is not `true` after this method is called, the caller should ignore the return value.

The provided property name will first be coerced to a `String`. If the property is a readable property of the base object, as per the JavaBeans specification, then return the result of the getter call. If the getter throws an exception, it is propagated to the caller. If the property is not found or is not readable, a `PropertyNotFoundException` is thrown.

**Specified by:**
```
getValue in class ELResolver
```

**Parameters:**
- `context` - The context of this evaluation.
- `base` - The bean on which to get the property.
- `property` - The name of the property to get. Will be coerced to a `String`.

**Returns:**
- If the `propertyResolved` property of `ELContext` was set to `true`, then the value of the given property. Otherwise, undefined.

**Throws:**
- `NullPointerException` - if `context` is `null`.
- `PropertyNotFoundException` - if `base` is not `null` and the specified property does not exist or is not readable.
- `ELException` - if an exception was thrown while performing the property or variable resolution. The thrown exception must be included as the cause property of this exception, if available.
public void setValue(ELContext context, Object base, Object property, Object val)

If the base object is not null, attempts to set the value of the given property on this bean.

If the base is not null, the propertyResolved property of the ELContext object must be set to true by this resolver, before returning. If this property is not true after this method is called, the caller can safely assume no value was set.

If this resolver was constructed in read-only mode, this method will
always throw PropertyNotWritableException.

The provided property name will first be coerced to a String. If property is a writable property of base (as per the JavaBeans Specification), the setter method is called (passing value). If the property exists but does not have a setter, then a PropertyNotFoundException is thrown. If the property does not exist, a PropertyNotFoundException is thrown.

Specified by:
setValue in class ELResolver

Parameters:
context - The context of this evaluation.
base - The bean on which to set the property.
property - The name of the property to set. Will be coerced to a String.
val - The value to be associated with the specified key.

Throws:
NullPointerException - if context is null.
PropertyNotFoundException - if base is not null and the specified property does not exist.
PropertyNotWritableException - if this resolver was constructed in read-only mode, or if there is no setter for the property.
ELException - if an exception was thrown while performing the property or variable resolution. The thrown exception must be included as the cause property of this exception, if available.
**PropertyNotFoundException**

```
context base Bean
property String
return ELContext propertyResolved true setValue true false
```

**Throws**

- NullPointerException: context null
- PropertyNotFoundException: base null
- ELException: cause

**isReadOnly**

```java
public boolean isReadOnly(ELContext context,
                          Object base,
                          Object property)
```

If the base object is not null, returns whether a call to `setValue(javax.el.ELContext, java.lang.Object, java.lang.Object, java.lang.Object)` will always fail.

If the base is not null, the `propertyResolved` property of the `ELContext` object must be set to `true` by this resolver, before returning. If this property is not `true` after this method is called, the caller can safely assume no value was set.

If this resolver was constructed in read-only mode, this method will always return `true`.

The provided property name will first be coerced to a `String`. If property is a writable property of `base`, `false` is returned. If the property is found but is not writable, `true` is returned. If the property is not found, a `PropertyNotFoundException` is thrown.

**Specified by:**

- `isReadOnly` in class `ELResolver`

**Parameters:**

- `context` - The context of this evaluation.
base - The bean to analyze.
property - The name of the property to analyzed. Will be coerced to a String.

Returns:
If the propertyResolved property of ELContext was set to true, then true if calling the setValue method will always fail or false if it is possible that such a call may succeed; otherwise undefined.

Throws:
 NullPointerException - if context is null
 PropertyNotFoundException - if base is not null and the specified property does not exist.
 ELEexception - if an exception was thrown while performing the property or variable resolution. The thrown exception must be included as the cause property of this exception, if available.

```
public java.util.Iterator<E> getFeatureDescriptors(ELContext context, Object base)
base null JavaBean Iterator null

Iterator 0 java.beans.FeatureDescriptor info
bean BeanInfo.getPropertyDescriptor PropertyDescriptor FeatureDescriptor "type"
"resolvableAtDesignTime"

• ELEResolver#TYPE -
PropertyDescriptor.getPropertyType()
• ELEResolver#RESOLVABLE_AT_DESIGN_TIME - true

context base return 0 FeatureDescriptor Iterator Bean null base
null null
```
getFeatureDescriptors

public Iterator<FeatureDescriptor> getFeatureDescriptors(ELContext context, Object base)

If the base object is not null, returns an Iterator containing the set of JavaBeans properties available on the given object. Otherwise, returns null.

The Iterator returned must contain zero or more instances of FeatureDescriptor. Each info object contains information about a property in the bean, as obtained by calling the BeanInfo.getPropertyDescriptors method. The FeatureDescriptor is initialized using the same fields as are present in the PropertyDescriptor, with the additional required named attributes "type" and "resolvableAtDesignTime" set as follows:

- ELResolver.TYPE - The runtime type of the property, from PropertyDescriptor.getPropertyType().
- ELResolver.RESOLVABLE_AT_DESIGN_TIME - true.

Specified by:
getFeatureDescriptors in class ELResolver

Parameters:
context - The context of this evaluation.
base - The bean to analyze.

Returns:
An Iterator containing zero or more FeatureDescriptor objects, each representing a property on this bean, or null if the base object is null.

See Also:
FeatureDescriptor

---

public Class<T> getCommonPropertyType(ELContext context, Object base)

base null property null

base null Object.class
getCommonPropertyType

public Class<? extends Object> getCommonPropertyType(ELContext context, Object base)

If the base object is not null, returns the most general type that this resolver accepts for the property argument. Otherwise, returns null.

Assuming the base is not null, this method will always return Object.class. This is because any object is accepted as a key and is coerced into a string.

**Specified by:**
getCommonPropertyType in class ELResolver

**Parameters:**
- context - The context of this evaluation.
- base - The bean to analyze.

**Returns:**
- null if base is null; otherwise Object.class.

DECIMAL_ID

public static final String DECIMAL_ID

The message identifier of the FacesMessage to be created if the conversion to BigDecimal fails. The message format string for this message may optionally include the following placeholders:

- {0} replaced by the unconverted value.
- {1} replaced by an example value.
- {2} replaced by a String whose value is the label of the input component that produced this message.

---

getAsObject

**public** **Object** **getAsObject**(FacesContext context, UICOMPONENT component, String value)**

**Description copied from interface: Converter**

Convert the specified string value, which is associated with the specified UICOMPONENT, into a model data object that is appropriate for being stored during the Apply Request Values phase of the request processing lifecycle.

**Specified by:** getAsObject in interface Converter

**Parameters:**

context - FacesContext for the request being processed

component - UICOMPONENT with which this model object value is associated

value - String value to be converted (may be null)

**Returns:**

null if the value to convert is null, otherwise the result of the
conversion

Throws:
  ConverterException - if conversion cannot be successfully performed
  NullPointerException - if context or component is null

public String getAsString(FacesContext context, UIComponent component, Object value)

Throws  ConverterException: NullPointerException
Throws  NullPointerException: NullPointerException

getAsString

public String getAsString(FacesContext context, UIComponent component, Object value)

Description copied from interface: Converter

Convert the specified model object value, which is associated with the specified UIComponent, into a String that is suitable for being included in the response generated during the Render Response phase of the request processing lifecycle.

Specified by:
  getAsString in interface Converter

Parameters:
  context - FacesContext for the request being processed
  component - UIComponent with which this model object value is associated
  value - Model object value to be converted (may be null)

Returns:
  a zero-length String if value is null, otherwise the result of the conversion

Throws:
  ConverterException - if conversion cannot be successfully
NullPointerException - if context or component is null

javax.xml.bind **Class Binder<XmlNode>**

**java.lang.Object**

```
javax.xml.bind.Binder<XmlNode>
```

---

public abstract class **Binder<XmlNode>** extends **Object**

**XML** **XML** **JAXB**

**XML** **XML** **JAXB**

`#getJAXBNode(Object)`

JAXB Binder  Binder
`#updateJAXB(Object)`

- **XML** **XML**
- **#unmarshal(Object)**  **XML** **JAXB**  **XML**  **JAXB**

- **XML / JAXB**
- **#updateXML(Object)**  **JAXB**  **XML**  **XML**  **PI**

Binder  `createBinder()`  `createBinder(Class)`

```
XmlNode  XML /Binder  org.w3c.dom.Node.class
XmlNode  Binder  XML
```

**since**  **JAXB 2.0**

Enable synchronization between XML infoset nodes and JAXB objects representing same XML document.

An instance of this class maintains the association between XML nodes
of an infoset preserving view and a JAXB representation of an XML document. Navigation between the two views is provided by the methods
`getXMLNode(Object)` and `getJAXBNode(Object)`.

Modifications can be made to either the infoset preserving view or the JAXB representation of the document while the other view remains unmodified. The binder is able to synchronize the changes made in the modified view back into the other view using the appropriate Binder update methods, `updateXML(Object, Object)` or `updateJAXB(Object)`.

A typical usage scenario is the following:

- load XML document into an XML infoset representation
- `unmarshal(Object)` XML infoset view to JAXB view. (Note to conserve resources, it is possible to only unmarshal a subtree of the XML infoset view to the JAXB view.)
- application access/updates JAXB view of XML document.
- `updateXML(Object)` synchronizes modifications to JAXB view back into the XML infoset view. Update operation preserves as much of original XML infoset as possible (i.e. comments, PI, ...)

A Binder instance is created using the factory method
`JAXBContext.createBinder()` or `JAXBContext.createBinder(Class)`.

The template parameter, `XmlNode`, is the root interface/class for the XML infoset preserving representation. A Binder implementation is required to minimally support an `XmlNode` value of `org.w3c.dom.Node.class`. A Binder implementation can support alternative XML infoset preserving representations.

**Since:**
JAXB 2.0

<td>Specifies whether marshal, unmarshal and update methods performs validation on their XML content.</td>
</tr>
<tr>
<td><code>unmarshal(XmlNode xmlNode)</code></td>
<td>Unmarshal XML infoset view to a JAXB object tree.</td>
</tr>
</tbody>
</table>
Unmarshal XML root element by provided declaredType to a JAXB object tree.

```java
unmarshal(XmlNode xmlNode, Class<T> declaredType)
```

Unmarshal XML infoset view to a JAXB object tree.

This method is similar to `Unmarshaller.unmarshal(Node)` with the
addition of maintaining the association between XML nodes and the produced JAXB objects, enabling future update operations, updateXML(Object, Object) or updateJAXB(Object).

When getSchema() is non-null, XmlNode and its descendants is validated during this operation.

This method throws UnmarshalException when the Binder's JAXBContext does not have a mapping for the XML element name or the type, specifiable via @xsi:type, of XmlNode to a JAXB mapped class. The method unmarshal(Object, Class) enables an application to specify the JAXB mapped class that the XmlNode should be mapped to.

**Parameters:**
XmlNode - the document/element to unmarshal XML data from.

**Returns:**
the newly created root object of the JAXB object tree.

**Throws:**
JAXBException - If any unexpected errors occur while unmarshalling
UnmarshalException - If the ValidationEventHandler returns false from its handleEvent method or the Binder is unable to perform the XML to Java binding.
IllegalArgumentException - If the node parameter is null

```java
public abstract <T> JAXBElement<T> unmarshal(XmlNode xmlNode, Class<T> declaredType)
throws JAXBException
```

Unmarshal XML root element by provided declaredType to a JAXB object tree.

Implements Unmarshal by Declared Type
This method is similar to `Unmarshaller.unmarshal(Node, Class)` with the addition of maintaining the association between XML nodes and the produced JAXB objects, enabling future update operations, `updateXML(Object, Object)` or `updateJAXB(Object)`.

When `getSchema()` is non-null, `XmlNode` and its descendants is validated during this operation.

**Parameters:**
- `XmlNode` - the document/element to unmarshal XML data from.
- `declaredType` - appropriate JAXB mapped class to hold node's XML data.

**Returns:**
- `JAXB Element` representation of `node`

**Throws:**
- `JAXBException` - If any unexpected errors occur while unmarshalling
- `UnmarshallerException` - If the `ValidationEventHandler` returns false from its `handleEvent` method or the Binder is unable to perform the XML to Java binding.
- `IllegalArgumentException` - If any of the input parameters are null

**Since:**
JAXB2.0

---

`marshal`

```java
public abstract void marshal(Object jaxbObject,
                              XmlNode xmlNode)
    throws JAXBException
```

Marshal a JAXB object tree to a new XML document.

This method is similar to `Marshaller.marshal(Object, Node)` with the addition of maintaining the association between JAXB objects and the produced XML nodes, enabling future update operations such as `updateXML(Object, Object)` or `updateJAXB(Object)`. 
When `getSchema()` is non-null, the marshalled xml content is validated during this operation.

**Parameters:**
- `jaxbObject` - The content tree to be marshalled.
- `xmlNode` - The parameter must be a Node that accepts children.

**Throws:**
- `JAXBException` - If any unexpected problem occurs during the marshalling.
- `MarshalException` - If the `ValidationEventHandler` returns false from its `handleEvent` method or the `Binder` is unable to marshal `jaxbObject` (or any object reachable from `jaxbObject`).
- `IllegalArgumentException` - If any of the method parameters are null

```java
abstract public Object getXMLNode(Object jaxbObject)
```

**abstract public Object getXMLNode(Object jaxbObject)**

**JAXB XML**

**XML JAXB bind update XML**

**JAXB JAXB XML**

```java
jaxbObject JAXB bind update
return JAXB Binder XML null
Throws IllegalArgumentException: jaxbObject null
```

**getXMLNode**

```java
public abstract XmlNode getXMLNode(Object jaxbObject)
```

**getXMLNode**

Gets the XML element associated with the given JAXB object.

Once a JAXB object tree is associated with an XML fragment, this method enables navigation between the two trees.
An association between an XML element and a JAXB object is established by the bind methods and the update methods. Note that this association is partial; not all XML elements have associated JAXB objects, and not all JAXB objects have associated XML elements.

**Parameters:**

jaxbObject - An instance that is reachable from a prior call to a bind or update method that returned a JAXB object tree.

**Returns:**

null if the specified JAXB object is not known to this Binder, or if it is not associated with an XML element.

**Throws:**

IllegalArgumentException - If the jaxbObject parameter is null

---

getJAXBNode

```java
public abstract Object getJAXBNode(XmlNode xmlNode)
```

Gets the JAXB object associated with the given XML element.

Once a JAXB object tree is associated with an XML fragment, this method enables navigation between the two trees.

An association between an XML element and a JAXB object is established by the unmarshal, marshal and update methods. Note that this association is partial; not all XML elements have associated JAXB objects, and not all JAXB objects have associated XML elements.

**Returns:**

null if the specified XML node is not known to this Binder, or if it is not associated with a JAXB object.

**Throws:**

IllegalArgumentException - If the node parameter is null
abstract public Object updateXML(Object jaxbObject)
throws JAXBException
JAXB XML

updateXML( jaxbObject, getXMLNode(jaxbObject));

Throws JAXBException: XML
Throws IllegalArgumentException: jaxbObject null

updateXML

public abstract XmlNode updateXML(Object jaxbObject)
throws JAXBException

Takes an JAXB object and updates its associated XML node and its descendants.

This is a convenience method of:

updateXML( jaxbObject, getXMLNode(jaxbObject));

Throws:
 JAXBException - If any unexpected problem occurs updating corresponding XML content.
IllegalArgumentException - If the jaxbObject parameter is null

updateXML

public abstract XmlNode updateXML(Object jaxbObject, XmlNode xmlNode)
throws JAXBException
Changes in JAXB object tree are updated in its associated XML parse tree.

This operation can be thought of as an "in-place" marshalling. The difference is that instead of creating a whole new XML tree, this operation updates an existing tree while trying to preserve the XML as much as possible.

For example, unknown elements/attributes in XML that were not bound to JAXB will be left untouched (whereas a marshalling operation would create a new tree that doesn't contain any of those.)

As a side-effect, this operation updates the association between XML nodes and JAXB objects.

**Parameters:**
- `jaxbObject` - root of potentially modified JAXB object tree
- `xmlNode` - root of update target XML parse tree

**Returns:**
Returns the updated XML node. Typically, this is the same node you passed in as `xmlNode`, but it maybe a different object, for example when the tag name of the object has changed.

**Throws:**
- `JAXBException` - If any unexpected problem occurs updating corresponding XML content.
- `IllegalArgumentException` - If any of the input parameters are null

updateJAXB

```java
public abstract Object updateJAXB(XmlNode xmlNode)
throws JAXBException
```

Takes an XML node and updates its associated JAXB object and its descendants.

This operation can be thought of as an "in-place" unmarshalling. The
difference is that instead of creating a whole new JAXB tree, this operation updates an existing tree, reusing as much JAXB objects as possible.

As a side-effect, this operation updates the association between XML nodes and JAXB objects.

**Returns:**
Returns the updated JAXB object. Typically, this is the same object that was returned from earlier `marshal(Object, Object)` or `updateJAXB(Object)` method invocation, but it maybe a different object, for example when the name of the XML element has changed.

**Throws:**
- `JAXBException` - If any unexpected problem occurs updating corresponding JAXB mapped content.
- `IllegalArgumentException` - If node parameter is null

### abstract public void setSchema(javax.xml.validation.Schema schema)

**marshalunmarshal update XML**

`schema` `null`

**See also**
`setSchema(Schema)`

### setSchema

**public abstract void** `setSchema(Schema schema)`

Specifies whether marshal, unmarshal and update methods performs validation on their XML content.

**Parameters:**
- `schema` - set to null to disable validation.

**See Also:**
`Unmarshaller.setSchema(Schema)`
abstract public javax.xml.validation.Schema getSchema()
    
    #setSchema(Schema)     Schema null
    return     Schema null

getSchema

public abstract Schema getSchema()

    Gets the last Schema object (including null) set by the
    setSchema(Schema) method.

    Returns:
    the Schema object for validation or null if not present

abstract public void setEventHandler(ValidationEventHandler handler) throws JAXBException

    Binder unmarshalmarshal update JAXB
    ValidationEventHandler

null Binder
    handler
    Throws JAXBException:

setEventHandler

public abstract void setEventHandler(ValidationEventHandler handler) throws JAXBException

    Allow an application to register a ValidationEventHandler.
The `ValidationEventHandler` will be called by the JAXB Provider if any validation errors are encountered during calls to any of the Binder unmarshal, marshal and update methods.

Calling this method with a null parameter will cause the Binder to revert back to the default default event handler.

**Parameters:**
- handler - the validation event handler

**Throws:**
- `JAXBException` - if an error was encountered while setting the event handler

---

**abstract public** `ValidationEventHandler` `getEventHandler()`
**throws** `JAXBException`

```java
return ValidationEventHandler
Throws JAXBException:
```

**getEventHandler**

**public abstract** `ValidationEventHandler` `getEventHandler()`
**throws** `JAXBException`

Return the current event handler or the default event handler if one hasn't been set.

**Returns:**
- the current `ValidationEventHandler` or the default event handler if it hasn't been set

**Throws:**
- `JAXBException` - if an error was encountered while getting the current event handler

---

**abstract public void** `setProperty(String name, Object value)`
unmarshal marshal PropertyException

Unmarshal Marshal

name value

Throws PropertyException:
Throws IllegalArgumentException: name null

setProperty

public abstract void setProperty(String name, Object value)
throws PropertyException

Set the particular property in the underlying implementation of Binder. This method can only be used to set one of the standard JAXB defined unmarshal/marshal properties or a provider specific property for binder, unmarshal or marshal. Attempting to set an undefined property will result in a PropertyException being thrown. See Supported Unmarshal Properties and Supported Marshal Properties.

Parameters:

name - the name of the property to be set. This value can either be specified using one of the constant fields or a user supplied string.
value - the value of the property to be set

Throws:

PropertyException - when there is an error processing the given property or value
IllegalArgumentException - If the name parameter is null

abstract public Object getProperty(String name) throws PropertyException
getProperty

public abstract Object getProperty(String name)
  throws PropertyException

Get the particular property in the underlying implementation of
Binder. This method can only be used to get one of the standard
JAXB defined unmarshal/marshal properties or a provider specific
property for binder, unmarshal or marshal. Attempting to get an
undefined property will result in a PropertyException being thrown.
See Supported Unmarshal Properties and Supported Marshal
Properties.

Parameters:
  name - the name of the property to retrieve

Returns:
  the value of the requested property

Throws:
  PropertyException - when there is an error retrieving the given
  property or value property name
  IllegalArgumentException - If the name parameter is null
PS:
public interface Binding

Implemented by: HTTPBinding, SOAPBinding

Binding JAX-WS

since JAX-WS 2.0

The Binding interface is the base interface for JAX-WS protocol bindings.

Since:
JAX-WS 2.0

Method Summary

<table>

</tr>
</tbody>
</table>

Method Detail

public java.util.List<E> getHandlerChain()

return java.util.List Handler
**getHandlerChain**

```java
List<Handler> getHandlerChain()
```

Gets a copy of the handler chain for a protocol binding instance. If the returned chain is modified a call to `setHandlerChain` is required to configure the binding instance with the new chain.

**Returns:**

java.util.List Handler chain

---

**setHandlerChain**

```java
void setHandlerChain(List<Handler> chain)
```

Sets the handler chain for the protocol binding instance.

**Parameters:**

- `chain` - A List of handler configuration entries

**Throws:**

- `WebServiceException` - On an error in the configuration of the handler chain
- `UnsupportedOperationException` - If this operation is not supported. This may be done to avoid any overriding of a pre-configured handler chain.
PS:
javax.xml.ws Interface BindingProvider

All Known Subinterfaces:
   Dispatch<T>

public interface BindingProvider

Implemented by: Dispatch

BindingProvider since JAX-WS 2.0
See also javax.xml.ws.Binding

The BindingProvider interface provides access to the protocol binding and associated context objects for request and response message processing.

Since: JAX-WS 2.0
See Also: Binding

## Field Detail

**USERNAME_PROPERTY**

static final String USERNAME_PROPERTY

    Standard property: User name for authentication.

    Type: java.lang.String

    **See Also:**

    [Constant Field Values](#)
static final String PASSWORD_PROPERTY

Standard property: Password for authentication.

Type: java.lang.String

See Also:
Constant Field Values

ENDPOINT_ADDRESS_PROPERTY

static final String ENDPOINT_ADDRESS_PROPERTY

Standard property: Target service endpoint address. The URI scheme for the endpoint address specification must correspond to the protocol/transport binding for the binding in use.

Type: java.lang.String

See Also:
Constant Field Values

SESSION_MAINTAIN_PROPERTY

static final String SESSION_MAINTAIN_PROPERTY

Standard property: This boolean property is used by a service client to indicate whether or not it wants to participate in a session with a service endpoint. If this property is set to true, the service client indicates that it wants the session to be maintained. If set to false, the session is not maintained. The default value for this property is false.

Type: java.lang.Boolean
SOAPACTION_USEPROPERTY

static final String SOAPACTION_USEPROPERTY

Standard property for SOAPAction. This boolean property indicates whether or not SOAPAction is to be used. The default value of this property is false indicating that the SOAPAction is not used.

Type: java.lang.Boolean

See Also:
Constant Field Values

SOAPACTION_URIPROPERTY

static final String SOAPACTION_URIPROPERTY

Standard property for SOAPAction. Indicates the SOAPAction URI if the javax.xml.ws.soap.http.soapaction.use property is set to true.

Type: java.lang.String

See Also:
Constant Field Values

Method Detail

public java.util.Map<K, V> getRequestContext()
getRequestContext

Map<String, Object> getRequestContext()

Get the context that is used to initialize the message context for request messages. Modifications to the request context do not affect the message context of either synchronous or asynchronous operations that have already been started.

Returns:
The context that is used in processing request messages.

public java.util.Map<K, V> getResponseContext()

Get the context that resulted from processing a response message. The returned context is for the most recently completed synchronous operation. Subsequent synchronous operation invocations overwrite the response context. Asynchronous operations return their response context via the Response interface.

Returns:
The context that resulted from processing the latest response messages.

public Binding getBinding()

Binding
getBinding

Binding getBinding()

Get the Binding for this binding provider.

**Returns:**

The Binding for this binding provider.
javax.xml.ws  Annotation Type BindingType

@Target(value=TYPE)  
@Retention(value=RUNTIME)  
@Documented
public @interface BindingType

**Implements:** Annotation  
@Target(value=TYPE)  
@Retention(value=RUNTIME)  
@Documented

BindingType  Web

**since**  JAX-WS 2.0

The BindingType annotation is used to specify the binding to use for a web service endpoint implementation class.

This annotation may be overridden programmatically or via deployment descriptors, depending on the platform in use.

**Since:**  
JAX-WS 2.0

---

**Optional Element Summary**

javax.servlet.jsp.tagext Class BodyContent

java.lang.Object
  └─ java.io.writer
      └─ javax.servlet.jsp.jspwriter
          └─ javax.servlet.jsp.tagext.bodycontent

All Implemented Interfaces:
   Closeable, Flushable, Appendable

public abstract class BodyContent
  extends JspWriter

Extends: java.io.writer > JspWriter

BodyContent  JspWriter

BodyContent

BodyContent  String

BodyContent  BodyContent  autoFlush  BodyContent
flush

BodyContent  PageContext  pushBody  popBody
BodyContent  JspWriter  BodyContent

  setBodyContent()  BodyContent  BodyTag  doEndTag()

An encapsulation of the evaluation of the body of an action so it is available to a tag handler. BodyContent is a subclass of JspWriter.

Note that the content of BodyContent is the result of evaluation, so it will not contain actions and the like, but the result of their invocation.

BodyContent has methods to convert its contents into a String, to read its
contents, and to clear the contents.

The buffer size of a BodyContent object is unbounded. A BodyContent object cannot be in autoFlush mode. It is not possible to invoke flush on a BodyContent object, as there is no backing stream.

Instances of BodyContent are created by invoking the pushBody and popBody methods of the PageContext class. A BodyContent is enclosed within another JspWriter (maybe another BodyContent object) following the structure of their associated actions.

A BodyContent is made available to a BodyTag through a setBodyContent() call. The tag handler can use the object until after the call to doEndTag().

---

**Field Summary**

Fields inherited from class javax.servlet.jsp.JspWriter

- autoFlush, bufferSize, DEFAULT_BUFFER, NO_BUFFER, UNBOUNDED_BUFFER

Fields inherited from class java.io.Writer

- lock

**Constructor Summary**

protected `BodyContent(JspWriter e)`

Protected constructor.

### Constructor Detail

#### protected BodyContent(**JspWriter** e)

**e** JspWriter

**BodyContent**

#### protected BodyContent(**JspWriter** e)

Protected constructor. Unbounded buffer, no autoflushing.
Parameters:
  e - the enclosing JspWriter

Method Detail

public void flush() throws java.io.IOException

flush()

BodyContent

Throws java.io.IOException:

flush

public void flush() throws IOException

Redefined flush() so it is not legal.

It is not valid to flush a BodyContent because there is no backing stream behind it.

Specified by:
  flush in interface Flushable

Specified by:
  flush in class JspWriter

Throws:
  IllegalArgumentException - always thrown

public void clearBody()

clearBody
public void clearBody()

    Clear the body without throwing any exceptions.

abstract public java.io.Reader getReader()
Reader  BodyContent
    return  Reader  BodyContent

getReader

public abstract Reader getReader()

    Return the value of this BodyContent as a Reader.

    Returns:  
    the value of this BodyContent as a Reader

abstract public String getString()
String  BodyContent
    return  String  BodyContent

getString

public abstract String getString()

    Return the value of the BodyContent as a String.

    Returns:  
    the value of the BodyContent as a String

abstract public void writeOut(java.io.Writer out) throws java.io.IOException
BodyContent  Writer
writeOut

public abstract void writeOut(Writer out)
   throws IOException

Write the contents of this BodyContent into a Writer. Subclasses may optimize common invocation patterns.

Parameters:
   out - The writer into which to place the contents of this body evaluation

Throws:
   IOException - if an I/O error occurred while writing the contents of this BodyContent to the given Writer

public JspWriter getEnclosingWriter()
JspWriter

   return JspWriter

getEnclosingWriter

public JspWriter getEnclosingWriter()

   Get the enclosing JspWriter.

   Returns:
   the enclosing JspWriter passed at construction time

PS :
javax.mail  **Class BodyPart**

```java
java.lang.Object
   \_ javax.mail.BodyPart
```

**All Implemented Interfaces:**
- Part

**Direct Known Subclasses:**
- MimeBodyPart

```java
public abstract class BodyPart
   extends Object
   implements Part

  Implements: Part
  Extended by: MimeBodyPart
  
  Multipart Part
  
  BodyPart Part ""
```

This class models a Part that is contained within a Multipart. This is an abstract class. Subclasses provide actual implementations.

BodyPart implements the Part interface. Thus, it contains a set of attributes and a "content".

**Author:**
  John Mani, Bill Shannon

---

**Field Summary**

PS:
public interface BodyTag

extends IterationTag

Implements: IterationTag
Implemented by: BodyTagSupport, UIComponentClassicTagBase

BodyTag IterationTag

bodyContent.getString String
bodyContent.writeOut JspWriter

BodyTag IterationTag doStartTag SKIP_BODY
EVAL_BODY_INCLUDE EVAL_BODY_BUFFERED

EVAL_BODY_INCLUDE IterationTag

EVAL_BODY_BUFFERED BodyContent JSP JSP
pageContext pushBody BodyContent out
PageContext popBody out

setter action

bodyContent BodyContent JSP setter
(setBodyContent) doStartTag() EVAL_BODY_BUFFERED
The BodyTag interface extends IterationTag by defining additional methods that let a tag handler manipulate the content of evaluating its body.

It is the responsibility of the tag handler to manipulate the body content. For example the tag handler may take the body content, convert it into a String using the bodyContent.getString method and then use it. Or the
A tag handler may take the body content and write it out into its enclosing JspWriter using the bodyContent.writeOut method.

A tag handler that implements BodyTag is treated as one that implements IterationTag, except that the doStartTag method can return SKIP_BODY, EVAL_BODY_INCLUDE or EVAL_BODY_BUFFERED.

If EVAL_BODY_INCLUDE is returned, then evaluation happens as in IterationTag.

If EVAL_BODY_BUFFERED is returned, then a BodyContent object will be created (by code generated by the JSP compiler) to capture the body evaluation. The code generated by the JSP compiler obtains the BodyContent object by calling the pushBody method of the current pageContext, which additionally has the effect of saving the previous out value. The page compiler returns this object by calling the popBody method of the PageContext class; the call also restores the value of out.

The interface provides one new property with a setter method and one new action method.

**Properties**

There is a new property: bodyContent, to contain the BodyContent object, where the JSP Page implementation object will place the evaluation (and reevaluation, if appropriate) of the body. The setter method (setBodyContent) will only be invoked if doStartTag() returns EVAL_BODY_BUFFERED and the corresponding action element does not have an empty body.

**Methods**

In addition to the setter method for the bodyContent property, there is a new action method: doInitBody(), which is invoked right after setBodyContent() and before the body evaluation. This method is only invoked if doStartTag() returns EVAL_BODY_BUFFERED.

**Lifecycle**

Lifecycle details are described by the transition diagram below.
Exceptions that are thrown during the computation of doStartTag(), setBodyContent(), doInitBody(), BODY, doAfterBody() interrupt the execution sequence and are propagated up the stack, unless the tag handler implements the TryCatchFinally interface; see that interface for details.

Empty and Non-Empty Action

If the TagLibraryDescriptor file indicates that the action must always have an empty element body, by an <body-content> entry of "empty", then the doStartTag() method must return SKIP_BODY. Otherwise, the doStartTag() method may return SKIP_BODY, EVAL_BODY_INCLUDE, or EVAL_BODY_BUFFERED.

Note that which methods are invoked after the doStartTag() depends on both the return value and on if the custom action element is empty or not in the JSP page, not how it's declared in the TLD.

If SKIP_BODY is returned the body is not evaluated, and doEndTag() is invoked.

If EVAL_BODY_INCLUDE is returned, and the custom action element is not empty, setBodyContent() is not invoked, doInitBody() is not invoked, the body is evaluated and "passed through" to the current out, doAfterBody() is invoked and then, after zero or more iterations, doEndTag() is invoked. If the custom action element is empty, only doStart() and doEndTag() are invoked.

If EVAL_BODY_BUFFERED is returned, and the custom action element is not empty, setBodyContent() is invoked, doInitBody() is invoked, the body is evaluated, doAfterBody() is invoked, and then, after zero or more iterations, doEndTag() is invoked. If the custom action element is empty, only doStart() and doEndTag() are invoked.

Field Summary
**EVAL_BODY_BUFFERED**
Request the creation of new buffer, a BodyContent on which to evaluate the body of this tag.

**EVAL_BODY_TAG**
*Deprecated.* As of Java JSP API 1.2, use BodyTag.EVAL_BODY_BUFFERED or IterationTag.EVAL_BODY_AGAIN.

**Fields inherited from interface** javax.servlet.jsp.tagext.IterationTag

- EVAL_BODY_AGAIN

**Fields inherited from interface** java.servlet.jsp.tagext.Tag

- EVAL_BODY_INCLUDE, EVAL_PAGE, SKIP_BODY, SKIP_PAGE

**Method Summary**

- **void** doInitBody()
  Prepare for evaluation of the body.

- **void** setBodyContent(BodyContent b)
  Set the bodyContent property.

**Methods inherited from interface** javax.servlet.jsp.tagext.IterationTag

- doAfterBody

**Methods inherited from interface** java.servlet.jsp.tagext.Tag

- doEndTag, doStartTag, getParent, release, setPageContext, setParent

**Field Detail**

**EVAL_BODY_TAG**
static final int EVAL_BODY_TAG

**Deprecated.** As of Java JSP API 1.2, use BodyTag.EVAL_BODY_BUFFERED or IterationTag.EVAL_BODY_AGAIN.
Deprecation constant that has the same value as EVAL_BODY_BUFFERED and EVAL_BODY_AGAIN. This name has been marked as deprecated to encourage the use of the two different terms, which are much more descriptive.

**See Also:**
[Constant Field Values](#)

---

EVAL_BODY_BUFFERED

static final int EVAL_BODY_BUFFERED

Request the creation of new buffer, a BodyContent on which to evaluate the body of this tag. Returned from doStartTag when it implements BodyTag. This is an illegal return value for doStartTag when the class does not implement BodyTag.

**See Also:**
[Constant Field Values](#)

---

**Method Detail**

def setBodyContent(BodyContent b)
def doInitBody()
def doStartTag() SKIP_BODY EVAL_BODY_INCLUDE

def setBodyContent out pageContext BodyContent
setBodyContent

```java
void setBodyContent(BodyContent b)
```

Set the bodyContent property. This method is invoked by the JSP page implementation object at most once per action invocation. This method will be invoked before doInitBody. This method will not be invoked for empty tags or for non-empty tags whose doStartTag() method returns SKIP_BODY or EVAL_BODY_INCLUDE.

When setBodyContent is invoked, the value of the implicit object out has already been changed in the pageContext object. The BodyContent object passed will have not data on it but may have been reused (and cleared) from some previous invocation.

The BodyContent object is available and with the appropriate content until after the invocation of the doEndTag method, at which case it may be reused.

**Parameters:**
- `b` - the BodyContent

**See Also:**
- `doInitBody()`, `IterationTag.doAfterBody()`
doInitBody

void doInitBody() throws JspException

Prepare for evaluation of the body. This method is invoked by the JSP page implementation object after setBodyContent and before the first time the body is to be evaluated. This method will not be invoked for empty tags or for non-empty tags whose doStartTag() method returns SKIP_BODY or EVAL_BODY_INCLUDE.

The JSP container will resynchronize the values of any AT_BEGIN and NESTED variables (defined by the associated TagExtraInfo or TLD) after the invocation of doInitBody().

**Throws:**

-JspException - if an error occurred while processing this tag

**See Also:**
IterationTag.doAfterBody()

---

```java
public class BodyTagSupport
    extends TagSupport
    implements BodyTag

Extends: TagSupport
Implements: BodyTag

BodyTag

BodyTagSupport BodyTag bodyContent getter out
JspWriter

BodyTagSupport

---
```

A base class for defining tag handlers implementing BodyTag.

The BodyTagSupport class implements the BodyTag interface and adds additional convenience methods including getter methods for the bodyContent property and methods to get at the previous out JspWriter.

Many tag handlers will extend BodyTagSupport and only redefine a few methods.

**Constructor Detail**

public BodyTagSupport()

**BodyTagSupport**

public BodyTagSupport()

Default constructor, all subclasses are required to only define a public constructor with the same signature, and to call the superclass constructor. This constructor is called by the code generated by the JSP translator.

**Method Detail**

public int doStartTag() throws JspException
EPAL_BODY_BUFFERED

return EVAL_BODY_BUFFERED

Throws JspException:

See also doStartTag

doStartTag

public int doStartTag()

throws JspException

Default processing of the start tag returning EVAL_BODY_BUFFERED.

**Specified by:**

doStartTag in interface Tag

**Overrides:**
doStartTag in class TagSupport
Returns:
    EVAL_BODY_BUFFERED

Throws:
    JspException - if an error occurred while processing this tag

See Also:
    Tag.doStartTag()

public int doEndTag() throws JspException

EVAL_PAGE

return EVAL_PAGE

Throws JspException:

See also doEndTag

doEndTag

public int doEndTag() throws JspException

Default processing of the end tag returning EVAL_PAGE.

Specified by:
    doEndTag in interface Tag

Overrides:
    doEndTag in class TagSupport

Returns:
    EVAL_PAGE

Throws:
    JspException - if an error occurred while processing this tag

See Also:
    Tag.doEndTag()

public void setBodyContent(BodyContent b)

bodyContent

See also doAfterBody, doInitBody(), setBodyContent
**setBodyContent**

```java
public void setBodyContent(BodyContent b)
```

Prepare for evaluation of the body: stash the bodyContent away.

**Specified by:**
`setBodyContent` in interface `BodyTag`

**Parameters:**
- `b` - the BodyContent

**See Also:**
- `doAfterBody()`, `doInitBody()`, `BodyTag.setBodyContent(javax.servlet.jsp.tagext.BodyContent)`

---

**public void doInitBody() throws JspException**

**Throws**
- `JspException`

**See also**
- `setBodyContent`, `doAfterBody`, `doInitBody`

---

**doInitBody**

```java
public void doInitBody()
```

```java
throws JspException
```

Prepare for evaluation of the body just before the first body evaluation: no action.

**Specified by:**
`doInitBody` in interface `BodyTag`

**Throws:**
- `JspException` - if an error occurred while processing this tag

**See Also:**
- `setBodyContent(javax.servlet.jsp.tagext.BodyContent)`, `doAfterBody()`, `BodyTag.doInitBody()`
public int doAfterBody() throws JspException
bodyContent
return SKIP_BODY
Throws JspException:
doInitBody, doAfterBody
See also

---

doAfterBody

public int doAfterBody()
throws JspException

After the body evaluation: do not reevaluate and continue with the page. By default nothing is done with the bodyContent data (if any).

Specified by:
doAfterBody in interface IterationTag
Overrides:
doAfterBody in class TagSupport
Returns:
SKIP_BODY
Throws:
JspException - if an error occurred while processing this tag
See Also:
doInitBody(), IterationTag.doAfterBody()

---

public void release()

See also

---

release

public void release()

Release state.
Specified by: release in interface Tag
Overrides: release in class TagSupport
See Also: Tag.release()

public BodyContent getBodyContent()
bodyContent
    return

getBodyContent

public BodyContent getBodyContent()

    Get current bodyContent.

    Returns:
    the body content.

getPreviousOut

public JspWriter getPreviousOut()
out JspWriter
    return JspWriter bodyContent

getPreviousOut

public JspWriter getPreviousOut()

    Get surrounding out JspWriter.

    Returns:
    the enclosing JspWriter, from the bodyContent.

### Constructor Detail

public BooleanConverter()
BooleanConverter

class BooleanConverter {
    public BooleanConverter()

    Method Detail

    public Object getAsObject(FacesContext context, UIComponent component, String value)

    Description copied from interface: Converter

    Convert the specified string value, which is associated with the specified UIComponent, into a model data object that is appropriate for being stored during the Apply Request Values phase of the request processing lifecycle.

    Specified by:

        getAsObject in interface Converter

    Parameters:

        context - FacesContext for the request being processed
        component - UIComponent with which this model object value is associated
        value - String value to be converted (may be null)

    Returns:

        null if the value to convert is null, otherwise the result of the conversion
Throws:
- `ConverterException` - if conversion cannot be successfully performed
- `NullPointerException` - if context or component is null

```java
public String getAsString(FacesContext context, UIComponent component, Object value)
```

Throws `ConverterException`: `NullPointerException`

Throws `NullPointerException`

getAsString

```java
public String getAsString(FacesContext context, UIComponent component, Object value)
```

Description copied from interface: `Converter`

Convert the specified model object value, which is associated with the specified `UIComponent`, into a String that is suitable for being included in the response generated during the `Render Response` phase of the request processing lifecycle.

Specified by:
- `getAsString` in interface `Converter`

Parameters:
- context - `FacesContext` for the request being processed
- component - `UIComponent` with which this model object value is associated
- value - Model object value to be converted (may be `null`)

Returns:
- a zero-length String if value is `null`, otherwise the result of the conversion

Throws:
- `ConverterException` - if conversion cannot be successfully performed
NullPointerException - if context or component is null

PS:
public interface BootstrapContext

version 1.0

This provides a mechanism to pass a bootstrap context to a resource adapter instance when it is bootstrapped. That is, when (start(BootstrapContext)) method on the ResourceAdapter class is invoked. The bootstrap context contains references to useful facilities that could be used by the resource adapter instance.

Version:
1.0
Author:
Ram Jeyaraman

<table>
<thead>
<tr>

</tr>
<tr>
<td>getXATerminator()</td>
</tr>
<tr>
<td>Provides a handle to a XATerminator instance.</td>
</tr>
</tbody>
</table>

Method Detail

public WorkManager getWorkManager()
getWorkManager

`WorkManager getWorkManager()`

Provides a handle to a `WorkManager` instance. The `WorkManager` instance could be used by a resource adapter to do its work by submitting `Work` instances for execution.

Returns:

- a `WorkManager` instance.

getXATerminator

`XATerminator getXATerminator()`

Provides a handle to a `XATerminator` instance. The `XATerminator` instance could be used by a resource adapter to flow-in transaction completion and crash recovery calls from an EIS.

Returns:

- a `XATerminator` instance.

public `java.util.Timer createTimer()` throws `UnavailableException`

`java.util.Timer createTimer()`

Throws `UnavailableException`:
createTimer

```java
Timer createTimer()
  throws UnavailableException
```

Creates a new `java.util.Timer` instance. The `Timer` instance could be used to perform periodic `Work` executions or other tasks.

**Returns:**

- a new `Timer` instance.

** Throws:**

- `UnavailableException` - indicates that a `Timer` instance is not available. The request may be retried later.
javax.management.j2ee.statistics  

**Interface BoundaryStatistic**

**All Superinterfaces:**  
Statistic

**All Known Subinterfaces:**  
BoundedRangeStatistic

```java
public interface BoundaryStatistic
extends Statistic

Implements: Statistic
Implemented by: BoundedRangeStatistic
```

Specifies standard measurements of the upper and lower limits of the value of an attribute.

### Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>getLowerBound()</code></td>
<td>The lower limit of the value of this attribute. The upper limit of the value of this attribute.</td>

javax.xml.registry Interface BulkResponse

All Superinterfaces:
   JAXRResponse

public interface BulkResponse
extends JAXRResponse

Implements: JAXRResponse

API

BulkResponse getStatus
JAXRResponse.STATUS_WARNING JAXRException Collection
BulkResponse JAXRException

See also javax.xml.registry.QueryManager,
javax.xml.registry.LifeCycleManager

Contains the response of a method in the API that performs a bulk operation and returns a bulk response. Partial commits are allowed on a bulk operation.

In the event of a partial success where only a subset of objects were processed successfully, the getStatus method of the BulkResponse must return JAXRResponse.STATUS_WARNING. In this case, a Collection of JAXRException instances is included in the BulkResponse instance. The JAXRExceptions provide information on each error that prevented some objects in the request to not be processed successfully.

Method Detail

public java.util.Collection<E> getCollection() throws JAXRException
Collection

return RegistryObject CollectionCollection null
Throws JAXRException: JAXR
See also javax.xml.registry.infomodel.RegistryObject
getCollection

`Collection getCollection() throws JAXRException`

Get the Collection of objects returned as a response of a bulk operation. Caller thread will block here if result is not yet available.

**Capability Level:** 0

**Returns:**

- Collection of RegistryObject instances. The Collection may be empty but not null.

**Throws:**

- `JAXRException` - If the JAXR provider encounters an internal error

**See Also:**

- `RegistryObject`

---

`public java.util.Collection<E> getExceptions() throws JAXRException`

RegistryException Collection

0

```java
return RegistryException Collection RegistryException null
```

**Throws**

- `JAXRException`: JAXR

**See also**

- `javax.xml.registry.RegistryException`

---

getExceptions

`Collection getExceptions() throws JAXRException`

Get the Collection of RegistryException instances in case of partial commit. Caller thread will block here if result is not yet available.
Capability Level: 0

Returns:
Collection of RegistryException instances. Return null if result is available and there is no RegistryException.

Throws:
JAXRException - If the JAXR provider encounters an internal error

See Also:
RegistryException

public boolean isPartialResponse() throws JAXRException

0

    return true false

Throws JAXRException: JAXR

isPartialResponse

boolean isPartialResponse() throws JAXRException

Determines whether the response is a partial response due to large result set.

Capability Level: 0

Returns:
true if the response is partial; false otherwise

Throws:
JAXRException - If the JAXR provider encounters an internal error

Method Detail

public BulkResponse saveOrganizations(java.util.Collection&lt;E&gt; organizations) throws JAXRException
Organization

SaveException

0
saveOrganizations

BulkResponse saveOrganizations(Collection organizations) throws JAXRException

Saves the specified Organizations.

If the object is not in the registry, it is created in the registry. If it already exists in the registry and has been modified, its state is updated (replaced) in the registry.

Partial commits are allowed. Processing stops on first SaveException encountered.

**Capability Level:** 0

**Parameters:**
- organizations - the Collection of Organization objects to be saved

**Returns:**
- a BulkResponse containing the Collection of keys for those objects that were saved successfully and any SaveException that was encountered in case of partial commit

**Throws:**
- JAXRException - if the JAXR provider encounters an internal error

---

public BulkResponse saveServices(java.util.Collection<E> services) throws JAXRException
Service
SaveException

0

services Service Collection
return BulkResponse Collection SaveException
Throws JAXRException: JAXR

saveServices

BulkResponse saveServices(Collection services) throws JAXRException

Saves the specified Services.

If the object is not in the registry, it is created in the registry. If it already exists in the registry and has been modified, its state is updated (replaced) in the registry.

Partial commits are allowed. Processing stops on first SaveException encountered.

Capability Level: 0

Parameters:
services - the Collection of Service objects to be saved

Returns:
a BulkResponse containing the Collection of keys for those objects that were saved successfully and any SaveException that was encountered in case of partial commit

Throws:
JAXRException - if the JAXR provider encounters an internal error

public BulkResponse saveServiceBindings(java.util.Collection<E> bindings)
throws JAXRException

ServiceBinding

SaveException

0

bindings ServiceBinding Collection

return BulkResponse Collection SaveException

Throws JAXRException: JAXR

saveServiceBindings

BulkResponse saveServiceBindings(Collection bindings) throws JAXRException

Saves the specified ServiceBindings.

If the object is not in the registry, it is created in the registry. If it already exists in the registry and has been modified, its state is updated (replaced) in the registry.

Partial commits are allowed. Processing stops on first SaveException encountered.

Capability Level: 0

Parameters:

bindings - the Collection of ServiceBinding objects to be saved

Returns:

a BulkResponse containing the Collection of keys for those objects that were saved successfully and any SaveException that was encountered in case of partial commit

Throws:

JAXRException - if the JAXR provider encounters an internal
public BulkResponse saveConcepts(java.util.Collection<E> concepts) throws JAXRException

Concept

SaveException

0

<table>
<thead>
<tr>
<th>concepts</th>
<th>Concept Collection</th>
</tr>
</thead>
<tbody>
<tr>
<td>return</td>
<td>BulkResponse Collection SaveException</td>
</tr>
<tr>
<td>Throws</td>
<td>JAXRException: JAXR</td>
</tr>
</tbody>
</table>

saveConcepts

BulkResponse saveConcepts(Collection concepts)

throws JAXRException

Saves the specified Concepts.

If the object is not in the registry, it is created in the registry. If it already exists in the registry and has been modified, its state is updated (replaced) in the registry.

Partial commits are allowed. Processing stops on first SaveException encountered.

Capability Level: 0

Parameters:

- concepts - the Collection of Concept objects to be saved

Returns:

- a BulkResponse containing the Collection of keys for those
objects that were saved successfully and any SaveException that was encountered in case of partial commit

Throws:
- `JAXRException` - if the JAXR provider encounters an internal error

```java
public BulkResponse saveClassificationSchemes(java.util.Collection<? extends ClassificationScheme> schemes) throws JAXRException
```

### SaveException

0

```java
schemes ClassificationScheme Collection
return BulkResponse Collection SaveException
throws JAXRException: JAXR
```

### saveClassificationSchemes

```java
BulkResponse saveClassificationSchemes(Collection schemes) throws JAXRException
```

Saves the specified ClassificationScheme instances.

If the object is not in the registry, it is created in the registry. If it already exists in the registry and has been modified, its state is updated (replaced) in the registry.

Partial commits are allowed. Processing stops on first SaveException encountered.

**Capability Level: 0**
Parameters:
  schemes - the Collection of ClassificationScheme objects to be saved

Returns:
  a BulkResponse containing the Collection of keys for those objects that were saved successfully and any SaveException that was encountered in case of partial commit

Throws:
  JAXRException - if the JAXR provider encounters an internal error

public BulkResponse saveAssociations(java.util.Collection<E> associations, boolean replace) throws JAXRException

SaveException

0

associations  Association  Collection
replace   true  false
return   BulkResponse  Collection  SaveException

Throws       JAXRException:  JAXR

saveAssociations

BulkResponse saveAssociations(Collection associations, boolean replace)
  throws JAXRException

Saves the specified Association instances.

If the object is not in the registry, it is created in the registry. If it
already exists in the registry and has been modified, its state is updated (replaced) in the registry.

Partial commits are allowed. Processing stops on first SaveException encountered.

**Capability Level: 0**

**Parameters:**
- `associations` - the Collection of Association objects to be saved
- `replace` - If set to true, the specified associations replace any existing associations owned by the caller. If set to false, the specified associations are saved, while any existing associations not being updated by this call are preserved.

**Returns:**
- A BulkResponse containing the Collection of keys for those objects that were saved successfully and any SaveException that was encountered in case of partial commit.

**Throws:**
- `JAXRException` - if the JAXR provider encounters an internal error

```java
public BulkResponse deleteOrganizations(java.util.Collection<E> organizationKeys) throws JAXRException
```

**Key**

**DeleteException**

0

```java
organizationKeys Organization Collection
return BulkResponse Collection DeleteException
Throws JAXRException: JAXR
```
deleteOrganizations

BulkResponse deleteOrganizations(Collection organizationKeys) throws JAXRException

Deletes the organizations corresponding to the specified Keys.

Partial commits are allowed. Processing stops on first DeleteException encountered.

Capability Level: 0

Parameters:
  organizationKeys - the Collection of keys for the Organization objects to be deleted

Returns:
  a BulkResponse containing the Collection of keys for those objects that were deleted successfully and any DeleteException that was encountered in case of partial commit

Throws:
  JAXRException - if the JAXR provider encounters an internal error

public BulkResponse deleteServices(java.util.Collection<E> serviceKeys) throws JAXRException

Key

DeleteException

0

serviceKeys Service Collection
return BulkResponse Collection DeleteException
Throws JAXRException: JAXR
deleteServices

BulkResponse deleteServices(Collection serviceKeys) throws JAXRException

Deletes the services corresponding to the specified Keys.

Partial commits are allowed. Processing stops on first DeleteException encountered.

Capability Level: 0

Parameters:
  serviceKeys - the Collection of keys for the Service objects to be deleted

Returns:
  a BulkResponse containing the Collection of keys for those objects that were deleted successfully and any DeleteException that was encountered in case of partial commit

Throws:
  JAXRException - if the JAXR provider encounters an internal error

public BulkResponse deleteServiceBindings(java.util.Collection<E> bindingKeys) throws JAXRException

Key ServiceBinding

DeleteException

0

bindingKeys ServiceBinding Collection
return BulkResponse Collection DeleteException
Throws JAXRException: JAXR
deleteServiceBindings

BulkResponse deleteServiceBindings(Collection bindingKeys) throws JAXRException

Deletes the ServiceBindings corresponding to the specified Keys.

Partial commits are allowed. Processing stops on first DeleteException encountered.

Capability Level: 0

Parameters:
  bindingKeys - the Collection of keys for the ServiceBinding objects to be deleted

Returns:
  a BulkResponse containing the Collection of keys for those objects that were deleted successfully and any DeleteException that was encountered in case of partial commit

Throws:
  JAXRException - if the JAXR provider encounters an internal error

public BulkResponse deleteConcepts(java.util.Collection<E> conceptKeys) throws JAXRException
  Key Concept

  DeleteException

  0

  conceptKeys Concept Collection
  return BulkResponse Collection DeleteException
  Throws JAXRException: JAXR
**deleteConcepts**

BulkResponse deleteConcepts(Collection conceptKeys) throws JAXRException

Deletes the Concepts corresponding to the specified Keys.

Partial commits are allowed. Processing stops on first DeleteException encountered.

**Capability Level: 0**

**Parameters:**
- conceptKeys - the Collection of keys for the Concept objects to be deleted

**Returns:**
- a BulkResponse containing the Collection of keys for those objects that were deleted successfully and any DeleteException that was encountered in case of partial commit

**Throws:**
- JAXRException - if the JAXR provider encounters an internal error

---

public BulkResponse deleteClassificationSchemes(java.util.Collection<E> schemeKeys) throws JAXRException

**Key ClassificationScheme**

**DeleteException**

0

schemeKeys ClassificationScheme Collection

return BulkResponse Collection DeleteException

**Throws**

JAXRException: JAXR
deleteClassificationSchemes

BulkResponse deleteClassificationSchemes(Collection schemeKeys) throws JAXRException

Deletes the ClassificationSchemes corresponding to the specified Keys.

Partial commits are allowed. Processing stops on first DeleteException encountered.

Capability Level: 0

Parameters:
schemeKeys - the Collection of keys for the ClassificationScheme objects to be deleted

Returns:
a BulkResponse containing the Collection of keys for those objects that were deleted successfully and any DeleteException that was encountered in case of partial commit

Throws:
JAXRException - if the JAXR provider encounters an internal error

public BulkResponse deleteAssociations(java.util.Collection<E> associationKeys) throws JAXRException
Key Association

DeleteException

0

associationKeys Association Collection
return BulkResponse Collection DeleteException
Throws JAXRException: JAXR
deleteAssociations

BulkResponse deleteAssociations(Collection associationKeys) throws JAXRException

Deletes the Associations corresponding to the specified Keys.

Partial commits are allowed. Processing stops on first DeleteException encountered.

Capability Level: 0

Parameters:
associationKeys - the Collection of keys for the Association objects to be deleted

Returns:
a BulkResponse containing the Collection of keys for those objects that were deleted successfully and any DeleteException that was encountered in case of partial commit

Throws:
JAXRException - if the JAXR provider encounters an internal error

public void confirmAssociation(Association assoc) throws JAXRException, InvalidRequestException

User Association Association User sourceObject targetObject

- Association
- Association isConfirmed true
- Association User

Association UDDI ebXML JAXR

0

assoc Association
void confirmAssociation(Association assoc)
throws JAXRException, 
InvalidRequestException

Confirms this Association by the User associated with the caller. The User must be the owner of the sourceObject or the targetObject in this association.

- If the Association is intramural, this method does nothing and returns.
- If the Association is extramural and already confirmed (isConfirmed returns true), this method does nothing and returns.
- If the Association is extramural and not already confirmed, this method confirms the association for the User associated with the caller.

The details of confirming an extramural Association are registry-specific. For UDDI and ebXML registries, the registry-specific details are described in the JAXR specification.

**Capability Level: 0**

**Parameters:**

assoc - the Association object to be confirmed

**Throws:**

JAXRException - if the JAXR provider encounters an internal error
InvalidRequestException - if the User is not the owner of the sourceObject or the targetObject
public void unConfirmAssociation(Association assoc) throws JAXRException, InvalidRequestException
User Association Association User
sourceObject targetObject

- Association
- Association isConfirmed true
- Association

Association UDDI ebXML JAXR

0

assoc Association

Throws JAXRException: JAXR
Throws InvalidRequestException: User sourceObject targetObject

unConfirmAssociation

void unConfirmAssociation(Association assoc) throws JAXRException, InvalidRequestException

Undoes a previous confirmation of this Association by the User associated with the caller. The User must be the owner of the sourceObject or the targetObject in this association.

- If the Association is intramural, this method does nothing and returns.
- If the Association is extramural and already confirmed (isConfirmed returns true), this method unconfirms it for the requestor.
- If the Association is extramural and not already confirmed, this method does nothing and returns.

The details of unconfirming an extramural Association are registry-
specific. For UDDI and ebXML registries, the registry-specific details are described in the JAXR specification.

**Capability Level: 0**

**Parameters:**
- `assoc` - the Association object to be unconfirmed

**Throws:**
- `JAXRException` - if the JAXR provider encounters an internal error
- `InvalidRequestException` - if the User is not the owner of the sourceObject or the targetObject
javax.xml.registry Interface BusinessQueryManager

All Superinterfaces:  
 QueryManager

public interface BusinessQueryManager
extends QueryManager

Implements:  QueryManager

BusinessQueryManager  Registry Service

See also  javax.xml.registry.DeclarativeQueryManager,  
javax.xml.registry.FindQualifier,  
javax.xml.registry.BulkResponse

The BusinessQueryManager interface, which is exposed by the Registry Service, implements the business style query interface. It is also referred to as the focused query interface.

return BulkResponse Association Collection
Throws JAXRException: JAXR

findAssociations

BulkResponse findAssociations(Collection findQualifiers,
String sourceObjectId,
String targetObjectId,
Collection associationTypes)
throws JAXRException
Finds all Association objects that match all of the criteria specified by the parameters of this call. This is a logical AND operation between all non-null parameters. If no parameters are specified, no Associations are returned.

**Capability Level: 0**

**Parameters:**
- `findQualifiers` - a Collection of find qualifiers as defined by the FindQualifier interface, which specifies qualifiers that affect string matching, sorting, boolean predicate logic, and the like.
- `sourceObjectId` - a String that represents the id for a RegistryObject that must be the sourceObject of the Associations that match. This parameter is ignored if specified as null.
- `targetObjectId` - a String that represents the id for a RegistryObject that must be the targetObject of the Associations that match. This parameter is ignored if specified as null.
- `associationTypes` - a Collection of associationTypes. This is a logical OR operation across the collection. This parameter is ignored if specified as null.

**Returns:**
a BulkResponse containing a Collection of Associations

**Throws:**
- `JAXRException` - if the JAXR provider encounters an internal error

```java
public BulkResponse findCallerAssociations(java.util.Collection<E> findQualifiers, Boolean confirmedByCaller, Boolean confirmedByOtherParty, java.util.Collection<E> associationTypes) throws JAXRException
    Association null AND Association

Connection

0
```
findCallerAssociations

BulkResponse findCallerAssociations(Collection findQualifiers, Boolean confirmedByCaller, Boolean confirmedByOtherParty, Collection associationTypes) throws JAXRException

Finds all Association objects owned by the caller that match all of the criteria specified by the parameters of this call. This is a logical AND operation between all non-null parameters. If no parameters are specified, no Associations are returned.

This call is sensitive to the identity of the caller and is a privileged operation that requires the caller to have provided its identity credentials to the Connection associated with this object.

Capability Level: 0

Parameters:

findQualifiers - a Collection of find qualifiers as defined by the FindQualifier interface, which specifies qualifiers that affect string matching, sorting, boolean predicate logic, and the like.

confirmedByCaller - If true, provider must include Associations involving the caller that have been confirmed by the caller. If
false, provider must include Associations involving the caller that have not been confirmed by the caller. This parameter is ignored if specified as null.

confirmedByOtherParty - If true, provider must include Associations involving the caller that have been confirmed by the other party. If false, provider must include Associations involving the caller that have not been confirmed by the other party. This parameter is ignored if specified as null.

associationTypes - a Collection of associationTypes. This is a logical OR operation across the collection. This parameter is ignored if specified as null.

**Returns:**
a BulkResponse containing a Collection of Associations

**Throws:**

JAXRException - if the JAXR provider encounters an internal error

```java
public BulkResponse findOrganizations(java.util.Collection<E> findQualifiers,
java.util.Collection<E> namePatterns,
java.util.Collection<E> classifications,
java.util.Collection<E> specifications,
java.util.Collection<E> externalIdentifiers,
java.util.Collection<E> externalLinks) throws JAXRException

Organization null AND

0

<table>

<td></td>
</tr>
</tbody>
</table>
findOrganizations

BulkResponse findOrganizations(Collection findQualifiers,
Collection namePatterns,
Collection classifications,
Collection specifications,
Collection externalIdentifiers,
Collection externalLinks)
throws JAXRException

Finds all Organization objects that match all of the criteria specified by the parameters of this call. This is a logical AND operation between all non-null parameters.

Capability Level: 0

Parameters:

findQualifiers - a Collection of find qualifiers as defined by the FindQualifier interface, which specifies qualifiers that affect string matching, sorting, boolean predicate logic, and the like.
namePatterns - a Collection that may consist of either String or...
LocalizedString objects. Each String or value within a LocalizedString is a partial or full name pattern with wildcard searching as specified by the SQL-92 LIKE specification. Unless otherwise specified in findQualifiers, this is a logical OR, and a match on any name qualifies as a match for this criterion.

classifications - a Collection of Classification objects that classify the object. It is analogous to a catgegoryBag in the UDDI specification. Unless otherwise specified in findQualifiers, this is a logical AND, and a match on all specified Classifications qualifies as a match for this criterion. The programmer may use the LifeCycleManager.createClassification method to create a transient Classification for use in this Collection.

specifications - a Collection of RegistryObjects that represent (proxy) a technical specification. It is analogous to a tModelBag in the UDDI specification. In the case of a UDDI provider, the RegistryObject is a specification Concept. In the case of an ebXML provider, the RegistryObject is likely to be an ExtrinsicObject. Unless otherwise specified in findQualifiers, this is a logical AND, and a match on all specified Specifications qualifies as a match for this criterion.

externalIdentifiers - a Collection of ExternalIdentifier objects that provide an external identifier for the object using an identification scheme such as DUNS. It is analogous to an identifierBag in the UDDI specification. Unless otherwise specified in findQualifiers, this is a logical AND, and a match on all specified ExternalIdentifiers qualifies as a match for this criterion. The programmer may use the LifeCycleManager.createExternalIdentifier method to create a transient ExternalIdentifier for use in this Collection.

externalLinks - a Collection of ExternalLink objects that link the object to content outside the registry. It is analogous to an overviewDoc in the UDDI specification. Unless otherwise specified in findQualifiers, this is a logical AND, and a match on all specified ExternalLinks qualifies as a match for this criterion.

Returns:
- a BulkResponse containing a Collection of Organizations

Throws:
- JAXRException - if the JAXR provider encounters an internal error
```java
public BulkResponse findServices(Key orgKey,
java.util.Collection<E> findQualifiers,
java.util.Collection<E> namePatterns,
java.util.Collection<E> classifications,
java.util.Collection<E> specifications) throws JAXRException

Service null AND

<table>

</tbody>
</table>

return BulkResponse Service Collection

Throws JAXRException: JAXR
```

**findServices**

```java
BulkResponse findServices(Key orgKey,
Collection findQualifiers,
Collection namePatterns,
Collection classifications,
Collection specifications)
throws JAXRException
```
Finds all Service objects that match all of the criteria specified by the parameters of this call. This is a logical AND operation between all non-null parameters.

**Capability Level: 0**

**Parameters:**

- `orgKey`: Key identifying an Organization. Required for UDDI providers.
- `findQualifiers`: a Collection of find qualifiers as defined by the FindQualifier interface, which specifies qualifiers that affect string matching, sorting, boolean predicate logic, and the like.
- `namePatterns`: a Collection that may consist of either String or LocalizedString objects. Each String or value within a LocalizedString is a partial or full name pattern with wildcard searching as specified by the SQL-92 LIKE specification. Unless otherwise specified in `findQualifiers`, this is a logical OR, and a match on any name qualifies as a match for this criterion.
- `classifications`: a Collection of Classification objects that classify the object. It is analogous to a categoryBag in the UDDI specification. Unless otherwise specified in `findQualifiers`, this is a logical AND, and a match on all specified Classifications qualifies as a match for this criterion. The programmer may use the `LifeCycleManager.createClassification` method to create a transient Classification for use in this Collection.
- `specifications`: a Collection of RegistryObjects that represent (proxy) a technical specification. It is analogous to a tModelBag in the UDDI specification. In the case of a UDDI provider, the RegistryObject is a specification Concept. In the case of an ebXML provider, the RegistryObject is likely to be an ExtrinsicObject. Unless otherwise specified in `findQualifiers`, this is a logical AND, and a match on all specified Specifications qualifies as a match for this criterion.

**Returns:**

- a BulkResponse containing a Collection of Services

**Throws:**

- `JAXRException` - if the JAXR provider encounters an internal error

return BulkResponse ServiceBinding Collection

Throws JAXRException: JAXR

findServiceBindings

BulkResponse findServiceBindings(Key serviceKey, Collection findQualifiers, Collection classifications, Collection specifications) throws JAXRException

Finds all ServiceBinding objects that match all of the criteria specified by the parameters of this call. This is a logical AND operation between all non-null parameters.

Capability Level: 0
Parameters:

serviceKey - Key identifying a Service. Required for UDDI providers.
findQualifiers - a Collection of find qualifiers as defined by the FindQualifier interface, which specifies qualifiers that affect string matching, sorting, boolean predicate logic, and the like.
classifications - a Collection of Classification objects that classify the object. It is analogous to a categorogyBag in the UDDI specification. Unless otherwise specified in findQualifiers, this is a logical AND, and a match on all specified Classifications qualifies as a match for this criterion. The programmer may use the LifecycleManager.createClassification method to create a transient Classification for use in this Collection.
specifications - a Collection of RegistryObjects that represent (proxy) a technical specification. It is analogous to a tModelBag in the UDDI specification. In the case of a UDDI provider, the RegistryObject is a specification Concept. In the case of an ebXML provider, the RegistryObject is likely to be an ExtrinsicObject. Unless otherwise specified in findQualifiers, this is a logical AND, and a match on all specified Specifications qualifies as a match for this criterion.

Returns:

a BulkResponse containing a Collection of ServiceBindings

Throws:

JAXRException - if the JAXR provider encounters an internal error

```java
public BulkResponse findClassificationSchemes(java.util.Collection<E> findQualifiers, java.util.Collection<E> namePatterns, java.util.Collection<E> classifications, java.util.Collection<E> externalLinks) throws JAXRException
ClassificationScheme null AND 0
```
findQualifiers - a Collection of find qualifiers as defined by the FindQualifier interface, which specifies qualifiers that affect string matching, sorting, boolean predicate logic, and the like.

namePatterns - a Collection that may consist of either String or LocalizedString objects. Each String or value within a LocalizedString is a partial or full name pattern with wildcard searching as specified by the SQL-92 LIKE specification. Unless otherwise specified in findQualifiers, this is a logical OR, and a match on any name qualifies as a match for this criterion.
classifications - a Collection of Classification objects that classify the object. It is analogous to a categoryBag in the UDDI specification. Unless otherwise specified in findQualifiers, this is a logical AND, and a match on all specified Classifications qualifies as a match for this criterion. The programmer may use the LifeCycleManager.createClassification method to create a transient Classification for use in this Collection.

externalLinks - a Collection of ExternalLink objects that link the object to content outside the registry. It is analogous to an overviewDoc in the UDDI specification. Unless otherwise specified in findQualifiers, this is a logical AND, and a match on all specified ExternalLinks qualifies as a match for this criterion.

Returns:
a BulkResponse containing a Collection of ClassificationSchemes

Throws:
JAXRException - if the JAXR provider encounters an internal error

public ClassificationScheme findClassificationSchemeByName(java.util.Collection<E> findQualifiers, String namePattern) throws JAXRException

ClassificationScheme

findQualifiers    FindQualifier find CollectionFindQualifier boolean (predicate logic)
namePattern       String SQL-92 LIKE
return            namePattern ClassificationScheme null

Throws
JAXRException: JAXR
InvalidRequestException

findClassificationSchemeByName
Finds a ClassificationScheme by name based on the specified find qualifiers and name pattern.

**Capability Level:** 0

**Parameters:**
- `findQualifiers` - a Collection of find qualifiers as defined by the FindQualifier interface, which specifies qualifiers that affect string matching, sorting, boolean predicate logic, and the like.
- `namePattern` - a String that is a partial or full name pattern with wildcard searching as specified by the SQL-92 LIKE specification

**Returns:**
the ClassificationScheme matching the namePattern, or null if no match is found.

**Throws:**
- `JAXRException` - if the JAXR provider encounters an internal error. Throws an InvalidRequestException if multiple matches are found.

```java
```

Concept null AND

0

`findQualifiers` FindQualifier find CollectionFindQualifier
boolean (predicate logic)
String LocalizedString Collection String
findConcepts

BulkResponse findConcepts(Collection findQualifiers, Collection namePatterns, Collection classifications, Collection externalIdentifiers, Collection externalLinks) throws JAXRException

Finds all Concept objects that match all of the criteria specified by the parameters of this call. This is a logical AND operation between all non-null parameters.

Capability Level: 0

Parameters:

findQualifiers - a Collection of find qualifiers as defined by the FindQualifier interface, which specifies qualifiers that affect string matching, sorting, boolean predicate logic, and the like.

namePatterns - a Collection that may consist of either String or LocalizedString objects. Each String or value within a
LocalizedString is a partial or full name pattern with wildcard searching as specified by the SQL-92 LIKE specification. Unless otherwise specified in findQualifiers, this is a logical OR, and a match on any name qualifies as a match for this criterion.

classifications - a Collection of Classification objects that classify the object. It is analogous to a categoryBag in the UDDI specification. Unless otherwise specified in findQualifiers, this is a logical AND, and a match on all specified Classifications qualifies as a match for this criterion. The programmer may use the LifeCycleManager.createClassification method to create a transient Classification for use in this Collection.

externalIdentifiers - a Collection of ExternalIdentifier objects that provide an external identifier for the object using an identification scheme such as DUNS. It is analogous to an identifierBag in the UDDI specification. Unless otherwise specified in findQualifiers, this is a logical AND, and a match on all specified ExternalIdentifiers qualifies as a match for this criterion. The programmer may use the LifeCycleManager.createExternalIdentifier method to create a transient ExternalIdentifier for use in this Collection.

externalLinks - a Collection of ExternalLink objects that link the object to content outside the registry. It is analogous to an overviewDoc in the UDDI specification. Unless otherwise specified in findQualifiers, this is a logical AND, and a match on all specified ExternalLinks qualifies as a match for this criterion.

Returns:
a BulkResponse containing a Collection of Concepts

Throws:
JAXRException - if the JAXR provider encounters an internal error

public Concept findConceptByPath(String path) throws JAXRException

Concept Concept Concept

0
findConceptByPath

```java
Concept findConceptByPath(String path)
throws JAXRException
```

Finds a Concept based on the path specified. If the specified path matches more than one Concept, the one that is most general (higher in the concept hierarchy) is returned.

**Capability Level:** 0

**Parameters:**
- `path` - a canonical path expression, as defined in the JAXR specification, that identifies the Concept.

**Returns:**
- the Concept found, or null if no match is found

**Throws:**
- `JAXRException` - if the JAXR provider encounters an internal error

---

```java
public BulkResponse findRegistryPackages(java.util.Collection<E> findQualifiers,
java.util.Collection<E> namePatterns,
java.util.Collection<E> classifications,
java.util.Collection<E> externalLinks) throws JAXRException
```

RegistryPackage null AND

1

```
findQualifiers FindQualifier find CollectionFindQualifier
boolean (predicate logic)
```
**findRegistryPackages**

*BulkResponse* `findRegistryPackages(Collection findQualifiers, Collection namePatterns, Collection classifications, Collection externalLinks) throws JAXRException*

Finds all RegistryPackage objects that match all of the criteria specified by the parameters of this call. This is a logical AND operation between all non-null parameters.

**Capability Level: 1**

**Parameters:**

- `findQualifiers` - a Collection of find qualifiers as defined by the FindQualifier interface, which specifies qualifiers that affect string matching, sorting, boolean predicate logic, and the like.
- `namePatterns` - a Collection that may consist of either String or LocalizedString objects. Each String or value within a LocalizedString is a partial or full name pattern with wildcard searching as specified by the SQL-92 LIKE specification. Unless otherwise specified in findQualifiers, this is a logical OR, and a match on any name qualifies as a match for this criterion.
- `classifications` - a Collection of Classification objects that classify the object. It is analogous to a categoryBag in the
UDDI specification. Unless otherwise specified in findQualifiers, this is a logical AND, and a match on all specified Classifications qualifies as a match for this criterion. The programmer may use the LifeCycleManager.createClassification method to create a transient Classification for use in this Collection.

`externalLinks` - a Collection of ExternalLink objects that link the object to content outside the registry. It is analogous to an overviewDoc in the UDDI specification. Unless otherwise specified in findQualifiers, this is a logical AND, and a match on all specified ExternalLinks qualifies as a match for this criterion.

**Returns:**
a BulkResponse containing a Collection of RegistryPackages

**Throws:**
- `JAXRException` - if the JAXR provider encounters an internal error
public class ByteArrayDataSource
extends Object
implements DataSource

Implements: DataSource

byte DataSource byte InputStream String byte

since JavaMail 1.4

A DataSource backed by a byte array. The byte array may be passed in directly, or may be initialized from an InputStream or a String.

Since:
JavaMail 1.4

Author:
John Mani, Bill Shannon, Max Spivak

### Constructor Summary

## Constructor Detail

```java
public ByteArrayDataSource(java.io.InputStream is, String type) throws java.io.IOException
{
    this(is, null, type);
}

public ByteArrayDataSource(InputStream is, String name, String type)
{
    this(is, name, type);
}

public ByteArrayDataSource(InputStream is, String name)
{
    this(is, name, null);
}

public ByteArrayDataSource(String name)
{
    this(null, name, null);
}
```

ByteArrayDataSource

```java
public ByteArrayDataSource(InputStream is, String name, String type)
{
    super(is, null, type);
    super.setName(name);
}
```

Throws java.io.IOException:
Create a ByteArrayInputStream with data from the specified InputStream and with the specified MIME type. The InputStream is read completely and the data is stored in a byte array.

**Parameters:**
- is - the InputStream
- type - the MIME type

**Throws:**
- `IOException` - errors reading the stream

```java
public ByteArrayInputStream(byte[] data, String type) throws IOException
```

**ByteArrayDataSource**

Create a ByteArrayInputStream with data from the specified byte array and with the specified MIME type.

**Parameters:**
- data - the data
- type - the MIME type

```java
public ByteArrayInputStream(data, type) throws java.io.IOException
```

```java
public ByteArrayInputStream(String data, String type) throws java.io.IOException
```
ByteArrayDataSource

public ByteArrayDataSource(String data, String type) throws IOException

Create a ByteArrayDataSource with data from the specified String and with the specified MIME type. The MIME type should include a charset parameter specifying the charset to be used for the string. If the parameter is not included, the default charset is used.

Parameters:
- data - the String
- type - the MIME type

Throws:
- IOException - errors reading the String

Method Detail

public java.io.InputStream getInputStream() throws java.io.IOException

InputStream

return InputStream

throws IOException:

getInputStream

public InputStream getInputStream() throws IOException

Return an InputStream for the data. Note that a new stream is returned each time this method is called.
public java.io.OutputStream getOutputStream() throws java.io.IOException

OutputStream

Throws java.io.IOException:

getOutputStream

public OutputStream getOutputStream() throws IOException

Return an OutputStream for the data. Writing the data is not supported; an IOException is always thrown.

Specified by:

getOutputStream in interface DataSource

Returns:

an OutputStream

Throws:

IOException - always

public String getContentType()

MIME

return MIME

gcontentType

public String getContentType()
Get the MIME content type of the data.

**Specified by:**

`getContentType` in interface `DataSource`

**Returns:**

the MIME type

---

```java
public String getName()
{
    return
}
```

**getName**

```java
public String getName()
{
    return
}
```

Get the name of the data. By default, an empty string (""") is returned.

**Specified by:**

`getName` in interface `DataSource`

**Returns:**

the name of this data

---

```java
public void setName(String name)
{
    name
}
```

**setName**

```java
public void setName(String name)
{
    name
}
```

Set the name of the data.

**Parameters:**

`name` - the name of this data
javax.xml.rpc.holders  **Class ByteArrayHolder**

**java.lang.Object**

## Method Detail

```java
public Object getAsObject(FacesContext context, UIComponent component, String value)
```

Throws: 
- `ConverterException`: NullPointerException
- NullPointerException: NullPointerException

### getAsObject

```java
public Object getAsObject(FacesContext context, UIComponent component, String value)
```

**Description copied from interface: Converter**

Convert the specified string value, which is associated with the specified `UIComponent`, into a model data object that is appropriate for being stored during the *Apply Request Values* phase of the request processing lifecycle.

**Specified by:**
- `getAsObject` in interface `Converter`

**Parameters:**
- `context` - `FacesContext` for the request being processed
- `component` - `UIComponent` with which this model object value is associated
- `value` - String value to be converted (may be `null`)

**Returns:**
- `null` if the value to convert is `null`, otherwise the result of the conversion

**Throws:**
- `ConverterException` - if conversion cannot be successfully
public String getAsString(FacesContext context, UIComponent component, Object value)

Throws ConverterException: NullPointerException

Throws NullPointerException: NullPointerException context null component null

getAsString

public String getAsString(FacesContext context, UIComponent component, Object value)

Description copied from interface: Converter

Convert the specified model object value, which is associated with the specified UIComponent, into a String that is suitable for being included in the response generated during the Render Response phase of the request processing lifecycle.

Specified by:
getAsString in interface Converter

Parameters:
context - FacesContext for the request being processed
component - UIComponent with which this model object value is associated
value - Model object value to be converted (may be null)

Returns:
a zero-length String if value is null, otherwise the result of the conversion

Throws:
ConverterException - if conversion cannot be successfully performed
NullPointerException - if context or component is null

MessageNotReadableException

MessageNotWriteableException

version 1.1 April 2, 2002

A `BytesMessage` object is used to send a message containing a stream of uninterpreted bytes. It inherits from the `Message` interface and adds a bytes message body. The receiver of the message supplies the interpretation of the bytes.

The `BytesMessage` methods are based largely on those found in `java.io.DataInputStream` and `java.io.DataOutputStream`.

This message type is for client encoding of existing message formats. If possible, one of the other self-defining message types should be used instead.

Although the JMS API allows the use of message properties with byte messages, they are typically not used, since the inclusion of properties may affect the format.

The primitive types can be written explicitly using methods for each type. They may also be written generically as objects. For instance, a call to `BytesMessage.writeInt(6)` is equivalent to `BytesMessage.writeObject(new Integer(6))`. Both forms are provided, because the explicit form is convenient for static programming, and the object form is needed when types are not known at compile time.

When the message is first created, and when `clearBody` is called, the body of the message is in write-only mode. After the first call to `reset` has been made, the message body is in read-only mode. After a message has been sent, the client that sent it can retain and modify it without affecting the message that has been sent. The same message object can be sent multiple times. When a message has been received, the provider has called `reset` so that the message body is in read-only mode for the client.

If `clearBody` is called on a message in read-only mode, the message body is cleared and the message is in write-only mode.

If a client attempts to read a message in write-only mode, a `MessageNotReadableException` is thrown.

If a client attempts to write a message in read-only mode, a `MessageNotWritableException` is thrown.

</tbody>
</table>
Converts the double argument to a long using the doubleToLongBits method in class Double, and then writes that long value to the bytes message stream as an 8-byte quantity, high byte first.

writeFloat(float value)
Converts the float argument to an int using the floatToIntBits method in class Float, and then writes that int value to the bytes message stream as a 4-byte quantity, high byte first.

writeInt(int value)
Writes an int to the bytes message stream as four bytes, high byte first.

writeLong(long value)
Writes a long to the bytes message stream as eight bytes, high byte first.

writeObject(Object value)
Writes an object to the bytes message stream.

writeShort(short value)
Writes a short to the bytes message stream as two bytes, high byte first.

writeUTF(String value)
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner.

Methods inherited from interface javax.jms.Message
Method Detail

public long getBodyLength() throws JMSException
byte

    return

Throws    JMSException: JMS
Throws    MessageNotReadableException:
since 1.1

getBodyLength

long getBodyLength() throws JMSException

Gets the number of bytes of the message body when the message is in read-only mode. The value returned can be used to allocate a byte array. The value returned is the entire length of the message body, regardless of where the pointer for reading the message is currently located.

Returns: number of bytes in the message

Throws: JMSException - if the JMS provider fails to read the message due to some internal error.
MessageNotReadableException - if the message is in write-only mode.

Since: 1.1

public boolean readBoolean() throws JMSException
boolean

    return boolean

Throws: JMSException - if the JMS provider fails to read the message due to some internal error.
throws `JMSException`: JMS

Throws `MessageEOFException`:  

Throws `MessageNotReadableException`:  

---

### readBoolean

```java
boolean readBoolean() throws JMSException
```

Reads a boolean from the bytes message stream.

**Returns:**

the boolean value read

**Throws:**

`JMSException` - if the JMS provider fails to read the message due to some internal error.
`MessageEOFException` - if unexpected end of bytes stream has been reached.
`MessageNotReadableException` - if the message is in write-only mode.

---

### public byte readByte() throws JMSException

```java
byte readByte() throws JMSException
```

Reads a signed 8-bit value from the bytes message stream.

---

### readByte

```java
byte readByte() throws JMSException
```

Reads a signed 8-bit value from the bytes message stream.
Returns:
the next byte from the bytes message stream as a signed 8-bit byte

Throws:
- `JMSException` - if the JMS provider fails to read the message due to some internal error.
- `MessageEOFException` - if unexpected end of bytes stream has been reached.
- `MessageNotReadableException` - if the message is in write-only mode.

---

public int readUnsignedByte() throws `JMSException`

```
return 8
```

Throws
- `JMSException`: JMS
- `MessageEOFException`
- `MessageNotReadableException`:

---

`readUnsignedByte`

```
int readUnsignedByte() throws JMSException
```

Reads an unsigned 8-bit number from the bytes message stream.

Returns:
the next byte from the bytes message stream, interpreted as an unsigned 8-bit number

Throws:
- `JMSException` - if the JMS provider fails to read the message due to some internal error.
- `MessageEOFException` - if unexpected end of bytes stream has been reached.
- `MessageNotReadableException` - if the message is in write-only mode.
public short readShort() throws JMSException

return 16

Throws JMSException: JMS
Throws MessageEOFException:
Throws MessageNotReadableException:

readShort

short readShort() throws JMSException

Reads a signed 16-bit number from the bytes message stream.

Returns:
the next two bytes from the bytes message stream, interpreted as a signed 16-bit number

Throws:
JMSException - if the JMS provider fails to read the message due to some internal error.
MessageEOFException - if unexpected end of bytes stream has been reached.
MessageNotReadableException - if the message is in write-only mode.

public int readUnsignedShort() throws JMSException

return 16

Throws JMSException: JMS
Throws MessageEOFException:
Throws MessageNotReadableException:

readUnsignedShort
int readUnsignedShort() throws JMSException

Reads an unsigned 16-bit number from the bytes message stream.

**Returns:**
the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer

**Throws:**

- `JMSException` - if the JMS provider fails to read the message due to some internal error.
- `MessageEOFException` - if unexpected end of bytes stream has been reached.
- `MessageNotReadableException` - if the message is in write-only mode.

---

public char readChar() throws JMSException

Unicode

```java
    return Unicode
```

**Throws:**

- `JMSException`: JMS
- `MessageEOFException`
- `MessageNotReadableException`

---

char readChar() throws JMSException

Reads a Unicode character value from the bytes message stream.

**Returns:**
the next two bytes from the bytes message stream as a Unicode character

**Throws:**

- `JMSException` - if the JMS provider fails to read the message due to some internal error.
- `MessageEOFException` - if unexpected end of bytes stream has
been reached.
MessageNotReadableException - if the message is in write-only mode.

```java
public int readInt() throws JMSException
```

Return int

Throws JMSException: JMS

Throws MessageEOFException:

Throws MessageNotReadableException:

readInt

```java
int readInt() throws JMSException
```

Reads a signed 32-bit integer from the bytes message stream.

Returns:
the next four bytes from the bytes message stream, interpreted as an int

Throws:
JMSException - if the JMS provider fails to read the message due to some internal error.
MessageEOFException - if unexpected end of bytes stream has been reached.
MessageNotReadableException - if the message is in write-only mode.

```java
public long readLong() throws JMSException
```

Return long

Throws JMSException: JMS

Throws MessageEOFException:

Throws MessageNotReadableException:
**readLong**

```java
long readLong() throws JMSException

Returns:
the next eight bytes from the bytes message stream, interpreted as a long
```

**Throws:**
- `JMSException` - if the JMS provider fails to read the message due to some internal error.
- `MessageEOFException` - if unexpected end of bytes stream has been reached.
- `MessageNotReadableException` - if the message is in write-only mode.

---

**public float readFloat() throws JMSException**

```java
float readFloat() throws JMSException

Returns:
the next four bytes from the bytes message stream, interpreted as a float
```

**Throws:**
- `JMSException`: JMS
- `MessageEOFException`
- `MessageNotReadableException`
Throws:

- **JMSException** - if the JMS provider fails to read the message due to some internal error.
- **MessageEOFException** - if unexpected end of bytes stream has been reached.
- **MessageNotReadableException** - if the message is in write-only mode.

public double readDouble() throws **JMSException**

double

return double

Throws

- **JMSException**: JMS
- **MessageEOFException**: 
- **MessageNotReadableException**: 

readDouble

double readDouble() throws **JMSException**

Reads a double from the bytes message stream.

Returns:

the next eight bytes from the bytes message stream, interpreted as a double

Throws:

- **JMSException** - if the JMS provider fails to read the message due to some internal error.
- **MessageEOFException** - if unexpected end of bytes stream has been reached.
- **MessageNotReadableException** - if the message is in write-only mode.

public String readUTF() throws **JMSException**

UTF-8
return Unicode
Throws JMSException: JMS
Throws MessageEOFException:
Throws MessageNotReadableException:

readUTF

String readUTF()
throws JMSException

Reads a string that has been encoded using a modified UTF-8 format from the bytes message stream.

For more information on the UTF-8 format, see "File System Safe UCS Transformation Format (FSS_UTF)", X/Open Preliminary Specification, X/Open Company Ltd., Document Number: P316. This information also appears in ISO/IEC 10646, Annex P.

Returns:
a Unicode string from the bytes message stream

Throws:
JMSException - if the JMS provider fails to read the message due to some internal error.
MessageEOFException - if unexpected end of bytes stream has been reached.
MessageNotReadableException - if the message is in write-only mode.

public int readBytes(byte[] value) throws JMSException
byte
value

value -1

value
return -1

Throws JMSException: JMS

Throws MessageNotReadableException:

readBytes

int readBytes(byte[] value)
throws JMSException

Reads a byte array from the bytes message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters: value - the buffer into which the data is read

Returns: the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Throws: JMSException - if the JMS provider fails to read the message due to some internal error.

MessageNotReadableException - if the message is in write-only mode.
public int readBytes(byte[] value, int length) throws JMSException

value

value -1

length

length

value

Throws JMSException: JMS

Throws MessageNotReadableException:

readBytes

int readBytes(byte[] value,

int length)

throws JMSException

Reads a portion of the bytes message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an IndexOutOfBoundsException is thrown. No bytes will be
read from the stream for this exception case.

Parameters:
value - the buffer into which the data is read
length - the number of bytes to read; must be less than or equal to value.length

Returns:
the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Throws:
JMSException - if the JMS provider fails to read the message due to some internal error.
MessageNotReadableException - if the message is in write-only mode.

---

public void writeBoolean(boolean value) throws JMSException

<table>
<thead>
<tr>
<th>boolean 1-byte</th>
<th>true (byte)1</th>
<th>false (byte)0</th>
</tr>
</thead>
</table>

Parameters:
value - the boolean value to be written

Throws: JMSException: JMS
MessageNotWriteableException: JMS

writeBoolean

void writeBoolean(boolean value)
throws JMSException

Writes a boolean to the bytes message stream as a 1-byte value. The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters:
value - the boolean value to be written

Throws: JMSException - if the JMS provider fails to write the message due
to some internal error.
MessageNotWriteableException - if the message is in read-only mode.

public void writeByte(byte value) throws JMSException
byte value
Throws JMSException: JMS
Throws MessageNotWriteableException:

writeByte

void writeByte(byte value)
throws JMSException

Writes a byte to the bytes message stream as a 1-byte value.

Parameters:
value - the byte value to be written

Throws:
JMSException - if the JMS provider fails to write the message due to some internal error.
MessageNotWriteableException - if the message is in read-only mode.

public void writeShort(short value) throws JMSException
short value
Throws JMSException: JMS
Throws MessageNotWriteableException:

writeShort

void writeShort(short value)
Throws: \texttt{JMSException} - if the JMS provider fails to write the message due to some internal error.
\texttt{MessageNotWriteableException} - if the message is in read-only mode.

\textbf{Parameters:}
\begin{itemize}
  \item \texttt{value} - the short to be written
\end{itemize}

\textbf{Throws:}
\begin{itemize}
  \item \texttt{JMSException} - if the JMS provider fails to write the message due to some internal error.
  \item \texttt{MessageNotWriteableException} - if the message is in read-only mode.
\end{itemize}

\begin{verbatim}
public void writeChar(char value) throws JMSException
char 2-byte
value char
Throws JMSException: JMS
Throws MessageNotWriteableException:
\end{verbatim}

\textbf{writeChar}

void \texttt{writeChar(char value)}
throws \texttt{JMSException}

Writes a \texttt{char} to the bytes message stream as a 2-byte value, high byte first.

\textbf{Parameters:}
\begin{itemize}
  \item \texttt{value} - the \texttt{char} value to be written
\end{itemize}

\textbf{Throws:}
\begin{itemize}
  \item \texttt{JMSException} - if the JMS provider fails to write the message due to some internal error.
  \item \texttt{MessageNotWriteableException} - if the message is in read-only mode.
\end{itemize}

\begin{verbatim}
public void writeInt(int value) throws JMSException
\end{verbatim}
writeInt

`void writeInt(int value)`

Throws `JMSException`: JMS

**Parameter:**
- `value` - the int to be written

**Throws:**
- `JMSException` - if the JMS provider fails to write the message due to some internal error.
- `MessageNotWriteableException` - if the message is in read-only mode.

writeLong

`void writeLong(long value)`

Throws `JMSException`: JMS

**Parameter:**
- `value` - the long to be written

**Throws:**
- `JMSException` - if the JMS provider fails to write the message due to some internal error.
- `MessageNotWriteableException` - if the message is in read-only mode.

Writes a long to the bytes message stream as eight bytes, high byte first.
Parameters:

value - the long to be written

Throws:

- `JMSException` - if the JMS provider fails to write the message due to some internal error.
- `MessageNotWriteableException` - if the message is in read-only mode.

```
public void writeFloat(float value) throws JMSException
```

Parameters:

value - the float value to be written

Throws:

- `JMSException` - if the JMS provider fails to write the message due to some internal error.
- `MessageNotWriteableException` - if the message is in read-only mode.

```
public void writeDouble(double value) throws JMSException
```

Converts the `double` argument to an `int` using the `doubleToLongBits` method in class `Double`, and then writes that `int` value to the bytes message stream as a 8-byte quantity, high byte first.
byte

void writeDouble(double value)
throws JMSException

Converts the double argument to a long using the doubleToLongBits method in class double, and then writes that long value to the bytes message stream as an 8-byte quantity, high byte first.

Parameters:
value - the double value to be written

Throws:
JMSException - if the JMS provider fails to write the message due to some internal error.
MessageNotWriteableException - if the message is in read-only mode.

public void writeUTF(String value) throws JMSException

UTF-8

UTF-8 "File System Safe UCS Transformation Format (FSS_UTF)"X/Open Preliminary Specification
X/Open Company Ltd.P316 ISO/IEC 10646Annex P

void writeUTF(String value)
throws JMSException

Throws:
JMSException - JMS
MessageNotWriteableException -
**writeUTF**

```java
void writeUTF(String value)
throws JMSException
```

Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner.

For more information on the UTF-8 format, see "File System Safe UCS Transformation Format (FSS_UTF)", X/Open Preliminary Specification, X/Open Company Ltd., Document Number: P316. This information also appears in ISO/IEC 10646, Annex P.

**Parameters:**
- `value` - the String value to be written

**Throws:**
- `JMSException` - if the JMS provider fails to write the message due to some internal error.
- `MessageNotWriteableException` - if the message is in read-only mode.

---

**public void writeBytes(byte[] value) throws JMSException**

```java
byte value
```

Writes a byte array to the bytes message stream.

**Parameters:**
- `value` - the byte array to be written

**Throws:**
- `JMSException` - JMS
- `MessageNotWriteableException` -
`JMSException` - if the JMS provider fails to write the message due to some internal error.
`MessageNotWriteableException` - if the message is in read-only mode.

```java
public void writeBytes(byte[] value, int offset, int length) throws JMSException;
```

**Parameters:**
- `value` - the byte array value to be written
- `offset` - the initial offset within the byte array
- `length` - the number of bytes to use

**Throws:**
- `JMSException` - if the JMS provider fails to write the message due to some internal error.
- `MessageNotWriteableException` - if the message is in read-only mode.

```java
public void writeObject(Object value) throws JMSException
```

`writeBytes` method writes a portion of a byte array to the bytes message stream.

**Parameters:**
- `value` - the byte array value to be written
- `offset` - the initial offset within the byte array
- `length` - the number of bytes to use

**Throws:**
- `JMSException` - if the JMS provider fails to write the message due to some internal error.
**writeObject**

```java
void writeObject(Object value)

throws JMSException
```

Writes an object to the bytes message stream.

This method works only for the objectified primitive object types (Integer, Double, Long ...), String objects, and byte arrays.

**Parameters:**

- `value` - the object in the Java programming language ("Java object") to be written; it must not be null

**Throws:**

- `JMSException` - if the JMS provider fails to write the message due to some internal error.
- `MessageFormatException` - if the object is of an invalid type.
- `MessageNotWriteableException` - if the message is in read-only mode.
- `NullPointerException` - if the parameter `value` is null.

---

**public void reset() throws JMSException**

```java
void reset()

throws JMSException
```

**Throws:**

- `JMSException` - JMS
- `MessageFormatException`:
void reset() throws JMSException

Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

**Throws:**
- `JMSException` - if the JMS provider fails to reset the message due to some internal error.
- `MessageFormatException` - if the message has an invalid format.

javax.xml.rpc Interface Call

public interface Call

javax.xml.rpc.Call  javax.xml.rpc.Service  Call

Call  Call

version  1.0

The javax.xml.rpc.Call interface provides support for the dynamic invocation of a service endpoint. The javax.xml.rpc.Service interface acts as a factory for the creation of call instances.

Once a Call instance is created, various setter and getter methods may be used to configure this Call instance.

Version:  1.0

USERNAMEPROPERTY

static final String USERNAMEPROPERTY

Standard property: User name for authentication

Type: java.lang.String

See Also:
Constant Field Values

PASSWORDPROPERTY

static final String PASSWORDPROPERTY

Standard property: Password for authentication

Type: java.lang.String

See Also:
Constant Field Values

OPERATIONSTYLEPROPERTY

static final String OPERATIONSTYLEPROPERTY

Standard property for operation style. This property is set to "rpc" if
the operation style is rpc; "document" if the operation style is document.

Type: java.lang.String

See Also: Constant Field Values

-------------------------------

SOAPACTION_USE_PROPERTY

static final String SOAPACTION_USE_PROPERTY

Standard property for SOAPAction. This boolean property indicates whether or not SOAPAction is to be used. The default value of this property is false indicating that the SOAPAction is not used.

Type: java.lang.Boolean

See Also: Constant Field Values

-------------------------------

SOAPACTION_URIPROPERTY

static final String SOAPACTION_URIPROPERTY

Standard property for SOAPAction. Indicates the SOAPAction URI if the javax.xml.rpc.soap.http.soapaction.use property is set to true.

Type: java.lang.String

See Also: Constant Field Values
ENCODINGSTYLE_URI_PROPERTY

static final String ENCODINGSTYLE_URI_PROPERTY

Standard property for encoding Style: Encoding style specified as a namespace URI. The default value is the SOAP 1.1 encoding http://schemas.xmlsoap.org/soap/encoding/

Type: java.lang.String

See Also:
Constant Field Values

---

SESSION_MAINTAIN_PROPERTY

static final String SESSION_MAINTAIN_PROPERTY

Standard property: This boolean property is used by a service client to indicate whether or not it wants to participate in a session with a service endpoint. If this property is set to true, the service client indicates that it wants the session to be maintained. If set to false, the session is not maintained. The default value for this property is false.

Type: java.lang.Boolean

See Also:
Constant Field Values

---

Method Detail

public boolean isParameterAndReturnSpecRequired(javax.xml.namespace.QName operationName)
addParameter  setReturnType
operationName
return  Call  addParameter  setReturnType  true  false
Threws  IllegalArgumentException:

isParameterAndReturnSpecRequired

boolean isParameterAndReturnSpecRequired(QName operationName)

Indicates whether addParameter and setReturnType methods are to be invoked to specify the parameter and return type specification for a specific operation.

Parameters:
operationName - Qualified name of the operation

Returns:
Returns true if the Call implementation class requires addParameter and setReturnType to be invoked in the client code for the specified operation. This method returns false otherwise.

Throws:
IllegalArgumentException - If invalid operation name is specified

public void addParameter(String paramName, javax.xml.namespace.QName xmlType, ParameterMode parameterMode)

invoke  addParameter

&l Call WSDL
&l paramName
&l xmlType
&l parameterMode

&l XML
ParameterMode.IN ParameterMode.OUT
ParameterMode.INOUT

Throws
javax.xml.rpc.JAXRPCException::
isParameterAndReturnSpecRequired  false
Throw IllegalArgumentException: XML
See also isParameterAndReturnSpecRequired

addParameter

void addParameter(String paramName, QName xmlType, ParameterMode parameterMode)

Adds a parameter type and mode for a specific operation. Note that the client code may not call any addParameter and setReturnType methods before calling the invoke method. In this case, the Call implementation class determines the parameter types by using reflection on parameters, using the WSDL description and configured type mapping registry.

Parameters:
- paramName - Name of the parameter
- xmlType - XML type of the parameter
- parameterMode - Mode of the parameter-whether ParameterMode.IN, ParameterMode.OUT, or ParameterMode.INOUT

Throws:
- javax.xml.rpc.JAXRPCException: - This exception may be thrown if the method isParameterAndReturnSpecRequired returns false for this operation.
- IllegalArgumentException - If any illegal parameter name or XML type is specified

See Also:
- isParameterAndReturnSpecRequired(javax.xml.namespace.QName)

public void addParameter(String paramName, javax.xml.namespace.QName xmlType, Class<T> javaType, ParameterMode parameterMode)

OUT INOUT Java

paramName
xmlType XML
**addParameter**

```java
void addParameter(String paramName,
                  QName xmlType,
                  Class javaType,
                  ParameterMode parameterMode)
```

Adds a parameter type and mode for a specific operation. This method is used to specify the Java type for either OUT or INOUT parameters.

**Parameters:**
- `paramName` - Name of the parameter
- `xmlType` - XML type of the parameter
- `javaType` - Java class of the parameter
- `parameterMode` - Mode of the parameter-whether ParameterMode.IN, OUT or INOUT

**Throws:**
- `JAXRPCException` -
  - This exception may be thrown if this method is invoked when the method `isParameterAndReturnSpecRequired` returns `false`.
  - If specified XML type and Java type mapping is not valid. For example, `TypeMappingRegistry` has no serializers for this mapping.
- `IllegalArgumentException` - If any illegal parameter name or
XML type is specified

UnsupportedOperationException - If this method is not supported

See Also:

isParameterAndReturnSpecRequired(javax.xml.namespace.QName)

---

public javax.xml.namespace.QName
getParameterTypeByName(String paramName)

XML

   paramName
   return

getParameterTypeByName

QName getParameterTypeByName(String paramName)

   Gets the XML type of a parameter by name

Parameters:

   paramName - Name of the parameter

Returns:

   Returns XML type for the specified parameter

---

public void setReturnType(javax.xml.namespace.QName xmlType)

setParameterType(null)   Call

xmlType   setReturnType(QName xmlType)

Throws JAXRPCException: isParameterAndReturnSpecRequired

false

Throws IllegalArgumentException: XML

---

setReturnType

void setReturnType(QName xmlType)
Sets the return type for a specific operation. Invoking `setReturnType(null)` removes the return type for this Call object.

**Parameters:**
- `xmlType` - XML data type of the return value

**Throws:**
- `JAXRPCException` - This exception may be thrown when the method `isParameterAndReturnSpecRequired` returns `false`.
- `IllegalArgumentException` - If an illegal XML type is specified

```java
public void setReturnType(javax.xml.namespace.QName xmlType, Class<T> javaType)
```

**type**
- XML

**javaType**
- Java

**Throws**
- `isParameterAndReturnSpecRequired` - `false`
- `TypeMapping` - XML, Java

**Throws**
- `UnsupportedOperationException`: 

**Throws**
- `IllegalArgumentException`: 

`setReturnType` 

```java
void setReturnType(QName xmlType,
                  Class javaType)
```

Sets the return type for a specific operation.

**Parameters:**
- `type` - XML data type of the return value
- `javaType` - Java Class of the return value

**Throws:**
- `JAXRPCException` - 
  - This exception may be thrown if this method is invoked when the method `isParameterAndReturnSpecRequired`
returns false.

- If XML type and Java type cannot be mapped using the standard type mapping or TypeMapping registry

  `UnsupportedOperationException` - If this method is not supported

  `IllegalArgumentException` - If an illegal XML type is specified

---

**public javax.xml.namespace.QName getReturnType()**

```java
return XML
```

**getReturnType**

```java
QName getReturnType()
```

Gets the return type for a specific operation

**Returns:**

- Returns the XML type for the return value

---

**public void removeAllParameters()**

```java
Call setReturnType(null)
```

**Throws:**

- `JAXRPCException`: `isParameterAndReturnSpecRequired`

---

**removeAllParameters**

```java
void removeAllParameters()
```

Removes all specified parameters from this `Call` instance. Note that this method removes only the parameters and not the return type. The `setReturnType(null)` is used to remove the return type.

**Throws:**

- `JAXRPCException` - This exception may be thrown if this method
is called when the method isParameterAndReturnSpecRequired returns false for this Call's operation.

```java
public javax.xml.namespace.QName getOperationName()
    Call
    return

getOperationName
QName getOperationName()

    Gets the name of the operation to be invoked using this call instance.

    Returns:
    Qualified name of the operation

public void setOperationName(javax.xml.namespace.QName operationName)
    Call
    operationName    Call    QName

setOperationName
void setOperationName(QName operationName)

    Sets the name of the operation to be invoked using this call instance.

    Parameters:
    operationName - QName of the operation to be invoked using the Call instance
```
public javax.xml.namespace.QName getPortTypeName()

    return

getPortTypeName
QName getPortTypeName()

    Gets the qualified name of the port type.

    Returns:
    Qualified name of the port type

public void setPortTypeName(javax.xml.namespace.QName portType)

    portType

setPortTypeName
void setPortTypeName(QName portType)

    Sets the qualified name of the port type.

    Parameters:
    portType - Qualified name of the port type

public void setTargetEndpointAddress(String address)

    address

setTargetEndpointAddress(String address)

    Call

    address URI
**setTargetEndpointAddress**

```java
void setTargetEndpointAddress(String address)
```

Sets the address of the target service endpoint. This address must correspond to the transport specified in the binding for this call instance.

**Parameters:**
- `address` - Address of the target service endpoint; specified as an URI

---

**public String getTargetEndpointAddress()**

```java
return URI
```

---

**getTargetEndpointAddress**

```java
String getTargetEndpointAddress()
```

Gets the address of a target service endpoint.

**Returns:**
- Address of the target service endpoint as an URI

---

**public void setProperty(String name, Object value)**

**JAX-RPC**

```java
name
value
```

**JAXRPCException**: Call

**Throws**: Call

- Call
setProperty

void setProperty(String name,
Object value)

Sets the value for a named property. JAX-RPC specification specifies a standard set of properties that may be passed to the Call.setProperty method.

Parameters:
- name - Name of the property
- value - Value of the property

Throws:
- JAXRPCException -
  - If an optional standard property name is specified, however this call implementation class does not support the configuration of this property.
  - If an invalid (or unsupported) property name is specified or if a value of mismatched property type is passed.
  - If there is any error in the configuration of a valid property.

public Object getProperty(String name)

name
return

Throws JAXRPCException:

getProperty

Object getProperty(String name)

Gets the value of a named property.

Parameters:
name - Name of the property

**Returns:**
Value of the named property

**Throws:**
[JAXRPCException](#) - if an invalid or unsupported property name is passed.

---

**public void removeProperty(String name)**

`name`

**return**
boolean true false

**Throws**
[JAXRPCException](#)

---

**removeProperty**

void removeProperty(String name)

Removes a named property.

**Parameters:**
name - Name of the property

**Throws:**
[JAXRPCException](#) - if an invalid or unsupported property name is passed.

---

**public java.util.Iterator<E> getPropertyNames()**

`Call`

**return**
Iterator

---

**getPropertyNames**

Iterator getPropertyNames()

Gets the names of configurable properties supported by this call.
object.

**Returns:**

Iterator for the property names

---

```java
public Object invoke(Object[] inputParams) throws java.rmi.RemoteException {
  Object[] --
  return null
  Throws java.rmi.RemoteException:
  throws SOAPFaultException: SOAP
  JAXRPCException:
  
  Throws
  • Call
  • inputParams addParameter WSDL
  •
}
```

**invoke**

```java
Object invoke(Object[] inputParams) throws RemoteException
```

Invokes a specific operation using a synchronous request-response interaction mode.

**Parameters:**

- **inputParams** - Object[]--Parameters for this invocation. This includes only the input params

**Returns:**

Returns the return value or null

**Throws:**

- `RemoteException` - if there is any error in the remote method invocation
- `SOAPFaultException` - Indicates a SOAP fault
- `JAXRPCException` -
- If there is an error in the configuration of the `Call` object
- If `inputParams` do not match the required parameter set (as specified through the `addParameter` invocations or in the corresponding WSDL)
- If parameters and return type are incorrectly specified

```java
public Object invoke(javax.xml.namespace.QName operationName, Object[] inputParams) throws java.rmi.RemoteException
-
    operationName QName
    inputParams Object[] --
    return null

Throws java.rmi.RemoteException:
Throws SOAPFaultException: SOAP
    JAXRPCException:

Throws
    Call

Throws
    inputParams addParameter WSDL
```

**invoke**

```java
Object invoke(QName operationName,
             Object[] inputParams)
throws RemoteException
```

Invokes a specific operation using a synchronous request-response interaction mode.

**Parameters:**
- `operationName` - QName of the operation
- `inputParams` - Object[]--Parameters for this invocation. This includes only the input params.

**Returns:**
Return value or null

Throws:
- RemoteException - if there is any error in the remote method invocation.
- SOAPFaultException - Indicates a SOAP fault
- JAXRPCException -
  - If there is an error in the configuration of the Call object
  - If inputParams do not match the required parameter set (as specified through the addParameter invocations or in the corresponding WSDL)
  - If parameters and return type are incorrectly specified

public void invokeOneWay(Object[] inputParams)
SOAP/HTTP  HTTP
JAXRPCException
  inputParams Object[] --
  Throws JAXRPCException: call void

void invokeOneWay(Object[] inputParams)

Invokes a remote method using the one-way interaction mode. The client thread does not normally block waiting for the completion of the server processing for this remote method invocation. When the protocol in use is SOAP/HTTP, this method should block until an HTTP response code has been received or an error occurs. This method must not throw any remote exceptions. This method may throw a JAXRPCException during the processing of the one-way remote call.

Parameters:
  inputParams - Object[]--Parameters for this invocation. This includes only the input params.

Throws:
  JAXRPCException - if there is an error in the configuration of the
call object (example: a non-void return type has been incorrectly specified for the one-way call) or if there is any error during the invocation of the one-way remote call

```java
public java.util.Map<K, V> getOutputParams()
    Map {name, value} Map return
    Map Call.invoke() Map
    Throws JAXRPCException: invoke
```

getOutputParams

```java
Map getOutputParams()
```

Returns a Map of {name, value} for the output parameters of the last invoked operation. The parameter names in the returned Map are of type java.lang.String.

Returns:
Map Output parameters for the last Call.invoke(). Empty Map is returned if there are no output parameters.

Throws:
JAXRPCException - If this method is invoked for a one-way operation or is invoked before any invoke method has been called.

```java
public java.util.List<E> getOutputValues()
    List return java.util.List
    List Call.invoke() List
    Throws JAXRPCException: invoke
```

getOutputValues

```java
List getOutputValues()
```
Returns a List values for the output parameters of the last invoked operation.

**Returns:**
java.util.List Values for the output parameters. An empty List is returned if there are no output values.

**Throws:**
JAXRPCException - If this method is invoked for a one-way operation or is invoked before any invoke method has been called.
javax.xml.registry  Interface CapabilityProfile

public interface CapabilityProfile

JAXR

Provides information about the capabilities of a JAXR provider.

Author:
    Farrukh S. Najmi

Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int</td>
<td>getCapabilityLevel()</td>
<td>Gets the capability level supported by the JAXR provider.</td>

### Enum Constant Detail

**ALL**

```java
public static final CascadeType ALL

    Cascade all operations
```

**PERSIST**
public static final CascadeType PERSIST

Cascade persist operation

MERGE

public static final CascadeType MERGE

Cascade merge operation

REMOVE

public static final CascadeType REMOVE

Cascade remove operation

REFRESH

public static final CascadeType REFRESH

Cascade refresh operation

Method Detail

final public static CascadeType[] values()

values

public static final CascadeType[] values()
Returns an array containing the constants of this enum type, in the order they're declared. This method may be used to iterate over the constants as follows:

```java
for(CascadeType c : CascadeType.values())
    System.out.println(c);
```

**Returns:**
an array containing the constants of this enum type, in the order they're declared

---

```java
public static CascadeType valueOf(String name)
```

**valueOf**

```java
public static CascadeType valueOf(String name)
```

Returns the enum constant of this type with the specified name. The string must match *exactly* an identifier used to declare an enum constant in this type. (Extraneous whitespace characters are not permitted.)

**Parameters:**
name - the name of the enum constant to be returned.

**Returns:**
the enum constant with the specified name

**Throws:**
`IllegalArgumentException` - if this enum type has no constant with the specified name
PS:
javax.faces.convert Class CharacterConverter

Throws
NullPointerException: NullPointerException

description

getAsString

public String getAsString(FacesContext context, UIComponent component, Object value)

Description copied from interface: Converter

Convert the specified model object value, which is associated with the specified UIComponent, into a String that is suitable for being included in the response generated during the Render Response phase of the request processing lifecycle.

Specified by:
getAsString in interface Converter

Parameters:
context - FacesContext for the request being processed
component - UIComponent with which this model object value is associated
value - Model object value to be converted (may be null)

Returns:
a zero-length String if value is null, otherwise the result of the conversion

Throws:
ConverterException - if conversion cannot be successfully performed
performed

NullPointerException - if context or component is null

PS:
javax.xml.stream.events Interface Characters

All Superinterfaces:
   XMLEvent, XMLStreamConstants

public interface Characters
extends XMLEvent

Implements: XMLEvent

Characters  Characters  CData  Characters
IgnorableWhitespace  false

Field Summary

Fields inherited from interface javax.xml.stream.XMLStreamConstants
ATTRIBUTE, CDATA, CHARACTERS, COMMENT, DTD, END_DOCUMENT, END_ELEMENT, ENTITY_DECLARATION, ENTITY_REFERENCE, NAMESPACE, NOTATION_DECLARATION, PROCESSING_INSTRUCTION, SPACE, START_DOCUMENT, START_ELEMENT

This describes the interface to Characters events. All text events get reported as Characters events. Content, CData and whitespace are all reported as Characters events. IgnorableWhitespace, in most cases, will be set to false unless an element declaration of element content is present for the current element.

Version:
   1.0

</table>

Methods inherited from interface `javax.xml.stream.events.XMLEvent`

- `asCharacters`, `asEndElement`, `asStartElement`, `getEventType`, `getLocation`, `getSchemaType`, `isAttribute`, `isCharacters`, `isEndDocument`, `isEndElement`, `isEntityReference`, `isNamespace`, `isProcessingInstruction`, `isStartDocument`, `isStartElement`, `writeAsEncodedUnicode`

Method Detail

public `String getData()`

`getData`

`String getData()`

Get the character data of this event

public `boolean isWhiteSpace()`

`isWhiteSpace`  
Characters  true CHARACTERS
CHARACTERS

isWhiteSpace

boolean isWhiteSpace()

Returns true if this set of Characters is all whitespace. Whitespace inside a document is reported as CHARACTERS. This method allows checking of CHARACTERS events to see if they are composed of only whitespace characters.

public boolean isCData()

boolean isCData()

Returns true if this is a CData section. If this event is CData its event type will be CDATA If javax.xml.stream.isCoalescing is set to true CDATA Sections that are surrounded by non CDATA characters will be reported as a single Characters event. This method will return false in this case.

public boolean isIgnorableWhiteSpace()

boolean isIgnorableWhiteSpace()

Returns true if this set of Characters is all whitespace. Whitespace inside a document is reported as CHARACTERS. This method allows checking of CHARACTERS events to see if they are composed of only whitespace characters.
boolean isIgnorableWhiteSpace()

    Return true if this is ignorableWhiteSpace. If this event is ignorableWhiteSpace its event type will be SPACE.

3. Classification
4. Classification

See [javax.xml.registry.infomodel.RegistryObject](http://example.com), [javax.xml.registry.infomodel.Concept](http://example.com)

The Classification interface is used to classify RegistryObject instances. A RegistryObject may be classified along multiple dimensions by adding zero or more Classification instances to the RegistryObject. For example, an Organization may be classified by its industry, by the products it sells and by its geographical location. In this example the RegistryObject would have at least three Classification instances added to it. The RegistryObject interface provides several addClassification methods to allow a client to add Classification instances to a Registry Object.

Figure 1 shows how a Classification classifies a RegistryObject using a ClassificationScheme.

Figure 1. Using a ClassificationScheme to Classify an Object
**Internal vs. External Taxonomies**

A taxonomy may be represented within a JAXR provider in one of the following ways:

1. The taxonomy elements and their structural relationship with each other are available within the JAXR provider. This case is referred to as *Internal Taxonomy* since the structure of the taxonomy is available internal to the JAXR provider.
2. The taxonomy elements and their structural relationship with each other is represented somewhere external to the JAXR provider. This case is referred to as *External Taxonomy* since the structure of the taxonomy is not available to the JAXR provider.
Internal vs. External Classifications

The Classification interface allows the classification of RegistryObjects using a ClassificationScheme whether the ClassificationScheme represents an internal taxonomy or an external taxonomy. When a Classification instance uses a ClassificationScheme representing an internal taxonomy then it is referred to as an internal Classification. When a Classification instance uses a ClassificationScheme representing an external taxonomy then it is referred to as an external Classification.
Internal Classification

When a Classification instance is used to classify a RegistryObject using an internal taxonomy it is referred to as an internal Classification. A client must call the setConcept method on a Classification and define a reference to a Concept instance from the Classification instance in order for that Classification to use an internal taxonomy. It is not necessary for the client to call setClassificationScheme for internal Classifications since the classifying Concept already knows its root ClassificationScheme.

Example of Internal Classification

Figure 2 shows an example of internal classification using a Concept to represent a taxonomy element. The example classifies an Organization instance as a Book Publisher using the NAICS standard taxonomy available as an internal taxonomy. Note that the figure does not show all the Concepts between the Book Publishers node and the NAICS ClassificationScheme to save space. Had they been there they would have been linked together by the parent attribute of each Concept.

Figure 2. Example of Internal Classification
External Classification

When a Classification instance is used to classify a RegistryObject using an external taxonomy it is referred to as an external Classification. A client must call the setValue method on a Classification and define a unique value that logically represents a taxonomy element within the taxonomy whose structure is defined externally. It is necessary for the client call setClassificationScheme for external Classifications since there is no other way to infer the ClassificationScheme that represents the external taxonomy.

Example of External Classification

Figure 3 shows an example of external classification. The example uses the same scenario where a Classification classifies an Organization instance as a Book Publisher using the NAICS standard taxonomy. However, this time the structure of the NAICS taxonomy is not available internally to the JAXR provider and consequently there is no Concept instance. Instead, the name and value attributes of the Classification are used to pinpoint the Book Publisher's taxonomy element. Note that name is optional but value is required.

Figure 3. Example of External Classification
An Example of Multiple Classifications

The next example shows how a RegistryObject may be classified by multiple classification schemes. In this example, two internal ClassificationSchemes named Industry and Geography are used to classify several Organization RegistryObjects by their industry and Geography. In Figure 4, in order to save space and improve readability, the Classification instances are not explicitly shown but are implied as associations between the RegistryObjects (shaded leaf node) and the associated Concepts.

**getClassificationScheme**

ClassificationScheme getClassificationScheme() throws JAXRException

Gets the ClassificationScheme that is used in classifying the object. If the Classification is an internal Classification then this method should return the value returned by calling the getClassificationScheme method on the Concept representing the
public void setClassificationScheme(ClassificationScheme classificationScheme) throws JAXRException

Sets the ClassificationScheme for this external classification.

If this method is called then you must also call setValue method. This method should be used mutually exclusively with the setConcept method.

Capability Level: 0

Parameters:
classificationScheme - the ClassificationScheme used by this Classification

Throws:
    JAXRException - If the JAXR provider encounters an internal error

---

public String getValue() throws JAXRException
Classification

0

    return Classification Classification Concept

Throws: JAXRException: JAX

---

String getValue()

Throws: JAXRException

Gets the taxonomy value for this Classification.

Capability Level: 0

Returns:
    the value of the taxonomy element if external Classification; the
    value of the Concept representing the taxonomy element if internal Classification

Throws: JAXRException - If the JAXR provider encounters an internal error

---

public void setValue(String value) throws JAXRException
Classification

0
setValue

```java
void setValue(String value)
   throws JAXRException
```

Sets the taxonomy value for this external Classification.

**Capability Level: 0**

**Parameters:**

- `value` - the taxonomy value used by this external Classification

**Throws:**

- `JAXRException` - If the JAXR provider encounters an internal error

---

**public RegistryObject get ClassifiedObject() throws JAXRException**

**Object**

```java
return Classification RegistryObject
   throws JAXRException: JAXR
```

**get ClassifiedObject**

```java
RegistryObject get ClassifiedObject()
   throws JAXRException
```

Gets the Object that is being classified.

**Capability Level: 0**
Returns:
the RegistryObject that is classified by this Classification

Throws:
JAXRException - If the JAXR provider encounters an internal error

---

public void setClassifiedObject(RegistryObject classifiedObject) throws JAXRException

0

classifiedObject  Classification  RegistryObject

Throws:  JAXRException: JAXR

setClassifiedObject

void setClassifiedObject(RegistryObject classifiedObject) throws JAXRException

Sets the object that is being classified.

Capability Level: 0

Parameters:
classifiedObject - the RegistryObject that is classified by this Classification

Throws:
JAXRException - If the JAXR provider encounters an internal error

---

public boolean isExternal() throws JAXRException

Classification true

0
isExternal

boolean isExternal() throws JAXRException

Returns true if this is an external classification.

Capability Level: 0

Returns:
true if this is an external Classification; false otherwise

Throws:
JAXRException - If the JAXR provider encounters an internal error
javax.xml.registry.infomodel **Interface ClassificationScheme**

**All Superinterfaces:**
ExtensibleObject, RegistryEntry, RegistryObject, Versionable

```java
class ClassificationScheme {
    extends RegistryEntry

    Implements RegistryEntry
}
```

**Classifications:**
ClassificationScheme, RegistryObject, ClassificationScheme
Dewey Decimal, North American Industry Classification System (NAICS)

1. Classification Scheme

A Classification Scheme instance represents a taxonomy that may be used to classify or categorize RegistryObject instances. A very common example of a classification scheme in science is the Classification of living things where living things are categorized in under a tree-like structure. Another example is the Dewey Decimal system used in libraries to categorize books and other publications. A common example in eBusiness is that of North American Industry Classification System (NAICS), which is a classification scheme used to classify businesses and services by the industry to which they belong.

Figure 1 shows how a Classification Scheme is used by a Classification to classify a RegistryObject.

**Figure 1. Using a Classification Scheme to Classify an Object**

concepts Concept Collection
Throws JAXRException: JAXR
addChildConcepts

void addChildConcepts(Collection concepts)
throws JAXRException

Adds a Collection of Concept children.

Capability Level: 0

Parameters:
- concepts - the Collection of Concepts being added as a children of this object

Throws:
- JAXRException - If the JAXR provider encounters an internal error

public void removeChildConcept(Concept concept) throws JAXRException

concept

concept

Throws
- JAXRException: JAXR

removeChildConcept

void removeChildConcept(Concept concept)
throws JAXRException

Removes a child Concept.

Capability Level: 0

Parameters:
public void removeChildConcepts(java.util.Collection<E> concepts) throws JAXRException

Removes a Collection of children Concepts.

Parameters:

- concepts - the Collection of Concepts being removed as children Concepts of this object

Throws:

- JAXRException - If the JAXR provider encounters an internal error

public int getChildConceptCount() throws JAXRException
getChildConceptCount

```java
int getChildConceptCount() throws JAXRException
```

Gets number of children.

**Capability Level: 0**

**Returns:**
the number of children Concepts

**Throws:**
- `JAXRException` - If the JAXR provider encounters an internal error

---

public java.util.Collection<E> getChildrenConcepts() throws JAXRException

**getChildrenConcepts**

```java
Collection getChildrenConcepts() throws JAXRException
```

Gets all immediate children Concepts.

**See also**
- `javax.xml.registry.infomodel.Concept`
Capability Level: 0

Returns:
Collection of Concept instances. The Collection may be empty but not null.

Throws:
*JAXRException* - If the JAXR provider encounters an internal error

See Also:
*Concept*

```java
public java.util.Collection<E> getDescendantConcepts()
throws JAXRException

Concept

return Concept Collection Collection null

Throws JAXRException: JAXR

See also javax.xml.registry.infomodel.Concept
```

getDescendantConcepts

*Collection* getDescendantConcepts()

Gets all descendant Concepts.

Capability Level: 0

Returns:
Collection of Concept instances. The Collection may be empty but not null.

Throws:
*JAXRException* - If the JAXR provider encounters an internal error
public boolean isExternal() throws JAXRException
ClassificationScheme ClassificationScheme
ClassificationScheme

0

return ClassificationScheme true false
Throws JAXRException: JAXR

isExternal

boolean isExternal() throws JAXRException

Determines whether this ClassificationScheme is an external ClassificationScheme or an internal ClassificationScheme.

Capability Level: 0

Returns: true if this is an external ClassificationScheme; false otherwise
Throws: JAXRException - If the JAXR provider encounters an internal error

public int getValueType() throws JAXRException

1

return ClassificationScheme
Throws JAXRException: JAXR
getValueType

```java
int getValueType() throws JAXRException
```

Gets the value type for this object. The value type describes how taxonomy values are defined within the scheme.

**Capability Level: 1**

**Returns:**
- an integer constant that describes the type of values supported by this ClassificationScheme

**Throws:**
- `JAXRException` - If the JAXR provider encounters an internal error

**See Also:**
- `VALUE_TYPE_UNIQUE`, `VALUE_TYPE_EMBEDDED_PATH`, `VALUE_TYPE_NON_UNIQUE`
void setValueType(int valueType)
    throws JAXRException

Sets the value type for this object.

**Capability Level: 1**

**Parameters:**
valueType - an integer constant that describes the type of values supported by this ClassificationScheme

**Throws:**
JAXRException - If the JAXR provider encounters an internal error

**See Also:**
VALUE_TYPE_UNIQUE, VALUE_TYPE_EMBEDDED_PATH, VALUE_TYPE_NON_UNIQUE

PS:
public interface ClassTransformer

PersistenceUnitInfo.addTransformer JVM
since Java Persistence 1.0

A persistence provider supplies an instance of this interface to the PersistenceUnitInfo.addTransformer method. The supplied transformer instance will get called to transform entity class files when they are loaded or redefined. The transformation occurs before the class is defined by the JVM.

Since: Java Persistence 1.0

### Method Summary

<table>
<thead>
<tr>
<th>transform(byte[], ClassLoader loader, String className, Class&lt;?&gt;, ClassBeingRedefined, ProtectionDomain protectionDomain, byte[] classfileBuffer)</th>
</tr>
</thead>
</table>
| Invoked when a class is being loaded or redefined.

### Method Detail

transform

byte[] transform(ClassLoader loader, String className, Class<?> classBeingRedefined,
ProtectionDomain protectionDomain,
byte[] classfileBuffer)
throws IllegalClassFormatException

Invoked when a class is being loaded or redefined. The implementation of this method may transform the supplied class file and return a new replacement class file.

Parameters:
- loader - The defining loader of the class to be transformed, may be null if the bootstrap loader
- className - The name of the class in the internal form of fully qualified class and interface names
- classBeingRedefined - If this is a redefine, the class being redefined, otherwise null
- protectionDomain - The protection domain of the class being defined or redefined
- classfileBuffer - The input byte buffer in class file format - must not be modified

Returns:
A well-formed class file buffer (the result of the transform), or null if no transform is performed

Throws:
- IllegalClassFormatException - If the input does not represent a well-formed class file
javax.enterprise.deploy.spi.status  Interface ClientConfiguration

All Superinterfaces:
    Serializable

public interface ClientConfiguration
    extends Serializable

Implements: java.io.Serializable

ClientConfiguration

The ClientConfiguration object installs, configures and executes an Application Client. This class resolves the settings for installing and running the application client.

---

Method Summary

<table>

public String unmarshal(String text)
Removes leading and trailing whitespaces of the string given as the parameter, then truncate any sequence of tab, CR, LF, and SP by a single whitespace character ".

Specified by:

unmarshal in class 'XmlAdapter<String, String>

Parameters:

text - The value to be converted. Can be null.

public String marshal(String s)

marshal

public String marshal(String s)

No-op. Just return the same string given as the parameter.

Specified by:

marshal in class 'XmlAdapter<String, String>

Parameters:

s - The value to be converted. Can be null.

protected static boolean isWhiteSpace(char ch)

char true

isWhiteSpace

protected static boolean isWhiteSpace(char ch)

returns true if the specified char is a white space character.

PS:
javax.persistence Annotation Type Column

@Target(value={METHOD, FIELD})
@Retention(value=RUNTIME)
public @interface Column

Implements: Annotation
@Target(value={METHOD, FIELD})
@Retention(value=RUNTIME)

Column

1
@Column(name="DESC", nullable=false, length=512)
public String getDescription() { return description; }

2
@Column(name="DESC",
columnDefinition="CLOB NOT NULL",
table="EMP_DETAIL")
@Lob
public String getDescription() { return description; }

3
@Column(name="ORDER_COST",
updatable=false, precision=12, scale=2)
public BigDecimal getCost() { return cost; }

since Java Persistence 1.0

Is used to specify a mapped column for a persistent property or field. If no Column annotation is specified, the default values are applied.

Examples:

Example 1:
@Column(name="DESC", nullable=false, length=512)
public String getDescription() { return description; }
Example 2:
@Column(name="DESC",
        columnDefinition="CLOB NOT NULL",
        table="EMP_DETAIL")
@Lob
public String getDescription() {
    return description;
}

Example 3:
@Column(name="ORDER_COST",
        updatable=false,
        precision=12,
        scale=2)
public BigDecimal getCost() {
    return cost;
}

Since:
Java Persistence 1.0

abstract public String name()

name

public abstract String name

(Optional) The name of the column. Defaults to the property or field name.

Default: ""

abstract public boolean unique()
UniqueConstraint

unique

public abstract boolean unique

(Optional) Whether the property is a unique key. This is a shortcut for the UniqueConstraint annotation at the table level and is useful for when the unique key constraint is only a single field. This constraint applies in addition to any constraint entailed by primary key mapping and to constraints specified at the table level.

Default: false
abstract public boolean nullable()
    null

nullable

public abstract boolean nullable
    (Optional) Whether the database column is nullable.
    Default: true

abstract public boolean insertable()
    SQL INSERT

insertable

public abstract boolean insertable
    (Optional) Whether the column is included in SQL INSERT statements generated by the persistence provider.
    Default: true

abstract public boolean updatable()
    SQL UPDATE

updatable

public abstract boolean updatable
Whether the column is included in SQL UPDATE statements generated by the persistence provider.

**Default:**
true

---

**abstract public String columnDefinition()**

**DDL SQL**

**SQL**

---

**columnDefinition**

**public abstract String columnDefinition**

(Optional) The SQL fragment that is used when generating the DDL for the column.

Defaults to the generated SQL to create a column of the inferred type.

**Default:**

""

---

**abstract public String table()**

---

**table**

**public abstract String table**

(Optional) The name of the table that contains the column. If absent the column is assumed to be in the primary table.
abstract public int length()

length

public abstract int length

(Optional) The column length. (Applies only if a string-valued column is used.)

Default:

255

abstract public int precision()

DDL

precision

public abstract int precision

(Optional) The precision for a decimal (exact numeric) column. (Applies only if a decimal column is used.) Value must be set by developer if used when generating the DDL for the column.

Default:

0

abstract public int scale()
public abstract int \texttt{scale}

(Optional) The scale for a decimal (exact numeric) column. (Applies only if a decimal column is used.)

\textbf{Default:}
\begin{itemize}
  \item 0
\end{itemize}
javax.persistence Annotation Type ColumnResult

@Target(value={})
@Retention(value=RUNTIME)
public @interface ColumnResult

Implements: Annotation
@Target(value={})
@Retention(value=RUNTIME)

SQL SELECT

Query q = em.createNativeQuery(
   "SELECT o.id AS order_id, " +
   "o.quantity AS order_quantity, " +
   "o.item AS order_item, " +
   "i.name AS item_name, " +
   "FROM Order o, Item i " +
   "WHERE (order_quantity > 25) AND (order_item = i.id)",
   "OrderResults");

@SqlResultSetMapping(name="OrderResults",
entities={
   @EntityResult(entityClass=com.acme.Order.class, fields={
      @FieldResult(name="id", column="order_id"),
      @FieldResult(name="quantity", column="order_quantity"),
      @FieldResult(name="item", column="order_item"))},
   columns={
      @ColumnResult(name="item_name")
   })

since Java Persistence 1.0

References name of a column in the SELECT clause of a SQL query - i.e., column alias, if applicable. Scalar result types can be included in the query result by specifying this annotation in the metadata.

Example:
Query q = em.createNativeQuery(
   "SELECT o.id AS order_id, " +
"o.quantity AS order_quantity, " +
"o.item AS order_item, " +
"i.name AS item_name, " +
"FROM Order o, Item i " +
"WHERE (order_quantity > 25) AND (order_item = i.id),
"OrderResults";

@SqlResultSetMapping(name="OrderResults",
    entities={
        @EntityResult(entityClass=com.acme.Order.class, fields={
            @FieldResult(name="id", column="order_id"),
            @FieldResult(name="quantity", column="order_quantity"
            @FieldResult(name="item", column="order_item"}}},
        columns={
            @ColumnResult(name="item_name")
        }
    )
)

Since:
Java Persistence 1.0

abstract public String name()

SQL SELECT

name

public abstract String name

    The name of a column in the SELECT clause of a SQL query
javax.activation Class CommandInfo

java.lang.Object
  ↓ javax.activation.CommandInfo

public class CommandInfo extends Object

CommandMap CommandInfo bean
CommandInfo CommandMap CommandMap JavaBean

The CommandInfo class is used by CommandMap implementations to describe the results of command requests. It provides the requestor with both the verb requested, as well as an instance of the bean. There is also a method that will return the name of the class that implements the command but it is not guaranteed to return a valid value. The reason for this is to allow CommandMap implementations that subclass CommandInfo to provide special behavior. For example a CommandMap could dynamically generate JavaBeans. In this case, it might not be possible to create an object with all the correct state information solely from the class name.

Constructor Summary

<table>
<thead>
<tr>
<th>Constructor</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CommandInfo(String verb, String className)</td>
<td>The Constructor for CommandInfo.</td>
</tr>
</tbody>
</table>

Method Summary

<table>
<thead>
<tr>
<th>Method Summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String getCommandClass()</td>
<td>Return the command's class name.</td>
</tr>
<tr>
<td>getCommandName()</td>
<td></td>
</tr>
</tbody>
</table>
Return the command verb.

`Object getCommandObject(DataHandler dh, ClassLoader loader)`
Return the instantiated JavaBean component.

Methods inherited from class java.lang.Object
`clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait`

Constructor Detail

`public CommandInfo(String verb, String className)`

CommandInfo

`verb` CommandInfo

`className`

CommandInfo

`public CommandInfo(String verb, String className)`

The Constructor for CommandInfo.

**Parameters:**

`verb` - The command verb this CommandInfo describes.
`className` - The command's fully qualified class name.

Method Detail

`public String getCommandName()`

return
getCommandName

public String getCommandName()

Return the command verb.

Returns:
the command verb.

getCommandClass

public String getCommandClass()

CommandMap CommandInfo null
return null

getCommandObject

public Object getCommandObject(DataHandler dh, ClassLoader loader) throws java.io.IOException, ClassNotFoundException, ClassNotFoundException

JavaBean

Beans.instantiate()

bean javax.activation.CommandObject
setCommandContext

DataHandler null bean : 
InputStream DataHandler IOExceptions bean

bean CommandObject java.io.Externalizable 
CommandObject DataHandler 
InputStream bean readExternal

dh DataHandler
loader bean ClassLoader
return bean
See also instantiate, javax.activation.CommandObject

getCommandObject

public Object getCommandObject(DataHandler dh, 
ClassLoader loader) 
throws IOException, 
ClassNotFoundException

Return the instantiated JavaBean component.

Begin by instantiating the component with Beans.instantiate().

If the bean implements the javax.activation.CommandObject interface, call its setCommandContext method.

If the DataHandler parameter is null, then the bean is instantiated with no data. NOTE: this may be useful if for some reason the DataHandler that is passed in throws IOExceptions when this method attempts to access its InputStream. It will allow the caller to retrieve a reference to the bean if it can be instantiated.

If the bean does NOT implement the CommandObject interface, this
method will check if it implements the java.io.Externalizable interface. If it does, the bean's readExternal method will be called if an InputStream can be acquired from the DataHandler.

**Parameters:**

- dh - The DataHandler that describes the data to be passed to the command.
- loader - The ClassLoader to be used to instantiate the bean.

**Returns:**
The bean

**Throws:**

- IOException
- ClassNotFoundException

**See Also:**

- Beans.instantiate(java.lang.ClassLoader, java.lang.String), CommandObject

Methods inherited from class java.lang.**Object**

`clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait`

**Constructor Detail**
public CommandMap()

CommandMap

public CommandMap()

### Method Detail

```java
public static CommandMap getDefaultCommandMap()
```

**CommandMap**

```java
public static CommandMap getDefaultCommandMap()
```

- CommandMap  
  ```java
  setDefaultCommandMap
  ```

- CommandMap CommandMap
  ```java
  MailcapCommandMap
  ```

  return CommandMap

### getDefaultsCommandMap

```java
public static CommandMap getDefaultsCommandMap()
```

Get the default CommandMap.

- In cases where a CommandMap instance has been previously set to some value (via `setDefaultCommandMap`) return the CommandMap.
- In cases where no CommandMap has been set, the CommandMap creates an instance of `MailcapCommandMap` and set that to the default, returning its value.

**Returns:**

the CommandMap
public static void setDefaultCommandMap(CommandMap commandMap)

CommandMap commandMap

null CommandMap

Throws SecurityException:

setDefaultCommandMap

public static void setDefaultCommandMap(CommandMap commandMap)

Set the default CommandMap. Reset the CommandMap to the default by calling this method with null.

Parameters:

commandMap - The new default CommandMap.

Throws:

SecurityException - if the caller doesn't have permission to change the default

abstract public CommandInfo[] getPreferredCommands(String mimeType)

MIME CommandMap

mimeType MIME return Bean CommandInfo

getPreferredCommands

public abstract CommandInfo[] getPreferredCommands(String mimeType)

Get the preferred command list from a MIME Type. The actual semantics are determined by the implementation of the CommandMap.

Parameters:
public CommandInfo[] getPreferredCommands(String mimeType, DataSource ds)

Get the preferred command list from a MIME Type. The actual semantics are determined by the implementation of the CommandMap.

The DataSource provides extra information, such as the file name, that a CommandMap implementation may use to further refine the list of commands that are returned. The implementation in this class simply calls the getPreferredCommands method that ignores this argument.

**Parameters:**

- mimeType - the MIME type
- ds - a DataSource for the data

**Returns:**

the CommandInfo classes that represent the command Beans.
Since:
JAF 1.1

abstract public CommandInfo[] getAllCommands(String mimeType)
MIME

mimeType
return

getAllCommands

public abstract CommandInfo[] getAllCommands(String mimeType)

Get all the available commands for this type. This method should return all the possible commands for this MIME type.

Parameters:
mimeType - the MIME type

Returns:
the CommandInfo objects representing all the commands.

public CommandInfo[] getAllCommands(String mimeType, DataSource ds)

DataSource CommandMap

mimeType
ds
return
since

getAllCommands

MIME

DataSource

CommandInfo

since
JAF 1.1
getAllCommands

public CommandInfo[] getAllCommands(String mimeType, DataSource ds)

Get all the available commands for this type. This method should return all the possible commands for this MIME type.

The DataSource provides extra information, such as the file name, that a CommandMap implementation may use to further refine the list of commands that are returned. The implementation in this class simply calls the getAllCommands method that ignores this argument.

Parameters:
mimeType - the MIME type
ds - a DataSource for the data

Returns:
the CommandInfo objects representing all the commands.

Since:
JAF 1.1

abstract public CommandInfo getCommand(String mimeType, String cmdName)

Get the default command corresponding to the MIME type.

Parameters:
mimeType - the MIME type
public CommandInfo getCommand(String mimeType, String cmdName, DataSource ds)

Get the default command corresponding to the MIME type.

The DataSource provides extra information, such as the file name, that a CommandMap implementation may use to further refine the command that is chosen. The implementation in this class simply calls the getCommand method that ignores this argument.

Parameters:
- mimeType - the MIME type
- cmdName - the command name
- ds - a DataSource for the data

Returns:
- the CommandInfo corresponding to the command.

Since:
abstract public DataContentHandler createDataContentHandler(String mimeType)
MIME DataContentHandler CommandMap

    mimeType MIME
    return MIME DataContentHandler

createDataContentHandler

public abstract DataContentHandler createDataContentHandler(String mimeType)

    Locate a DataContentHandler that corresponds to the MIME type. The mechanism and semantics for determining this are determined by the implementation of the particular CommandMap.

Parameters:
    mimeType - the MIME type

Returns:
    the DataContentHandler for the MIME type

public DataContentHandler createDataContentHandler(String mimeType, DataSource ds)
MIME DataContentHandler CommandMap

    DataSource CommandMap DataContentHandler
    mimeType MIME
    ds DataSource
    return MIME DataContentHandler
    since JAF 1.1
createDataContentHandler

public DataContentHandler createDataContentHandler(String mimeType, DataSource ds)

Locate a DataContentHandler that corresponds to the MIME type. The mechanism and semantics for determining this are determined by the implementation of the particular CommandMap.

The DataSource provides extra information, such as the file name, that a CommandMap implementation may use to further refine the choice of DataContentHandler. The implementation in this class simply calls the createDataContentHandler method that ignores this argument.

Parameters:
- mimeType: the MIME type
- ds: a DataSource for the data

Returns:
- the DataContentHandler for the MIME type

Since:
- JAF 1.1

getMimeTypes

public String[] getMimeTypes()

Get all the MIME types known to this command map. If the command map doesn't support this operation, null is returned.

Since:
- JAF 1.1
**Returns:**
array of MIME types as strings, or null if not supported

**Since:**
JAF 1.1
javax.activation  Interface CommandObject

public interface CommandObject

Activation Framework  JavaBean  DataHandler
JavaBean  Externalizable

JavaBeans components that are Activation Framework aware implement this interface to find out which command verb they're being asked to perform, and to obtain the DataHandler representing the data they should operate on. JavaBeans that don't implement this interface may be used as well. Such commands may obtain the data using the Externalizable interface, or using an application-specific method.

Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void setCommandContext(String verb, DataHandler dh)</td>
<td>Initialize the Command with the verb it is requested to handle and the DataHandler that describes the data it will operate on.</td>
</tr>
</tbody>
</table>

Method Detail

public void setCommandContext(String verb, DataHandler dh) throws java.io.IOException

DataHandler  Command

verb  Command Verb
dh  DataHandler
void setCommandContext(String verb, DataHandler dh)
throws IOException

Initialize the Command with the verb it is requested to handle and the DataHandler that describes the data it will operate on. **NOTE:** it is acceptable for the caller to pass *null* as the value for DataHandler.

**Parameters:**
- *verb* - The Command Verb this object refers to.
- *dh* - The DataHandler.

**Throws:**
- IOException

public static final CommandType DISTRIBUTED

The DeploymentManger action operation being processed is distribute.

START

public static final CommandType START

The DeploymentManger action operation being processed is start.

STOP

public static final CommandType STOP

The DeploymentManger action operation being processed is stop.

UNDEPLOY

public static final CommandType UNDEPLOY

The DeploymentManger action operation being processed is undeploy.

REDEPLOY

public static final CommandType REDEPLOY
The DeploymentManger action operation being processed is redeploy.

Constructor Detail

protected CommandType(int value)

Construct a new enumeration value with the given integer value.

Parameters:
value - Integer value.

Method Detail

public int getValue()

Returns this enumeration value's integer value.

Returns:
the value
protected String[] getStringTable()

getStringTable

protected String[] getStringTable()

  Returns the string table for class CommandType

protected CommandType[] getEnumValueTable()

getEnumValueTable

protected CommandType[] getEnumValueTable()

  Returns the enumeration value table for class CommandType

public static CommandType getCommandType(int value)

getCommandType

public static CommandType getCommandType(int value)

  Return an object of the specified value.

  Parameters:

  value - a designator for the object.
public String toString()

CommandType

toString

public String toString()

Return the string name of this CommandType or the integer value if outside the bounds of the table

Overrides:

toString in class Object

protected int getOffset()

0

return

getOffset

protected int getOffset()

Returns the lowest integer value used by this enumeration value's enumeration class.

The default implementation returns 0.

Returns:

the offset of the lowest enumeration value.
javax.xml.stream.events Interface Comment

All Superinterfaces:

XMLEvent, XMLStreamConstants

public interface Comment

CommException
public CommException()

Constructs a new instance with null as its detail message.

public CommException(String message)

message

CommException

public CommException(String message)

Constructs a new instance with the specified detail message.

Parameters:
message - the detail message.

public CommException(Throwable cause)

cause throwable

cause Throwable

CommException

public CommException(Throwable cause)

Constructs a new throwable with the specified cause.

Parameters:
cause - a chained exception of type Throwable.

public CommException(String message, Throwable cause)

cause throwable

message
CommException

public CommException(String message, Throwable cause)

Constructs a new throwable with the specified detail message and cause.

Parameters:
message - the detail message.
cause - a chained exception of type Throwable.

public CommException(String message, String errorCode)

Constructs a new throwable with the specified detail message and an error code.

Parameters:
message - a description of the exception.
errorCode - a string specifying the vendor specific error code.
Class ComparisonTerm

javax.mail.search  
java.lang.Object
   ↓javax.mail.search.SearchTerm
      ↓javax.mail.search.ComparisonTerm

All Implemented Interfaces:
   Serializable

Direct Known Subclasses:
   DateTerm, IntegerComparisonTerm

public abstract class ComparisonTerm
   extends SearchTerm

Extends: SearchTerm
Extended by: DateTerm, IntegerComparisonTerm

This class models the comparison operator. This is an abstract class; subclasses implement comparisons for different datatypes.

Author:
   Bill Shannon, John Mani

javax.el  **Class CompositeELResolver**

```java
java.lang.Object  
    ▼ javax.el.ELResolver  
        ▼ javax.el.CompositeELResolver
```

public class **CompositeELResolver**

extends **ELResolver**

**Extends:** **ELResolver**

```
ELResolver  ELContext  ELResolver
CompositeELResolver
```

```
#getValue#getType#setValue  #isReadOnly  ELResolver (base, property)
propertyResolved  true  propertyResolved  false
```

CompositeELResolver  ELContext.propertyResolved  false

```
#getFeatureDescriptors  #getCommonPropertyType
ELContext.propertyResolved  ELResolver
```

since **JSP 2.1**

See also  **javax.el.ELContext, javax.el.ELResolver**

Maintains an ordered composite list of child **ELResolver**s.

Though only a single **ELResolver** is associated with an **ELContext**, there are usually multiple resolvers considered for any given variable or property resolution. **ELResolver**s are combined together using a **CompositeELResolver**, to define rich semantics for evaluating an expression.
For the `getValue(javax.el.ELContext, java.lang.Object, java.lang.Object)`, `getType(javax.el.ELContext, java.lang.Object, java.lang.Object)`, `setValue(javax.el.ELContext, java.lang.Object, java.lang.Object, java.lang.Object)` and `isReadOnly(javax.el.ELContext, java.lang.Object, java.lang.Object)` methods, an `ELResolver` is not responsible for resolving all possible (base, property) pairs. In fact, most resolvers will only handle a base of a single type. To indicate that a resolver has successfully resolved a particular (base, property) pair, it must set the `propertyResolved` property of the `ELContext` to true. If it could not handle the given pair, it must leave this property alone. The caller must ignore the return value of the method if `propertyResolved` is false.

The `CompositeELResolver` initializes the `ELContext.propertyResolved` flag to false, and uses it as a stop condition for iterating through its component resolvers.

The `ELContext.propertyResolved` flag is not used for the design-time methods `getFeatureDescriptors(javax.el.ELContext, java.lang.Object)` and `getCommonPropertyType(javax.el.ELContext, java.lang.Object)`. Instead, results are collected and combined from all child `ELResolver`S for these methods.

Since: JSP 2.1

Constructor Detail

public CompositeELResolver()

CompositeELResolver

public CompositeELResolver()

Method Detail

public void add(ELResolver elResolver)

elResolver

Throws

NullPointeException: null

add

public void add(ELResolver elResolver)

Adds the given resolver to the list of component resolvers.

Resolvers are consulted in the order in which they are added.
Parameters:
   elResolver - The component resolver to add.

Throws:
   NullPointerException - If the provided resolver is null.

```java
public Object getValue(ELContext context, Object base, Object property)
```

(base, property) ELContext propertyResolved true true
   ELContext propertyResolved false

1. getValue() context base property
2. ELContext propertyResolved false
3. getValue()
   null propertyResolved false

context base base null
property return ELContext propertyResolved true
Throws NullPointerException: context null
Throws PropertyNotFoundException: ELResolver (base, property)
Throws ELException: cause

getValue
public Object getValue(ELContext context, Object base, Object property)

Attempts to resolve the given property object on the given base object by querying all component resolvers.

If this resolver handles the given (base, property) pair, the propertyResolved property of the ELContext object must be set to true by the resolver, before returning. If this property is not true after this method is called, the caller should ignore the return value.

First, propertyResolved is set to false on the provided ELContext.

Next, for each component resolver in this composite:

1. The getValue() method is called, passing in the provided context, base and property.
2. If the ELContext's propertyResolved flag is false then iteration continues.
3. Otherwise, iteration stops and no more component resolvers are considered. The value returned by getValue() is returned by this method.

If none of the component resolvers were able to perform this operation, the value null is returned and the propertyResolved flag remains set to false.

Any exception thrown by component resolvers during the iteration is propagated to the caller of this method.

Specified by: getValue in class ELResolver

Parameters:
context - The context of this evaluation.
base - The base object whose property value is to be returned, or null to resolve a top-level variable.
property - The property or variable to be resolved.
Returns:
If the `propertyResolved` property of `ELContext` was set to `true`, then the result of the variable or property resolution; otherwise undefined.

Throws:
- `NullPointerException` - if context is `null`
- `PropertyNotFoundException` - if the given (base, property) pair is handled by this `ELResolver` but the specified variable or property does not exist or is not readable.
- `ELException` - if an exception was thrown while performing the property or variable resolution. The thrown exception must be included as the cause property of this exception, if available.

```java
public Class<T> getType(ELContext context, Object base, Object property)
    base   property   #setValue   value
(base, property)   ELContext   propertyResolved
true   true

ELContext   propertyResolved   false
```

1. `getType()` `context` `base` `property`
2. `ELContext` `propertyResolved` `false`
3. `getType()`
   `null` `propertyResolved` `false`

```java
context
base   base   null
property
```
**get**"Type**

```java
public Class<?> getType(ELContext context, Object base, Object property)
```

For a given base and property, attempts to identify the most general type that is acceptable for an object to be passed as the value parameter in a future call to the `setValue(javax.el.ELContext, java.lang.Object, java.lang.Object, java.lang.Object)` method. The result is obtained by querying all component resolvers.

If this resolver handles the given (base, property) pair, the `propertyResolved` property of the `ELContext` object must be set to `true` by the resolver, before returning. If this property is not `true` after this method is called, the caller should ignore the return value.

First, `propertyResolved` is set to `false` on the provided `ELContext`.

Next, for each component resolver in this composite:

1. The `getType()` method is called, passing in the provided context, base and property.
2. If the `ELContext`'s `propertyResolved` flag is `false` then iteration continues.
3. Otherwise, iteration stops and no more component resolvers are considered. The value returned by `getType()` is returned by this method.

If none of the component resolvers were able to perform this operation, the value `null` is returned and the `propertyResolved` flag remains set to `false`.
Any exception thrown by component resolvers during the iteration is propagated to the caller of this method.

**Specified by:**
`getType` in class `ELResolver`

**Parameters:**
- `context` - The context of this evaluation.
- `base` - The base object whose property value is to be analyzed, or `null` to analyze a top-level variable.
- `property` - The property or variable to return the acceptable type for.

**Returns:**
If the `propertyResolved` property of `ELContext` was set to `true`, then the most general acceptable type; otherwise undefined.

**Throws:**
- `NullPointerException` - if `context` is `null`
- `PropertyNotFoundException` - if the given (base, property) pair is handled by this `ELResolver` but the specified variable or property does not exist or is not readable.
- `ELException` - if an exception was thrown while performing the property or variable resolution. The thrown exception must be included as the cause property of this exception, if available.

```java
public void setValue(ELContext context, Object base, Object property, Object val)

(base, property) ELContext propertyResolved
true true

ELContext propertyResolved false
```

1. `setValue()` context base property value
2. ELContext propertyResolved false
3. propertyResolved false

context
base base null
property
val

Throws NullPointerException: context null
Throws PropertyNotFoundException: ELResolver (base, property)
Throws PropertyNotWritableException: ELResolver (base, property)
Throws ELException: cause

setValue

public void setValue(ELContext context,
        Object base,
        Object property,
        Object val)

Attempts to set the value of the given property object on the given base object. All component resolvers are asked to attempt to set the value.

If this resolver handles the given (base, property) pair, the propertyResolved property of the ELContext object must be set to true by the resolver, before returning. If this property is not true after this method is called, the caller can safely assume no value has been set.

First, propertyResolved is set to false on the provided ELContext.
Next, for each component resolver in this composite:

1. The `setValue()` method is called, passing in the provided context, base, property and value.
2. If the `ELContext`'s propertyResolved flag is `false` then iteration continues.
3. Otherwise, iteration stops and no more component resolvers are considered.

If none of the component resolvers were able to perform this operation, the propertyResolved flag remains set to `false`.

Any exception thrown by component resolvers during the iteration is propagated to the caller of this method.

**Specified by:**

`setValue` in class `ELResolver`

**Parameters:**
- `context` - The context of this evaluation.
- `base` - The base object whose property value is to be set, or `null` to set a top-level variable.
- `property` - The property or variable to be set.
- `val` - The value to set the property or variable to.

**Throws:**
- `NullPointerException` - if `context` is `null`
- `PropertyNotFoundException` - if the given (base, property) pair is handled by this `ELResolver` but the specified variable or property does not exist.
- `PropertyNotWritableException` - if the given (base, property) pair is handled by this `ELResolver` but the specified variable or property is not writable.
- `ELException` - if an exception was thrown while attempting to set the property or variable. The thrown exception must be included as the cause property of this exception, if available.

```java
public boolean isReadOnly(ELContext context, Object
```
base, Object property)
(base, property) ELContext propertyResolved true true

1. isReadOnly() context base property
2. ELContext propertyResolved false
3. isReadOnly()

false propertyResolved false

context
base base null
property
return ELContext propertyResolved true true false
Throws NullPointerException: context null
Throws PropertyNotFoundException: ELResolver (base, property)
Throws ELException: cause

isReadOnly

public boolean isReadOnly(ELContext context,
Object base,
Object property)

For a given base and property, attempts to determine whether a call to setValue(javax.el.ELContext, java.lang.Object, java.lang.Object) will always fail. The result is
obtained by querying all component resolvers.

If this resolver handles the given (base, property) pair, the propertyResolved property of the ELContext object must be set to true by the resolver, before returning. If this property is not true after this method is called, the caller should ignore the return value.

First, propertyResolved is set to false on the provided ELContext.

Next, for each component resolver in this composite:

1. The isReadOnly() method is called, passing in the provided context, base and property.
2. If the ELContext's propertyResolved flag is false then iteration continues.
3. Otherwise, iteration stops and no more component resolvers are considered. The value returned by isReadOnly() is returned by this method.

If none of the component resolvers were able to perform this operation, the value false is returned and the propertyResolved flag remains set to false.

Any exception thrown by component resolvers during the iteration is propagated to the caller of this method.

Specified by:

isReadOnly in class ELResolver

Parameters:

- context - The context of this evaluation.
- base - The base object whose property value is to be analyzed, or null to analyze a top-level variable.
- property - The property or variable to return the read-only status for.

Returns:

If the propertyResolved property of ELContext was set to true, then true if the property is read-only or false if not; otherwise undefined.
Throws:

- NullPointerException - if context is null
- PropertyNotFoundException - if the given (base, property) pair is handled by this ELResolver but the specified variable or property does not exist.
- ELException - if an exception was thrown while performing the property or variable resolution. The thrown exception must be included as the cause property of this exception, if available.

public java.util.Iterator<E> getFeatureDescriptors(ELContext context, Object base)

Returns information about the set of variables or properties that can be resolved for the given base object. One use for this method is to assist tools in auto-completion. The results are collected from all component resolvers.

The propertyResolved property of the ELContext is not relevant to this method. The results of all ELResolvers are concatenated.
The Iterator returned is an iterator over the collection of FeatureDescriptor objects returned by the iterators returned by each component resolver’s getFeatureDescriptors method. If null is returned by a resolver, it is skipped.

Specified by:

getFeatureDescriptors in class ELResolver

Parameters:

context - The context of this evaluation.
base - The base object whose set of valid properties is to be enumerated, or null to enumerate the set of top-level variables that this resolver can evaluate.

Returns:

An Iterator containing zero or more (possibly infinitely more) FeatureDescriptor objects, or null if this resolver does not handle the given base object or that the results are too complex to represent with this method.

See Also:

FeatureDescriptor

```
public Class<T> getCommonPropertyType(ELContext context, Object base)
    base property
    Class getCommonPropertyType null
        context
        base
        return null
    base
    return ELResolver base null property
    Object.class base property
```

getCommonPropertyType

```
public Class<? super T> getCommonPropertyType(ELContext context, Object base)
```

Returns the most general type that this resolver accepts for the property argument, given a base object. One use for this method is to assist tools in auto-completion. The result is obtained by querying all component resolvers.

The class returned is the most specific class that is a common superclass of all the classes returned by each component resolver's getCommonPropertyType method. If null is returned by a resolver, it is skipped.

**Specified by:**

getCommonPropertyType in class ELResolver

**Parameters:**

- context - The context of this evaluation.
- base - The base object to return the most general property type for, or null to enumerate the set of top-level variables that this resolver can evaluate.

**Returns:**

null if this ELResolver does not know how to handle the given base object; otherwise Object.class if any type of property is accepted; otherwise the most general property type accepted for the given base.
The `Concept` interface is used to represent taxonomy elements and their structural relationship with each other in order to describe an internal taxonomy. Concept instances are used to define tree structures where the root of the tree is a `ClassificationScheme` instance and each node in the tree is a `Concept` instance. Two Concepts may be defined as being equivalent.

Figure 1 shows how Concept instances are used to represent taxonomy elements and their structural relationship with each other in order to describe an internal taxonomy.

### Method Detail

`public String getValue() throws JAXRException`  

Concept

```java
0

return Concept

Throws JAXRException: JAXR
```

`getValue`
String getValue() throws JAXRException

Gets the value (usually a code in a taxonomy) associated with this Concept.

**Capability Level: 0**

**Returns:**
- the value (usually a taxonomy value) associated with this Concept

**Throws:**
- JAXRException - If the JAXR provider encounters an internal error

---

public void setValue(String value) throws JAXRException

Concept

0

value - the value (usually a taxonomy value) associated with this Concept

**Throws:**
- JAXRException: JAXR

---

void setValue(String value) throws JAXRException

Sets the value (usually a taxonomy value) associated with this Concept.

**Capability Level: 0**

**Parameters:**
- value - the value (usually a taxonomy value) associated with this Concept

**Throws:**
public void addChildConcept(Concept concept) throws JAXRException

Adds a child Concept.

Capability Level: 0

Parameters:
concept - the concept being added as a child of this object

Throws:
JAXRException - If the JAXR provider encounters an internal error

public void addChildConcepts(java.util.Collection<E> concepts) throws JAXRException

Concept Collection
Throws JAXRException: JAXR

addChildConcepts

void addChildConcepts(Collection concepts) throws JAXRException

Adds a Collection of Concept children.

Capability Level: 0

Parameters:
    concepts - the Collection of Concepts being added as a children
    of this object

Throws:
    JAXRException - If the JAXR provider encounters an internal
    error

public void removeChildConcept(Concept concept) throws JAXRException

Concept

0

concept Concept

Throws JAXRException: JAXR

removeChildConcept

void removeChildConcept(Concept concept) throws JAXRException

Removes a child Concept.

Capability Level: 0
public void removeChildConcepts(java.util.Collection<E> concepts) throws JAXRException
Concep Collection

0

concepts Concept Collection

Throws JAXRException: JAXR

removeChildConcepts

void removeChildConcepts(Collection concepts)
throws JAXRException

Removes a Collection of children Concepts.

Capability Level: 0

Parameters:
concepts - the Collection of Concepts being removed as children Concepts of this object

Throws:
JAXRException - If the JAXR provider encounters an internal error

public int getChildConceptCount() throws JAXRException
getChildConceptCount

```java
int getChildConceptCount() throws JAXRException
```

Gets number of children.

**Capability Level:** 0

**Returns:**
the number of children Concepts

**Throws:**
*JAXRException* - If the JAXR provider encounters an internal error

-------------------------------

**public java.util.Collection<E> getChildrenConcepts()**

```java
throws JAXRException
```

**Concept**

0

```java
return Concept CollectionCollection null
```

**Throws**
*JAXRException* - JAXR

**See also**
[javax.xml.registry.infomodel.Concept](https://docs.oracle.com/javaee/8/api/javax/xml/registry/infomodel/Concept.html)

getChildrenConcepts

```java
Collection getChildrenConcepts()
```

```java
throws JAXRException
```
Gets all immediate children Concepts.

**Capability Level: 0**

**Returns:**
Collection of Concept instances. The Collection may be empty but not null.

**Throws:**
- `JAXRException` - If the JAXR provider encounters an internal error

**See Also:**
- `Concept`

---

```java
public java.util.Collection<E> getDescendantConcepts()
throws JAXRException
```

```
Concept 0

    return Concept Collection Collection null

Throws  JAXRException: JAXR
See also  java.xml.registry.infomodel.Concept
```

### getDescendantConcepts

**Returns:**
Collection of Concept instances. The Collection may be empty but not null.

**Throws:**
- `JAXRException` - If the JAXR provider encounters an internal error

**See Also:**
- `javax.xml.registry.infomodel.Concept`
public Concept getParentConcept() throws JAXRException
Concept Concept  ClassificationScheme null

0

directed
supplierCardinality 0..1
associates

getParentConcept

Concept getParentConcept() throws JAXRException

Gets the parent Concept or null if parent is a ClassificationScheme.

Capability Level: 0

Returns:
the Concept that is the parent of this object

Throws:
JAXRException - If the JAXR provider encounters an internal error

public ClassificationScheme getClassificationScheme() throws JAXRException
Concept ClassificationScheme
getClassificationScheme

getClassificationScheme():

0

return ClassificationScheme null

Throws

JAXRException: JAXR

label classificationScheme

directed

supplierCardinality 0..1

associates

\{javax.xml.registry.infomodel.ClassificationScheme\}

Concept

public String getPath() throws JAXRException

0

return String

Throws

JAXRException: JAXR

getPath
String getPath() throws JAXRException

Gets the canonical path representation for this Concept.

**Capability Level: 0**

**Returns:**
the canonical path String representing this object

**Throws:**
  JAXRException - If the JAXR provider encounters an internal error

---

public RegistryObject getParent() throws JAXRException

Concept ClassificationScheme

0

    return Concept ClassificationScheme

**Throws**
  JAXRException: JAXR

**getParent**

RegistryObject getParent() throws JAXRException

Gets the parent Concept or ClassificationScheme for this object.

**Capability Level: 0**

**Returns:**
the parent Concept or ClassificationScheme for this object

**Throws:**
  JAXRException - If the JAXR provider encounters an internal error

### Constructor Detail

```java
public ConfigurationException()
    ConfigurationException
```

**ConfigurationException**

```java
public ConfigurationException()
    Creates new ConfigurationException without detail message.
```

```java
public ConfigurationException(String msg)
    ConfigurationException
```

**ConfigurationException**

```java
public ConfigurationException(String msg)
    Constructs an ConfigurationException with the specified detail message.
```
Parameters:

msg - the detail message.

javax.jms.QueueConnection,  
javax.jms.TopicConnection
A `Connection` object is a client's active connection to its JMS provider. It typically allocates provider resources outside the Java virtual machine (JVM).

Connections support concurrent use.

A connection serves several purposes:

- It encapsulates an open connection with a JMS provider. It typically represents an open TCP/IP socket between a client and the service provider software.
- Its creation is where client authentication takes place.
- It can specify a unique client identifier.
- It provides a `ConnectionMetaData` object.
- It supports an optional `ExceptionListener` object.

Because the creation of a connection involves setting up authentication and communication, a connection is a relatively heavyweight object. Most clients will do all their messaging with a single connection. Other more advanced applications may use several connections. The JMS API does not architect a reason for using multiple connections; however, there may be operational reasons for doing so.

A JMS client typically creates a connection, one or more sessions, and a number of message producers and consumers. When a connection is created, it is in stopped mode. That means that no messages are being delivered.

It is typical to leave the connection in stopped mode until setup is complete (that is, until all message consumers have been created). At that point, the client calls the connection's `start` method, and messages begin arriving at the connection's consumers. This setup convention minimizes any client confusion that may result from asynchronous message delivery while the client is still in the process of setting itself up.

A connection can be started immediately, and the setup can be done afterwards. Clients that do this must be prepared to handle asynchronous message delivery while they are still in the process of setting up.

A message producer can send messages while a connection is stopped.

</table>
### void start()
Starts (or restarts) a connection's delivery of incoming messages.

### void stop()
Temporarily stops a connection's delivery of incoming messages.

## Method Detail

**public** [Session](createSession) **createSession**(boolean transacted, int acknowledgeMode) **throws** [JMSException](JMSException)

**Session**

- **transacted**

  - Indicates whether the session is transacted

**acknowledgeMode**

- Session.AUTO_ACKNOWLEDGE
- Session.CLIENT_ACKNOWLEDGE
- Session.DUPS_OK_ACKNOWLEDGE

**return**

**Throws** [JMSException](JMSException): Connection since 1.1

**AUTO_ACKNOWLEDGE, CLIENT_ACKNOWLEDGE, DUPS_OK_ACKNOWLEDGE**

**createSession**

**Session** **createSession**(boolean transacted, int acknowledgeMode) **throws** [JMSException](JMSException)

Creates a Session object.

**Parameters:**

- **transacted** - Indicates whether the session is transacted
- **acknowledgeMode** - Indicates whether the consumer or the client will acknowledge any messages it receives; ignored if the session is transacted. Legal values are
Session.AUTO_ACKNOWLEDGE, Session.CLIENT_ACKNOWLEDGE, and Session.DUPS_OK_ACKNOWLEDGE.

**Returns:**
a newly created session

**Throws:**
*JMSException* - if the Connection object fails to create a session due to some internal error or lack of support for the specific transaction and acknowledgement mode.

**Since:**
1.1

**See Also:**
*Session.AUTO_ACKNOWLEDGE, Session.CLIENT_ACKNOWLEDGE, Session.DUPS_OK_ACKNOWLEDGE*

---

**public String getClientID() throws JMSException**

**JMS** ConnectionFactory setClientID

return

**Throws** *JMSException*: JMS ID

**getClientID**

**String** getClientID() throws JMSException

Gets the client identifier for this connection.

This value is specific to the JMS provider. It is either preconfigured by an administrator in a ConnectionFactory object or assigned dynamically by the application by calling the setClientID method.

**Returns:**
the unique client identifier

**Throws:**
*JMSException* - if the JMS provider fails to return the client ID for
this connection due to some internal error.

```java
public void setClientID(String clientID) throws JMSException {
    JMS ConnectionFactory Connection
    IllegalStateException
    IllegalStateException

    JMS API

    clientId  JMS ID  InvalidClientIDException
    clientId
    Throws  JMSException: JMS ID
    Throws  InvalidClientIDException: JMS ID
    Throws  IllegalStateException: JMS ID

    setClientID

    void setClientID(String clientID)
        throws JMSException

    Sets the client identifier for this connection.

    The preferred way to assign a JMS client's client identifier is for it to be configured in a client-specific ConnectionFactory object and transparently assigned to the Connection object it creates.

    Alternatively, a client can set a connection's client identifier using a provider-specific value. The facility to set a connection's client identifier explicitly is not a mechanism for overriding the identifier that has been administratively configured. It is provided for the case
where no administratively specified identifier exists. If one does exist, an attempt to change it by setting it must throw an `IllegalStateException`. If a client sets the client identifier explicitly, it must do so immediately after it creates the connection and before any other action on the connection is taken. After this point, setting the client identifier is a programming error that should throw an `IllegalStateException`.

The purpose of the client identifier is to associate a connection and its objects with a state maintained on behalf of the client by a provider. The only such state identified by the JMS API is that required to support durable subscriptions.

If another connection with the same `clientID` is already running when this method is called, the JMS provider should detect the duplicate ID and throw an `InvalidClientIDException`.

**Parameters:**
- `clientID` - the unique client identifier

**Throws:**
- `JMSException` - if the JMS provider fails to set the client ID for this connection due to some internal error.
- `InvalidClientIDException` - if the JMS client specifies an invalid or duplicate client ID.
- `IllegalStateException` - if the JMS client attempts to set a connection's client ID at the wrong time or when it has been administratively configured.

```java
public ConnectionMetaData getMetaData() throws JMSException
```

**Throws**
- `JMSException`: JMS

**See also**
- `javax.jms.ConnectionMetaData`
ConnectionMetaData getMetaData() throws JMSException

Gets the metadata for this connection.

**Returns:**
the connection metadata

**Throws:**
JMSException - if the JMS provider fails to get the connection metadata for this connection.

**See Also:**
ConnectionMetaData

public ExceptionListener getExceptionListener() throws JMSException

```
ExceptionListener return
Connection   ExceptionListener   ExceptionListener   null
Throws      JMSException: JMS
```

See also
setExceptionListener

getExceptionListener

ExceptionListener getExceptionListener() throws JMSException

Gets the ExceptionListener object for this connection. Not every Connection has an ExceptionListener associated with it.

**Returns:**
the ExceptionListener for this connection, or null. if no ExceptionListener is associated with this connection.

**Throws:**
JMSException - if the JMS provider fails to get the ExceptionListener for this connection.

**See Also:**
setExceptionListener(javax.jms.ExceptionListener)
public void setExceptionListener(ExceptionListener listener) throws JMSException

JMS ExceptionListener onException
JMSException

ExceptionListener

JMS

/listener

Throws JMSException: JMS

setExceptionListener

void setExceptionListener(ExceptionListener listener)
throws JMSException

Sets an exception listener for this connection.

If a JMS provider detects a serious problem with a connection, it informs the connection's ExceptionListener, if one has been registered. It does this by calling the listener's onException method, passing it a JMSException object describing the problem.

An exception listener allows a client to be notified of a problem asynchronously. Some connections only consume messages, so they would have no other way to learn their connection has failed.

A connection serializes execution of its ExceptionListener.

A JMS provider should attempt to resolve connection problems itself before it notifies the client of them.
Parameters:
   listener - the exception listener

Throws:
   JMSException - if the JMS provider fails to set the exception listener for this connection.

---

public void start() throws JMSException

Starts (or restarts) a connection's delivery of incoming messages. A call to start on a connection that has already been started is ignored.

Throws:
   JMSException - if the JMS provider fails to start message delivery due to some internal error.

See Also:
   stop()
void stop() throws JMSException

Temporarily stops a connection's delivery of incoming messages. Delivery can be restarted using the connection's start method. When the connection is stopped, delivery to all the connection's message consumers is inhibited: synchronous receives block, and messages are not delivered to message listeners.

This call blocks until receives and/or message listeners in progress have completed.

Stopping a connection has no effect on its ability to send messages. A call to stop on a connection that has already been stopped is ignored.

A call to stop must not return until delivery of messages has paused. This means that a client can rely on the fact that none of its message listeners will be called and that all threads of control waiting for receive calls to return will not return with a message until the connection is restarted. The receive timers for a stopped connection continue to advance, so receives may time out while the connection is stopped.

If message listeners are running when stop is invoked, the stop call must wait until all of them have returned before it may return. While these message listeners are completing, they must have the full services of the connection available to them.

Throws:
JMSException - if the JMS provider fails to stop message delivery
due to some internal error.

See Also:

start()

public void close() throws JMSException

JVM

null close JMS

commit rollback

acknowledge IllegalStateException

Throws JMSException: JMS

close

void close() throws JMSException

Closes the connection.

Since a provider typically allocates significant resources outside the JVM on behalf of a connection, clients should close these resources when they are not needed. Relying on garbage collection to eventually reclaim these resources may not be timely enough.

There is no need to close the sessions, producers, and consumers of a closed connection.
Closing a connection causes all temporary destinations to be deleted.

When this method is invoked, it should not return until message processing has been shut down in an orderly fashion. This means that all message listeners that may have been running have returned, and that all pending receives have returned. A close terminates all pending message receives on the connection's sessions' consumers. The receives may return with a message or with null, depending on whether there was a message available at the time of the close. If one or more of the connection's sessions' message listeners is processing a message at the time when connection close is invoked, all the facilities of the connection and its sessions must remain available to those listeners until they return control to the JMS provider.

Closing a connection causes any of its sessions' transactions in progress to be rolled back. In the case where a session's work is coordinated by an external transaction manager, a session's commit and rollback methods are not used and the result of a closed session's work is determined later by the transaction manager.

Closing a connection does NOT force an acknowledgment of client-acknowledged sessions.

Invoking the acknowledge method of a received message from a closed connection's session must throw an IllegalStateException. Closing a closed connection must NOT throw an exception.

Throws:

- JMSException - if the JMS provider fails to close the connection due to some internal error. For example, a failure to release resources or to close a socket connection can cause this exception to be thrown.

```java
public ConnectionConsumer createConnectionConsumer(Destination destination, String messageSelector, ServerSessionPool sessionPool, int
```
maxMessages) throws JMSException
JMS

  destination
messageSelector null
sessionPool
maxMessages
return

Throws JMSException: Connection sessionPool
messageSelector

Throws InvalidDestinationException:

Throws InvalidSelectorException:
since 1.1
See also javax.jms.ConnectionConsumer

createConnectionConsumer

ConnectionConsumer createConnectionConsumer(Destination destination,
String messageSelector,
ServerSessionPool sessionPool,
int maxMessages)
throws JMSException

Creates a connection consumer for this connection (optional operation). This is an expert facility not used by regular JMS clients.

Parameters:
  destination - the destination to access
messageSelector - only messages with properties matching the message selector expression are delivered. A value of null or an empty string indicates that there is no message selector for the message consumer.
sessionPool - the server session pool to associate with this connection consumer
maxMessages - the maximum number of messages that can be assigned to a server session at one time

Returns:
  the connection consumer
Throws:

- `JMSException` - if the `Connection` object fails to create a connection consumer due to some internal error or invalid arguments for `sessionPool` and `messageSelector`.
- `InvalidDestinationException` - if an invalid destination is specified.
- `InvalidSelectorException` - if the message selector is invalid.

Since: 1.1

See Also:

- `ConnectionConsumer`

```java
public ConnectionConsumer createDurableConnectionConsumer(Topic topic, String subscriptionName, String messageSelector, ServerSessionPool sessionPool, int maxMessages) throws JMSException
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>topic</code></td>
<td>JMS topic</td>
</tr>
<tr>
<td><code>subscriptionName</code></td>
<td>String</td>
</tr>
<tr>
<td><code>messageSelector</code></td>
<td>null</td>
</tr>
<tr>
<td><code>sessionPool</code></td>
<td>ServerSessionPool</td>
</tr>
<tr>
<td><code>maxMessages</code></td>
<td>int</td>
</tr>
</tbody>
</table>

Returns

`ConnectionConsumer`

Throws

- `JMSException`: Connection, `sessionPool`, `messageSelector`.
- `InvalidDestinationException`.
- `InvalidSelectorException`.

Since: 1.1

See also

- `javax.jms.ConnectionConsumer`
Create a durable connection consumer for this connection (optional operation). This is an expert facility not used by regular JMS clients.

Parameters:
- topic - topic to access
- subscriptionName - durable subscription name
- messageSelector - only messages with properties matching the message selector expression are delivered. A value of null or an empty string indicates that there is no message selector for the message consumer.
- sessionPool - the server session pool to associate with this durable connection consumer
- maxMessages - the maximum number of messages that can be assigned to a server session at one time

Returns:
- the durable connection consumer

Throws:
- JMSException - if the Connection object fails to create a connection consumer due to some internal error or invalid arguments for sessionPool and messageSelector.
- InvalidDestinationException - if an invalid destination is specified.
- InvalidSelectorException - if the message selector is invalid.

Since:
- 1.1

See Also:
- ConnectionConsumer
to license terms.

PS:
A Connection represents an application-level handle that is used by a client to access the underlying physical connection. The actual physical connection associated with a Connection instance is represented by a ManagedConnection instance.

A client gets a Connection instance by using the `getConnection` method on a `ConnectionFactory` instance. A connection can be associated with zero or more `Interaction` instances.

**Version:**
0.8

**Author:**
Rahul Sharma

**See Also:**
`ConnectionFactory`, `Interaction`

### Method Summary

</tr>
</thead>
<tbody>
<tr>
<td><code>close()</code></td>
<td>void</td>
<td>Initiates close of the connection handle at the application level.</td>
</tr>
</tbody>
</table>
**Method Detail**

```java
public Interaction createInteraction() throws ResourceException
```

<table>
<thead>
<tr>
<th>Public Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>createInteraction()</strong></td>
<td>Creates an Interaction associated with this Connection. <strong>Interaction</strong> throws <strong>ResourceException</strong>: Interaction</td>
</tr>
<tr>
<td><strong>getLocalTransaction()</strong></td>
<td>Returns an LocalTransaction instance that enables a component to demarcate resource manager local transactions on the Connection.</td>
</tr>
<tr>
<td><strong>getMetaData()</strong></td>
<td>Gets the information on the underlying EIS instance represented through an active connection.</td>
</tr>
<tr>
<td><strong>getResultSetInfo()</strong></td>
<td>Gets the information on the ResultSet functionality supported by a connected EIS instance.</td>
</tr>
</tbody>
</table>

**createInteraction**

- **Interaction createInteraction()**
- **throws** **ResourceException**

Creates an Interaction associated with this Connection. An Interaction enables an application to execute EIS functions.

**Returns:**
- Interaction instance

**Throws:**
- **ResourceException** - Failed to create an Interaction
public `LocalTransaction` `getLocalTransaction()` throws `ResourceException`

Returns an `LocalTransaction` instance that enables a component to demarcate resource manager local transactions on the `Connection`. If a resource adapter does not allow a component to demarcate local transactions on a `Connection` using `LocalTransaction` interface, then the method `getLocalTransaction` should throw a `NotSupportedException`.

**Returns:**
- `LocalTransaction` instance

**Throws:**
- `ResourceException` - Failed to return a `LocalTransaction` instance because of a resource adapter error
- `NotSupportedException` - Demarcation of Resource manager local transactions is not supported on this `Connection`

**See Also:**
- `LocalTransaction`

public `ConnectionMetaData` `getMetaData()` throws `ResourceException`
getMetaData

ConnectionMetaData getMetaData()
throws ResourceException

Gets the information on the underlying EIS instance represented through an active connection.

Returns:
ConnectionMetaData instance representing information about the EIS instance

Throws:
ResourceException - Failed to get information about the connected EIS instance. Error can be resource adapter-internal, EIS-specific or communication related.

public ResultSetInfo getResultSetInfo() throws ResourceException

EIS ResultSet

return ResultSetInfo
Threws ResourceException: ResultSet

Throws NotSupportedException: ResultSet

getResultSetInfo

ResultSetInfo getResultSetInfo()
throws ResourceException

Gets the information on the ResultSet functionality supported by a connected EIS instance.
public void close() throws ResourceException

EIS

ResourceException:

close

Initiates close of the connection handle at the application level. A client should not use a closed connection to interact with an EIS.

Throws:

ResourceException - Exception thrown if close on a connection handle fails.

Any invalid connection close invocation--example, calling close on a connection handle that is already closed--should also throw this exception.

Resources:

Returns:
ResultSetInfo instance

Throws:
ResourceException - Failed to get ResultSet related information
NotSupportedException - ResultSet functionality is not supported
PS:

</tbody>
</table>
communication with JAXR provider or not.

```java
void setCredentials(Set credentials)
Sets the Credentials associated with this client.
```

```java
void setSynchronous(boolean sync)
Sets whether the client uses synchronous communication or not.
```

## Method Detail

```java
public RegistryService getRegistryService() throws JAXRException
Connection RegistryService Connection
getRegistryService Connection
RegistryService
```

```java
return RegistryService
Throws JAXRException: JAXR associates
<RegistryService>
See also javax.xml.registry.RegistryService
```

### getRegistryService

```java
RegistryService getRegistryService()
throws JAXRException
```

Gets the RegistryService interface associated with the Connection. If a Connection property (e.g. credentials) is set after the client calls `getRegistryService` then the newly set Connection property is visible to the RegistryService previously returned by this call.

**Capability Level: 0**
Returns:
the RegistryService associated with this object

 Throws:
  JAXRException - If the JAXR provider encounters an internal error

 See Also:
  RegistryService

---

public void close() throws JAXRException

Connection  Connection  JVM

0

Throws
  JAXRException: JAXR

close

void close()
  throws JAXRException

Closes a Connection when it is no longer needed. Since a provider typically allocates significant resources outside the JVM on behalf of a Connection, clients should close them when they are not needed.

Capability Level: 0

Throws:
  JAXRException - If the JAXR provider encounters an internal error

---

public boolean isClosed() throws JAXRException

Connection

0
**isClosed**

```java
boolean isClosed() throws JAXRException
```

Indicated whether this Connection has been closed or not.

**Capability Level:** 0

**Returns:**
true if Connection is closed; false otherwise

**Throws:**
JAXRException - If the JAXR provider encounters an internal error

---

**public boolean isSynchronous() throws JAXRException**

JAXR JAXR JAXR

```java
0
```

**return**
Connection
ture false

**Throws**
JAXRException: JAXR

---

**isSynchronous**

```java
boolean isSynchronous() throws JAXRException
```

Indicates whether a client uses synchronous communication with JAXR provider or not. A JAXR provider must support both modes of communication. A JAXR client can choose which mode it wants to use.
Capability Level: 0

Returns:
true if Connection is synchronous (default); false otherwise

Throws:
JAXRException - If the JAXR provider encounters an internal error

public void setSynchronous(boolean sync) throws JAXRException
JAXR
0

sync Connection true false

Throws JAXRException: JAXR

setSynchronous

void setSynchronous(boolean sync)
throws JAXRException

Sets whether the client uses synchronous communication or not. A JAXR client may dynamically change its communication style preference.

Capability Level: 0

Parameters:
sync - true if Connection is desired to be synchronous; false otherwise

Throws:
JAXRException - If the JAXR provider encounters an internal error
public void setCredentials(java.util.Set<E> credentials)
throws JAXRException
Credential JAXR JAXR

0

credentials java.lang.Object Collection
Throws JAXRException: JAXR

setCredentials

void setCredentials(Set credentials)
throws JAXRException

Sets the Credentials associated with this client. The credentials is used to authenticate the client with the JAXR provider. A JAXR client may dynamically change its identity by changing the credentials associated with it.

Capability Level: 0

Parameters:
  credentials - a Collection of java.lang.Objects which provide identity related information for the caller.

Throws:
  JAXRException - If the JAXR provider encounters an internal error

public java.util.Set<E> getCredentials() throws JAXRException

0

return java.lang.Object SetCollection null
getCredentials

Set getCredentials() throws JAXRException

Gets the credentials associated with this client.

Capability Level: 0

Returns:
Set of java.lang.Object instances. The Collection may be empty but not null.

Throws:
JAXRException - If the JAXR provider encounters an internal error
javax.mail.event  **Class ConnectionAdapter**

java.lang.Object  
  ```
  - javax.mail.event.ConnectionAdapter
  ```

**All Implemented Interfaces:**
  
  [EventListener](https://docs.oracle.com/en/java/javase/11/docs/api/java.desktop/javax/mail/event/EventListener.html),  
  [ConnectionListener](https://docs.oracle.com/en/java/javase/11/docs/api/java.desktop/javax/mail/event/ConnectionListener.html)

---

```
public abstract class ConnectionAdapter
extends Object
implements ConnectionListener
```

**Implements:**  
  [ConnectionListener](https://docs.oracle.com/en/java/javase/11/docs/api/java.desktop/javax/mail/event/ConnectionListener.html)

---

The adapter which receives connection events. The methods in this class are empty; this class is provided as a convenience for easily creating listeners by extending this class and overriding only the methods of interest.

closed

public void closed(ConnectionEvent e)

Description copied from interface: ConnectionListener
Invoked when a Store/Folder/Transport is closed.

Specified by:
   closed in interface ConnectionListener
public interface ConnectionConsumer

Connection	ConnectionConsumer	Destination
ConnectionConsumer	ServerSessionPool

ConnectionConsumer	ServerSession
ConnectionConsumer	ServerSession

For application servers, Connection objects provide a special facility for creating a ConnectionConsumer (optional). The messages it is to consume are specified by a Destination and a message selector. In addition, a ConnectionConsumer must be given a ServerSessionPool to use for processing its messages.

Normally, when traffic is light, a ConnectionConsumer gets a ServerSession from its pool, loads it with a single message, and starts it. As traffic picks up, messages can back up. If this happens, a ConnectionConsumer can load each ServerSession with more than one message. This reduces the thread context switches and minimizes resource use at the expense of some serialization of message processing.

Method Detail

public ServerSessionPool getServerSessionPool() throws JMSException

return

Throws JMSException: JMS

g.getServerSessionPool

ServerSessionPool g.getServerSessionPool() throws JMSException
Gets the server session pool associated with this connection consumer.

**Returns:**
the server session pool used by this connection consumer

**Throws:**
- `JMSException` - if the JMS provider fails to get the server session pool associated with this consumer due to some internal error.

```java
public void close() throws JMSException
```

**Java**

throws `JMSException`: JMS

**close**

```java
void close() throws JMSException
```

Closes the connection consumer.

Since a provider may allocate some resources on behalf of a connection consumer outside the Java virtual machine, clients should close these resources when they are not needed. Relying on garbage collection to eventually reclaim these resources may not be timely enough.

**Throws:**
- `JMSException` - if the JMS provider fails to release resources on behalf of the connection consumer or fails to close the connection consumer.

version 0.5
See also javax.resource.spi.ConnectionEventListener

The ConnectionEvent class provides information about the source of a connection related event. A ConnectionEvent instance contains the following information:
- Type of the connection event
- ManagedConnection instance that generated the connection event. A ManagedConnection instance is returned from the method ConnectionEvent.getSource.
- Connection handle associated with the ManagedConnection instance; required for the CONNECTION_CLOSED event and optional for the other event types.
- Optionally, an exception indicating the connection related error. Note that exception is used for CONNECTION_ERROR_OCCURRED.

This class defines following types of event notifications:

- CONNECTION_CLOSED
- LOCAL_TRANSACTION_STARTED
- LOCAL_TRANSACTION_COMMITTED
- LOCAL_TRANSACTION_ROLLED_BACK
- CONNECTION_ERROR_OCCURRED

ConnectionEvent

public ConnectionEvent(ManagedConnection source, int eid)

Construct a ConnectionEvent object. Exception defaults to null.

Parameters:

source - ManagedConnection that is the source of the event
eid - type of the Connection event

ConnectionEvent

public ConnectionEvent(ManagedConnection source, int eid, Exception exception)

ConnectionEvent

public ConnectionEvent(ManagedConnection source, int eid, Exception exception)

Construct a ConnectionEvent object.
Parameters:
  source - ManagedConnection that is the source of the event
  exception - exception about to be thrown to the application
  eid - type of the Connection event

Method Detail

public Object getConnectionHandle()
ManagedConnection CONNECTION_CLOSED

    return null

getConnectionHandle

public Object getConnectionHandle()

    Get the connection handle associated with the Managed Connection instance. Used for CONNECTION_CLOSED event.

    Returns:
    the connection handle. May be null

public void setConnectionHandle(Object connectionHandle)
    CONNECTION_CLOSED

setConnectionHandle

public void setConnectionHandle(Object connectionHandle)

    Set the connection handle. Used for CONNECTION_CLOSED event
public Exception getException()
    null
    return

getException

public Exception getException()

    Get the exception. May be null.

    Returns:
    the exception about to be thrown.

FRAMES    NO FRAMES
DETAIL: FIELD | CONSTRUCTOR | METHOD
The `ConnectionEventListener` interface provides an event callback mechanism to enable an application server to receive notifications from a `ManagedConnection` instance.

An application server uses these event notifications to manage its connection pool, to clean up any invalid or terminated connections and to manage local transactions.

An application server implements the `ConnectionEventListener` interface. It registers a connection listener with a `ManagedConnection` instance by using `ManagedConnection.addConnectionEventListener` method.

**Version:**

0.5

</tbody>
</table>

Method Detail

```java
public void connectionClosed(ConnectionEvent event)

ManagedConnection
ConnectionEventListener.connectionClosed
ManagedConnection

event
```
connectionClosed

```java
void connectionClosed(ConnectionEvent event)
```

Notifies that an application component has closed the connection.

A ManagedConnection instance notifies its registered set of listeners by calling `ConnectionEventListener.connectionClosed` method when an application component closes a connection handle. The application server uses this connection close event to put the ManagedConnection instance back in to the connection pool.

**Parameters:**

- **event** - event object describing the source of the event

---

public void localTransactionStarted(ConnectionEvent event)

```java
ManagedConnection event
```

localTransactionStarted

```java
void localTransactionStarted(ConnectionEvent event)
```

Notifies that a Resource Manager Local Transaction was started on the ManagedConnection instance.

**Parameters:**

- **event** - event object describing the source of the event

---

public void localTransactionCommitted(ConnectionEvent event)

```java
ManagedConnection event
```

**localTransactionCommitted**

```java
void localTransactionCommitted(ConnectionEvent event)
```

Notifies that a Resource Manager Local Transaction was committed on the ManagedConnection instance.
**localTransactionCommitted**

```java
void localTransactionCommitted(ConnectionEvent event)
```

Notifies that a Resource Manager Local Transaction was committed on the ManagedConnection instance.

**Parameters:**
- `event` - event object describing the source of the event

---

**public void localTransactionRolledback(ConnectionEvent event)**

ManagedConnection

```java
void localTransactionRolledback(ConnectionEvent event)
```

Notifies that a Resource Manager Local Transaction was rolled back on the ManagedConnection instance.

**Parameters:**
- `event` - event object describing the source of the event

---

**public void connectionErrorOccurred(ConnectionEvent event)**

ManagedConnection

```java
ConnectionEventListener.connectionErrorOccurred
```

```java
connectionErrorOccurred
```

```java
ManagedConnection
```

```java
ManagedConnection.destroy
```

```java
event
```
connectionErrorOccurred

void connectionErrorOccurred(ConnectionEvent event)

Notifies a connection related error. The ManagedConnection instance calls the method ConnectionEventListener.connectionErrorOccurred to notify its registered listeners of the occurrence of a physical connection-related error. The event notification happens just before a resource adapter throws an exception to the application component using the connection handle. The connectionErrorOccurred method indicates that the associated ManagedConnection instance is now invalid and unusable. The application server handles the connection error event notification by initiating application server-specific cleanup (for example, removing ManagedConnection instance from the connection pool) and then calling ManagedConnection.destroy method to destroy the physical connection.

Parameters:
  
  event - event object describing the source of the event
javax.jms Interface ConnectionFactory

JNDI API

Java

version 1.1 - February 1, 2002

See also javax.jms.Connection, javax.jms.QueueConnectionFactory, javax.jms.TopicConnectionFactory
A `ConnectionFactory` object encapsulates a set of connection configuration parameters that has been defined by an administrator. A client uses it to create a connection with a JMS provider.

A `ConnectionFactory` object is a JMS administered object and supports concurrent use.

JMS administered objects are objects containing configuration information that are created by an administrator and later used by JMS clients. They make it practical to administer the JMS API in the enterprise.

Although the interfaces for administered objects do not explicitly depend on the Java Naming and Directory Interface (JNDI) API, the JMS API establishes the convention that JMS clients find administered objects by looking them up in a JNDI namespace.

An administrator can place an administered object anywhere in a namespace. The JMS API does not define a naming policy.

It is expected that JMS providers will provide the tools an administrator needs to create and configure administered objects in a JNDI namespace. JMS provider implementations of administered objects should be both `javax.jndi.Referenceable` and `java.io.Serializable` so that they can be stored in all JNDI naming contexts. In addition, it is recommended that these implementations follow the JavaBeans™ design patterns.

This strategy provides several benefits:

- It hides provider-specific details from JMS clients.
- It abstracts administrative information into objects in the Java programming language ("Java objects") that are easily organized and administered from a common management console.
- Since there will be JNDI providers for all popular naming services, this means that JMS providers can deliver one implementation of administered objects that will run everywhere.
An administered object should not hold on to any remote resources. Its lookup should not use remote resources other than those used by the JNDI API itself.

Clients should think of administered objects as local Java objects. Looking them up should not have any hidden side effects or use surprising amounts of local resources.

<td>Connection createConnection()</td>
<td>Creates a connection with the default user identity.</td>
</tr>
<tr>
<td>Connection createConnection(String userName, String password)</td>
<td>Creates a connection with the specified user identity.</td>
</tr>
</tbody>
</table>

---

### Method Detail

```java
public Connection createConnection() throws JMSException
```

    return Connection.state

    @Override
    throws JMSException
```

createConnection
Connection createConnection() throws JMSException

Creates a connection with the default user identity. The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called.

Returns:
a newly created connection

Throws:

JMSException - if the JMS provider fails to create the connection due to some internal error.
JMSSecurityException - if client authentication fails due to an invalid user name or password.

Since: 1.1

public Connection createConnection(String userName, String password) throws JMSException

userName
password
return

Throws JMSException: JMS

Throws JMSSecurityException:

since 1.1

createConnection

Connection createConnection(String userName, String password) throws JMSException

Creates a connection with the specified user identity. The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called.
**Parameters:**
- `userName` - the caller's user name
- `password` - the caller's password

**Returns:**
a newly created connection

**Throws:**
- `JMSException` - if the JMS provider fails to create the connection due to some internal error.
- `JMSSecurityException` - if client authentication fails due to an invalid user name or password.

**Since:**
1.1

Implements: java.io.Serializable, Referenceable

ConnectionFactory  EIS ConnectionFactory

JNDI  ConnectionFactory  EIS

ConnectionFactory  java.io.Serializable
javax.resource.Referenceable  JNDI

version 0.8
See javax.resource.cci.Connection,
also javax.resource.Referenceable

ConnectionFactory provides an interface for getting connection to an EIS instance. An implementation of ConnectionFactory interface is provided by a resource adapter.

Application code looks up a ConnectionFactory instance from JNDI namespace and uses it to get EIS connections.

An implementation class for ConnectionFactory is required to implement java.io.Serializable and javax.resource.Referenceable interfaces to support JNDI registration.

### Method Detail

```java
public Connection getConnection() throws ResourceException

EIS EIS getConnection

return Connection

ResourceException: EIS

- ManagedConnectionFactory —
- ...

Throws
- EIS —EIS
- ...
```
getConnection

Connection getConnection() throws ResourceException

Gets a connection to an EIS instance. This getConnection variant should be used when a component wants the container to manage EIS sign-on. This case is termed container-managed sign-on. The component does not pass any security information.

Returns:
Connection instance

Throws:
ResourceException - Failed to get a connection to the EIS instance. Examples of error cases are:
- Invalid configuration of ManagedConnectionFactory--example: invalid server name
- Application server-internal error--example: connection pool related error
- Communication error
- EIS-specific error--example: EIS not active
- Resource adapter-internal error
- Security related error; example: invalid user
- Failure to allocate system resources

public Connection getConnection(ConnectionSpec properties) throws ResourceException
EIS javax.resource.cci.ConnectionSpec getConnection ConnectionSpec

getConnection EIS
EIS ManagedConnectionFactory
getConnection

Get a connection to an EIS instance. A component should use the getConnection variant with javax.resource.cci.ConnectionSpec parameter, if it needs to pass any resource adapter specific security information and connection parameters. In the component-managed sign-on case, an application component passes security information (example: username, password) through the ConnectionSpec instance.

It is important to note that the properties passed through the getConnection method should be client-specific (example: username, password, language) and not related to the configuration of a target EIS instance (example: port number, server name). The ManagedConnectionFactory instance is configured with complete set of properties required for the creation of a connection to an EIS instance.

**Parameters:**

- properties - Connection parameters and security information

See also [javax.resource.cci.ConnectionSpec](https://docs.oracle.com/en/java/javase/11/docs/api/jdk.xml/javax/resource/cdi/ConnectionSpec.html)
specified as ConnectionSpec instance

**Returns:**
Connection instance

**Throws:**
- `ResourceException` - Failed to get a connection to the EIS instance. Examples of error cases are:
  - Invalid specification of input parameters
  - Invalid configuration of ManagedConnectionFactory--example: invalid server name
  - Application server-internal error--example: connection pool related error
  - Communication error
  - EIS-specific error--example: EIS not active
  - Resource adapter-internal error
  - Security related error; example: invalid user
  - Failure to allocate system resources

**See Also:**
- `ConnectionSpec`

---

```java
public RecordFactory getRecordFactory() throws ResourceException
```

**RecordFactory**  
**Record**

**return**  
RecordFactory RecordFactory

**Throws**  
- `ResourceException`: RecordFactory

**Throws**  
- `NotSupportedException`:

---

**getRecordFactory**

```java
RecordFactory getRecordFactory() throws ResourceException
```

Gets a RecordFactory instance. The RecordFactory is used for the creation of generic Record instances.

**Returns:**
RecordFactory RecordFactory instance
public ResourceAdapterMetaData getMetaData() throws ResourceException

getMetaData

ResourceAdapterMetaData getMetaData() throws ResourceException

Gets metadata for the Resource Adapter. Note that the metadata information is about the ResourceAdapter and not the EIS instance. An invocation of this method does not require that an active connection to an EIS instance should have been established.

Returns:
ResourceAdapterMetaData instance

Throws:
ResourceException - Failed to get metadata information about the resource adapter
PS:
javax.xml.registry Class ConnectionFactory

java.lang.Object
   \ javax.xml.registry.ConnectionFactory

public abstract class ConnectionFactory
extends Object

JAXR JAXR ConnectionFactory
JNDI API  ConnectionFactory

JAXR ConnectionFactory  Java Naming and Directory Interface (JNDI) API ConnectionFactory  JNDI API ConnectionFactory  ConnectionFactory  ConnectionFactory
JNDI API  ConnectionFactory

JAXR API  JAXR ConnectionFactory  JNDI API  JAXR API
ConnectionFactory  newInstance  newInstance  JAXR
ConnectionFactory  javax.xml.registry.ConnectionFactoryClass
newInstance  JAXR  ConnectionFactory

See also  javax.xml.registry.Connection

This is the abstract base class for factory classes for creating a JAXR connection. A JAXR ConnectionFactory object is configured in a provider-specific way to create connections with registry providers.
Looking Up a ConnectionFactory Using the JNDI API

The preferred way for a client to look up a JAXR ConnectionFactory is within the Java Naming and Directory Interface™ (JNDI) API. A ConnectionFactory object is registered with a naming service in a provider specific way, such as one based on the JNDI API. This registration associates the ConnectionFactory object with a logical name. When an application wants to establish a connection with the provider associated with that ConnectionFactory object, it does a lookup, providing the logical name. The application can then use the ConnectionFactory object that is returned to create a connection to the messaging provider.
Looking Up a ConnectionFactory Without Using the JNDI API

The JAXR API provides an alternative way to look up a JAXR ConnectionFactory that does not require the use of the JNDI API. This is done using the newInstance static method on the abstract class ConnectionFactory provided in the JAXR API. The newInstance method returns a JAXR ConnectionFactory. The client may indicate which factory class should be instantiated by the newInstance method by defining the system property javax.xml.registry.ConnectionFactoryClass. If this property is not set, the JAXR provider must return a default ConnectionFactory instance.

properties JAXR
Throws JAXRException: JAXR

setProperties

public abstract void setProperties(Properties properties) throws JAXRException

Sets the Properties used during createConnection and createFederatedConnection calls.

Standard Connection Properties:
javax.xml.registry.queryManagerURL - URL String for the query manager service within the target registry provider
javax.xml.registry.lifeCycleManagerURL - URL String for the life cycle manager service within the target registry provider. If unspecified, must default to value of the queryManagerURL described above
javax.xml.registry.semanticEquivalences - String that allows specification of semantic equivalences
javax.xml.registry.security.authenticationMethod - string that provides a hint to the JAXR provider on the authentication method to be used when authenticating with the registry provider. Possible value include but are not limited to "UDDI_GET_AUTHTOKEN", "HTTP_BASIC", "CLIENT_CERTIFICATE", "MS_PASSPORT"
javax.xml.registry.uddi.maxRows - integer that specifies the maximum number of rows to be returned for find operations. This property is specific for UDDI providers
javax.xml.registry.postalAddressScheme - String that specifies
the id of a ClassificationScheme that is used as the default postal address scheme for this connection

**Capability Level:** 0

**Parameters:**
- **properties** - configuration properties that are either specified by JAXR specification or are provider specific.

**Throws:**
- [JAXRException](#) - If the JAXR provider encounters an internal error

---

```java
abstract public java.util.Properties getProperties() throws JAXRException
createConnection  createFederatedConnection

0

return

Throws               JAXRException:  JAXR
```

**getProperties**

```java
public abstract Properties getProperties() throws JAXRException
```

Gets the Properties used during createConnection and createFederatedConnection calls.

**Capability Level:** 0

**Returns:**
- the Properties defined for this object

**Throws:**
- [JAXRException](#) - If the JAXR provider encounters an internal error

label creates

associates <{Connection}>

createConnection

public abstract Connection createConnection() throws JAXRException

Create a named connection. Such a connection can be used to communicate with a JAXR provider.

Capability Level: 0

Returns:
the Connection created by this call

Throws:
JAXRException - If the JAXR provider encounters an internal error

abstract public FederatedConnection createFederatedConnection(java.util.Collection<E> connections) throws JAXRException

FederatedConnection
### createFederatedConnection

```java
public abstract FederatedConnection createFederatedConnection(Collection<Connection> connections) throws JAXRException;
```

Create a FederatedConnection.

**Capability Level: 0 (optional)**

**Parameters:**
- `connections`: Is a Collection of Connection objects. Note that Connection objects may also be FederatedConnection objects.

**Returns:**
- the FederatedConnection created by this call

**Throws:**
- `JAXRException`: If the JAXR provider encounters an internal error

---

### newInstance

```java
public static ConnectionFactory newInstance() throws JAXRException
```

```java
ConnectionFactory return
```

```java
Throws JAXRException: JAXR
```
newInstance

public static ConnectionFactory newInstance() throws JAXRException

Creates a default ConnectionFactory object.

Returns:
a new instance of a ConnectionFactory

Throws:
JAXRException - If the JAXR provider encounters an internal error

</tr>
<tr>
<td>void <strong>opened</strong> <em>(ConnectionEvent e)</em></td>
<td>Invoked when a Store/Folder/Transport is opened.</td>
</tr>
</tbody>
</table>

Method Detail
public void opened(\texttt{ConnectionEvent} e) 
\textit{Store/Folder/Transport}

\textbf{opened} 

\texttt{void opened(\texttt{ConnectionEvent} e)}

Invoked when a Store/Folder/Transport is opened.

\textbf{public void disconnected(\texttt{ConnectionEvent} e) 
\textit{Store}}

\textbf{disconnected} 

\texttt{void disconnected(\texttt{ConnectionEvent} e)}

Invoked when a Store is disconnected. Note that a folder cannot be disconnected, so a folder will not fire this event.

\textbf{public void closed(\texttt{ConnectionEvent} e) 
\textit{Store/Folder/Transport}}

\textbf{closed} 

\texttt{void closed(\texttt{ConnectionEvent} e)}

Invoked when a Store/Folder/Transport is closed.
javax.resource.spi  Interface ConnectionManager

All Superinterfaces:
   Serializable

public interface ConnectionManager
extends Serializable

Implements: java.io.Serializable

ConnectionManager
ConnectionManager
ConnectionManager  (QoS) - /
EIS
ManagedConnectionFactory
ConnectionManager  java.io.Serializable
ConnectionManager  ConnectionManager
QOS

since 0.6
See also javax.resource.spi.ManagedConnectionFactory

ConnectionManager interface provides a hook for the resource adapter to pass a connection request to the application server.

An application server provides implementation of the ConnectionManager interface. This implementation is not specific to any particular type of the resource adapter or connection factory interface.
The ConnectionManager implementation delegates to the application server to enable latter to provide quality of services (QoS) - security, connection pool management, transaction management and error logging/tracing.

An application server implements these services in a generic manner, independent of any resource adapter and EIS specific mechanisms. The connector architecture does not specify how an application server implements these services; the implementation is specific to an application server.

After an application server hooks-in its services, the connection request gets delegated to a ManagedConnectionFactory instance either for the creation of a new physical connection or for the matching of an already existing physical connection.

An implementation class for ConnectionManager interface is required to implement the java.io.Serializable interface.

In the non-managed application scenario, the ConnectionManager implementation class can be provided either by a resource adapter (as a default ConnectionManager implementation) or by application developers. In both cases, QOS can be provided as components by third party vendors.

Since: 0.6
Author: Rahul Sharma

<table>
<thead>
<tr>
<th>Method Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>allocateConnection(ManagedConnectionFactory mcf, ConnectionRequestInfo cxRequestInfo)</td>
</tr>
<tr>
<td>The method allocateConnection gets called by the resource adapter's connection factory instance.</td>
</tr>
</tbody>
</table>
The method allocateConnection gets called by the resource adapter’s connection factory instance. This lets connection factory instance (provided by the resource adapter) pass a connection request to the ConnectionManager instance.

The connectionRequestInfo parameter represents information
specific to the resource adapter for handling of the connection request.

**Parameters:**
- `mcf` - used by application server to delegate connection matching/creation
- `cxRequestInfo` - connection request Information

**Returns:**
connection handle with an EIS specific connection interface.

**Throws:**
- `ResourceException` - Generic exception
- `ApplicationServerInternalException` - Application server specific exception
- `SecurityException` - Security related error
- `ResourceAllocationException` - Failed to allocate system resources for connection request
- `ResourceAdapterInternalException` - Resource adapter related error condition
javax.jms Interface ConnectionMetaData

public interface ConnectionMetaData

ConnectionMetaData Connection

version 1.0 - 13 March 1998

A ConnectionMetaData object provides information describing the Connection object.

Version:
1.0 - 13 March 1998
Author:
Mark Hapner, Rich Burridge

Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
public String getProviderVersion() throws JMSException

Gets the JMS provider version.

Method Detail

public String getJMSVersion() throws JMSException

JMS API

    return JMS API

    Throws JMSException: JMS

getJMSVersion

String getJMSVersion()

Throws JMSException

Gets the JMS API version.

Returns: the JMS API version

Throws: JMSException - if the JMS provider fails to retrieve the metadata due to some internal error.

public int getJMSMajorVersion() throws JMSException

JMS

    return JMS API

    Throws JMSException: JMS

getJMSMajorVersion

int getJMSMajorVersion()

Throws JMSException
Gets the JMS major version number.

Returns:  
the JMS API major version number

Throws:  
JMSException - if the JMS provider fails to retrieve the metadata due to some internal error.

```
public int getJMSMinorVersion() throws JMSException

return JMS API

Throws JMSException: JMS
```

getJMSMinorVersion

int getJMSMinorVersion() throws JMSException

Gets the JMS minor version number.

Returns:  
the JMS API minor version number

Throws:  
JMSException - if the JMS provider fails to retrieve the metadata due to some internal error.

```
public String getJMSProviderName() throws JMSException

return JMS

Throws JMSException: JMS
```

getJMSProviderName

String getJMSProviderName()
Throws: `JMSException` - if the JMS provider fails to retrieve the metadata due to some internal error.

```java
public String getProviderVersion() throws JMSException
```

getProviderVersion

```java
public int getProviderMajorVersion() throws JMSException
```

getProviderMajorVersion
int getProviderMajorVersion() throws JMSException

Gets the JMS provider major version number.

**Returns:**
the JMS provider major version number

**Throws:**
JMSException - if the JMS provider fails to retrieve the metadata
due to some internal error.

---

public int getProviderMinorVersion() throws JMSException

JMS

return JMS

**Throws**
JMSException: JMS

---

getProviderMinorVersion

int getProviderMinorVersion() throws JMSException

Gets the JMS provider minor version number.

**Returns:**
the JMS provider minor version number

**Throws:**
JMSException - if the JMS provider fails to retrieve the metadata
due to some internal error.

---

public java.util Enumeration<E> getJMSXPropertyNames() throws JMSException

JMSX

return JMSX

**Throws**
JMSException: JMS
getJMSXPropertyNames

Enumeration getJMSXPropertyNames() throws JMSException

Gets an enumeration of the JMSX property names.

Returns:
   an Enumeration of JMSX property names

Throws:
   JMSException - if the JMS provider fails to retrieve the metadata
due to some internal error.

PS:
public interface ConnectionMetaData

ConnectionMetaData Connection EIS
Connection.getMetaData ConnectionMetaData

version 0.8
See javax.resource.cci.Connection,
also javax.resource.cci.ResultSetInfo

The interface ConnectionMetaData provides information about an EIS instance connected through a Connection instance. A component calls the method Connection.getMetaData to get a ConnectionMetaData instance.

Version:
0.8
Author:
Rahul Sharma
See Also:
Connection, ResultSetInfo

Method Summary

<table>
<thead>
<tr>
<th>String</th>
<th>getEISProductName()</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns product name of the underlying EIS instance connected through the Connection that produced this metadata.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>String</th>
<th>getEISProductVersion()</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns product version of the underlying EIS instance.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>String</th>
<th>getUserName()</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns the user name for an active connection as known to the underlying EIS instance.</td>
<td></td>
</tr>
</tbody>
</table>
public String getEISProductName() throws ResourceException

Connection EIS

    return EIS

Throws ResourceException: EIS

getEISProductName

String getEISProductName() throws ResourceException

    Returns product name of the underlying EIS instance connected through the Connection that produced this metadata.

    Returns:
    Product name of the EIS instance

    Throws:
    ResourceException - Failed to get the information for the EIS instance

public String getEISProductVersion() throws ResourceException

EIS

    return EIS

Throws ResourceException: EIS

getEISProductVersion

String getEISProductVersion() throws ResourceException

    Returns product name of the underlying EIS instance connected through the Connection that produced this metadata.

    Returns:
    Product name of the EIS instance

    Throws:
    ResourceException - Failed to get the information for the EIS instance
Returns product version of the underlying EIS instance.

**Returns:**

Product version of an EIS instance.

**Throws:**

ResourceException - Failed to get the information for the EIS instance

---

public String getUserName() throws ResourceException

```java
EIS EIS
return
```

**Throws**

ResourceException: EIS

---

### getUserName

**String** getUserName()

```java
throws ResourceException
```

Returns the user name for an active connection as known to the underlying EIS instance. The name corresponds the resource principal under whose security context a connection to the EIS instance has been established.

**Returns:**

String representing the user name

**Throws:**

ResourceException - Failed to get the information for the EIS instance
PS:
javax.resource.spi Interface ConnectionRequestInfo

public interface ConnectionRequestInfo

ConnectionRequestInfo

ID match/createManagedConnection

ConnectionRequestInfo ManagedConnectionFactory
match/createManagedConnection

version 0.8

See javax.resource.spi.ManagedConnectionFactory,
also javax.resource.spi.ManagedConnection

The ConnectionRequestInfo interface enables a resource adapter to pass its own request specific data structure across the connection request flow. A resource adapter extends the empty interface to supports its own data structures for connection request.

A typical use allows a resource adapter to handle application component specified per-connection request properties (example - client ID, language). The application server passes these properties back across to match/createManagedConnection calls on the resource adapter. These properties remain opaque to the application server during the connection request flow.

Once the ConnectionRequestInfo reaches match/createManagedConnection methods on the ManagedConnectionFactory instance, resource adapter uses this additional per-request information to do connection creation and matching.

Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean equals(Object other)</td>
<td>Checks whether this instance is equal to another.</td>
</tr>
<tr>
<td>int hashCode()</td>
<td>Returns the hashCode of the ConnectionRequestInfo.</td>
</tr>
</tbody>
</table>

Method Detail

public boolean equals(Object other)

connectionRequestInfo

    return true

equals

boolean equals(Object other)

Checks whether this instance is equal to another. Since connectionRequestInfo is defined specific to a resource adapter, the resource adapter is required to implement this method. The conditions for equality are specific to the resource adapter.

Overrides:

equals in class Object

Returns:

True if the two instances are equal.
public int hashCode()
ConnectionRequestInfo

return

hashCode

int hashCode()

Returns the hashCode of the ConnectionRequestInfo.

Overrides:
hashCode in class Object

Returns:
hashCode of this instance

PS:
public interface ConnectionSpec

ConnectionSpec  ConnectionFactory.getConnection

ConnectionSpec  JavaBean  ConnectionSpec

CCI  ConnectionSpec  ConnectionSpec  EIS

See also  javax.resource.cci.ConnectionFactory

ConnectionSpec is used by an application component to pass connection request-specific properties to the ConnectionFactory. getConnection method.

It is recommended that the ConnectionSpec interface be implemented as a JavaBean to support tools. The properties on the ConnectionSpec implementation class must be defined through the getter and setter methods pattern.

The CCI specification defines a set of standard properties for an ConnectionSpec. The properties are defined either on a derived interface or an implementation class of an empty ConnectionSpec interface. In addition, a resource adapter may define additional properties specific to its underlying EIS.

**Constructor Detail**

**public ContentDisposition()**

ContentDisposition

**public ContentDisposition()**

No-arg Constructor.
public ContentDisposition(String disposition, ParameterList list)

Constructor.

Parameters:
- disposition - disposition
- list - ParameterList

Since:
JavaMail 1.2

public ContentDisposition(String s) throws ParseException

Throws
- ParseException:

Since
JavaMail 1.2

Constructor that takes a ContentDisposition string. The String is
parsed into its constituents: disposition and parameters. A ParseException is thrown if the parse fails.

**Parameters:**

s - the ContentDisposition string.

**Throws:**

ParseException - if the parse fails.

**Since:**

JavaMail 1.2

### Method Detail

#### public String getDisposition()

```java
definition
return disposition
since JavaMail 1.2
```

**getDisposition**

public String getDisposition()

Return the disposition value.

**Returns:**

the disposition

**Since:**

JavaMail 1.2

#### public String getParameter(String name)

```java
null
return
since JavaMail 1.2
```

```java
null
return
since JavaMail 1.2
```
getParameter

public String getParameter(String name)

Return the specified parameter value. Returns null if this parameter is absent.

Retruns:
parameter value

Since:
JavaMail 1.2

getParameterList

public ParameterList getParameterList()

ParameterList null

return ParameterList

since JavaMail 1.2

getParameterList

public ParameterList getParameterList()

Return a ParameterList object that holds all the available parameters. Returns null if no parameters are available.

Returns:
ParameterList

Since:
JavaMail 1.2

disposition

public void setDisposition(String disposition)

disposition disposition

since JavaMail 1.2
**setDisposition**

public void **setDisposition** (String disposition)

Set the disposition. Replaces the existing disposition.

**Parameters:**

disposition - the disposition

**Since:**

JavaMail 1.2

---

**public void setParameter(String name, String value)**

name
value
since
JavaMail 1.2

**setParameter**

public void **setParameter** (String name, String value)

Set the specified parameter. If this parameter already exists, it is replaced by this new value.

**Parameters:**

name - parameter name
value - parameter value

**Since:**

JavaMail 1.2

---

**public void setParameterList(ParameterList list)**

ParameterList

list

**ParameterList**
setParameterList

public void setParameterList(ParameterList list)

Set a new ParameterList.

Parameters:
  list - ParameterList

Since:
    JavaMail 1.2

public String toString()

ContentDisposition RFC2045

return RFC2045

since JavaMail 1.2

toString

public String toString()

Retrieve a RFC2045 style string representation of this ContentDisposition. Returns null if the conversion failed.

Overrides:
  toString in class Object

Returns:
  RFC2045 style string

Since:
  JavaMail 1.2

public ContentType(String s) throws ParseException

Content-Type String primaryTypesubType
ParseException
    s  Content-Type
Throws

ParseException:

**ContentType**

```java
public ContentType(String s) throws ParseException

Constructor that takes a Content-Type string. The String is parsed into its constituents: primaryType, subType and parameters. A ParseException is thrown if the parse fails.

**Parameters:**

  s - the Content-Type string.

**Throws:**

  ParseException - if the parse fails.
```

### Method Detail

**public String getPrimaryType()**

```java
return

getPrimaryType
```

**Returns:**

  the primary type

**public String getSubType()**

```java
subType

return
```
**getSubType**

```java
public String getSubType()
```

Return the subType.

**Returns:**
the subType

---

**public String getBaseType()**

```java
MIME primaryType'/' secondaryType
return
```

**getBaseType**

```java
public String getBaseType()
```

Return the MIME type string, without the parameters. The returned value is basically the concatenation of the primaryType, the '/*' character and the secondaryType.

**Returns:**
the type

---

**public String getParameter(String name)**

```java
null
return
```

**getParameter**

```java
public String getParameter(String name)
```
Return the specified parameter value. Returns null if this parameter is absent.

**Returns:**
- parameter value

```java
public ParameterList getParameterList()
ParameterList null
                   return ParameterList
```

getParameterList

```java
public ParameterList getParameterList()
```

Return a ParameterList object that holds all the available parameters. Returns null if no parameters are available.

**Returns:**
- ParameterList

```java
public void setPrimaryType(String primaryType)
```

```java
primaryType
```

setPrimaryType

```java
public void setPrimaryType(String primaryType)
```

Set the primary type. Overrides existing primary type.

**Parameters:**
- primaryType - primary type
public void setSubType(String subType)
subType subType

setSubType

public void setSubType(String subType)

Set the subType. Replaces the existing subType.

Parameters:

subType - the subType

public void setParameter(String name, String value)

setParameter

public void setParameter(String name, String value)

Set the specified parameter. If this parameter already exists, it is replaced by this new value.

Parameters:

name - parameter name
value - parameter value

public void setParameterList(ParameterList list)

setParameterList

public void setParameterList(ParameterList list)
**setParameterList**

```java
public void setParameterList(ParameterList list)

Set a new ParameterList.

**Parameters:**

- list - ParameterList
```

**toString**

```java
public String toString()

Content-Type  RFC2045

return  RFC2045

toString
```

**toString**

```java
public String toString()

Retrieve a RFC2045 style string representation of this Content-Type. Returns null if the conversion failed.

**Overrides:**

toString in class Object

**Returns:**

RFC2045 style string
```

**match**

```java
public boolean match(ContentType cType)

ContentType primaryType  subType

ContentType charset=foobar"  "text/plain"  "text/plain;

true  subtype  

ContentType  "text/plain"  "text/*"  true

ContentType  cType  ContentType
```
public boolean match(ContentType cType)

Match with the specified ContentType object. This method compares only the primaryType and subType. The parameters of both operands are ignored.

For example, this method will return true when comparing the ContentTypes for "text/plain" and "text/plain; charset=foobar". If the subType of either operand is the special character '*', then the subtype is ignored during the match. For example, this method will return true when comparing the ContentTypes for "text/plain" and "text/*"

Parameters:

cType - ContentType to compare this against

---

public boolean match(String s)

Match with the specified content-type string. This method compares only the primaryType and subType. The parameters of both operands are ignored.

contentType primaryType subType
"text/plain" true "text/plain; charset=foobar" subType *
"text/plain" "text/*" true

match

public boolean match(String s)
For example, this method will return true when comparing the ContentType for "text/plain" with "text/plain; charset=foobar". If the subtype of either operand is the special character ",", then the subtype is ignored during the match. For example, this method will return true when comparing the ContentType for "text/plain" with "text/*".
javax.faces.component Interface ContextCallback

public interface ContextCallback

UIComponent facet

A simple callback interface that enables taking action on a specific UIComponent (either facet or child) in the view while preserving any contextual state for that component instance in the view.

### Method Summary

<table>
<thead>
<tr>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>void invokeContextCallback(FacesContext context, UIComponent target)</code></td>
</tr>
</tbody>
</table>

This method will be called by an implementation of `UIComponent.invokeOnComponent(javax.faces.context.FacesContext, java.lang.String, javax.faces.component.ContextCallback)` and must be passed the component with the clientId given as an argument to `invokeOnComponent`.

### Method Detail

```
public void invokeContextCallback(FacesContext context, UIComponent target)
```

```java
UIComponent#invokeOnComponent
clientId
invokeOnComponent

context

FacesContext

clientId

UIComponent

clientId
```
invokeContextCallback

void invokeContextCallback(FacesContext context, UIComponent target)

This method will be called by an implementation of
UIComponent.invokeOnComponent(javax.faces.context.FacesContext,
java.lang.String, javax.faces.component.ContextCallback) and
must be passed the component with the clientId given as an
argument to invokeOnComponent. At the point in time when this
method is called, the argument target is guaranteed to be in the
proper state with respect to its ancestors in the View.

Parameters:
context - the FacesContext for this request.
target - the UIComponent that was located by clientId by a call
to UIComponent.invokeOnComponent(javax.faces.context.FacesConte

javax.faces.convert Interface Converter

All Known Implementing Classes:

- BigDecimalConverter
- BigIntegerConverter
- BooleanConverter
- ByteConverter
- CharacterConverter
- DateTimeConverter
- DoubleConverter
- EnumConverter
- FloatConverter
- IntegerConverter
- LongConverter
- NumberConverter
- ShortConverter

---

```java
public interface Converter

Implemented by: BigDecimalConverter, BigIntegerConverter, BooleanConverter, ByteConverter, CharacterConverter, DateTimeConverter, DoubleConverter, EnumConverter, FloatConverter, IntegerConverter, LongConverter, NumberConverter, ShortConverter

Converter String Object-to-String String-to-Object Java

<table>
<thead>
<tr>
<th>Converter</th>
<th>Converter</th>
<th>StateHolder</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.2</td>
<td>Class</td>
<td>Class</td>
</tr>
<tr>
<td>Java</td>
<td>java.util.Locale</td>
<td>FacesContext</td>
</tr>
<tr>
<td>javax.faces.componentUIViewRoot</td>
<td>Locale</td>
<td>Converter</td>
</tr>
</tbody>
</table>

Converter is an interface describing a Java class that can perform Object-to-String and String-to-Object conversions between model data objects and a String representation of those objects that is suitable for rendering.

Converter implementations must have a zero-arguments public constructor. In addition, if the Converter class wishes to have configuration property values saved and restored with the component tree, the implementation must also implement StateHolder.
Starting with version 1.2 of the specification, an exception to the above zero-arguments constructor requirement has been introduced. If a converter has a single argument constructor that takes a class instance and the class of the data to be converted is known at converter instantiation time, this constructor must be used to instantiate the converter instead of the zero-argument version. This enables the per-class conversion of Java enumerated types.

If any Converter implementation requires a java.util.Locale to perform its job, it must obtain that Locale from the UIViewRoot of the current FacesContext, unless the Converter maintains its own Locale as part of its state.

---

**Method Summary**

<table>
<thead>
<tr>
<th>Method</th>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Object</strong></td>
<td><code>getAsObject(FacesContext context, UIComponent component, String value)</code></td>

<tr>
<td><strong>String</strong></td>
<td><code>getAsString(FacesContext context, UIComponent component, Object value)</code></td>
<td>Convert the specified model object value, which is associated with the specified UIComponent, into a String that is suitable for being included in the response generated during the Render Response phase of the request processing lifecycle.</td>
</tr>
</tbody>
</table>

---

**Method Detail**

```java
public Object getAsObject(FacesContext context, UIComponent component, String value)
```

UIComponent
getAsObject

**Object** getAsObject(FacesContext context, UIComponent component, String value)

Convert the specified string value, which is associated with the specified UIComponent, into a model data object that is appropriate for being stored during the Apply Request Values phase of the request processing lifecycle.

**Parameters:**
- **context** - FacesContext for the request being processed
- **component** - UIComponent with which this model object value is associated
- **value** - String value to be converted (may be null)

**Returns:**
- null if the value to convert is null, otherwise the result of the conversion

**Throws:**
- ConverterException - if conversion cannot be successfully performed
- NullPointerException - if context or component is null

---

public String getAsString(FacesContext context, UIComponent component, Object value)

UIComponent
getAsString

String getAsString(FacesContext context, UIComponent component, Object value)

Convert the specified model object value, which is associated with the specified UIComponent, into a String that is suitable for being included in the response generated during the Render Response phase of the request processing lifecycle.

Parameters:
- context - FacesContext for the request being processed
- component - UIComponent with which this model object value is associated
- value - Model object value to be converted (may be null)

Returns:
a zero-length String if value is null, otherwise the result of the conversion

Throws:
- ConverterException - if conversion cannot be successfully performed
- NullPointerException - if context or component is null
to license terms.

PREV CLASS  NEXT CLASS  FRAMES NO FRAMES
SUMMARY: NESTED  FIELD  CONSTR  METHOD  DETAIL: FIELD  CONSTR  METHOD
public abstract class ConverterELTag
extends TagSupport

Extends: TagSupport

ConverterELTag is a base class for all JSP custom actions that create and register a Converter instance on the ValueHolder associated with our most immediate surrounding instance of a tag whose implementation class is a subclass of UICOMPONENTCLASSICTAGBASE. To avoid creating duplicate instances when a page is redisplayed, creation and registration of a Converter occurs only if the corresponding UICOMPONENT was created (by the owning UICOMPONENTTAG) during the execution of the current page.

This class may be used as a base class for tag instances that support
specific Converter subclasses.

Subclasses of this class must implement the createConverter() method, which creates and returns a Converter instance. Any configuration properties that specify behavior of this Converter must have been set by the createConverter() method. Generally, this occurs by copying corresponding attribute values on the tag instance.

This tag creates no output to the page currently being created. It is used solely for the side effect of Converter creation.

deprecated  ConverterELTag  #createConverter

public class ConverterTag
extends TagSupport

ConverterTag is a base class for all JSP custom actions that create and register a Converter instance on the ValueHolder associated with our most immediate surrounding instance of a tag whose implementation
class is a subclass of UIComponentTag. To avoid creating duplicate instances when a page is redisplayed, creation and registration of a Converter occurs only if the corresponding UIComponent was created (by the owning UIComponentTag) during the execution of the current page.

This class may be used directly to implement a generic converter registration tag (based on the converter-id specified by the converterId attribute), or as a base class for tag instances that support specific Converter subclasses. This converterId attribute must refer to one of the well known converter-ids, or a custom converter-id as defined in a faces-config.xml file.

Subclasses of this class must implement the createConverter() method, which creates and returns a Converter instance. Any configuration properties that specify behavior of this Converter must have been set by the createConverter() method. Generally, this occurs by copying corresponding attribute values on the tag instance.

This tag creates no output to the page currently being created. It is used solely for the side effect of Converter creation.

PS:
javax.servlet.http  **Class Cookie**

java.lang.Object  
   \_ javax.servlet.http.Cookie

**All Implemented Interfaces:**  
  Cloneable

```java
public class Cookie
extends Object
implements Cloneable

Implements: Cloneable
```

cookie  servlet  Web  cookie  cookie

cookie  Web  bug  servlet

servlet  HttpServletResponse#addCookie  cookie  HTTP
cookie  Web  20  cookie  300  cookie  cookie
4 KB

HTTP  cookie  servlet  HttpServletResponse#getCookies
cookie  cookie

cookie  Web  HTTP 1.0  cookie  HTTP 1.1

0  Netscape  1  RFC 2109  cookie  cookie
0

Creates a cookie, a small amount of information sent by a servlet to a Web browser, saved by the browser, and later sent back to the server. A cookie's value can uniquely identify a client, so cookies are commonly used for session management.
A cookie has a name, a single value, and optional attributes such as a comment, path and domain qualifiers, a maximum age, and a version number. Some Web browsers have bugs in how they handle the optional attributes, so use them sparingly to improve the interoperability of your servlets.

The servlet sends cookies to the browser by using the `HttpServletResponse.addCookie(javax.servlet.http.Cookie)` method, which adds fields to HTTP response headers to send cookies to the browser, one at a time. The browser is expected to support 20 cookies for each Web server, 300 cookies total, and may limit cookie size to 4 KB each.

The browser returns cookies to the servlet by adding fields to HTTP request headers. Cookies can be retrieved from a request by using the `HttpServletRequest.getCookies()` method. Several cookies might have the same name but different path attributes.

Cookies affect the caching of the Web pages that use them. HTTP 1.0 does not cache pages that use cookies created with this class. This class does not support the cache control defined with HTTP 1.1.

This class supports both the Version 0 (by Netscape) and Version 1 (by RFC 2109) cookie specifications. By default, cookies are created using Version 0 to ensure the best interoperability.

**Throws**

IllegalArgumentException: cookie cookie

**See also**

setValue, setVersion

---

## Cookie

**public Cookie(String name, String value)**
Constructs a cookie with a specified name and value.

The name must conform to RFC 2109. That means it can contain only ASCII alphanumeric characters and cannot contain commas, semicolons, or white space or begin with a $ character. The cookie’s name cannot be changed after creation.

The value can be anything the server chooses to send. Its value is probably of interest only to the server. The cookie’s value can be changed after creation with the `setValue` method.

By default, cookies are created according to the Netscape cookie specification. The version can be changed with the `setVersion` method.

**Parameters:**
- `name` - a `String` specifying the name of the cookie
- `value` - a `String` specifying the value of the cookie

**Throws:**
- `IllegalArgumentException` - if the cookie name contains illegal characters (for example, a comma, space, or semicolon) or it is one of the tokens reserved for use by the cookie protocol

**See Also:**
- `setValue(java.lang.String)`, `setVersion(int)`

### Method Detail

**public void setComment(String purpose)**

```java
cookie  cookieNetscape Version 0 cookie

    purpose  String
See also  getComment
```

### setComment

**public void setComment(String purpose)**
Specifies a comment that describes a cookie's purpose. The comment is useful if the browser presents the cookie to the user. Comments are not supported by Netscape Version 0 cookies.

**Parameters:**
- *purpose* - a String specifying the comment to display to the user

**See Also:**
- `getComment()`

```java
public String getComment()

cookie
cookie

null

return

String
null

setComment
```

**getComment**

```java
public String getComment()

Returns the comment describing the purpose of this cookie, or null if the cookie has no comment.

**Returns:**
- a String containing the comment, or null if none

**See Also:**
- `setComment(java.lang.String)`

```java
public void setDomain(String pattern)

RFC 2109 ( .foo.com) Domain Name System
DNS www.foo.com a.b.foo.com cookie cookie

pattern

cookie

String RFC 2109

See also
getDomain
```
setDomain

public void setDomain(String pattern)

Specifies the domain within which this cookie should be presented.

The form of the domain name is specified by RFC 2109. A domain name begins with a dot (\.foo.com) and means that the cookie is visible to servers in a specified Domain Name System (DNS) zone (for example, www.foo.com, but not a.b.foo.com). By default, cookies are only returned to the server that sent them.

Parameters:

pattern - a String containing the domain name within which this cookie is visible; form is according to RFC 2109

See Also:

getDomain()

---

getDomain

public String getDomain()

return String

See also setDomain

---

getDomain

public String getDomain()

Returns the domain name set for this cookie. The form of the domain name is set by RFC 2109.

Returns:

a String containing the domain name

See Also:

setDomain(java.lang.String)
public void setMaxAge(int expiry)

Sets the maximum age of the cookie in seconds.

A positive value indicates that the cookie will expire after that many seconds have passed. Note that the value is the *maximum* age when the cookie will expire, not the cookie's current age.

A negative value means that the cookie is not stored persistently and will be deleted when the Web browser exits. A zero value causes the cookie to be deleted.

**Parameters:**
expiry - an integer specifying the maximum age of the cookie in seconds; if negative, means the cookie is not stored; if zero, deletes the cookie

**See Also:**
getMaxAge()

---

public int getMaxAge()

return -1

See also setMaxAge
**getMaxAge**

```java
def public int getMaxAge()
```

Returns the maximum age of the cookie, specified in seconds. By default, -1 indicating the cookie will persist until browser shutdown.

**Returns:**
an integer specifying the maximum age of the cookie in seconds; if negative, means the cookie persists until browser shutdown

**See Also:**
`setMaxAge(int)`

---

**public void setPath(String uri)**

```java
def public void setPath(String uri)
```

Specifies a path for the cookie to which the client should return the cookie.

The cookie is visible to all the pages in the directory you specify, and all the pages in that directory's subdirectories. A cookie's path must include the servlet that set the cookie, for example, `/catalog`, which makes the cookie visible to all directories on the server under
Consult RFC 2109 (available on the Internet) for more information on setting path names for cookies.

**Parameters:**
- `uri` - a `String` specifying a path

**See Also:**
- `getPath()`

---

### getPath

```java
public String getPath() {
    return servletString;
}
```

**getPath**

public `String` `getPath()`

Returns the path on the server to which the browser returns this cookie. The cookie is visible to all subpaths on the server.

**Returns:**
- a `String` specifying a path that contains a servlet name, for example, `/catalog`

**See Also:**
- `setPath(java.lang.String)`

---

### setSecure(boolean flag)

**setSecure**

public `void` `setSecure(boolean flag)`

false

**See also**
- `getSecure()`
setSecure

```java
public void setSecure(boolean flag)
```

Indicates to the browser whether the cookie should only be sent using a secure protocol, such as HTTPS or SSL.

The default value is `false`.

**Parameters:**
- `flag` - if `true`, sends the cookie from the browser to the server only when using a secure protocol; if `false`, sent on any protocol

**See Also:**
- `getSecure()`

---

getSecure

```java
public boolean getSecure()
```

 Returns `true` if the browser is sending cookies only over a secure protocol, or `false` if the browser can send cookies using any protocol.

**Returns:**
- `true` if the browser uses a secure protocol; otherwise, `true`

**See Also:**
- `setSecure(boolean)`

---

getName

```java
public String getName()
```
### getName

```java
public String getName()
```

Returns the name of the cookie. The name cannot be changed after creation.

**Returns:**
- a `String` specifying the cookie's name

### setValue

```java
public void setValue(String newValue)
```

Assigns a new value to a cookie after the cookie is created. If you use a binary value, you may want to use BASE64 encoding.

With Version 0 cookies, values should not contain white space, brackets, parentheses, equals signs, commas, double quotes, slashes, question marks, at signs, colons, and semicolons. Empty values may not behave the same way on all browsers.

**Parameters:**
- `newValue` - a `String` specifying the new value
public String getValue()

    cookie

    return

See also

    setValue, java.servlet.http.Cookie

getValue

public String getValue()

    Returns the value of the cookie.

    Returns:
    
    a String containing the cookie's present value

    See Also:
    
    setValue(java.lang.String), Cookie

public int getVersion()

    cookie 1 RFC 2109 0 Netscape cookie cookie cookie

    return  cookie Netscape 0 cookie RFC 2109 1

See also

    setVersion

getVersion

public int getVersion()

    Returns the version of the protocol this cookie complies with. Version 1 complies with RFC 2109, and version 0 complies with the original cookie specification drafted by Netscape. Cookies provided by a browser use and identify the browser's cookie version.
Returns:
0 if the cookie complies with the original Netscape specification;
1 if the cookie complies with RFC 2109

See Also:
setVersion(int)

---

`public void setVersion(int v)`

cookie  cookie  0 Netscape cookie  1
RFC 2109

RFC 2109  1

v  cookie  Netscape  0 cookie  RFC 2109

See also  getVersion

---

**setVersion**

`public void setVersion(int v)`

Sets the version of the cookie protocol this cookie complies with. Version 0 complies with the original Netscape cookie specification. Version 1 complies with RFC 2109.

Since RFC 2109 is still somewhat new, consider version 1 as experimental; do not use it yet on production sites.

**Parameters:**

v - 0 if the cookie should comply with the original Netscape specification; 1 if the cookie should comply with RFC 2109

**See Also:**
getVersion()
public Object clone()

Overrides the standard java.lang.Object.clone method to return a copy of this cookie.

Overrides:

clone in class Object
javax.management.j2ee.statistics  

**Interface CountStatistic**

All Superinterfaces:  
  [Statistic](#)

```java
public interface CountStatistic
extends Statistic

Implements: Statistic
```

Specifies standard count measurements.

### Method Detail

`public long getCount()`

**getCount**
long `getCount()`

The count since the last reset.
javax.ejb  **Class CreateException**

**java.lang.Object**
- **java.lang.Throwable**
  - **java.lang.Exception**
    - **javax.ejb.CreateException**

**All Implemented Interfaces:**
- **Serializable**

**Direct Known Subclasses:**
- **DuplicateKeyException**

```java
public class CreateException
    extends Exception

Extends: Throwable > Exception
Extended by: DuplicateKeyException

Bean home throws CreateException

EJB
```

The CreateException exception must be included in the throws clauses of all create methods defined in an enterprise Bean's home interface.

This exception is used as a standard application-level exception to report a failure to create an EJB object.

**See Also:**
- **Serialized Form**

---

**Constructor Summary**
CreateException()
Constructs a CreateException with no detail message.

CreateException(String message)
Constructs a CreateException with the specified detail message.

**Method Summary**

public CreateException()
CreateException

CreateException

public CreateException()

    Constructs a CreateException with no detail message.
public CreateException(String message)

Constructs a CreateException with the specified detail message.
javax.activation Interface DataContentHandler

public interface DataContentHandler

DataContentHandler Transferable DataHandler
DataContentHandler

DataContentHandler DataHandler DataHandler
DataContentHandlerFactory MIME DataContentHandler
DataHandler DataContentHandler then

The DataContentHandler interface is implemented by objects that can be used to extend the capabilities of the DataHandler's implementation of the Transferable interface. Through DataContentHandlers the framework can be extended to convert streams in to objects, and to write objects to streams.

Applications don't generally call the methods in DataContentHandlers directly. Instead, an application calls the equivalent methods in DataHandler. The DataHandler will attempt to find an appropriate DataContentHandler that corresponds to its MIME type using the current DataContentHandlerFactory. The DataHandler then calls through to the methods in the DataContentHandler.

<table>

</tr>
</tbody>
</table>
getTransferDataFlavors()  
Returns an array of DataFlavor objects indicating the flavors the data can be provided in.

writeTo(Object obj, String mimeType, OutputStream os) 
Convert the object to a byte stream of the specified MIME type and write it to the output stream.

Method Detail

public java.awt.datatransfer.DataFlavor[]
getTransferDataFlavors()

DataFlavor flavor

return DataFlavor

getTransferDataFlavors

DataFlavor[] getTransferDataFlavors()

Returns an array of DataFlavor objects indicating the flavors the data can be provided in. The array should be ordered according to preference for providing the data (from most richly descriptive to least descriptive).

Returns:
The DataFlavors.

public Object
getTransferData(java.awt.datatransfer.DataFlavor df, DataSource ds) throws java.awt.datatransfer.UnsupportedFlavorException, java.io.IOException

flavor

df DataFlavor
getTransferData

Object getTransferData(DataFlavor df, DataSource ds)
throws UnsupportedFlavorException,
IOException

Returns an object which represents the data to be transferred. The class of the object returned is defined by the representation class of the flavor.

Parameters:
  df - The DataFlavor representing the requested type.
  ds - The DataSource representing the data to be converted.

Returns:
The constructed Object.

Throws:
  UnsupportedFlavorException - if the handler doesn't support the requested flavor
  IOException - if the data can't be accessed

public Object getContent(DataSource ds) throws java.io.IOException

getContent
Object getContent(DataSource ds) throws IOException

Return an object representing the data in its most preferred form. Generally this will be the form described by the first DataFlavor returned by the getTransferDataFlavors method.

Parameters:
  ds - The DataSource representing the data to be converted.

Returns:
The constructed Object.

Throws:
  IOException - if the data can't be accessed

public void writeTo(Object obj, String mimeType, java.io.OutputStream os) throws java.io.IOException

Convert the object to a byte stream of the specified MIME type and write it to the output stream.

Parameters:
  obj - The object to be converted.
  mimeType - The requested MIME type of the resulting byte stream.
  os - The output stream into which to write the converted byte
stream.

**Throws:**

`IOException` - errors writing to the stream

PS:
javax.activation Interface DataContentHandlerFactory

public interface DataContentHandlerFactory

DataContentHandler MIME ContentHandler
java.net.URL ContentHandler

This interface defines a factory for DataContentHandlers. An implementation of this interface should map a MIME type into an instance of DataContentHandler. The design pattern for classes implementing this interface is the same as for the ContentHandler mechanism used in java.net.URL.

Method Summary

<table>
<thead>

All Implemented Interfaces:
   Transferable

public class DataHandler
extends Object
implements Transferable

Implements: java.awt.datatransfer.Transferable

DataHandler DataContentHandler CommandMap

DataHandler Transferable

DataHandler Transferable AWT Transferable
DataContentHandler DataContentHandler DataHandler
MIME

DataHandler CommandMap

DataHandler CommandMap
getCommand getAllCommands getPreferredCommands setCommandMap

URL DataHandler URLDataSource

See also
javax.activation.CommandMap,
javax.activation.DataContentHandler,
javax.activation.DataSource,
javax.activation.URLDataSource
The DataHandler class provides a consistent interface to data available in many different sources and formats. It manages simple stream to string conversions and related operations using DataContentHandlers. It provides access to commands that can operate on the data. The commands are found using a CommandMap.

**DataHandler and the Transferable Interface**

DataHandler implements the Transferable interface so that data can be used in AWT data transfer operations, such as cut and paste and drag and drop. The implementation of the Transferable interface relies on the availability of an installed DataContentHandler object corresponding to the MIME type of the data represented in the specific instance of the DataHandler.

**DataHandler and CommandMaps**

The DataHandler keeps track of the current CommandMap that it uses to service requests for commands (getCommand, getAllCommands, getPreferredCommands). Each instance of a DataHandler may have a CommandMap associated with it using the setCommandMap method. If a CommandMap was not set, DataHandler calls the getDefaultCommandMap method in CommandMap and uses the value it returns. See CommandMap for more information.

**DataHandler and URLs**

The current DataHandler implementation creates a private instance of URLDataSource when it is constructed with a URL.

**See Also:**

CommandMap, DataContentHandler, DataSource, URLDataSource

---

**Constructor Summary**

DataHandler(Source ds)

Create a DataHandler instance referencing the specified
**DataSource.**

**DataHandler**(*Object* obj, *String* mimeType)

Create a DataHandler instance representing an object of this MIME type.

**DataHandler**(*URL* url)

Create a DataHandler instance referencing a URL.

### Methods inherited from class java.lang.Object

- `clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`  

### Constructor Detail

#### public DataHandler(DataSource ds)

**DataSource**

**DataHandler**

**InputStream**

Create a DataHandler instance referencing the specified DataSource. The data exists in a byte stream form. The DataSource will provide an InputStream to access the data.

**Parameters:**

- `ds` - the DataSource
public DataHandler(Object obj, String mimeType)

Create a DataHandler instance representing an object of this MIME type. This constructor is used when the application already has an in-memory representation of the data in the form of a Java Object.

Parameters:
- obj - the Java Object
- mimeType - the MIME type of the object

public DataHandler(java.net.URL url)

Create a DataHandler instance referencing a URL. The DataHandler internally creates a URLDataSource instance to represent the URL.

Parameters:
- url - a URL object
### Method Detail

**public DataSource getDataSource()**

```
DataHandler DataSource

DataSource DataHandler DataHandler
DataSource DataHandler DataHandler
DataSource DataSource DataHandler DataHandler

return DataHandler DataSource
```

**getDataSource**

```
public DataSource getDataSource()

Return the DataSource associated with this instance of DataHandler.

For DataHandlers that have been instantiated with a DataSource, this method returns the DataSource that was used to create the DataHandler object. In other cases the DataHandler constructs a DataSource from the data used to construct the DataHandler. DataSources created for DataHandlers not instantiated with a DataSource are cached for performance reasons.

Returns:

a valid DataSource object for this DataHandler
```

**public String getName()**

```
DataHandler DataSource
null

return
```
**getName**

```java
public String getName()
```

Return the name of the data object. If this DataHandler was created with a DataSource, this method calls through to the DataSource.getName method, otherwise it returns `null`.

**Returns:**
the name of the object

---

**public String getContentType()**

```java
MIME
return
```

**getContentType**

```java
public String getContentType()
```

Return the MIME type of this object as retrieved from the source object. Note that this is the full type with parameters.

**Returns:**
the MIME type

---

**public java.io.InputStream getInputStream() throws java.io.IOException**

```java
InputSteam
```

**DataSource DataHandler DataHandler**

```java
DataSource.getInputStream
```

**Object DataHandler DataHandler Object**

**DataContentHandler DataHandler MIME**
getInputStream

public <pre>InputStream</pre> getInputStream()<br>throws <pre>IOException</pre>

Get the InputStream for this object.

For DataHandlers instantiated with a DataSource, the DataHandler calls the DataSource.getInputStream method and returns the result to the caller.

For DataHandlers instantiated with an Object, the DataHandler first attempts to find a DataContentHandler for the Object. If the DataHandler can not find a DataContentHandler for this MIME type, it throws an UnsupportedDataTypeException. If it is successful, it creates a pipe and a thread. The thread uses the DataContentHandler's writeTo method to write the stream data into one end of the pipe. The other end of the pipe is returned to the caller. Because a thread is created to copy the data, IOExceptions that may occur during the copy can not be propagated back to the caller. The result is an empty stream.

Returns:
the InputStream representing this data

Throws:
  IOException - if an I/O error occurs

See Also:
  DataContentHandler.writeTo(java.lang.Object, java.lang.String, java.io.OutputStream)
public void writeTo(java.io.OutputStream os) throws java.io.IOException

OutputStream

DataHandler DataSource writeTo
InputStream Inputstream OutputStream

DataHandler Object writeTo
DataContentHandler DataContentHandler

DataContentHandler writeTo
OutputStream os

Throws java.io.IOException: I/O *

writeTo

public void writeTo(OutputStream os)

throws IOException

Write the data to an OutputStream.

If the DataHandler was created with a DataSource, writeTo retrieves the InputStream and copies the bytes from the InputStream to the OutputStream passed in.

If the DataHandler was created with an object, writeTo retrieves the DataContentHandler for the object's type. If the DataContentHandler was found, it calls the writeTo method on the DataContentHandler.

Parameters:

- os - the OutputStream to write to

Throws:

- IOException - if an I/O error occurs
public java.io.OutputStream getOutputStream() throws java.io.IOException

DataHandler  OutputStream DataHandler
DataSource  DataSource

null

return  OutputStream

See also  getOutputStream, javax.activation.URLDataSource

getOutputStream

public  OutputStream getOutputStream()

throws IOException

Get an OutputStream for this DataHandler to allow overwriting the underlying data. If the DataHandler was created with a DataSource, the DataSource's getOutputStream method is called. Otherwise, null is returned.

Returns:
the OutputStream

Throws:
IOException

See Also:
DataSource.getOutputStream(), URLDataSource

public java.awt.datatransfer.DataFlavor[]
getTransferDataFlavors()

DataFlavor

flavor  DataFlavor

DataHandler  MIME  DataContentHandler
DataHandler  DataContentHandler

getTransferDataFlavors
getTransferDataFlavors

public DataFlavor[] getTransferDataFlavors()

Return the DataFlavors in which this data is available.

Returns an array of DataFlavor objects indicating the flavors the data can be provided in. The array is usually ordered according to preference for providing the data, from most richly descriptive to least richly descriptive.

The DataHandler attempts to find a DataContentHandler that corresponds to the MIME type of the data. If one is located, the DataHandler calls the DataContentHandler's getTransferDataFlavors method.

If a DataContentHandler can not be located, and if the DataHandler was created with a DataSource (or URL), one DataFlavor is returned that represents this object's MIME type and the java.io.InputStream class. If the DataHandler was created with an object and a MIME type, getTransferDataFlavors returns one DataFlavor that represents this object's MIME type and the object's class.

Specified by:
getTransferDataFlavors in interface Transferable

Returns:
an array of data flavors in which this data can be transferred

See Also:
DataContentHandler.getTransferDataFlavors()
public boolean isDataFlavorSupported(DataFlavor flavor)

Returns whether the specified data flavor is supported for this object.

This method iterates through the DataFlavors returned from getTransferDataFlavors, comparing each with the specified flavor.

Specified by: isDataFlavorSupported in interface Transferable

Parameters:
flavor - the requested flavor for the data

Returns:
true if the data flavor is supported

See Also:
getTransferDataFlavors()
flavor

DataSource URL DataHandler

DataHandler MIME DataContentHandler
DataFlavor getTransferData DataHandler
DataContentHandler flavor MIME
java.io.InputStream InputStream
UnsupportedFlavorException

Object DataHandler

DataHandler MIME DataContentHandler
DataFlavor getTransferData DataHandler
DataContentHandler flavor MIME
DataHandler UnsupportedFlavorException

flavor

return

Throws java.awt.datatransfer.UnsupportedFlavorException: flavor
Throws java.io.IOException: I/O *
See also javax.activation.ActivationDataFlavor

getTransferData

public Object getTransferData(DataFlavor flavor) throws UnsupportedFlavorException, IOException

Returns an object that represents the data to be transferred. The class of the object returned is defined by the representation class of the data flavor.

For DataHandler's created with DataSources or URLs:

The DataHandler attempts to locate a DataContentHandler for this
MIME type. If one is found, the passed in DataFlavor and the type of the data are passed to its getTransferData method. If the DataHandler fails to locate a DataContentHandler and the flavor specifies this object's MIME type and the java.io.InputStream class, this object's InputStream is returned. Otherwise it throws an UnsupportedFlavorException.

For DataHandler's created with Objects:

The DataHandler attempts to locate a DataContentHandler for this MIME type. If one is found, the passed in DataFlavor and the type of the data are passed to its getTransferData method. If the DataHandler fails to locate a DataContentHandler and the flavor specifies this object's MIME type and its class, this DataHandler's referenced object is returned. Otherwise it throws an UnsupportedFlavorException.

Specified by:
   getTransferData in interface Transferable
Parameters:
   flavor - the requested flavor for the data
Returns:
   the object
Throws:
   UnsupportedFlavorException - if the data could not be converted to the requested flavor
   IOException - if an I/O error occurs
See Also:
   ActivationDataFlavor

```
public void setCommandMap(CommandMap commandMap)
   DataHandler CommandMap null
CommandMap CommandMap.getOrDefaultCommandMap
CommandMap CommandMap
```

**setCommandMap**

```java
public void setCommandMap(CommandMap commandMap)
```

Set the CommandMap for use by this DataHandler. Setting it to `null` causes the CommandMap to revert to the CommandMap returned by the `CommandMap.getDefaultCommandMap` method. Changing the CommandMap, or setting it to `null`, clears out any data cached from the previous CommandMap.

**Parameters:**
- `commandMap` - the CommandMap to use in this DataHandler

**See Also:**
- `CommandMap.setDefaultCommandMap(javax.activation.CommandMap)`

---

**getPreferredCommands**

```java
public CommandInfo[] getPreferredCommands()
```

```
CommandMap DataHandler
getPreferredCommands DataHandler MIME
CommandMap
```

Return the preferred commands for this type of data. This method calls the `getPreferredCommands` method in the CommandMap associated with this instance of DataHandler. This method returns an array that represents a subset of available commands. In cases where multiple commands for the MIME type represented by this DataHandler are present, the installed CommandMap chooses the appropriate commands.

**See also**
- `getPreferredCommands`
public CommandInfo[] getAllCommands()

Return all the commands for this type of data. This method returns an array containing all commands for the type of data represented by this DataHandler. The MIME type for the underlying data represented by this DataHandler is used to call through to the getAllCommands method of the CommandMap associated with this DataHandler.

Returns:
the CommandInfo objects representing all the commands
See Also:
CommandMap.getAllCommands(java.lang.String)

public CommandInfo getCommand(String cmdName)

cmdName DataHandler CommandMap
DataHandler MIME DataHandler CommandMap
getCommand

return CommandInfo
See also
getCommand
getCommand

public CommandInfo getCommand(String cmdName)

Get the command cmdName. Use the search semantics as defined by the CommandMap installed in this DataHandler. The MIME type for the underlying data represented by this DataHandler is used to call through to the getCommand method of the CommandMap associated with this DataHandler.

Parameters:
- cmdName - the command name

Returns:
- the CommandInfo corresponding to the command

See Also:
- CommandMap.getCommand(java.lang.String, java.lang.String)

---------------------------------------------------------------------

public Object getContent() throws java.io.IOException

Object

DataHandler

DataHandler DataSource DataContentHandler

DataSource

Inputstream

return

Throws java.io.IOException: IOException

g getContent

public Object getContent() throws IOException

Object
Return the data in its preferred Object form.

If the DataHandler was instantiated with an object, return the object.

If the DataHandler was instantiated with a DataSource, this method uses a DataContentHandler to return the content object for the data represented by this DataHandler. If no DataContentHandler can be found for the the type of this data, the DataHandler returns an InputStream for the data.

**Returns:**
the content.

**Throws:**
IOException - if an IOException occurs during this operation.

```java
public Object getBean(CommandInfo cmdinfo)
CommandInfo  JavaBean

CommandInfo getCommandObject
javax.activation.DataHandler ClassLoader
    cmdinfo CommandInfo
    return
```

getBean

```java
public Object getBean(CommandInfo cmdinfo)

    A convenience method that takes a CommandInfo object and instantiates the corresponding command, usually a JavaBean component.

    This method calls the CommandInfo's getCommandObject method with the ClassLoader used to load the javax.activation.DataHandler class itself.
```
**Parameters:**
cmdinfo - the CommandInfo corresponding to a command

**Returns:**
the instantiated command object

---

**public static void setDataContentHandlerFactory(DataContentHandlerFactory newFactory)**

Sets the DataContentHandlerFactory. The DataContentHandlerFactory is called first to find DataContentHandlers. The DataContentHandlerFactory can only be set once.

If the DataContentHandlerFactory has already been set, this method throws an Error.

**Parameters:**
newFactory - the DataContentHandlerFactory

**Throws:**
Error - if the factory has already been defined.

**See Also:**
DataContentHandlerFactory

PS :
Class **DataModel**

`javax.faces.model.DataModel` extends `java.lang.Object`

**Direct Known Subclasses:**
- ArrayDataModel, ListDataModel, ResultDataModel, ResultSetDataModel, ScalarDataModel

**Extended by:** ArrayDataModel, ListDataModel, ResultDataModel, ResultSetDataModel, ScalarDataModel

```java
public abstract class DataModel extends Object
```

**DataModel** is an abstraction around arbitrary data binding technologies that can be used to adapt a variety of data sources for use by JavaServer Faces components that support per-row processing for their child components (such as **UIData**).

The data collection underlying a **DataModel** instance is modeled as a collection of row objects that can be accessed by a zero-relative cursor (row index). The APIs provide mechanisms to position to a specified location.
zero-relative row index, and to retrieve an object that represents the data that corresponds to the current row index.

A concrete `DataModel` instance is attached to a particular collection of underlying data by calling the `setWrappedData()` method. It can be detached from that underlying data collection by passing a `null` parameter to this method.

Concrete `DataModel` implementations must provide a public zero-arguments constructor that calls `setWrappedData(null)`. A convenience constructor that takes a wrapped object of the appropriate type (and passes it on via a call to `setWrappedData()`), should also be provided.

Event listeners may be registered to receive notifications of when a new row index is selected.

---

abstract Object getWrappedData()  
Return the object representing the data wrapped by this DataModel, if any.

abstract boolean isRowAvailable()  
Return a flag indicating whether there is rowData available at the current rowIndex.

void removeDataModellListener(DataModellListener listener)  
Remove an existing DataModellListener from the set interested in notifications from this DataModel.

abstract void setRowIndex(int rowIndex)  
Set the zero-relative index of the currently selected row, or -1 to indicate that we are not positioned on a row.

abstract void setWrappedData(Object data)  
Set the object representing the data collection wrapped by this DataModel.

Methods inherited from class java.lang.Object
clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait

Constructor Detail

public DataModel()

DataModel

public DataModel()

Method Detail

abstract public boolean isRowAvailable()
Throws

### isRowAvailable

```java
public abstract boolean isRowAvailable()
```

Return a flag indicating whether there is rowData available at the current rowIndex. If no wrappedData is available, return false.

**Throws:**

- `FacesException` - if an error occurs getting the row availability

---

### abstract public int getRowCount()

```java
public abstract int getRowCount()
```

Return the number of rows of data objects represented by this DataModel. If the number of rows is unknown, or no wrappedData is available, return -1.

**Throws:**

- `FacesException` - if an error occurs getting the row count

---

### abstract public Object getRowData()

```java
public abstract Object getRowData()
```

Return the row data for the current rowIndex.

**Throws:**

- `FacesException` - if an error occurs getting the row data

---
Throws:  
FacesException:  
Throws:  
IllegalArgument Exception:  

getRowData

public abstract Object getRowData()

Return an object representing the data for the currently selected row index. If no wrappedData is available, return null.

Throws:
   FacesException - if an error occurs getting the row data
   IllegalArgumentException - if now row data is available at the currently specified row index

abstract public int getRowIndex()

return 0

wrappedData = -1

Throws:  
FacesException:

getRowIndex

public abstract int getRowIndex()

Return the zero-relative index of the currently selected row. If we are not currently positioned on a row, or no wrappedData is available, return -1.

Throws:
   FacesException - if an error occurs getting the row index

abstract public void setRowIndex(int rowIndex)
setRowIndex

public abstract void setRowIndex(int rowIndex)

Set the zero-relative index of the currently selected row, or -1 to indicate that we are not positioned on a row. It is possible to set the row index at a value for which the underlying data collection does not contain any row data. Therefore, callers may use the isRowAvailable() method to detect whether row data will be available for use by the getRowData() method.

If there is no wrappedData available when this method is called, the specified rowIndex is stored (and may be retrieved by a subsequent call to getRowData()), but no event is sent. Otherwise, if the currently selected row index is changed by this call, a DataModelEvent will be sent to the rowSelected() method of all registered DataModelListenerS.

Parameters:
rowIndex - The new zero-relative index (must be non-negative)

Throws:
FacesException - if an error occurs setting the row index
IllegalArgumentException - if rowIndex is less than -1

abstract public Object getWrappedData()
**DataModel**

**getWrappedData**

```java
public abstract Object getWrappedData()
```

Return the object representing the data wrapped by this `DataModel`, if any.

**abstract public void setWrappedData(Object data)**

```java
public abstract void setWrappedData(Object data)
```

Set the object representing the data collection wrapped by this `DataModel`. If the specified `data` is null, detach this `DataModel` from any previously wrapped data collection instead.

If `data` is non-null, the currently selected row index must be set to zero, and a `DataModelEvent` must be sent to the `rowSelected()` method of all registered `DataModelListener`s indicating that this row is now selected.

**Parameters:**
public void addDataModelListener(DataModelListener listener)

Add a new DataModelListener to the set interested in notifications from this DataModel.

Parameters:
listener - The new DataModelListener to be registered

Throws:
NullPointerException - if listener is null

public DataModelListener[] getDataModelListeners()
Return the set of DataModelListener interested in notifications from this DataModel. If there are no such listeners, an empty array is returned.

public void removeDataModelListener(DataModelListener listener)

removeDataModelListener

public void removeDataModelListener(DataModelListener listener)

Remove an existing DataModelListener from the set interested in notifications from this DataModel.

Parameters:

listener - The old DataModelListener to be deregistered

Throws:

NullPointerException - if listener is null
javax.faces.model Class DataModelEvent

java.lang.Object  
   java.util.EventObject  
   javax.faces.model.DataModelEvent

All Implemented Interfaces:
   Serializable

public class DataModelEvent
  extends EventObject

Extends: java.util.EventObject

DataModelEvent represents an event of interest to registered listeners that occurred on the specified DataModel.

See Also:
   Serialized Form

Field Summary

Fields inherited from class java.util.EventObject
source

Constructor Summary

DataModelEvent(DataModel model, int index, Object data)
Construct an event object that is associated with the specified

DataModelEvent
public DataModelEvent(DataModel model, int index, Object data)

Construct an event object that is associated with the specified row index and associated data.

Parameters:
model - The DataModel on which this event occurred
index - The zero relative row index for which this event occurred, or -1 for no specific row association
data - Representation of the data for the row specified by index, or null for no particular row data

Method Detail

public DataModel getDataModel()

DataModel

dataGetModel

gDataModel

public Object getRowData()

null

getRowData

getRowData
Return the object representing the data for the specified row index, or null for no associated row data.

```java
public int getRowIndex()
-1
```

getRowIndex

```java
public int getRowIndex()
```

Return the row index for this event, or -1 for no specific row.

javax.faces.model Interface `DataModelListener`

All Superinterfaces:
   `EventListener`

---

```java
public interface DataModelListener
extends EventListener
Implements: java.util.EventListener
```

`DataModelListener` represents an event listener that wishes to be notified of `DataModelEvent`s occurring on a particular `DataModel` instance.

---

**Method Summary**

```java
void rowSelected(DataModelEvent event)
```

Notification that a particular row index, with the associated row data, has been selected for processing.

**Method Detail**

```java
public void rowSelected(DataModelEvent event)
```

`event`  `DataModelEvent`
void rowSelected(DataModelEvent event)

Notification that a particular row index, with the associated row data, has been selected for processing.

Parameters:
  event - The DataModelEvent we are processing
All Known Subinterfaces:
   MultipartDataSource

All Known Implementing Classes:
   ByteArrayOutputStream, FileDataSource, MimePartDataSource, URLDataSource

The `DataSource` interface provides the JavaBeans Activation Framework with an abstraction of an arbitrary collection of data. It provides a type for that data as well as access to it in the form of InputStreams and OutputStreams where appropriate.

### Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>String getContentType()</code></td>
<td>This method returns the MIME type of the data in the form of a string.</td>
</tr>
<tr>
<td><code>InputStream getInputStream()</code></td>
<td>This method returns an InputStream representing the data and throws the appropriate exception if it cannot do so.</td>
</tr>
<tr>
<td><code>String getName()</code></td>
<td>Return the name of this object where the name of the object is dependant on the nature of the underlying objects.</td>
</tr>
<tr>
<td><code>getOutputStream()</code></td>
<td></td>
</tr>
</tbody>
</table>
This method returns an OutputStream where the data can be written and throws the appropriate exception if it cannot do so.

**Method Detail**

```java
public java.io.InputStream getInputStream() throws java.io.IOException

InputStream return

getInputStream

InputStream InputStream

getInputStream

throws IOException

This method returns an InputStream representing the data and throws the appropriate exception if it cannot do so. Note that a new InputStream object must be returned each time this method is called, and the stream must be positioned at the beginning of the data.

Returns:
an InputStream

Throws:
IOException
```

```java
public java.io.OutputStream getOutputStream() throws java.io.IOException

OutputStream return

getOutputStream

OutputStream OutputStream

getOutputStream

throws IOException

This method returns an OutputStream where the data can be written and throws the appropriate exception if it cannot do so.
```
**OutputStream** getOutputStream()

This method returns an `OutputStream` where the data can be written and throws the appropriate exception if it can not do so. Note that a new `OutputStream` object must be returned each time this method is called, and the stream must be positioned at the location the data is to be written.

**Returns:**
- an `OutputStream`

**Throws:**
- `IOException`

---

```java
public String getContentType()
```

### MIME DataSource getContentType

"application/octet-stream"

```java
return MIME
```

**getContentType**

### String getContentType()

This method returns the MIME type of the data in the form of a string. It should always return a valid type. It is suggested that `getContentType` return "application/octet-stream" if the `DataSource` implementation can not determine the data type.

**Returns:**
- the MIME Type

---

```java
public String getName()
```

### DataSource getName()

```java
return
```

---
getName

String getName()

Return the name of this object where the name of the object is dependant on the nature of the underlying objects. DataSources encapsulating files may choose to return the filename of the object. (Typically this would be the last component of the filename, not an entire pathname.)

Returns:
the name of the object.
javax.xml.bind  **Class DatatypeConverter**

java.lang.Object
  ▼javax.xml.bind.DatatypeConverter

public final class DatatypeConverter
extends Object

**javaType**  XML  Java  XML  parse  print
parse  print  **XML Schema Part2: Datatypes**

parse  print  parse  print  JAXB  parse  print
parse  print  parse  print  xsd:dateTime  long

// Customized parse method
public long myParseCal( String dateTimeString ) {
    java.util.Calendar cal = DatatypeConverter.parseDateTime(dateTimeString);
    long longval = convert_calendar_to_long(cal);  //application specific
    return longval;
}

// Customized print method
public String myPrintCal( Long longval ) {
    java.util.Calendar cal = convert_long_to_calendar(longval);  //app
    String dateTimeString = DatatypeConverter.printDateTime(cal);
    return dateTimeString;
}

DatatypeConverterInterface  parse  print  parse  print

**javaType**  parse  print

JAXB  JAXBContext.newInstance
API

XML  print  XML  IllegalArgumentException
IllegalArgumentException
The javaType binding declaration can be used to customize the binding of an XML schema datatype to a Java datatype. Customizations can involve writing a parse and print method for parsing and printing lexical representations of a XML schema datatype respectively. However, writing parse and print methods requires knowledge of the lexical representations (XML Schema Part2: Datatypes specification) and hence may be difficult to write.

This class makes it easier to write parse and print methods. It defines static parse and print methods that provide access to a JAXB provider's implementation of parse and print methods. These methods are invoked by custom parse and print methods. For example, the binding of xsd:dateTime to a long can be customized using parse and print methods as follows:

```java
// Customized parse method
public long myParseCal( String dateTimeString ) {
    java.util.Calendar cal = DatatypeConverter.parseDateTime(dateTimeString);
    long longval = convert_calendar_to_long(cal); // application specific
    return longval;
}

// Customized print method
public String myPrintCal( Long longval ) {
    java.util.Calendar cal = convert_long_to_calendar(longval);
    String dateTimeString = DatatypeConverter.printDateTime(cal);
    return dateTimeString;
}
```

There is a static parse and print method corresponding to each parse and print method respectively in the DatatypeConverterInterface.

The static methods defined in the class can also be used to specify a
parse or a print method in a javaType binding declaration.

JAXB Providers are required to call the `setDatatypeConverter` api at some point before the first marshal or unmarshal operation (perhaps during the call to JAXBContext.newInstance). This step is necessary to configure the converter that should be used to perform the print and parse functionality.

A print method for a XML schema datatype can output any lexical representation that is valid with respect to the XML schema datatype. If an error is encountered during conversion, then an `IllegalArgumentException`, or a subclass of `IllegalArgumentException` must be thrown by the method.

static String printBase64Binary(byte[] val)
    Converts an array of bytes into a string.
static String printBoolean(boolean val)
    Converts a boolean value into a string.
static String printByte(byte val)
    Converts a byte value into a string.
static String printDate(Calendar val)
    Converts a Calendar value into a string.
static String printDateTime(Calendar val)
    Converts a Calendar value into a string.
static String printDecimal(BigDecimal val)
    Converts a BigDecimal value into a string.
static String printDouble(double val)
    Converts a double value into a string.
static String printFloat(float val)
    Converts a float value into a string.
static String printHexBinary(byte[] val)
    Converts an array of bytes into a string.
static String printInt(int val)
    Converts an int value into a string.
static String printInteger(BigInteger val)
    Converts a BigInteger value into a string.
static String printLong(long val)
    Converts a long value into a string.
static String printQName(QName val, NamespaceContext nsc)
    Converts a QName instance into a string.
static String printShort(short val)
    Converts a short value into a string.
static String printString(String val)
    Converts the string argument into a string.
static String printTime(Calendar val)
    Converts a Calendar value into a string.
static String printUnsignedInt(long val)
    Converts a long value into a string.
**Method Detail**

**public static void setDatatypeConverter(DatatypeConverterInterface converter)**

This method is for JAXB provider use only.

JAXB Providers are required to call this method at some point before allowing any of the JAXB client marshal or unmarshal operations to occur. This is necessary to configure the datatype converter that should be used to perform the print and parse conversions.
Calling this api repeatedly will have no effect - the 
DatatypeConverterInterface instance passed into the first invocation 
is the one that will be used from then on.

Parameters:
  converter - an instance of a class that implements the 
  DatatypeConverterInterface class - this parameter must not be 
  null.

Throws:
  IllegalArgumentException - if the parameter is null

public static String parseString(String lexicalXSDString)

XSD String
  lexicalXSDString
  return

parseString

public static String parseString(String lexicalXSDString)

  Convert the lexical XSD string argument into a String value.

Parameters:
  lexicalXSDString - A string containing a lexical representation of 
  xsd:string.

Returns:
  A String value represented by the string argument.

public static java.math.BigInteger parseInteger(String 
lexicalXSDInteger)

BigInteger
  lexicalXSDInteger
  xsd:integer
parseInteger

public static BigInteger parseInteger(String lexicalXSDInteger)

Convert the string argument into a BigInteger value.

Parameters:
  lexicalXSDInteger - A string containing a lexical representation of xsd:integer.

Returns: A BigInteger value represented by the string argument.

Throws:NumberFormatException - lexicalXSDInteger is not a valid string representation of a BigInteger value.

parseInt

public static int parseInt(String lexicalXSDInt)

int lexicalXSDInt xsd:int
return int

throws NumberFormatException: lexicalXSDInt int

parseInt

public static int parseInt(String lexicalXSDInt)

Convert the string argument into an int value.

Parameters:
lexicalXSDInt - A string containing a lexical representation of xsd:int.

Returns:
A int value represented by the string argument.

Throws:
NumberFormatException - lexicalXSDInt is not a valid string representation of an int value.

public static long parseLong(String lexicalXSDLong)

long

lexicalXSDLong - A string containing lexical representation of xsd:long.

return long

Throws

NumberFormatException: lexicalXSDLong long

parseLong

public static long parseLong(String lexicalXSDLong)

Converts the string argument into a long value.

Parameters:

lexicalXSDLong - A string containing lexical representation of xsd:long.

Returns:
A long value represented by the string argument.

Throws:

NumberFormatException - lexicalXSDLong is not a valid string representation of a long value.

public static short parseShort(String lexicalXSDShort)

short
parseShort

public static short parseShort(String lexicalXSDShort)

Converts the string argument into a short value.

Parameters:
  lexicalXSDShort - A string containing lexical representation of xsd:short.

Returns:
  A short value represented by the string argument.

Throws:
  NumberFormatException - lexicalXSDShort is not a valid string representation of a short value.

public static java.math.BigDecimal parseDecimal(String lexicalXSDDecimal)

BigDecimal

lexicalXSDDecimal  xsd:decimal
return  BigDecimal
Throws  NumberFormatException: lexicalXSDDecimal

parseDecimal

public static BigDecimal parseDecimal(String lexicalXSDDecimal)
Converts the string argument into a BigDecimal value.

**Parameters:**

lexicalXSDDecimal - A string containing lexical representation of xsd:decimal.

**Returns:**

A BigDecimal value represented by the string argument.

**Throws:**

NumberFormatException - lexicalXSDDecimal is not a valid string representation of BigDecimal.

---

```java
public static float parseFloat(String lexicalXSDFloat)
```

**parseFloat**

Converts the string argument into a float value.

**Parameters:**

lexicalXSDFloat - A string containing lexical representation of xsd:float.

**Returns:**

A float value represented by the string argument.

**Throws:**

NumberFormatException - lexicalXSDFloat is not a valid string representation of a float value.
public static double parseDouble(String lexicalXSDDouble)

double

    lexicalXSDDouble    xsd:double
    return double

    Thows
    NumberFormatException: lexicalXSDDouble

parseDouble

public static double parseDouble(String lexicalXSDDouble)

    Converts the string argument into a double value.

    Parameters:
    lexicalXSDDouble - A string containing lexical representation of xsd:double.

    Returns:
    A double value represented by the string argument.

    Thows:
    NumberFormatException - lexicalXSDDouble is not a valid string representation of a double value.

public static boolean parseBoolean(String lexicalXSDBoolean)

boolean

    lexicalXSDBoolean    xsd:boolean
    return boolean

    Thows
    IllegalArgumentException: XML Schema Part 2: Datatypes xsd:boolean
parseBoolean

public static boolean parseBoolean(String lexicalXSDBoolean)

Converts the string argument into a boolean value.

Parameters:
lexicalXSDBoolean - A string containing lexical representation of xsd:boolean.

Returns:
A boolean value represented by the string argument.

Throws:
IllegalArgumentException - if string parameter does not conform to lexical value space defined in XML Schema Part 2: Datatypes for xsd:boolean.

public static byte parseByte(String lexicalXSDByte)

byte

lexicalXSDByte xsd:byte
return byte

Throws
IllegalArgumentException: XML Schema Part 2: Datatypes xsd:byte

parseByte

public static byte parseByte(String lexicalXSDByte)

Converts the string argument into a byte value.

Parameters:
lexicalXSDByte - A string containing lexical representation of xsd:byte.

Returns:
A byte value represented by the string argument.

Throws:
IllegalArgumentException - if string parameter does not conform to lexical value space defined in XML Schema Part 2: Datatypes for xsd:byte.

```java
public static javax.xml.namespace.QName parseQName(String lexicalXSDQName, javax.xml.namespace.NamespaceContext nsc)

byte

<table>
<thead>
<tr>
<th>lexicalXSDQName</th>
<th>XML Schema Part 2: Datatypes</th>
</tr>
</thead>
<tbody>
<tr>
<td>lexicalXSDQName</td>
<td>xsd:QName</td>
</tr>
<tr>
<td>nsc</td>
<td>QName</td>
</tr>
<tr>
<td>return</td>
<td>QName</td>
</tr>
</tbody>
</table>

Throws

IllegalArgumentException: XML Schema Part 2

parseQName

public static QName parseQName(String lexicalXSDQName, NamespaceContext nsc)

Converts the string argument into a byte value.

String parameter lexicalXSDQName must conform to lexical value space specified at XML Schema Part 2: Datatypes specification:QNames

Parameters:

- lexicalXSDQName - A string containing lexical representation of xsd:QName.
- nsc - A namespace context for interpreting a prefix within a QName.
Returns:
   A QName value represented by the string argument.

Throws:
   IllegalArgumentException - if string parameter does not conform
to XML Schema Part 2 specification or if namespace prefix of
lexicalXSDQname is not bound to a URI in NamespaceContext
nsc.

---

**public static java.util.Calendar parseDateTime(String lexicalXSDDateTime)**

Calendar

*lexicalXSDDateTime* xsd:datetime

*return* Calendar

*Throws*

IllegalArgumentException: XML Schema Part 2: Datatypes xsd:dateTime

---

**parseDateTime**

**public static Calendar parseDateTime(String lexicalXSDDateTime)**

Converts the string argument into a Calendar value.

**Parameters:**

*lexicalXSDDateTime* - A string containing lexical representation
of xsd:datetime.

**Returns:**

A Calendar object represented by the string argument.

**Throws:**

IllegalArgumentException - if string parameter does not conform
to lexical value space defined in XML Schema Part 2: Datatypes
for xsd:dateTime.

---

**public static byte[] parseBase64Binary(String**
parseBase64Binary

public static byte[] parseBase64Binary(String lexicalXSDBase64Binary)

Converts the string argument into an array of bytes.

Parameters:

- lexicalXSDBase64Binary - A string containing lexical representation of xsd:base64Binary.

Returns:

- An array of bytes represented by the string argument.

Throws:

- IllegalArgumentException - if string parameter does not conform to lexical value space defined in XML Schema Part 2: Datatypes for xsd:base64Binary

parseHexBinary

public static byte[] parseHexBinary(String lexicalXSDHexBinary)

Converts the string argument into an array of bytes.

Parameters:

- lexicalXSDHexBinary - A string containing lexical representation of xsd:hexBinary.

Returns:

- An array of bytes represented by the string argument.

Throws:

- IllegalArgumentException - if string parameter does not conform to lexical value space defined in XML Schema Part 2: Datatypes for xsd:hexBinary
parseHexBinary

public static byte[] parseHexBinary(String lexicalXSDHexBinary)

Converts the string argument into an array of bytes.

Parameters:
   lexicalXSDHexBinary - A string containing lexical representation of xsd:hexBinary.

Returns:
   An array of bytes represented by the string argument.

Throws:
   IllegalArgumentException - if string parameter does not conform to lexical value space defined in XML Schema Part 2: Datatypes for xsd:hexBinary.

---

public static long parseUnsignedInt(String lexicalXSDUnsignedInt)

long

   lexicalXSDUnsignedInt     xsd:unsignedInt
   return                   long
   Throws                   NumberFormatException:

parseUnsignedInt

public static long parseUnsignedInt(String lexicalXSDUnsignedInt)

Converts the string argument into a long value.

Parameters:
   lexicalXSDUnsignedInt - A string containing lexical representation of xsd:unsignedInt.

Returns:
   A long value represented by the string argument.
public static int parseUnsignedShort(String lexicalXSDUnsignedShort)

int

lexicalXSDUnsignedShort  xsd:unsignedShort
return int

Throws: NumberFormatException - if string parameter can not be parsed into a long value.

parseUnsignedShort

public static int parseUnsignedShort(String lexicalXSDUnsignedShort)

Converts the string argument into an int value.

Parameters:

lexicalXSDUnsignedShort - A string containing lexical representation of xsd:unsignedShort.

Returns:

An int value represented by the string argument.

Throws:

NumberFormatException - if string parameter can not be parsed into an int value.

public static java.util.Calendar parseTime(String lexicalXSDTime)

Calendar

lexicalXSDTime  xsd:time
return Calendar
parseTime

public static Calendar parseTime(String lexicalXSDTime)

Converts the string argument into a Calendar value.

Parameters:

lexicalXSDTime - A string containing lexical representation of xsd:time.

Returns:

A Calendar value represented by the string argument.

Throws:

IllegalArgumentException - if string parameter does not conform to lexical value space defined in XML Schema Part 2: Datatypes for xsd:Time.

parseDate

public static java.util.Calendar parseDate(String lexicalXSDDate)

Calendar

lexicalXSDDate     xsd:Date
return            Calendar

Throws

IllegalArgumentException - if string parameter does not conform to lexical value space defined in XML Schema Part 2: Datatypes xsd:Date.
Parameters:
  lexicalXSDDate - A string containing lexical representation of xsd:Date.

Returns:
  A Calendar value represented by the string argument.

Throws:
  IllegalArgumentException - if string parameter does not conform to lexical value space defined in XML Schema Part 2: Datatypes for xsd:Date.

public static String parseAnySimpleType(String lexicalXSDAnySimpleType)

    lexicalXSDAnySimpleType
    return

parseAnySimpleType

public static String parseAnySimpleType(String lexicalXSDAnySimpleType)

    Return a string containing the lexical representation of the simple type.

Parameters:
  lexicalXSDAnySimpleType - A string containing lexical representation of the simple type.

Returns:
  A string containing the lexical representation of the simple type.

public static String printString(String val)

    val
printString

public static String printString(String val)

Converts the string argument into a string.

Parameters:
   val - A string value.

Returns:
   A string containing a lexical representation of xsd:string.

printInteger

public static String printInteger(java.math.BigInteger val)

BigInteger

val

return xsd:integer

Throws
   IllegalArgument exception: val null

printInteger

public static String printInteger(BigInteger val)

Converts a BigInteger value into a string.

Parameters:
   val - A BigInteger value

Returns:
   A string containing a lexical representation of xsd:integer

Throws:
   IllegalArgumentException - val is null.
public static String printInt(int val)

int val
return int

public static String printInt(int val)

Converts an int value into a string.

Parameters:
val - An int value

Returns:
A string containing a lexical representation of xsd:int

public static String printLong(long val)

long val
return long

public static String printLong(long val)

Converts a long value into a string.

Parameters:
val - A long value

Returns:
A string containing a lexical representation of xsd:long
public static String printShort(short val)

short val
return short
-xsd:short

printShort

public static String printShort(short val)

Converts a short value into a string.

**Parameters:**
val - A short value

**Returns:**
A string containing a lexical representation of xsd:short

public static String printDecimal(java.math.BigDecimal val)

BigDecimal val
BigDecimal return
-xsd:decimal
Throws IllegalArgumentException: val null

printDecimal

public static String printDecimal(BigDecimal val)

Converts a BigDecimal value into a string.

**Parameters:**
val - A BigDecimal value
public static String printFloat(float val)

float
val float

return xsd:float

printFloat

Parameters:
val - A float value

Returns:
A string containing a lexical representation of xsd:float

public static String printDouble(double val)

double
val double

return xsd:double

printDouble

Parameters:
val - A double value

Returns:
A string containing a lexical representation of xsd:double

Returns:
A string containing a lexical representation of xsd:decimal

Throws:
IllegalArgumentException - val is null.
Converts a double value into a string.

**Parameters:**
val - A double value

**Returns:**
A string containing a lexical representation of xsd:double

---

**public static String printBoolean(boolean val)**

```java
boolean val
return xsd:boolean
```

**printBoolean**

```java
public static String printBoolean(boolean val)

    Converts a boolean value into a string.

    **Parameters:**
    val - A boolean value

    **Returns:**
    A string containing a lexical representation of xsd:boolean
```

---

**public static String printByte(byte val)**

```java
byte val
return xsd:byte
```

**printByte**
public static String printByte(byte val)

Converts a byte value into a string.

**Parameters:**
val - A byte value

**Returns:**
A string containing a lexical representation of xsd:byte

public static String printQName(javax.xml.namespace.QName val, javax.xml.namespace.NamespaceContext nsc)

**QName**

<table>
<thead>
<tr>
<th>val</th>
<th>QName</th>
</tr>
</thead>
<tbody>
<tr>
<td>nsc</td>
<td>QName</td>
</tr>
<tr>
<td>return</td>
<td>QName</td>
</tr>
</tbody>
</table>

**Throws**

IllegalArgumentException: val null nsc null
nsc.getPrefix(nsPrefixFromVal) null

**printQName**

public static String printQName(QName val, NamespaceContext nsc)

Converts a QName instance into a string.

**Parameters:**
val - A QName value
nsc - A namespace context for interpreting a prefix within a QName.

**Returns:**
A string containing a lexical representation of QName

**Throws:**

IllegalArgumentException - if val is null or if nsc is non-null or
public static String printDateTime(java.util.Calendar val)

Converts a Calendar value into a string.

Parameters:
val - A Calendar value

Returns:
A string containing a lexical representation of xsd:dateTime

Throws:
IllegalArgumentException - if val is null.

public static String printBase64Binary(byte[] val)

Throws: IllegalArgumentException: val null

printBase64Binary
public static String printBase64Binary(byte[] val)

Converts an array of bytes into a string.

Parameters:
val - An array of bytes

Returns:
A string containing a lexical representation of xsd:base64Binary

Throws:
IllegalArgumentException - if val is null.

public static String printHexBinary(byte[] val)

val
return xsd:hexBinary

Throws IllegalArgumentException: val null

printHexBinary

public static String printHexBinary(byte[] val)

Converts an array of bytes into a string.

Parameters:
val - An array of bytes

Returns:
A string containing a lexical representation of xsd:hexBinary

Throws:
IllegalArgumentException - if val is null.

public static String printUnsignedInt(long val)

long
public static String printUnsignedInt(long val)

Converts a long value into a string.

Parameters:
  val - A long value

Returns:
  A string containing a lexical representation of xsd:unsignedInt

public static String printUnsignedShort(int val)

Converts an int value into a string.

Parameters:
  val - An int value

Returns:
  A string containing a lexical representation of xsd:unsignedShort

public static String printTime(java.util.Calendar val)
Calendar

    val Calendar
    return xsd:time
    Throws IllegalArgumentException: val null

printTime

public static String printTime(Calendar val)

    Converts a Calendar value into a string.

Parameters:
    val - A Calendar value

Returns:
    A string containing a lexical representation of xsd:time

Throws:
    IllegalArgumentException - if val is null.

public static String printDate(java.util.Calendar val)

Calendar

    val Calendar
    return xsd:date
    Throws IllegalArgumentException: val null

printDate

public static String printDate(Calendar val)

    Converts a Calendar value into a string.

Parameters:
    val - A Calendar value
public static String printAnySimpleType(String val)

val
return xsd:AnySimpleType

printAnySimpleType

public static String printAnySimpleType(String val)

Converts a string value into a string.

Parameters:
val - A string value

Returns:
A string containing a lexical representation of xsd:AnySimpleType
javax.xml.bind **Interface DatatypeConverterInterface**

$Revision: 1.5 $ en

JAXB1.0

The DatatypeConverterInterface is for JAXB provider use only. A JAXB provider must supply a class that implements this interface. JAXB Providers are required to call the
DatatypeConverter.setDatatypeConverter api at some point before the
first marshal or unmarshal operation (perhaps during the call to JAXBContext.newInstance). This step is necessary to configure the converter that should be used to perform the print and parse functionality. Calling this api repeatedly will have no effect - the DatatypeConverter instance passed into the first invocation is the one that will be used from then on.

This interface defines the parse and print methods. There is one parse and print method for each XML schema datatype specified in the the default binding Table 5-1 in the JAXB specification.

The parse and print methods defined here are invoked by the static parse and print methods defined in the DatatypeConverter class.

A parse method for a XML schema datatype must be capable of converting any lexical representation of the XML schema datatype (specified by the XML Schema Part2: Datatypes specification) into a value in the value space of the XML schema datatype. If an error is encountered during conversion, then an IllegalArgumentException or a subclass of IllegalArgumentException must be thrown by the method.

A print method for a XML schema datatype can output any lexical representation that is valid with respect to the XML schema datatype. If an error is encountered during conversion, then an IllegalArgumentException, or a subclass of IllegalArgumentException must be thrown by the method.

The prefix xsd: is used to refer to XML schema datatypes XML Schema Part2: Datatypes specification.

**Method Detail**

**public String parseString(String lexicalXSDString)**

```java
lexicalXSDString
XML xsd:string
```

**parseString**

`String parseString(String lexicalXSDString)`

Convert the string argument into a string.

**Parameters:**

- `lexicalXSDString` - A lexical representation of the XML Schema datatype `xsd:string`
Returns:
A string that is the same as the input string.

public java.math.BigInteger parseInteger(String lexicalXSDInteger)

BigInteger
lexicalXSDInteger    xsd:integer
return
BigInteger

Throws
NumberFormatException: lexicalXSDInteger
java.math.BigInteger

parseInteger

BigInteger parseInteger(String lexicalXSDInt)

int
lexicalXSDInt    xsd:int
return
int

Throws
NumberFormatException: lexicalXSDInt
java.math.BigInteger

public int parseInt(String lexicalXSDInt)
**parseInt**

```java
int parseInt(String lexicalXSDInt)
```

Convert the string argument into an int value.

**Parameters:**
- `lexicalXSDInt` - A string containing a lexical representation of `xsd:int`.

**Returns:**
An int value represented byte the string argument.

**Throws:**
- `NumberFormatException` - `lexicalXSDInt` is not a valid string representation of an int value.

---

**public long parseLong(String lexicalXSDLong)**

```java
long parseLong(String lexicalXSDLong)
```

Converts the string argument into a long value.

**Parameters:**
- `lexicalXSDLong` - A string containing lexical representation of `xsd:long`.

**Returns:**

---

**parseLong**

```java
long parseLong(String lexicalXSDLong)
```

Converts the string argument into a long value.

**Parameters:**
- `lexicalXSDLong` - A string containing lexical representation of `xsd:long`.

**Returns:**
A long value represented by the string argument.

Throws:

- `NumberFormatException` - `lexicalXSDLong` is not a valid string representation of a long value.

public short parseShort(String lexicalXSDShort)

short

`lexicalXSDShort`  xsd:short

return  short

Throws  `NumberFormatException`:  `lexicalXSDShort`  short

parseShort

short  parseShort(String lexicalXSDShort)

Converts the string argument into a short value.

Parameters:

- `lexicalXSDShort` - A string containing lexical representation of xsd:short.

Returns:

A short value represented by the string argument.

Throws:

- `NumberFormatException` - `lexicalXSDShort` is not a valid string representation of a short value.

public java.math.BigDecimal parseDecimal(String lexicalXSDDecimal)

BigDecimal

`lexicalXSDDecimal`  xsd:decimal

return  BigDecimal
**parseDecimal**

**BigDecimal** `parseDecimal(String lexicalXSDDecimal)`

Converts the string argument into a BigDecimal value.

**Parameters:**
- `lexicalXSDDecimal` - A string containing lexical representation of `xsd:decimal`.

**Returns:**
A BigDecimal value represented by the string argument.

**Throws:**
- `NumberFormatException` - `lexicalXSDDecimal` is not a valid string representation of `BigDecimal`.

---

**public float parseFloat(String lexicalXSDFloat)**

**float**

`lexicalXSDFloat` - `xsd:float`

**return**
- float

**Throws**
- `NumberFormatException` - `lexicalXSDFloat` is not a valid string representation of `BigDecimal`.

---

**parseFloat**

**float** `parseFloat(String lexicalXSDFloat)`

Converts the string argument into a float value.

**Parameters:**
lexicalXSDFloat - A string containing lexical representation of xsd:float.

Returns:
A float value represented by the string argument.

Throws:
NumberFormatException - lexicalXSDFloat is not a valid string representation of a float value.

public double parseDouble(String lexicalXSDDouble)

double

lexicalXSDDouble - A string containing lexical representation of xsd:double.

Returns:
A double value represented by the string argument.

Throws:
NumberFormatException - lexicalXSDDouble is not a valid string representation of a double value.

public boolean parseBoolean(String lexicalXSDBoolean)

boolean

parseBoolean

double parseDouble(String lexicalXSDDouble)

Converts the string argument into a double value.

Parameters:
lexicalXSDDouble - A string containing lexical representation of xsd:double.

Returns:
A double value represented by the string argument.

Throws:
NumberFormatException - lexicalXSDDouble is not a valid string representation of a double value.
### parseBoolean

**java**

```java
public boolean parseBoolean(String lexicalXSDBoolean)
```

Converts the string argument into a boolean value.

**Parameters:**
- `lexicalXSDBoolean` - A string containing lexical representation of `xsd:boolean`.

**Returns:**
A boolean value represented by the string argument.

**Throws:**
- `IllegalArgumentException` - if string parameter does not conform to lexical value space defined in XML Schema Part 2: Datatypes for `xsd:boolean`.

---

### parseByte

**java**

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```

```java
public byte parseByte(String lexicalXSDByte)
```
Converts the string argument into a byte value.

**Parameters:**
- `lexicalXSDByte` - A string containing lexical representation of xsd:byte.

**Returns:**
A byte value represented by the string argument.

**Throws:**
- `NumberFormatException` - `lexicalXSDByte` does not contain a parseable byte.
- `IllegalArgumentException` - if string parameter does not conform to lexical value space defined in XML Schema Part 2: Datatypes for xsd:byte.

```java
public javax.xml.namespace.QName parseQName(String lexicalXSDQName, javax.xml.namespace.NamespaceContext nsc)
```

**QName**

- `lexicalXSDQname`  
  - **XML Schema Part 2: Datatypes specification:** QNames
  - `lexicalXSDQName`  
    - xsd:QName
  - `ns`  
    - QName
  - `return`  
    - QName
  - `Throws`  
    - `IllegalArgumentException`  
      - XML Schema Part 2

**parseQName**

```java
QName parseQName(String lexicalXSDQName, NamespaceContext nsc)
```

Converts the string argument into a QName value.
String parameter `lexicalXSDQName` must conform to lexical value space specified at [XML Schema Part 2: Datatypes specification: QNames](https://www.w3.org/2001/XMLSchema#)

**Parameters:**
- `lexicalXSDQName` - A string containing lexical representation of `xsd:QName`.
- `nsc` - A namespace context for interpreting a prefix within a QName.

**Returns:**
A QName value represented by the string argument.

**Throws:**
- `IllegalArgumentException` - if string parameter does not conform to XML Schema Part 2 specification or if namespace prefix of `lexicalXSDQName` is not bound to a URI in NamespaceContext `nsc`.

```java
public java.util.Calendar parseDateTime(String lexicalXSDDateTime) {
    // Convert the string argument into a Calendar value.

    lexicalXSDDateTime
    xsd:datetime
    return
    Calendar
    Throws
    IllegalArgumentException: XML Schema Part 2: Datatypes xsd:dateTime
}
```

**parseDateTime**

```java
Calendar parseDateTime(String lexicalXSDDateTime) {
    // Converts the string argument into a Calendar value.

    lexicalXSDDateTime
    xsd:datetime
    return
    Calendar
    Throws
    IllegalArgumentException: XML Schema Part 2: Datatypes xsd:dateTime
}
```
Returns:
A Calendar object represented by the string argument.

Throws:
IllegalArgumentException - if string parameter does not conform to lexical value space defined in XML Schema Part 2: Datatypes for xsd:dateTime.

public byte[] parseBase64Binary(String lexicalXSDBase64Binary)

lexicalXSDBase64Binary    xsd:base64Binary

return

Throws
IllegalArgumentException: XML Schema Part 2: Datatypes xsd:base64Binary

parseBase64Binary

byte[] parseBase64Binary(String lexicalXSDBase64Binary)

Converts the string argument into an array of bytes.

Parameters:
lexicalXSDBase64Binary - A string containing lexical representation of xsd:base64Binary.

Returns:
An array of bytes represented by the string argument.

Throws:
IllegalArgumentException - if string parameter does not conform to lexical value space defined in XML Schema Part 2: Datatypes for xsd:base64Binary

public byte[] parseHexBinary(String lexicalXSDHexBinary)
**parseHexBinary**

```java
byte[] parseHexBinary(String lexicalXSDHexBinary)
```

Converts the string argument into an array of bytes.

**Parameters:**
- `lexicalXSDHexBinary` - A string containing lexical representation of `xsd:hexBinary`.

**Returns:**
- An array of bytes represented by the string argument.

**Throws:**
- `IllegalArgumentException` - if string parameter does not conform to lexical value space defined in XML Schema Part 2: Datatypes for `xsd:hexBinary`.

---

**public long parseUnsignedInt(String lexicalXSDUnsignedInt)**

```java
long
```

**Parameters:**
- `lexicalXSDUnsignedInt` - A string containing lexical representation of `xsd:unsignedInt`.

**Returns:**
- `long` value represented by the string argument.

**Throws:**
- `NumberFormatException` - if string parameter does not conform to lexical value space defined in XML Schema Part 2: Datatypes for `xsd:unsignedInt`.
long parseUnsignedInt(String lexicalXSDUnsignedInt)

Converts the string argument into a long value.

**Parameters:**
- lexicalXSDUnsignedInt - A string containing lexical representation of xsd:unsignedInt.

**Returns:**
- A long value represented by the string argument.

**Throws:**
- `NumberFormatException` - if string parameter can not be parsed into a long value.

---

public int parseUnsignedShort(String lexicalXSDUnsignedShort)

**Parameters:**
- lexicalXSDUnsignedShort - A string containing lexical representation of xsd:unsignedShort.

**Returns:**
- An int value represented by the string argument.

**Throws:**
- `NumberFormatException` - if string parameter can not be parsed into an int value.

---

int parseUnsignedShort(String lexicalXSDUnsignedShort)

Converts the string argument into an int value.

**Parameters:**
- lexicalXSDUnsignedShort - A string containing lexical representation of xsd:unsignedShort.

**Returns:**
- An int value represented by the string argument.

**Throws:**
- `NumberFormatException` - if string parameter can not be parsed into an int value.
public java.util.Calendar parseTime(String lexicalXSDTime)

Calendar

    lexicalXSDTime    xsd:Time
    return            Calendar
    Throws             IllegalArgumentException: XML Schema Part 2:
                        Datatypes xsd:Time

parseTime

Calendar parseTime(String lexicalXSDTime)

Converts the string argument into a Calendar value.

Parameters:
    lexicalXSDTime - A string containing lexical representation of
                    xsd:Time.

Returns:
    A Calendar value represented by the string argument.

Throws:
    IllegalArgumentException - if string parameter does not conform
to lexical value space defined in XML Schema Part 2: Datatypes
for xsd:Time.

public java.util.Calendar parseDate(String lexicalXSDDate)

Calendar

    lexicalXSDDate    xsd:Date
    return            Calendar
    Throws             IllegalArgumentException: XML Schema Part 2:
                        Datatypes xsd:Date
parseDate

`Calendar parseDate(String lexicalXSDDate)`

Converts the string argument into a Calendar value.

**Parameters:**
- `lexicalXSDDate` - A string containing lexical representation of xsd:Date.

**Returns:**
- A Calendar value represented by the string argument.

**Throws:**
- `IllegalArgumentException` - if string parameter does not conform to lexical value space defined in XML Schema Part 2: Datatypes for xsd:Date.

---

public String parseAnySimpleType(String lexicalXSDAnySimpleType)

`lexicalXSDAnySimpleType`

`return`

parseAnySimpleType

`String parseAnySimpleType(String lexicalXSDAnySimpleType)`

Return a string containing the lexical representation of the simple type.

**Parameters:**
- `lexicalXSDAnySimpleType` - A string containing lexical representation of the simple type.

**Returns:**
- A string containing the lexical representation of the simple type.
public String printString(String val)

    val
    return xsd:string

printString

String printString(String val)

    Converts the string argument into a string.

Parameters:
    val - A string value.

Returns:
    A string containing a lexical representation of xsd:string

public String printInteger(java.math.BigInteger val)

BigInteger

    val
    return xsd:integer
    Throws IllegalArgumentException: val null

printInteger

String printInteger(BigInteger val)

    Converts a BigInteger value into a string.

Parameters:
    val - A BigInteger value
Returns:
A string containing a lexical representation of xsd:integer

Throws:
IllegalArgumentException - val is null.

---

**public String printInt(int val)**

```
int
    val int
    return xsd:int
```

**printInt**

*String printInt(int val)*

Converts an int value into a string.

**Parameters:**
val - An int value

**Returns:**
A string containing a lexical representation of xsd:int

---

**public String printLong(long val)**

```
long
    val long
    return xsd:long
```

**printLong**

*String printLong(long val)*
Converts a long value into a string.

**Parameters:**
val - A long value

**Returns:**
A string containing a lexical representation of xsd:long

```
public String printShort(short val)
```

short
val short
return xsd:short

**printShort**

`String printShort(short val)`

Converts a short value into a string.

**Parameters:**
val - A short value

**Returns:**
A string containing a lexical representation of xsd:short

```
public String printDecimal(java.math.BigDecimal val)
```

BigDecimal
val BigDecimal
return xsd:decimal
Throws IllegalArgumentException: val null
printDecimal

String printDecimal(BigDecimal val)

Converts a BigDecimal value into a string.

**Parameters:**

val - A BigDecimal value

**Returns:**

A string containing a lexical representation of xsd:decimal

**Throws:**

IllegalArgumentException - val is null.

---

public String printFloat(float val)

float

val float

return xsd:float

---

printFloat

String printFloat(float val)

Converts a float value into a string.

**Parameters:**

val - A float value

**Returns:**

A string containing a lexical representation of xsd:float

---

public String printDouble(double val)

double

val double
printDouble

String printDouble(double val)

Converts a double value into a string.

Parameters:
val - A double value

Returns:
A string containing a lexical representation of xsd:double

public String printBoolean(boolean val)

boolean val

return xsd:boolean

printBoolean

String printBoolean(boolean val)

Converts a boolean value into a string.

Parameters:
val - A boolean value

Returns:
A string containing a lexical representation of xsd:boolean

public String printByte(byte val)
printByte

String printByte(byte val)

Converts a byte value into a string.

Parameters:
- val - A byte value

Returns:
A string containing a lexical representation of xsd:byte

public String printQName(javax.xml.namespace.QName val, javax.xml.namespace.NamespaceContext nsc)

QName

String printQName(QName val, NamespaceContext nsc)

Converts a QName instance into a string.

Parameters:
val - A QName value
nsc - A namespace context for interpreting a prefix within a QName.

Returns:
A string containing a lexical representation of QName

Throws:
IllegalArgumentException - if val is null or if nsc is non-null or
nsc.getPrefix(nsPrefixFromVal) is null.

public String printDateTime(java.util.Calendar val)

Calendar
  val Calendar
  return xsd:dateTime
  Throws IllegalArgument Exception: val null

printDateTime

String printDateTime(Calendar val)

Converts a Calendar value into a string.

Parameters:
val - A Calendar value

Returns:
A string containing a lexical representation of xsd:dateTime

Throws:
IllegalArgumentException - if val is null.

public String printBase64Binary(byte[] val)

val byte[]
return xsd:base64Binary
printBase64Binary

String printBase64Binary(byte[] val)

Converts an array of bytes into a string.

Parameters:
val - an array of bytes

Returns:
A string containing a lexical representation of xsd:base64Binary

Throws:
IllegalArgumentException - if val is null.

printHexBinary

String printHexBinary(byte[] val)

val
return xsd:hexBinary
Throws IllegalArgumentException: val null

printHexBinary

String printHexBinary(byte[] val)

Converts an array of bytes into a string.

Parameters:
val - an array of bytes

Returns:
A string containing a lexical representation of xsd:hexBinary

Throws:
IllegalArgumentException - if val is null.

public String printUnsignedInt(long val)

long
val
return

printUnsignedInt

String printUnsignedInt(long val)

Converts a long value into a string.

Parameters:
val - A long value

Returns:
A string containing a lexical representation of xsd:unsignedInt

public String printUnsignedShort(int val)

int
val
return

printUnsignedShort

String printUnsignedShort(int val)

Converts an int value into a string.

Parameters:
val - An int value

**Returns:**
A string containing a lexical representation of xsd:unsignedShort

```java
public String printTime(java.util.Calendar val)
```

**Calendar**

```java
val Calendar
return xsd:time
Throws IllegalArgumentException: val null
```

**printTime**

```java
String printTime(Calendar val)
```

Converts a Calendar value into a string.

**Parameters:**
val - A Calendar value

**Returns:**
A string containing a lexical representation of xsd:time

**Throws:**
`IllegalArgumentException` - if val is null.

---

```java
public String printDate(java.util.Calendar val)
```

**Calendar**

```java
val Calendar
return xsd:date
Throws IllegalArgumentException: val null
```
printDate

String printDate(Calendar val)

Converts a Calendar value into a string.

Parameters:
val - A Calendar value

Returns:
A string containing a lexical representation of xsd:date

Throws:
IllegalArgumentException - if val is null.

public String printAnySimpleType(String val)

val
return xsd:AnySimpleType

printAnySimpleType

String printAnySimpleType(String val)

Converts a string value into a string.

Parameters:
val - A string value

Returns:
A string containing a lexical representation of xsd:AnySimpleType
javax.mail.search Class DateTerm

java.lang.Object
   | javax.mail.search.SearchTerm
      | javax.mail.search.ComparisonTerm
      | javax.mail.search.DateTerm

All Implemented Interfaces:
   Serializable

Direct Known Subclasses:
   ReceivedDateTerm, SentDateTerm

public abstract class DateTerm extends ComparisonTerm

Extends: SearchTerm > ComparisonTerm
Extended by: ReceivedDateTerm, SentDateTerm

Date

This class implements comparisons for Dates

The date.

**Constructor Detail**

protected `DateTerm(int comparison, java.util.Date date)`

```
comparison  
date        Date
```

**DateTerm**

protected `DateTerm(int comparison, Date date)`

Constructor.

**Parameters:**
- `comparison` - the comparison type
- `date` - The Date to be compared against

**Method Detail**

public `java.util.Date getDate()`

`Date`

**getDATE**

public `Date getDate()`

Return the Date to compare with.

public `int getComparison()`
getComparison

public int getComparison()

    Return the type of comparison.

protected boolean match(java.util.Date d)

    d
    return true false

match

protected boolean match(Date d)

    The date comparison method.

    Parameters:
    d - the date in the constructor is compared with this date

    Returns:
    true if the dates match, otherwise false

equals

equals

public boolean equals(Object obj)

    Equality comparison.

    Overrides:
public int hashCode()
hashCode

hashCode

public int hashCode()

Compute a hashCode for this object.

Overrides:
hashCode in class ComparisonTerm

javax.faces.convert Class DateTimeConverter

java.lang.Object
   \ javax.faces.convert.DateTimeConverter

All Implemented Interfaces:
   StateHolder, Converter

public class DateTimeConverter
   extends Object
   implements Converter, StateHolder

Implements: Converter, StateHolder

java.util.Date Converter

getAsObject() String java.util.Date

   • String null null
   • String 0 null
   • locale null Locale UIViewRoot Locale
   • pattern java.text.SimpleDateFormat typedateStyle
timeStyle
   • pattern type dateStyle timeStyle
   • timezone DateFormat "GMT"

getAsString() java.util.Date String

   • null 0 String
   • String
   • locale null Locale UIViewRoot Locale
   • timezone DateFormat "GMT"
   • pattern java.text.SimpleDateFormat typedateStyle
timeStyle
   • pattern type String dateStyle timeStyle
Converter implementation for java.util.Date values.

The getAsObject() method parses a String into a java.util.Date, according to the following algorithm:

- If the specified String is null, return a null. Otherwise, trim leading and trailing whitespace before proceeding.
- If the specified String - after trimming - has a zero length, return null.
- If the locale property is not null, use that Locale for managing parsing. Otherwise, use the Locale from the UIViewRoot.
- If a pattern has been specified, its syntax must conform the rules specified by java.text.SimpleDateFormat. Such a pattern will be used to parse, and the type, dateStyle, and timeStyle properties will be ignored.
- If a pattern has not been specified, parsing will be based on the type property, which expects a date value, a time value, or both. Any date and time values included will be parsed in accordance to the styles specified by dateStyle and timeStyle, respectively.
- If a timezone has been specified, it must be passed to the underlying DateFormat instance. Otherwise the "GMT" timezone is used.
- In all cases, parsing must be non-lenient; the given string must strictly adhere to the parsing format.

The getAsString() method expects a value of type java.util.Date (or a subclass), and creates a formatted String according to the following algorithm:

- If the specified value is null, return a zero-length String.
- If the specified value is a String, return it unmodified.
- If the locale property is not null, use that Locale for managing formatting. Otherwise, use the Locale from the UIViewRoot.
- If a timezone has been specified, it must be passed to the underlying DateFormat instance. Otherwise the "GMT" timezone is used.
- If a pattern has been specified, its syntax must conform the rules
Specified by java.text.SimpleDateFormat. Such a pattern will be used to format, and the type, dateStyle, and timeStyle properties will be ignored.

- If a pattern has not been specified, formatting will be based on the type property, which includes a date value, a time value, or both into the formatted String. Any date and time values included will be formatted in accordance to the styles specified by dateStyle and timeStyle, respectively.

### Constructor Summary

**DateTimeConverter()**

### Method Summary

**getAsObject(FacesContext context, UICOMPONENT component, String value)**
Convert the specified string value, which is associated with the specified `UIComponent`, into a model data object that is appropriate for being stored during the *Apply Request Values* phase of the request processing lifecycle.

```java
String getAsString(FacesContext context, UIComponent component, Object value)
```

Convert the specified model object value, which is associated with the specified `UIComponent`, into a String that is suitable for being included in the response generated during the *Render Response* phase of the request processing lifecycle.

```java
String getDateStyle()
```

Return the style to be used to format or parse dates.

```java
Locale getLocale()
```

Return the `Locale` to be used when parsing or formatting dates and times.

```java
String getPattern()
```

Return the format pattern to be used when formatting and parsing dates and times.

```java
String getTimeStyle()
```

Return the style to be used to format or parse times.

```java
TimeZone getTimeZone()
```

Return the `TimeZone` used to interpret a time value.

```java
String getType()
```

Return the type of value to be formatted or parsed.

```java
boolean isTransient()
```

If true, the Object implementing this interface must not participate in state saving or restoring.

```java
void restoreState(FacesContext context, Object state)
```

Perform any processing required to restore the state from the entries in the state Object.

```java
Object saveState(FacesContext context)
```

Gets the state of the instance as a `Serializable` Object.

```java
void setDateStyle(String dateStyle)
```

Set the style to be used to format or parse dates.

```java
void setLocale(Locale locale)
```

Set the `Locale` to be used when parsing or formatting

**Field Detail**

**CONVERTER_ID**

public static final String **CONVERTER_ID**

The standard converter id for this converter.

**See Also:**

[Constant Field Values](#)
DATE_ID

public static final String DATE_ID

The message identifier of the FacesMessage to be created if the conversion to Date fails. The message format string for this message may optionally include the following placeholders:

- `{0}` replaced by the unconverted value.
- `{1}` replaced by an example value.
- `{2}` replaced by a String whose value is the label of the input component that produced this message.

See Also:
Constant Field Values

---

TIME_ID

public static final String TIME_ID

The message identifier of the FacesMessage to be created if the conversion to Time fails. The message format string for this message may optionally include the following placeholders:

- `{0}` replaced by the unconverted value.
- `{1}` replaced by an example value.
- `{2}` replaced by a String whose value is the label of the input component that produced this message.

See Also:
Constant Field Values

---

DATETIME_ID
public static final String DATETIME_ID

The message identifier of the FacesMessage to be created if the conversion to DateTime fails. The message format string for this message may optionally include the following placeholders:

- `{0}` replaced by the unconverted value.
- `{1}` replaced by an example value.
- `{2}` replaced by a String whose value is the label of the input component that produced this message.

See Also:
Constant Field Values

STRING_ID

public static final String STRING_ID

The message identifier of the FacesMessage to be created if the conversion of the DateTime value to String fails. The message format string for this message may optionally include the following placeholders:

- `{0}` replaced by the unconverted value.
- `{1}` replaced by a String whose value is the label of the input component that produced this message.

Constructor Detail

public DateTimeConverter()
DateTimeConverter

```java
public DateTimeConverter()
```

### Method Detail

**public String getDateStyle()**

default

**getDateTimeStyle**

```java
public String getDateStyle()
```

Return the style to be used to format or parse dates. If not set, the default value, default, is returned.

**public void setDateStyle(String dateStyle)**

```java
public void setDateStyle(String dateStyle)
```

default short medium long full getAsObject() getAsString() ConverterException

dateStyle

**setDateTimeStyle**

```java
public void setDateStyle(String dateStyle)
```

Set the style to be used to format or parse dates. Valid values are default, short, medium, long, and full. An invalid value will cause a `ConverterException` when `getAsObject()` or `getAsString()` is called.

**Parameters:**
public java.util.Locale getLocale()

Locale javax.faces.component.UUIViewRoot Locale

getLocale

public Locale getLocale()

Return the Locale to be used when parsing or formatting dates and times. If not explicitly set, the Locale stored in the UUIViewRoot for the current request is returned.

public void setLocale(java.util.Locale locale)

Locale null javax.faces.component.UUIViewRoot Locale

locale Locale null

setLocale

public void setLocale(Locale locale)

Set the Locale to be used when parsing or formatting dates and times. If set to null, the Locale stored in the UUIViewRoot for the current request will be utilized.

Parameters:
locale - The new Locale (or null)

public String getPattern()
getPattern

```java
public String getPattern()

    Return the format pattern to be used when formatting and parsing dates and times.
```

setPattern

```java
public void setPattern(String pattern)

    java.text.SimpleDateFormat getAsObject()
getAsString()    ConverterException

    pattern
```

public void setPattern(String pattern)

Set the format pattern to be used when formatting and parsing dates and times. Valid values are those supported by java.text.SimpleDateFormat. An invalid value will cause a ConverterException when getAsObject() or getAsString() is called.

Parameters:

    pattern - The new format pattern
```

public String getTimeStyle()

    default
getTimeStyle

public String getTimeStyle()

    Return the style to be used to format or parse times. If not set, the default value, default, is returned.

public void setTimeStyle(String timeStyle)

    default short medium long full getAsObject()
getAsString() ConverterException

timeStyle

setTimeStyle

public void setStyle(String timeStyle)

    Set the style to be used to format or parse times. Valid values are default, short, medium, long, and full. An invalid value will cause a ConverterException when getAsObject() or getAsString() is called.

    Parameters:
        timeStyle - The new style code

public java.util.TimeZone getTimeZone()

    TimeZone GMT

g getTimeZone

public TimeZone getTimeZone()
Return the TimeZone used to interpret a time value. If not explicitly set, the default time zone of GMT returned.

public void setTimeZone(java.util.TimeZone timeZone)

TimeZone

timeZone

setTimeZone

public void setTimeZone(TimeZone timeZone)

Set the TimeZone used to interpret a time value.

Parameters:

timeZone - The new time zone

public String getType()

date

g getType

public String getType()  

Return the type of value to be formatted or parsed. If not explicitly set, the default type, date is returned.

public void setType(String type)

bothdate time getAsObject() getAsString()
ConverterException

:type

**setType**

public void **set**Type(String type)

Set the type of value to be formatted or parsed. Valid values are both, date, or time. An invalid value will cause a ConverterException when getAsObject() or getAsString() is called.

**Parameters:**

type - The new date style

---

**getAsObject**

public Object **getAs**Object(FacesContext context, UIComponent component, String value)

**Throws** ConverterException: NullPointerException

Throws NullPointerException: NullPointerException

---

**getAsObject**

public Object **getAs**Object(FacesContext context, UIComponent component, String value)

**Description copied from interface:** Converter

Convert the specified string value, which is associated with the specified UIComponent, into a model data object that is appropriate for being stored during the Apply Request Values phase of the request processing lifecycle.

**Specified by:** getAsObject in interface Converter
public String getAsString(FacesContext context, UIComponent component, Object value)

Throws ConverterException: NullPointerException
Throws NullPointerException: NullPointerException

getAsString

public String getAsString(FacesContext context, UIComponent component, Object value)

Description copied from interface: Converter

Convert the specified model object value, which is associated with the specified UIComponent, into a String that is suitable for being included in the response generated during the Render Response phase of the request processing lifecycle.

Specified by:
getAsString in interface Converter

Parameters:
context - FacesContext for the request being processed
component - UIComponent with which this model object value is associated
value - String value to be converted (may be null)
associated value - Model object value to be converted (may be null)

Returns:
a zero-length String if value is null, otherwise the result of the conversion

Throws:
ConverterException - if conversion cannot be successfully performed
NullPointerException - if context or component is null

public Object saveState(FacesContext context)

Object saveState(FacesContext context)

Description copied from interface: StateHolder

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.saveState(javax.faces.context.FacesContext) method on all those instances as well. **This method must not save the state of children and facets.** That is done via theStateManager

This method must not alter the state of the implementing object. In other words, after executing this code:

    Object state = component.saveState(facesContext);

component should be the same as before executing it.

The return from this method must be Serializable

Specified by:
public void restoreState(FacesContext context, Object state)

Description copied from interface: StateHolder

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object) method on all those instances as well.

Specified by: 
restoreState in interface StateHolder

public boolean isTransient()

isTransient

public boolean isTransient()

Description copied from interface: StateHolder

If true, the Object implementing this interface must not participate in state saving or restoring.
Specified by:

`isTransient` in interface `StateHolder`

public void `setTransient(boolean transientFlag)`

**setTransient**

public void `setTransient(boolean transientFlag)`

Description copied from interface: `StateHolder`

Denotes whether or not the Object implementing this interface must or must not participate in state saving or restoring.

Specified by:

`setTransient` in interface `StateHolder`

Parameters:

- `transientFlag` - boolean pass `true` if this Object will participate in state saving or restoring, otherwise pass `false`.

Copyright 2007 Sun Microsystems, Inc. All rights reserved. Use is subject to [license terms](https://www.oracle.com/legal/license-agreements.html).
The DConfigBean is a deployment configuration bean (DConfigBean) that is associated with one or more deployment descriptor beans, (DDBean). A DConfigBean represents a logical grouping of deployment configuration data to be presented to the Deploier. A DConfigBean provides zero or more XPaths that identifies the XML information it requires. A DConfigBean may contain other DConfigBeans and regular JavaBeans. The top most DConfigBean is a DConfigBeanRoot object which represents a single XML instance document.

A DConfigBean is created by calling DConfigBean.getDConfigBean(DDBean) method, where DConfigBean is the object that provided the XPath which the DDBean represents.
A DConfigBean is a JavaBean component that presents the dynamic deployment configuration information for a J2EE plugin to the deployer. It is a JavaBean. The JavaBean architecture was chosen because of its versatility in providing both simple and complex components. JavaBeans also enable the development of property sheets and property editors, as well as sophisticated customization wizards.

It is expected that a plugin vendor will provide a Property Editor for any complex datatype in a DConfigBean that a deployer needs to edit through a property sheet. The Property Editor should be implemented and made available to a tool according to the guidelines defined in the JavaBeans API Specification version 1.01.

</tbody>
</table>
public **DDBean** getDDBean()

DConfigBean XML JavaBean

return DConfigBean XML Bean

getDDBean

**DDBean** getDDBean()

Return the JavaBean containing the deployment descriptor XML text associated with this DConfigBean.

**Returns:**

The bean class containing the XML text for this DConfigBean.

---

public **String[]** getXpaths()

DConfigBean XPath

String X

return XML XPath String 'null'

g getXpaths

**String[]** getXpaths()

Return a list of XPaths designating the deployment descriptor information this DConfigBean requires. A given server vendor will need to specify some server-specific information. Each String returned by this method is an XPath describing a certain portion of the standard deployment descriptor for which there is corresponding server-specific configuration.

**Returns:**

a list of XPath Strings representing XML data to be retrieved or 'null' if there are none.
public **DConfigBean** getDConfigBean(**DDBean** bean) throws **ConfigurationException**

JavaBean DDBean XML

    return Bean DConfigBean
    bean XML DDBean

Throws **ConfigurationException**: Bean DDBean

### getDConfigBean

**DConfigBean** getDConfigBean(**DDBean** bean) throws **ConfigurationException**

Return the JavaBean containing the server-specific deployment configuration information based upon the XML data provided by the DDBean.

**Parameters:**

- **bean** - The DDBean containing the XML data to be evaluated.

**Returns:**

The DConfigBean to display the server-specific properties for the standard bean.

**Throws:**

- **ConfigurationException** - reports errors in generating a configuration bean. This DDBean is considered undeployable to this server until this exception is resolved. A suitably descriptive message is required so the user can diagnose the error.

---

public void removeDConfigBean(**DConfigBean** bean) throws **BeanNotFoundException**

Bean DConfigBean

    bean DConfigBean

Throws **BeanNotFoundException**: Bean Bean
removeDConfigBean

void removeDConfigBean(DConfigBean bean)
    throws BeanNotFoundException

Remove a child DConfigBean from this bean.

Parameters:
    bean - The child DConfigBean to be removed.

Throws:
    BeanNotFoundException - the bean provided is not in the child list of this bean.

public void notifyDDChange(XpathEvent event)
DDBean Bean Bean
    event DDBean

notifyDDChange

void notifyDDChange(XpathEvent event)

A notification that the DDBean provided in the event has changed and this bean or its child beans need to reevaluate themselves.

Parameters:
    event - an event containing a reference to the DDBean which has changed.

public void
addPropertyChangeListener(java.beans.PropertyChangeListener pcl)
Bean Bean
    pcl PropertyChangeListener

addPropertyChangeListener
addPropertyChangeListener

void addPropertyChangeListener(PropertyChangeListener pcl)

Register a property listener for this bean.

Parameters:

 pcl - PropertyChangeListener to add

public void removePropertyChangeListener(java.beans.PropertyChangeListener pcl)

Unregister a property listener for this bean.

Parameters:

 pcl - Listener to remove.
javax.enterprise.deploy.spi  Interface DConfigBeanRoot

All Superinterfaces:
DConfigBean

public interface DConfigBeanRoot
extends DConfigBean

Implements: DConfigBean

J2EE 0 XML 0 XML
Web

DConfigBeanRoot  Bean (DConfigBean)
DeploymentConfiguration.getDConfigBean(DDBeanRoot)
DDBeanRoot

DConfigBean  DConfigBeanRoot.getDConfigBean(DDBeanRoot)
DConfigBean  DConfigBeanRoot DDBeanRoot
webservice.xml  webserviceclient.xml

DDBeanRoot  XML
DeployableObject.getDDBeanRoot(String)  String WSDL
XML

A J2EE component module consists of one or more deployment descriptor files and zero or more non-deployment descriptor XML instance documents. A module must contain a component-specific deployment descriptor file (see the component specification for details). It may contain one or more secondary deployment descriptor files that define extra functionality on the component and zero or more non-deployment descriptor XML instance documents (see the Web Services specification).

The DConfigBeanRoot object is a deployment configuration bean
A DConfigBean object is associated with a deployment descriptor that extends a component's functionality. It must be created by calling the DConfigBeanRoot.getDConfigBean(DDBeanRoot) method. This DConfigBean object is a child of the component's DConfigBeanRoot object. The DDBeanRoot argument represents the secondary deployment descriptor. Deployment descriptor files such as webservice.xml and webserviceclient.xml are examples of secondary deployment descriptor files.

The server plugin must request a DDBeanRoot object for any non-deployment descriptor XML instance document data it requires. The plugin must call method DeployableObject.getDDBeanRoot(String) where String is the full path name from the root of the module to the file to be represented. A WSDL file is an example of a non-deployment descriptor XML instance document.

Method Detail
public DConfigBean getDConfigBean(DDBeanRoot ddBeanRoot)
DConfigBeanWeb DDBeanRoot
Web Web Web
    ddBeanRoot
    return DConfigBean DConfigBean null

getDConfigBean

DConfigBean getDConfigBean(DDBeanRoot ddBeanRoot)

Return a DConfigBean for a deployment descriptor that is not the module's primary deployment descriptor. Web services provides a deployment descriptor in addition to the module's primary deployment descriptor. Only the DDBeanRoot for this category of secondary deployment descriptors are to be passed as arguments through this method. Web service has two deployment descriptor files, one that defines the web service and one that defines a client of a web service. See the Web Service specificiation for the details.

Parameters:
    ddBeanRoot - represents the root element of a deployment descriptor file.

Returns:
    a DConfigBean to be used for processing this deployment descriptor data. Null may be returned if no DConfigBean is required for this deployment descriptor.

**Field Detail**

V1_3

public static final DConfigBeanVersionType V1_3
J2EE Platform version 1.3

V1_3_1

public static final DConfigBeanVersionType V1_3_1

J2EE Platform version 1.3.1 THIS CONSTANT SHOULD NEVER BE USED. Use V1_3 instead.

V1_4

public static final DConfigBeanVersionType V1_4

J2EE Platform version 1.4

V5

public static final DConfigBeanVersionType V5

Java EE Platform version 5

Constructor Detail

protected DConfigBeanVersionType(int value)

value

DConfigBeanVersionType
protected `DConfigBeanVersionType(int value)`

Construct a new enumeration value with the given integer value.

**Parameters:**
value - Integer value.

**Method Detail**

```java
public int getValue()
```

```java
    return getValue()
```

**getValue**

```java
public int getValue()
```

Returns this enumeration value's integer value.

**Returns:**
the value

```java
protected String[] getStringTable()
```

`DConfigBeanVersionType`

**getStringTable**

```java
protected String[] getStringTable()
```

Returns the string table for class `DConfigBeanVersionType`

```java
protected `DConfigBeanVersionType[]` getEnumValueTable()
```

`DConfigBeanVersionType`
getEnumValueTable

protected DConfigBeanVersionType[] getEnumValueTable()

Returns the enumeration value table for class DConfigBeanVersionType

public static DConfigBeanVersionType getDConfigBeanVersionType(int value)

value

getDConfigBeanVersionType

public static DConfigBeanVersionType getDConfigBeanVersionType(int value)

Return an object of the specified value.

Parameters:
value - a designator for the object.

public String toString()
DConfigBeanVersionType

toString

public String toString()

Return the string name of this DConfigBeanVersionType or the integer value if outside the bounds of the table

Overrides:
protected int getOffset()

0

return

getOffset

protected int getOffset()

Returns the lowest integer value used by this enumeration value's enumeration class.

The default implementation returns 0.

Returns:
the offset of the lowest enumeration value.

public class DConfigBeanVersionUnsupportedException
extends Exception

Extends: Throwable > Exception

DConfigBean

This exception is to report that there is no support for the DConfigBean version requested.

See Also:
    Serialized Form

Constructor Summary

DConfigBeanVersionUnsupportedException(String s)
    Creates a new DConfigBeanVersionUnsupportedException object.

Method Summary

Methods inherited from class java.lang.Throwable
Constructor Detail

public DConfigBeanVersionUnsupportedException(String s)
DConfigBeanVersionUnsupportedException
   s

DConfigBeanVersionUnsupportedException

public DConfigBeanVersionUnsupportedException(String s)

   Creates an new DConfigBeanVersionUnsupportedException object.

   Parameters:
   s - a string indicating what was wrong with the version request.
javax.enterprise.deploy.model

**Interface DDBean**

All Known Subinterfaces:
- DDBeanRoot

```java
public interface DDBean
```

**Implemented by:** DDBeanRoot

Bean Bean J2EE

An interface for beans that represent a fragment of a standard deployment descriptor. A link is provided to the J2EE application that includes this bean.

### Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>addXpathListener</strong></td>
<td>Register a listener for a specific XPath.</td>
</tr>
<tr>
<td><strong>getAttributeNames</strong></td>
<td>Returns the list of attribute names associated with the XML element.</td>
</tr>
<tr>
<td><strong>getAttributeValue</strong></td>
<td>Returns the string value of the named attribute.</td>
</tr>
<tr>
<td><strong>getChildBean</strong></td>
<td>Return a list of DDBeans based upon the XPath.</td>
</tr>
<tr>
<td><strong>getId</strong></td>
<td>Returns a tool-specific reference for attribute ID on an element in the deployment descriptor.</td>
</tr>
<tr>
<td><strong>getRoot</strong></td>
<td>Return the root element for this DDBean.</td>
</tr>
<tr>
<td><strong>getText</strong></td>
<td>Returns the XML text for by this bean.</td>
</tr>
</tbody>
</table>
**Method Detail**

**public String getXpath()**

DConfigBean xpath

    return Bean XPath

**getXpath()**

String get xpath()

    Returns the original xpath string provided by the DConfigBean.

**Returns:**
The XPath of this Bean.

**public String getText()**

Bean XML

    return Bean XML

**getText()**

String get Text()
Returns the XML text for by this bean.

**Returns:**

The XML text for this Bean.

---

```java
public String getId()
```

**ID J2EE 1.2  J2EE 1.3**

```java
return Bean XML 'null'
```

**getId**

```java
String getId()
```

Returns a tool-specific reference for attribute ID on an element in the deployment descriptor. This attribute is defined for J2EE 1.2 and 1.3 components.

**Returns:**

The XML text for this Bean or 'null' if no attribute was specified with the tag.

---

```java
public DDBeanRoot getRoot()
```

**DDBean**

```java
return DDBean DDBeanRoot
```

**getRoot**

```java
DDBeanRoot getRoot()
```

Return the root element for this DDBean.

**Returns:**

The DDBeanRoot at the root of this DDBean tree.
public DDBean[] getChildBean(String xpath)

XPath DDBeans

    xpath    Bean XPath
    return    DDBeans XML 'null'

getChildBean

DDBean[] getChildBean(String xpath)

Return a list of DDBeans based upon the XPath.

Parameters:
    xpath - An XPath string referring to a location in the same
            deployment descriptor as this standard bean.

Returns:
    a list of DDBeans or 'null' if no matching XML data is found.

public String[] getText(String xpath)

XPath

    xpath    XPath
    return    XPath XML 'null'

getText

String[] getText(String xpath)

Return a list of text values for a given XPath in the deployment
descriptor.

Parameters:
    xpath - An XPath.

Returns:
    The list text values for this XPath or 'null' if no matching XML
data is found.
public void addXpathListener(String xpath, XpathListener xpl)

```
addXpathListener
```

Parameters:
- `xpath` - The XPath this listener is to be registered for.
- `xpl` - The listener object.

public void removeXpathListener(String xpath, XpathListener xpl)

```
removeXpathListener
```

Parameters:
- `xpath` - The XPath from which this listener is to be unregistered.
- `xpl` - The listener object.
public String[] getAttributeNames()

XML

    return null

getAttributeNames

String[] getAttributeNames()

    Returns the list of attribute names associated with the XML element.

    Returns:
    a list of attribute names on this element. Null is returned if there are no attributes.

public String getAttributeValue(String attrName)

    return null

getAttributeValue

String getAttributeValue(String attrName)

    Returns the string value of the named attribute.

    Returns:
    a the value of the attribute. Null is returned if there is no such attribute.
to **license terms.**

javaxenterprise.deploy.model.exceptions Class

DDBeanCreateException

java.lang.Object
  java.lang.Throwable
    java.lang.Exception
      javaxenterprise.deploy.model.exceptions.DDBeanCreateException

All Implemented Interfaces:
  Serializable

public class DDBeanCreateException extends Exception

Extends: Throwable > Exception

DDBean

This exception reports errors in generating a DDBean.

Author: gfink
See Also: Serialized Form

Constructor Summary

DDBeanCreateException()
Creates new DDBeanCreateException without detail message.

DDBeanCreateException(String msg)
Constructs an DDBeanCreateException with the specified detail message.
Method Summary

Methods inherited from class java.lang.Throwable
fillInStackTrace, getCause, getLocalizedMessage, getMessage, getStackTrace, initCause, printStackTrace, printStackTrace, printStackTrace, setStackTrace, toString

Methods inherited from class java.lang.Object
clone, equals, finalize, getClass, hashCode, notify, notifyAll, wait, wait, wait

Constructor Detail

public DDBeanCreateException()

DDBeanCreateException

public DDBeanCreateException()

Creates new DDBeanCreateException without detail message.

public DDBeanCreateException(String msg)

DDBeanCreateException

msg

DDBeanCreateException

public DDBeanCreateException(String msg)

Constructs an DDBeanCreateException with the specified detail message.
Parameters:
msg - the detail message.
javax.enterprise.deploy.model Interface DDBeanRoot

All Superinterfaces:
   DDBean

public interface DDBeanRoot
extends DDBean

Implements: DDBean

DDBeanRoot  DDBean

An interface that represents the root of a standard deployment descriptor. A DDBeanRoot is a type of DDBean.

Author:
gfink

<table>
<thead>
<tr>
<th>Method Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
</tr>
<tr>
<td>getDDBeanRootVersion()</td>
</tr>
<tr>
<td>Returns the version number of an XML instance document.</td>

</tr>
</tbody>
</table>
ModuleType getType()
ModuleType getType()

Return the ModuleType of deployment descriptor.

Returns:
The ModuleType of deployment descriptor

String getXpath()

Return the XPath for this standard bean.

Methods inherited from interface javax.enterprise.deploy.model.DDBean
addXpathListener, getAttributeNames, getAttributeValue, getChildBean, getId, getRoot, getText, getText, removeXpathListener

Method Detail

deployableObject

public DeployableObject getDeployableObject()
DeployableObject

getDeployableObject

Returns:

Return the containing DeployableObject

**Returns:**
The DeployableObject that contains this deployment descriptor

```java
public String getModuleDTDVersion()

DTD DeployableObject

    @return DTD
    DD DTD XML Schema
    DDBeanRoot.getDDBeanRootVersion
    
    @deprecated 1.1 DDBeanRoot.getDDBeanRootVersion()
```

### getModuleDTDVersion

```java
String getModuleDTDVersion()
```

**Deprecated. As of version 1.1 replaced by**

`DDBeanRoot.getDDBeanRootVersion()`

A convenience method to return the DTD version number. The DeployableObject has this information.

**Returns:**
a string containing the DTD version number This method is being deprecated. Two DD data formats are being used, DTD and XML Schema. DDBeanRoot.getDDBeanRootVersion should be used in its place.

```java
public String getDDBeanRootVersion()

XML DDBeanRoot.getModuleDTDVersion

DeployableObject.getModuleDTDVersion J2EE XML

    @return XML null
```
getDDBeanRootVersion

`String getDDBeanRootVersion()`

Returns the version number of an XML instance document. This method is replacing the methods `DDBeanRoot.getModuleDTDVersion` and `DeployableObject.getModuleDTDVersion`. This method returns the version number of any J2EE XML instance document.

**Returns:**
a string that is the version number of the XML instance document. Null is returned if no version number can be found.

---

public `String getXpath()`

**Bean** XPath XPath "/"

`return"/"` Bean

getxpath

`String getXpath()`

Return the XPath for this standard bean. The root XPath is "/".

**Specified by:**
`getXpath` in interface `DDBean`

**Returns:**
"/" this is the root standard bean.

---

public `String getFilename()`

**DDBeanRoot** XML

`return(String)`

getFilename
String  getFilename()

Returns the filename relative to the root of the module of the XML instance document this DDBeanRoot represents.

**Returns:**

String the filename relative to the root of the module
javax.xml.registry  Interface DeclarativeQueryManager

All Superinterfaces:  
QueryManager

public interface DeclarativeQueryManager
extends QueryManager

Implements: QueryManager

SQL

This interface provides the ability to execute declarative queries (e.g. SQL)

Author: 
Farrukh S. Najmi

Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query</td>
<td><code>createQuery(int queryType, String queryString)</code></td>
</tr>
<tr>
<td></td>
<td>Creates a Query object given a queryType (for example, QUERY_TYPE_SQL) and a String that represents a query in the syntax appropriate for queryType.</td>
</tr>
<tr>
<td>BulkResponse</td>
<td><code>executeQuery(Query query)</code></td>
</tr>
<tr>
<td></td>
<td>Executes a query as specified by query parameter.</td>
</tr>
</tbody>
</table>

Methods inherited from interface javax.xml.registry.QueryManager
getRegistryObject, getRegistryObject, getRegistryObjects, getRegistryObjects, getRegistryObjects, getRegistryService
public Query createQuery(int queryType, String queryString) throws InvalidRequestException, JAXRException

queryType QUERY_TYPE_SQL queryType
String Query

Throws:

throws JAXRException: JAXR

Throws InvalidRequestException: JAXR sqlQuery

See also:
QUERY_TYPE_SQL, QUERY_TYPE_XQUERY, QUERY_TYPE_EBXML_FILTER_QUERY

createQuery

Query createQuery(int queryType,
String queryString)
throws InvalidRequestException,
JAXRException

Creates a Query object given a queryType (for example, QUERY_TYPE_SQL) and a String that represents a query in the syntax appropriate for queryType.

Capability Level: 1

Parameters:

queryType - the type of query
queryString - the query in its string representation

Throws:

JAXRException - If the JAXR provider encounters an internal error
InvalidRequestException - If the JAXR provider validates query syntax (optional) and the sqlQuery is not valid

See Also:
Query.QUERY_TYPE_SQL, Query.QUERY_TYPE_XQUERY,
Query.QUERY_TYPE_EBXML_FILTER_QUERY

```java
default public BulkResponse executeQuery(Query query) throws JAXRException
```

query

```java
query
return BulkResponse
Throws JAXRException: JAXR
```

executeQuery

```java
BulkResponse executeQuery(Query query) throws JAXRException
```

Executes a query as specified by query parameter.

**Capability Level: 1**

**Parameters:**
query - the query to be executed

**Returns:**
the BulkResponse that is the result of the query

**Throws:**
JAXRException - If the JAXR provider encounters an internal error

javax.xml.bind.helpers Class DefaultValidationEventHandler

java.lang.Object
   ↓ javax.xml.bind.helpers.DefaultValidationEventHandler

All Implemented Interfaces:
   ValidationEventHandler

public class DefaultValidationEventHandler
extends Object
implements ValidationEventHandler

Implements: ValidationEventHandler

JAXB 1.0  JAXB 1.0  JAXBContext

JAXB 2.0  JAXB
javax.xml.bind.Marshaller

version
since
See
also
$Revision: 1.5 $
JAXB1.0
javax.xml.bind.Unmarshaller, javax.xml.bind.Validator,
javax.xml.bind.ValidationEventHandler

JAXB 1.0 only default validation event handler. This is the default handler for all objects created from a JAXBContext that is managing schema-derived code generated by a JAXB 1.0 binding compiler.

This handler causes the unmarshal and validate operations to fail on the first error or fatal error.
This handler is not the default handler for JAXB mapped classes following JAXB 2.0 or later versions. Default validation event handling has changed and is specified in Unmarshaller and Marshaller.

Since:
   JAXB1.0
Version:
   $Revision: 1.5$
Author:
   - Ryan Shoemaker, Sun Microsystems, Inc.
See Also:
   Unmarshaller, Validator, ValidationEventHandler

Constructor Summary

DefaultValidationEventHandler()

Method Summary

| boolean | handleEvent(ValidationEvent event) |
Receive notification of a validation warning or error.

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

Constructor Detail

public DefaultValidationEventHandler()
public boolean handleEvent(ValidationEvent event)

Description copied from interface: ValidationEventHandler
Receive notification of a validation warning or error. The ValidationEvent will have a ValidationEventLocator embedded in it that indicates where the error or warning occurred.

If an unchecked runtime exception is thrown from this method, the JAXB provider will treat it as if the method returned false and interrupt the current unmarshal, validate, or marshal operation.

Specified by:
handleEvent in interface ValidationEventHandler

Parameters:
event - the encapsulated validation event information. It is a provider error if this parameter is null.

Returns:
true if the JAXB Provider should attempt to continue the current unmarshal, validate, or marshal operation after handling this warning/error, false if the provider should terminate the current operation with the appropriate UnmarshalException, ValidationException, Or MarshalException.
PS:
javax.xml.registry  Class DeleteException

All Implemented Interfaces: Serializable, JAXRResponse

public class DeleteException
extends RegistryException

Extends: Throwable > Exception > JAXRException > RegistryException

delete  RegistryException

A RegistryException that occurs during a delete action.

public DeleteException()
    Throwable  JAXRException

DeleteException

public DeleteException()
    Constructs a JAXRException object with no reason or embedded Throwable.

public DeleteException(String reason)
    JAXRException  String
    reason

DeleteException

public DeleteException(String reason)
    Constructs a JAXRException object with the given String as the reason for the exception being thrown.

Parameters:
    reason - a description of what caused the exception

public DeleteException(String reason, Throwable cause)
    JAXRException  String  Throwable
    reason
    cause
DeleteException

public DeleteException(String reason, Throwable cause)

Constructs a JAXRException object with the given String as the reason for the exception being thrown and the given Throwable object as an embedded Throwable.

Parameters:
reason - a description of what caused the exception
cause - a Throwable object that is to be embedded in this JAXRException object

public DeleteException(Throwable cause)

Constructs a JAXRException object initialized with the given Throwable object.

Parameters:
cause - the Throwable that caused this Exception
PS:
The delivery modes supported by the JMS API are **PERSISTENT** and **NON_PERSISTENT**.

A client marks a message as persistent if it feels that the application will have problems if the message is lost in transit. A client marks a message as non-persistent if an occasional lost message is tolerable. Clients use delivery mode to tell a JMS provider how to balance message transport reliability with throughput.

Delivery mode covers only the transport of the message to its destination. Retention of a message at the destination until its receipt is acknowledged is not guaranteed by a **PERSISTENT** delivery mode. Clients should assume that message retention policies are set administratively. Message retention policy governs the reliability of message delivery from destination to message consumer. For example, if a client's message storage space is exhausted, some messages may be dropped in accordance with a site-specific message retention policy.

A message is guaranteed to be delivered once and only once by a JMS provider if the delivery mode of the message is **PERSISTENT** and if the destination has a sufficient message retention policy.
Field Summary

<table>
<thead>
<tr>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>static int</td>
<td>NON_PERSISTENT</td>
<td>This is the lowest-overhead delivery mode because it does not require that the message be logged to stable storage.</td>
</tr>
<tr>
<td>static int</td>
<td>PERSISTENT</td>
<td>This delivery mode instructs the JMS provider to log the message to stable storage as part of the client's send operation.</td>
</tr>
</tbody>
</table>

Field Detail

NON_PERSISTENT

static final int NON_PERSISTENT

This is the lowest-overhead delivery mode because it does not require that the message be logged to stable storage. The level of JMS provider failure that causes a NON_PERSISTENT message to be lost is not defined.

A JMS provider must deliver a NON_PERSISTENT message with an at-most-once guarantee. This means that it may lose the message, but it must not deliver it twice.

See Also:

Constant Field Values
static final int PERSISTENT

This delivery mode instructs the JMS provider to log the message to stable storage as part of the client's send operation. Only a hard media failure should cause a PERSISTENT message to be lost.

**Method Detail**

```java
definition
public ModuleType getType()

ModuleType EARJARWARRAR

DeploymentManager

```

### getType

```java
definition
public ModuleType getType()

```

Return the ModuleType of deployment descriptor (i.e., EAR, JAR, WAR, RAR) this deployable object represents. Values are found in DeploymentManager.

**Returns:**

The ModuleType of deployable object
public DDBeanRoot getDDBeanRoot()

return Bean

getDDBeanRoot

DDBeanRoot getDDBeanRoot()

Return the top level standard bean representing the root of the deployment descriptor.

Returns:
A standard bean representing the deployment descriptor.

gublic DDBean[] getChildBean(String xpath)

Bean Bean XPath XML

xpath XPath

return DDBean 'null'

getChildBean

DDBean[] getChildBean(String xpath)

Return an array of standard beans representing the XML content returned based upon the XPath.

Parameters:
xpath - An XPath string identifying the data to be extracted from the deployment descriptor.

Returns:
a array of DDBeans or 'null' if no matching data found.
public String[] getText(String xpath)

XPath XML
xpath xpath
return XML 'null'

ggetText

String[] getText(String xpath)

Return the XML content associated with the XPath from a deployment descriptor.

Parameters:
 xpath - An xpath string referring to a location in the deployment descriptor

Returns:
 a list XML content or 'null' if no matching data found.

public Class<T> getClassFromScope(String className)

EJB cross-path

className
return (Class)

gGetClassFromScope

Class getClassFromScope(String className)

Retrieve the specified class from this deployable module.

One use: to get all finder methods from an EJB If the tool is attempting to package an module and retrieve a class from the package, the class request may fail. The class may not yet be
available. The tool should respect the manifest cross-path entries.

**Parameters:**
- className - Class to retrieve.

**Returns:**
- Class representation of the class

```java
public String getModuleDTDVersion()
XML DOCTYPE DTD J2EE XML DOCTYPE

DTD

DOCTYPE

DOCTYPE

<!DOCTYPE root_element PUBLIC "-//organization//label//language" "location">

root_element - DTD

return

label -

language - ISO 639 id
DTD
location - DTD URL

J2EE DOCTYPE

<!DOCTYPE application-client PUBLIC "-//Sun Microsystems, Inc.//DTD J2EE Application Client 1.3/,
"http://java.sun.com/dtd/application-client_1_3.dtd">

"DTD J2EE Application Client 1.3"
DTD 1.3 getModuleDTDVersion
"1.3"

J2EE 1.4 DDBeanRoot.getDDBeanRootVersion```
getModuleDTDVersion

String getModuleDTDVersion()

Deprecated. As of version 1.1 replaced by DDBeanRoot.getDDBeanRootVersion()

Returns the DTD version number given in the XML DOCTYPE text provided in every standard J2EE module's deployment descriptor file.

Returns:

a string containing the DTD version number

A module's deployment descriptor file always contains a document type identifier, DOCTYPE. The DOCTYPE statement contains the module DTD version number in the label of the statement.

The format of the DOCTYPE statement is:

```xml
<!DOCTYPE root_element PUBLIC "-//organization//label//language" "location">
```

root_element - is the name of the root document in the DTD.
organization - is the name of the organization responsible for the creation and maintenance of the DTD being referenced.
label - is a unique descriptive name for the public text being referenced.
language - is the ISO 639 language id representing the natural language encoding of the DTD.
location - is the URL of the DTD.

An example J2EE deployment descriptor DOCTYPE statement is:

```xml
<!DOCTYPE application-client PUBLIC "-//Sun Microsystems, Inc./DTD J2EE Application Client 1_3.dtd" "http://java.sun.com/dtd/application-client_1_3.dtd">
```

In this example the label is, "DTD J2EE Application Client" and the DTD version number is 1.3. A call to getModuleDTDVersion...
would return a string containing, "1.3".

This method is being deprecated. With the addition of multiple deployment descriptors in components for J2EE 1.4 this method is being replaced by DDBeanRoot.getDDBeanRootVersion.

```java
public DDBeanRoot getDDBeanRoot(String filename)
throws java.io.FileNotFoundException,
DDBeanCreateException
XML DDBeanRoot XML WSDL
DDBeanRoot
  return XML DDBeanRoot
  Throws java.io.FileNotFoundException,:
  Throws DDBeanCreateException: DDBeanRoot
```

getDDBeanRoot

```java
DDBeanRoot getDDBeanRoot(String filename)
throws FileNotFoundException,
DDBeanCreateException
```

Returns a DDBeanRoot object for the XML instance document named. This method should be used to return DDBeanRoot objects for non deployment descriptor XML instance documents such as WSDL files.

**Returns:**
- a DDBeanRoot object for the XML data.

**Throws:**
- java.io.FileNotFoundException, - if the named file can not be found
- DDBeanCreateException - if an error is encountered creating the DDBeanRoot object.
- FileNotFoundException
public java.util.Enumeration\langle E \rangle \ entries() \\
String \ String \\
\hspace{1cm} \text{return} \\

\textbf{entries} \\

\hspace{1cm} \textit{Enumeration entries()} \\

Returns an enumeration of the module file entries. All elements in the enumeration are of type String. Each String represents a file name relative to the root of the module.

\textbf{Returns:} \\
\hspace{1cm} an enumeration of the archive file entries.

\textbf{public java.io.InputStream \ getEntry(String name)} \\
\hspace{1cm} \textit{InputStream \ name} \\
\hspace{1cm} \text{return} \hspace{1cm} \text{InputStream null} \\

\textbf{getEntry} \\

\hspace{1cm} \textit{InputStream \ getEntry(String name)} \\

Returns the InputStream for the given entry name. The file name must be relative to the root of the module.

\textbf{Parameters:} \\
\hspace{1cm} \textit{name} - the file name relative to the root of the module. \\

\textbf{Returns:} \\
\hspace{1cm} the InputStream for the given entry name or null if not found.

PS:
public interface DeploymentConfiguration

J2EE DeploymentConfiguration  EAR
    version  0.1

An interface that defines a container for all the server-specific configuration information for a single top-level J2EE module. The DeploymentConfiguration object could represent a single stand alone module or an EAR file that contains several sub-modules.

**Version:**
  0.1

**Author:**
gfink

| restoreDConfigBean( InputStream inputArchive,  
| DDBeanRoot bean) |
| Restore from disk to instantiated objects all the  
| DConfigBeans associated with a specific deployment descriptor. |
| void  | Save to disk the current set configuration beans created for this deployable module. |
| save( OutputStream outputArchive) |
| void  | Save to disk all the configuration beans associated with a particular deployment descriptor file. |
| saveDConfigBean( OutputStream outputArchive,  
| DConfigBeanRoot bean) |

**Method Detail**

```java
public DeployableObject getDeployableObject() {
    return DeployableObject
}
```

**getDeployableObject**

```java
DeployableObject getDeployableObject() {
    return DeployableObject
}
```

Returns an object that provides access to the deployment descriptor data and classes of a J2EE module.

**Returns:**

DeployableObject

```java
public DConfigBeanRoot getDConfigBeanRoot(DDBeanRoot bean) throws
```

```java
DConfigBeanRoot getDConfigBeanRoot(DDBeanRoot bean) throws
```
ConfigurationException
Bean DConfigBeanRoot DDBeanRoot Bean

```java
return

Throws

DConfigBeanRoot getDConfigBeanRoot(DDBeanRoot bean)
throws ConfigurationException
```

getDConfigBeanRoot

Returns the top level configuration bean, DConfigBeanRoot, associated with the deployment descriptor represented by the designated DDBeanRoot bean.

**Parameters:**
- `bean` - The top level bean that represents the associated deployment descriptor.

**Returns:**
- the DConfigBeanRoot for editing the server-specific properties required by the module.

**Throws:**
- `ConfigurationException` - reports errors in generating a configuration bean

---

```java
public void removeDConfigBean(DConfigBeanRoot bean)
throws BeanNotFoundException
DConfigBean Bean

Throws

BeanNotFoundException: Bean Bean
```

removeDConfigBean

```java
void removeDConfigBean(DConfigBeanRoot bean)
throws BeanNotFoundException
```

Throws
Remove the root DConfigBean and all its children.

**Parameters:**
bean - the top level DConfigBean to remove.

**Throws:**
BeanNotFoundException - the bean provided is not in this bean's child list.

```java
public DConfigBeanRoot restoreDConfigBean(java.io.InputStream inputArchive, DDBeanRoot bean) throwsConfigurationException
```

**DConfigBean Bean**

- `inputArchive` - DConfigBean
- `bean` - DDBeanRoot Bean
- `return` - Bean DConfigBeanRoot

**Throws**
ConfigurationException: Bean

**restoreDConfigBean**

```java
DConfigBeanRoot restoreDConfigBean(InputStream inputArchive, DDBeanRoot bean)
```

**Parameters:**
- `inputArchive` - The input stream for the file from which the DConfigBeans should be restored.
- `bean` - The DDBeanRoot bean associated with the deployment descriptor file.

**Returns:**
The top most parent configuration bean, DConfigBeanRoot

**Throws:**
ConfigurationException - reports errors in generating a
public void saveDConfigBean(java.io.OutputStream outputArchive, DConfigBeanRoot bean) throws ConfigurationException

Bean DConfigBean XML

outputArchive DConfigBean
bean Bean DConfigBeanRoot Bean
Throws ConfigurationException: Bean

saveDConfigBean

void saveDConfigBean(OutputStream outputArchive, DConfigBeanRoot bean)
throws ConfigurationException

Save to disk all the configuration beans associated with a particular deployment descriptor file. The saved data may be fully or partially configured DConfigBeans. The output file format is recommended to be XML.

Parameters:
outputArchive - The output stream to which the DConfigBeans should be saved.
bean - The top level bean, DConfigBeanRoot, from which to be save.

Throws:
ConfigurationException - reports errors in generating a configuration bean

public void restore(java.io.InputStream inputArchive)
throws ConfigurationException

Bean

inputArchive
Throws ConfigurationException: Bean
restore

```java
void restore(InputStream inputArchive)
    throws ConfigurationException
```

Restore from disk to a full set of configuration beans previously stored.

**Parameters:**
- `inputArchive` - The input stream from which to restore the Configuration.

**Throws:**
- `ConfigurationException` - reports errors in generating a configuration bean

---

save

```java
public void save(java.io.OutputStream outputArchive)
    throws ConfigurationException
```

Save to disk the current set configuration beans created for this deployable module. It is recommended the file format be XML.

**Parameters:**
- `outputArchive` - The output stream to which to save the Configuration.

**Throws:**
- `ConfigurationException`

PS :
The DeploymentFactory interface is a deployment driver for a J2EE platform product. It returns a DeploymentManager object which represents a connection to a specific J2EE platform product.

Each application server vendor must provide an implementation of this class in order for the J2EE Deployment API to work with their product.

The class implementing this interface should have a public no-argument constructor, and it should be stateless (two instances of the class should always behave the same). It is suggested but not required that the class have a static initializer that registers an instance of the class with the DeploymentFactoryManager class.

A connected or disconnected DeploymentManager can be requested. A DeploymentManager that runs connected to the platform can provide access to J2EE resources. A DeploymentManager that runs disconnected only provides module deployment configuration support.

<td>Provide a string identifying version of this vendor's <code>DeploymentManager</code>.</td>
</tr>
<tr>
<td><code>boolean handlesURI(String uri)</code></td>
<td>Tests whether this factory can create a <code>DeploymentManager</code> object based on the specified URI.</td>
</tr>
</tbody>
</table>

## Method Detail

```java
default public boolean handlesURI(String uri) {
    // Implementation details...
    return true;
}
```
Tests whether this factory can create a DeploymentManager object based on the specified URI. This does not indicate whether such an attempt will be successful, only whether the factory can handle the uri.

**Parameters:**
- **uri** - The uri to check

**Returns:**
- true if the factory can handle the uri.

```java
public DeploymentManager getDeploymentManager(String uri, String username, String password) throws DeploymentManagerCreationException
```

```
uri
username
password
return
```

**Throws**
- DeploymentManagerCreationException

**getDeploymentManager**

```java
DeploymentManager getDeploymentManager(String uri,
String username,
String password)
```

**Returns:**

- Connected DeploymentManager instance.

**Parameters:**
- **uri** - The URI that specifies the connection parameters
- **username** - An optional username (may be null if no authentication is required for this platform).
- **password** - An optional password (may be null if no authentication is required for this platform).

**Returns:**
A ready DeploymentManager instance.

**Throws:**
- `DeploymentManagerCreationException` - occurs when a DeploymentManager could not be returned (server down, unable to authenticate, etc).

```java
public DeploymentManager getDisconnectedDeploymentManager(String uri) throws DeploymentManagerCreationException
    return DeploymentManager
Throws DeploymentManagerCreationException: DeploymentManager
```

**getDisconnectedDeploymentManager**

```java
DeploymentManager getDisconnectedDeploymentManager(String uri) throws DeploymentManagerCreationException
```

Return a disconnected DeploymentManager instance.

**Parameters:**
- `uri` - the uri of the DeploymentManager to return.

**Returns:**
- A DeploymentManager disconnected instance.

**Throws:**
- `DeploymentManagerCreationException` - occurs if the DeploymentManager could not be created.

```java
public String getDisplayName()
    return DeploymentManager
```

```java
DeploymentManager
```
getDisplayName

String getDisplayName()

Provide a string with the name of this vendor's DeploymentManager.

Returns:
the name of the vendor's DeploymentManager.

public String getProductVersion()

DeploymentManager return DeploymentManager

getProductVersion

String getProductVersion()

Provide a string identifying version of this vendor's DeploymentManager.

Returns:
the name of the vendor's DeploymentManager.
The DeploymentFactoryManager class is a central registry for J2EE DeploymentFactory objects. The DeploymentFactoryManager retains references to DeploymentFactory objects loaded by a tool. A DeploymentFactory object provides a reference to a DeploymentManager. The DeploymentFactoryManager has been implemented as a singleton. A tool gets a reference to the DeploymentFactoryManager via the getInstance method. The DeploymentFactoryManager can return two types of DeploymentManagers, a connected DeploymentManager and a disconnected DeploymentManager. The connected DeploymentManager provides access to any product resources that may be required for configurations and deployment. The method to retrieve a connected DeploymentManager is getDeploymentManager. This method provides parameters for user name and password that the product may require for
user authentication. A disconnected DeploymentManager does not provide access to a running J2EE product. The method to retrieve a disconnected DeploymentManager is getDisconnectedDeploymentManager. A disconnected DeploymentManager does not need user authentication information.

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

### Method Detail

public static DeploymentFactoryManager getInstance()

DeploymentFactoryManager

return DeploymentFactoryManager
getInstance

public static DeploymentFactoryManager getInstance()

Retrieve the Singleton DeploymentFactoryManager

Returns:
DeploymentFactoryManager instance

getDeploymentFactories

DeploymentFactory[] getDeploymentFactories()

return DeploymentFactory

getDeploymentFactories

public DeploymentFactory[] getDeploymentFactories()

Retrieve the lists of currently registered DeploymentFactories.

Returns:
the list of DeploymentFactory objects or an empty array if there are none.

getDeploymentManager

DeploymentManager getDeploymentManager(String uri, String username, String password) throws DeploymentManagerCreationException

DeploymentManager URI
DeploymentFactory URI DeploymentFactory

uri
username
password

uri
null

uri
null
getDeploymentManager

```java
public DeploymentManager getDeploymentManager(String uri,
                                             String username,
                                             String password)
throws DeploymentManagerCreationException
```

Retrieves a DeploymentManager instance to use for deployment. The caller provides a URI and optional username and password, and all registered DeploymentFactories will be checked. The first one to understand the URI provided will attempt to initiate a server connection and return a ready DeploymentManager instance.

**Parameters:**
- **uri** - The uri to check
- **username** - An optional username (may be null if no authentication is required for this platform).
- **password** - An optional password (may be null if no authentication is required for this platform).

**Returns:**
A ready DeploymentManager instance.

**Throws:**
- **DeploymentManagerCreationException** - Occurs when the factory appropriate to the specified URI was unable to initialize a DeploymentManager instance (server down, unable to authenticate, etc.).

public void registerDeploymentFactory(DeploymentFactory factory)

registerDeploymentFactory
public void registerDeploymentFactory(DeploymentFactory factory)

Registers a DeploymentFactory so it will be able to handle requests.

public DeploymentManager getDisconnectedDeploymentManager(String uri) throws DeploymentManagerCreationException

    DeploymentManager uri DeploymentManager
    return DeploymentManager
    Throws DeploymentDriverException: DeploymentManager

getDisconnectedDeploymentManager

public DeploymentManager getDisconnectedDeploymentManager(String uri) throws DeploymentManagerCreationException

    Return a disconnected DeploymentManager instance.

    Parameters:
    uri - identifier of the disconnected DeploymentManager to return.

    Returns:
    A DeploymentManager instance.

    Throws:
    DeploymentDriverException - occurs if the DeploymentManager could not be created.
    DeploymentManagerCreationException

<tr>
<td><code>redeploy()</code></td>
<td></td>
</tr>
</tbody>
</table>
The redeploy method provides a means for updating currently deployed J2EE applications.

```java
ProgressObject redeploy(TargetModuleID[] moduleIDList, InputStream moduleArchive, InputStream deploymentPlan)
```

The release method is the mechanism by which signals to the DeploymentManager that the tool does to continue running connected to the platform.

```java
void release()
```

Set the configuration beans to be used to the J2EE platform version specified.

```java
void setDConfigBeanVersion(DConfigBeanVersionType version)
```

Set the active locale for this implementation of javax.enterprise.deploy.spi subpackages to run.

```java
void setLocale(Locale locale)
```

Start the application running.

```java
ProgressObject start(TargetModuleID[] moduleIDList)
```

Stop the application running.

```java
ProgressObject stop(TargetModuleID[] moduleIDList)
```

Remove the application from the target server.

```java
ProgressObject undeploy(TargetModuleID[] moduleIDList)
```

Method Detail

```java
public Target[] getTargets() throws IllegalStateException
```

Throws IllegalArgumentException:

```java
return Target 'null'
```

getTargets
getTargets() throws IllegalStateException

Retrieve the list of deployment targets supported by this DeploymentManager.

Returns:
A list of deployment Target designators the user may select for application deployment or 'null' if there are none.

Throws:
IllegalStateException - is thrown when the method is called when running in disconnected mode.

public TargetModuleID[] getRunningModules(ModuleType moduleType, Target[] targetList) throws TargetException, IllegalStateException

J2EE

moduleType J2EE

targetList Target

return TargetModuleID 'null'

Throws IllegalStateException:

Throws TargetException: Target

getRunningModules

TargetModuleID[] getRunningModules(ModuleType moduleType, Target[] targetList) throws TargetException, IllegalStateException

Retrieve the list of J2EE application modules distributed to the identified targets and that are currently running on the associated server or servers.

Parameters:
moduleType - A predefined designator for a J2EE module type.
targetList - A list of deployment Target designators the user
wants checked for module run status.

**Returns:**
An array of TargetModuleID objects representing the running modules or 'null' if there are none.

**Throws:**
- `IllegalStateException` - is thrown when the method is called when running in disconnected mode.
- `TargetException` - An invalid Target designator encountered.

```java
public TargetModuleID[] getNonRunningModules(ModuleType moduleType, Target[] targetList) throws TargetException, IllegalStateException
```

**J2EE**

- **moduleType**
  - J2EE
- **targetList**
  - Target
- **return**
  - TargetModuleID 'null'
- **Throws**
  - TargetException: Target

```
getNonRunningModules
```

Retrieve the list of J2EE application modules distributed to the identified targets and that are currently not running on the associated server or servers.

**Parameters:**
- `moduleType` - A predefined designator for a J2EE module type.
- `targetList` - A list of deployment Target designators the user wants checked for module not running status.

**Returns:**
An array of TargetModuleID objects representing the non-
running modules or 'null' if there are none.

**Throws:**
- `IllegalStateException` - is thrown when the method is called when running in disconnected mode.
- `TargetException` - An invalid Target designator encountered.

```java
public TargetModuleID[] getAvailableModules(ModuleType moduleType, Target[] targetList) throws TargetException, IllegalStateException
```

**J2EE**

moduleType - A predefined designator for a J2EE module type.
targetList - A list of deployment Target designators the user wants checked for module not running status.

**Returns:**
An array of TargetModuleID objects representing all deployed modules running or not or 'null' if there are no deployed modules.

**Throws:**
- `IllegalStateException` - is thrown when the method is called when running in disconnected mode.
when running in disconnected mode.  
TargetException - An invalid Target designator encountered.

```
public DeploymentConfiguration createConfiguration(DeployableObject dObj) throws InvalidModuleException

J2EE dObj J2EE

Throws InvalidModuleException: DeployableObject

createConfiguration

DeploymentConfiguration createConfiguration(DeployableObject dObj) throws InvalidModuleException

Retrieve the object that provides server-specific deployment configuration information for the J2EE deployable component.

Parameters:

dObj - An object representing a J2EE deployable component.

Throws:

InvalidModuleException - The DeployableObject is an unknown or unsupport component for this configuration tool.

public ProgressObject distribute(Target[] targetList, java.io.File moduleArchive, java.io.File deploymentPlan) throws IllegalStateException

(targetList moduleArchive deploymentPlan

Throws IllegalStateException: ProgressObject

return
The distribute method performs three tasks; it validates the deployment configuration data, generates all container specific classes and interfaces, and moves the fully baked archive to the designated deployment targets.

**Parameters:**
- `targetList` - A list of server targets the user is specifying this application be deployed to.
- `moduleArchive` - The file name of the application archive to be distributed.
- `deploymentPlan` - The XML file containing the runtime configuration information associated with this application archive.

**Returns:**
- ProgressObject an object that tracks and reports the status of the distribution process.

**Throws:**
- `IllegalStateException` - is thrown when the method is called when running in disconnected mode.

```java
public ProgressObject distribute(Target[] targetList,
                                 File moduleArchive,
                                 File deploymentPlan)
                                 throws IllegalStateException
```

deprecated

Java EE 5

```java
#distribute(Target[], ModuleType,
            InputStream, InputStream)
```
The distribute method performs three tasks; it validates the deployment configuration data, generates all container specific classes and interfaces, and moves the fully baked archive to the designated deployment targets.

**Parameters:**
- **targetList** - A list of server targets the user is specifying this application be deployed to.
- **moduleArchive** - The input stream containing the application archive to be distributed.
- **deploymentPlan** - The input stream containing the deployment configuration information associated with this application archive.

**Returns:**
ProgressObject an object that tracks and reports the status of the distribution process.

**Throws:**
- **IllegalStateException** - is thrown when the method is called when running in disconnected mode.
The distribute method performs three tasks; it validates the deployment configuration data, generates all container specific classes and interfaces, and moves the fully baked archive to the designated deployment targets.

**Parameters:**
- `targetList` - A list of server targets the user is specifying this application be deployed to.
- `moduleType` - The module type of this application archive.
- `moduleArchive` - The input stream containing the application archive to be distributed.
- `deploymentPlan` - The input stream containing the deployment configuration information associated with this application archive.

**Returns:**
- `ProgressObject` an object that tracks and reports the status of the distribution process.

**Throws:**
- `IllegalStateException` - is thrown when the method is called when running in disconnected mode.
public ProgressObject stop(TargetModuleID[] moduleIDList) throws IllegalStateException

Stop the application running.

Only the TargetModuleIDs which represent a root module are valid for being stopped. A root TargetModuleID has no parent. A TargetModuleID with a parent can not be individually stopped. A root TargetModuleID module and all its child modules will be stopped.

Parameters:
moduleIDList - A array of TargetModuleID objects representing the modules to be stopped.

Returns:
ProgressObject an object that tracks and reports the status of the stop operation.

Throws:
IllegalStateException - is thrown when the method is called when running in disconnected mode.
stop

**ProgressObject** stop(**TargetModuleID[]** moduleIDList) throws **IllegalStateException**

Stop the application running.

Only the **TargetModuleID**s which represent a root module are valid for being stopped. A root **TargetModuleID** has no parent. A **TargetModuleID** with a parent can not be individually stopped. A root **TargetModuleID** module and all its child modules will be stopped.

**Parameters:**
- **moduleIDList** - A array of **TargetModuleID** objects representing the modules to be stopped.

**Returns:**
- **ProgressObject** an object that tracks and reports the status of the stop operation.

**Throws:**
- **IllegalStateException** - is thrown when the method is called when running in disconnected mode.

---

public **ProgressObject** undeploy(**TargetModuleID[]** moduleIDList) throws **IllegalStateException**
Throws
IllegalStateException:
return ProgressObject

**undeploy**

**ProgressObject** undeploy(TargetModuleID[] moduleIDList)
throws **IllegalStateException**

Remove the application from the target server.

Only the TargetModuleIDs which represent a root module are valid for undeployment. A root TargetModuleID has no parent. A TargetModuleID with a parent can not be undeployed. A root TargetModuleID module and all its child modules will be undeployed. The root TargetModuleID module and all its child modules must stopped before they can be undeployed.

**Parameters:**
moduleIDList - An array of TargetModuleID objects representing the root modules to be stopped.

**Returns:**
ProgressObject an object that tracks and reports the status of the stop operation.

**Throws:**
**IllegalStateException** - is thrown when the method is called when running in disconnected mode.

---

**public boolean isRedeploySupported()**

true false

return true DeploymentManager false

isRedeploySupported

boolean **isRedeploySupported()**
This method designates whether this platform vendor provides application redeployment functionality. A value of true means it is supported. False means it is not.

**Returns:**
A value of true means redeployment is supported by this vendor’s DeploymentManager. False means it is not.

```java
public ProgressObject redeploy(TargetModuleID[] moduleIdList, java.io.File moduleArchive, java.io.File deploymentPlan) throws UnsupportedOperationException, IllegalStateException
```

The redeploy method provides a means for updating currently deployed J2EE applications. This is an optional method for vendor implementation. Redeploy replaces a currently deployed application with an updated version. The runtime configuration information for the updated application must remain identical to the application it is updating. When an application update is redeployed,
all existing client connections to the original running application must not be disrupted; new clients will connect to the application update. This operation is valid for TargetModuleIDs that represent a root module. A root TargetModuleID has no parent. A root TargetModuleID module and all its child modules will be redeployed. A child TargetModuleID module cannot be individually redeployed. The redeploy operation is complete only when this action for all the modules has completed.

**Parameters:**
- `moduleIDList` - An array of designators of the applications to be updated.
- `moduleArchive` - The file name of the application archive to be distributed.
- `deploymentPlan` - The deployment configuration information associated with this application archive.

**Returns:**
- `ProgressObject` an object that tracks and reports the status of the redeploy operation.

**Throws:**
- `IllegalStateException` - is thrown when the method is called when running in disconnected mode.
- `UnsupportedOperationException` - this optional command is not supported by this implementation.

```java
public ProgressObject redeploy(TargetModuleID[] moduleIDList, java.io.InputStream moduleArchive, java.io.InputStream deploymentPlan) throws UnsupportedOperationException, IllegalStateException
J2EE
TargetModuleID  TargetModuleID
TargetModuleID  TargetModuleID

moduleIDList
moduleArchive
deploymentPlan
return ProgressObject
```
redeploy

`ProgressObject` `redeploy`(`TargetModuleID[]` `moduleIDList`, `InputStream` `moduleArchive`, `InputStream` `deploymentPlan`) throws `UnsupportedOperationException`, `IllegalStateException` (optional)

The redeploy method provides a means for updating currently deployed J2EE applications. This is an optional method for vendor implementation. Redeploy replaces a currently deployed application with an updated version. The runtime configuration information for the updated application must remain identical to the application it is updating. When an application update is redeployed, all existing client connections to the original running application must not be disrupted; new clients will connect to the application update. This operation is valid for TargetModuleIDs that represent a root module. A root TargetModuleID has no parent. A root TargetModuleID module and all its child modules will be redeployed. A child TargetModuleID module cannot be individually redeployed. The redeploy operation is complete only when this action for all the modules has completed.

**Parameters:**
- `moduleIDList` - An array of designators of the applications to be updated.
- `moduleArchive` - The input stream containing the application archive to be distributed.
- `deploymentPlan` - The input stream containing the runtime configuration information associated with this application archive.

**Returns:**
- `ProgressObject` an object that tracks and reports the status of the redeploy operation.

**Throws:**
- `IllegalStateException` - is thrown when the method is called
when running in disconnected mode.

UnsupportedOperationException - this optional command is not supported by this implementation.

```java
public void release()
release DeploymentManager
DeploymentManager J2EE
ProgressObject ProgressObject
```

The release method is the mechanism by which the tool signals to the DeploymentManager that the tool does not need it to continue running connected to the platform. The tool may be signaling it wants to run in a disconnected mode or it is planning to shutdown. When release is called the DeploymentManager may close any J2EE resource connections it had for deployment configuration and perform other related resource cleanup. It should not accept any new operation requests (i.e., distribute, start stop, undeploy, redeploy. It should finish any operations that are currently in process. Each ProgressObject associated with a running operation should be marked as released (see the ProgressObject).

```java
public java.util.Locale getDefaultLocale()
javax.enterprise.deploy.spi
return (Locale)
```

defaultLocale

```java
Locale getDefaultLocale()
```
Returns the default locale supported by this implementation of javax.enterprise.deploy.spi subpackages.

**Returns:**
Locale the default locale for this implementation.

```java
public java.util.Locale getCurrentLocale()
javax.enterprise.deploy.spi
return (Locale)
```

**getCurrentLocale**

Locale getCurrentLocale()

Returns the active locale this implementation of javax.enterprise.deploy.spi subpackages is running.

**Returns:**
Locale the active locale of this implementation.

```java
public void setLocale(java.util.Locale locale) throws UnsupportedOperationException
javax.enterprise.deploy.spi
Throws UnsupportedOperationException:
```

**setLocale**

void setLocale(Locale locale)
throws UnsupportedOperationException

Set the active locale for this implementation of javax.enterprise.deploy.spi subpackages to run.

**Throws:**
UnsupportedOperationException - the provide locale is not supported.

public java.util.Locale[] getSupportedLocales()

    return (Locale[])

getSupportedLocales

Locale[] getSupportedLocales()

    Returns an array of supported locales for this implementation.

    Returns:
    Locale[] the list of supported locales.

public boolean isLocaleSupported(java.util.Locale locale)

    return 'true' 'false'

isLocaleSupported

boolean isLocaleSupported(Locale locale)

    Reports if this implementation supports the designated locale.

    Returns:
    A value of 'true' means it is support and 'false' it is not.

public DConfigBeanVersionType getDConfigBeanVersion()

Bean J2EE Bean J2EE J2SE

    return Bean DConfigBeanVersionType
getDConfigBeanVersion

DConfigBeanVersionType getDConfigBeanVersion()

Returns the J2EE platform version number for which the configuration beans are provided. The beans must have been compiled with the J2SE version required by the J2EE platform.

Returns:
a DConfigBeanVersionType object representing the platform version number for which these beans are provided.

public boolean isDConfigBeanVersionSupported(DConfigBeanVersionType version)

Bean J2EE 'true' 'false'

version J2EE DConfigBeanVersionType
return 'true' 'false'

isDConfigBeanVersionSupported

boolean isDConfigBeanVersionSupported(DConfigBeanVersionType version)

Returns 'true' if the configuration beans support the J2EE platform version specified. It returns 'false' if the version is not supported.

Parameters:
version - a DConfigBeanVersionType object representing the J2EE platform version for which support is requested.

Returns:
'true' if the version is supported and 'false if not.
setDConfigBeanVersion(DConfigBeanVersionType version) throws DConfigBeanVersionUnsupportedException

J2EE Bean

    version    J2EE DConfigBeanVersionType
Throws DConfigBeanVersionUnsupportedException: Bean

setDConfigBeanVersion

void setDConfigBeanVersion(DConfigBeanVersionType version) throws DConfigBeanVersionUnsupportedException

Set the configuration beans to be used to the J2EE platform version specified.

Parameters:
    version - a DConfigBeanVersionType object representing the J2EE platform version for which support is requested.

Throws:
    DConfigBeanVersionUnsupportedException - when the requested bean version is not supported.
javax.enterprise.deploy.spi.exceptions Class DeploymentManagerCreationException

java.lang.Object
  ↓ java.lang.Throwable
  ↓ java.lang.Exception
  ↓ javax.enterprise.deploy.spi.exceptions.DeploymentManagerCreationException

All Implemented Interfaces:
  Serializable

public class DeploymentManagerCreationException
  extends Exception

Extends: Throwable > Exception

DeploymentManager

This exception is to report problems in returning a DeploymentManager object cause by such things as server down, unable to authenticate and the like.

Constructor Detail

public DeploymentManagerCreationException(String s)
DeploymentManagerCreationException

s

DeploymentManagerCreationException

public DeploymentManagerCreationException(String s)

Creates an new DeploymentManagerCreationException object.

Parameters:

s - a string providing more information about the problem.
public interface DeploymentStatus

DeploymentStatus

The DeploymentStatus interface provides information about the progress status of a deployment action.

**Method Summary**

<table>
<thead>
<tr>
<th>Method</th>

Method Detail

public **StateType** getState()

```java
StateType
```

return StateType

**getState**

**StateType** getState()

Retrieve the StateType value.

**Returns:**
the StateType object

---

public **CommandType** getCommand()

```java
CommandType
```

return CommandType

**getCommand**

**CommandType** getCommand()

Retrieve the deployment CommandType of this event.

**Returns:**
the CommandType Object

---

public **ActionType** getAction()

```java
ActionType
```

return ActionType

**getAction**

**ActionType** getAction()
**getAction**

*ActionType* `getAction()`

Retrieve the deployment *ActionType* for this event.

**Returns:**
- the *ActionType* Object

---

**public String getMessage()**

`return`

---

**getmessage**

*String* `getmessage()`

Retrieve any additional information about the status of this event.

**Returns:**
- message text

---

**public boolean isCompleted()**

`return true`

---

**isCompleted**

*boolean* `isCompleted()`

A convenience method to report if the operation is in the completed state.

**Returns:**
true if this command has completed successfully

public boolean isFailed()

    return true

isFailed

boolean isFailed()

    A convenience method to report if the operation is in the failed state.

    Returns:
    true if this command has failed

public boolean isRunning()

    return true

isRunning

boolean isRunning()

    A convenience method to report if the operation is in the running state.

    Returns:
    true if this command is still running

Method Detail

public Deserializer getDeserializerAs(String mechanismType) throws JAXRPCException:

XML Deserializer

getDeserializerAs

Deserializer getDeserializerAs(String mechanismType)

Returns a Deserializer for the specified XML processing mechanism type.

Parameters:
mechanismType - XML processing mechanism type [TBD: definition of valid constants]

Throws:
JAXRPCException - If DeserializerFactory does not support the specified XML processing mechanism

public java.util.Iterator<E> getSupportedMechanismTypes() throws JAXRPCException:

DeserializerFactory XML

getSupportedMechanismTypes

Iterator getSupportedMechanismTypes()

Returns a list of all XML processing mechanism types supported by
this DeserializerFactory.

**Returns:**
List of unique identifiers for the supported XML processing mechanism types

---

- JMS
- JMS Java "Java"
- JNDI JMS

JNDI API

Java
A Destination object encapsulates a provider-specific address. The JMS API does not define a standard address syntax. Although a standard address syntax was considered, it was decided that the differences in address semantics between existing message-oriented middleware (MOM) products were too wide to bridge with a single syntax.

Since Destination is an administered object, it may contain provider-specific configuration information in addition to its address.

The JMS API also supports a client's use of provider-specific address names.

Destination objects support concurrent use.

A Destination object is a JMS administered object.

JMS administered objects are objects containing configuration information that are created by an administrator and later used by JMS clients. They make it practical to administer the JMS API in the enterprise.

Although the interfaces for administered objects do not explicitly depend on the Java Naming and Directory Interface (JNDI) API, the JMS API establishes the convention that JMS clients find administered objects by looking them up in a JNDI namespace.

An administrator can place an administered object anywhere in a namespace. The JMS API does not define a naming policy.

It is expected that JMS providers will provide the tools an administrator needs to create and configure administered objects in a JNDI namespace. JMS provider implementations of administered objects should implement the javax.naming.Referenceable and java.io.Serializable interfaces so that they can be stored in all JNDI naming contexts. In addition, it is recommended that these
implementations follow the JavaBeans™ design patterns.

This strategy provides several benefits:

- It hides provider-specific details from JMS clients.
- It abstracts JMS administrative information into objects in the Java programming language ("Java objects") that are easily organized and administered from a common management console.
- Since there will be JNDI providers for all popular naming services, JMS providers can deliver one implementation of administered objects that will run everywhere.

An administered object should not hold on to any remote resources. Its lookup should not use remote resources other than those used by the JNDI API itself.

Clients should think of administered objects as local Java objects. Looking them up should not have any hidden side effects or use surprising amounts of local resources.

javax.xml.soap  Interface Detail

**All Superinterfaces:**
- Element, Node, SOAPElement, SOAPFaultElement

```
public interface Detail
extends SOAPFaultElement

Implements: SOAPFaultElement
```

```
DetailEntry   DetailEntry   SOAPBody
            SOAPFault.getDetail  Detail  SOAPFault  Detail
DetailEntry   Detail   Detail  DetailEntry

sf    SOAPFault    Detail ( d)    DetailEntry  d  
DetailEntry addDetailEntry    Name    Se    Name
SOAPEnvelope

Detail d = sf.getDetail();
Name name = se.createName("GetLastTradePrice", "WOMBAT",
"http://www.wombat.org/trader");
d.addDetailEntry(name);
Iterator it = d.getDetailEntries();
```

A container for DetailEntry objects. DetailEntry objects give detailed error information that is application-specific and related to the SOAPBody object that contains it.

A Detail object, which is part of a SOAPFault object, can be retrieved using the method SOAPFault.getDetail. The Detail interface provides two methods. One creates a new DetailEntry object and also automatically adds it to the Detail object. The second method gets a list of the DetailEntry objects contained in a Detail object.
The following code fragment, in which \texttt{sf} is a \texttt{SOAPFault} object, gets its \texttt{Detail} object (\texttt{d}), adds a new \texttt{DetailEntry} object to \texttt{d}, and then gets a list of all the \texttt{DetailEntry} objects in \texttt{d}. The code also creates a \texttt{Name} object to pass to the method \texttt{addDetailEntry}. The variable \texttt{se}, used to create the \texttt{Name} object, is a \texttt{SOAPEnvelope} object.

```java
Detail d = sf.getDetail();
Name name = se.createName("GetLastTradePrice", "WOMBAT", "http://www.wombat.org/trader");
d.addDetailEntry(name);
Iterator it = d.getDetailEntries();
```

Method Detail

class addDetailEntry(\texttt{Name} name) throws SOAPException

\begin{itemize}
\item \texttt{DetailEntry} addDetailEntry(\texttt{Name} name) throws SOAPException
\end{itemize}

Create a new \texttt{DetailEntry} object with the given name and adds it to this \texttt{Detail} object.

\textbf{Parameters:}

- name - a \texttt{Name} object identifying the new \texttt{DetailEntry} object

\textbf{Throws:}

- \texttt{SOAPException} - thrown when there is a problem in adding a \texttt{DetailEntry} object to this \texttt{Detail} object.

\textbf{See Also:}

Methods inherited from interface org.w3c.dom.Node

appendChild, cloneNode, compareDocumentPosition, getAttributes, getBaseURI, getChildNodes, getFeature, getFirstChild, getLastChild, getLocalName, getNamespaceURI, getNextSibling, getNodeName, getNodeType, getNodeValue, getOwnerDocument, getParentNode, getPrefix, getPreviousSibling, getTextContent, getUserData, hasAttributes, hasChildNodes, insertBefore, isDefaultNamespace, isEqualNode, isSameNode, isSupported, lookupNamespaceURI, lookupPrefix, normalize, removeChild, replaceChild, setNodeValue, setPrefix, setTextContent, setUserData
javax.persistence Annotation Type DiscriminatorColumn

@Target(value=TYPE)
@Retention(value=RUNTIME)
public @interface DiscriminatorColumn

Implements: Annotation
@Target(value=TYPE)
@Retention(value=RUNTIME)

@link InheritanceType#SINGLE_TABLE SINGLE_TABLE} JOINED

DiscriminatorColumn "DTYPE" DiscriminatorType.STRING

@Entity
@Table(name="CUST")
@Inheritance(strategy=SINGLE_TABLE)
@DiscriminatorColumn(name="DISC", discriminatorType=STRING,length=20)
public class Customer {
... }

@Entity
public class ValuedCustomer extends Customer {
... }

since Java Persistence 1.0 en

Is used to define the discriminator column for the SINGLE_TABLE and
JOINED inheritance mapping strategies.

The strategy and the discriminator column are only specified in the root of
an entity class hierarchy or subhierarchy in which a different inheritance
strategy is applied.

If the DiscriminatorColumn annotation is missing, and a discriminator
column is required, the name of the discriminator column defaults to
"DTYPE" and the discriminator type to `DiscriminatorType.STRING`.

Example:
```java
@Entity
@Table(name="CUST")
@Inheritance(strategy=SINGLE_TABLE)
@DiscriminatorColumn(name="DISC", discriminatorType=STRING, length=20)
public class Customer {
    ...
}

@Entity
public class ValuedCustomer extends Customer {
    ...
}
```

Since:
Java Persistence 1.0

<td><code>DiscriminatorType</code></td>
<td><code>discriminatorType</code></td>
<td>(Optional) The type of object/column to use as a class discriminator.</td>
</tr>
<tr>
<td><code>int</code></td>
<td><code>length</code></td>
<td>(Optional) The column length for String-based discriminator types.</td>
</tr>
<tr>
<td><code>String</code></td>
<td><code>name</code></td>
<td>(Optional) The name of column to be used for the discriminator.</td>
</tr>
</tbody>
</table>

abstract public String name()

name

public abstract String name
(Optional) The name of column to be used for the discriminator.

**Default:**

"DTYPE"

---

```java
abstract public DiscriminatorType discriminatorType()
/
   DiscriminatorType.STRING
```

**discriminatorType**

**public abstract**  

```java
DiscriminatorType discriminatorType
```

(Optional) The type of object/column to use as a class discriminator.  
Defaults to `DiscriminatorType.STRING`.

**Default:**

`STRING`

---

```java
abstract public String columnDefinition()
```

**SQL**

**SQL**

**columnDefinition**

**public abstract**  

```java
String columnDefinition
```

(Optional) The SQL fragment that is used when generating the DDL  
for the discriminator column.

Defaults to the provider-generated SQL to create a column of the  
specified discriminator type.
abstract public int length()
String

length

public abstract int length

(Optional) The column length for String-based discriminator types. Ignored for other discriminator types.

Default:
31
javax.persistence  **Enum DiscriminatorType**

java.lang.Object  
   - java.lang.Enum<DiscriminatorType>  
   - javax.persistence.DiscriminatorType

**All Implemented Interfaces:**  
Serializable, Comparable<DiscriminatorType>

```java
public enum DiscriminatorType
extends Enum<DiscriminatorType>

Extends: Enum<E>
```

**since**  
Java Persistence 1.0  
en

Defines supported types of the discriminator column.

**Since:**  
Java Persistence 1.0

## Enum Constant Detail

**STRING**

- `public static final DiscriminatorType STRING`  
  - String as the discriminator type

---

**CHAR**

- `public static final DiscriminatorType CHAR`  
  - Single character as the discriminator type

---
public static final DiscriminatorType INTEGER

Integer as the discriminator type

### Method Detail

#### final public static DiscriminatorType[] values()

Returns an array containing the constants of this enum type, in the order they're declared. This method may be used to iterate over the constants as follows:

```java
for(DiscriminatorType c : DiscriminatorType.values())
    System.out.println(c);
```

**Returns:**
- an array containing the constants of this enum type, in the order they're declared

#### public static DiscriminatorType[] values()

**Returns:**
- an array containing the constants of this enum type, in the order they're declared

#### public static DiscriminatorType valueOf(String name)

Returns the enum constant of this type with the specified name. The string must match exactly an identifier used to declare an enum constant in this type. (Extraneous whitespace characters are not permitted.)
Parameters:
  name - the name of the enum constant to be returned.

Returns:
  the enum constant with the specified name

Throws:
  IllegalArgumentException - if this enum type has no constant with the specified name
javax.persistence  Annotation Type DiscriminatorValue

@Target(value=TYPE)
@Retention(value=RUNTIME)
public @interface DiscriminatorValue

Implements: Annotation
@Target(value=TYPE)
@Retention(value=RUNTIME)

DiscriminatorValue

Discriminator

DiscriminatorType  STRING

@Entity
@Table(name="CUST")
@Inheritance(strategy=SINGLE_TABLE)
@DiscriminatorColumn(name="DISC", discriminatorType=STRING, length=20)
@DiscriminatorValue("CUSTOMER")
public class Customer {
  ...
}

@Entity
@DiscriminatorValue("VCUSTOMER")
public class ValuedCustomer extends Customer {
  ...
}

since  Java Persistence 1.0  en

Is used to specify the value of the discriminator column for entities of the given type. The DiscriminatorValue annotation can only be specified on a concrete entity class. If the DiscriminatorValue annotation is not specified and a discriminator column is used, a provider-specific function will be used to generate a value representing the entity type. If the DiscriminatorType is STRING, the discriminator value default is the entity name.
The inheritance strategy and the discriminator column are only specified in the root of an entity class hierarchy or subhierarchy in which a different inheritance strategy is applied. The discriminator value, if not defaulted, should be specified for each entity class in the hierarchy.

Example:

```java
@Entity
@Table(name="CUST")
@Inheritance(strategy=SINGLE_TABLE)
@DiscriminatorColumn(name="DISC", discriminatorType=STRING,length=20)
@DiscriminatorValue("CUSTOMER")
public class Customer {
    ...
}

@Entity
@DiscriminatorValue("VCUSTOMER")
public class ValuedCustomer extends Customer {
    ...
}
```

Since: Java Persistence 1.0

**Method Summary**

---

\begin{Verbatim}
I invoke(I msg)
\end{Verbatim}

Invoke a service operation synchronously.

\begin{Verbatim}
Response\<I\> invokeAsync(I msg)
\end{Verbatim}
Invoke a service operation asynchronously.

```java
Future<?> invokeAsync(T msg, AsyncHandler<T> handler)
```

Invoke a service operation asynchronously.

```java
void invokeOneWay(T msg)
```

Invokes a service operation using the one-way interaction mode.

Methods inherited from interface javax.xml.ws.BindingProvider

```java
getBinding, getRequestContext, getResponseContext
```

Method Detail

```java
T invoke(T msg)
```

Invoke a service operation synchronously. The client is responsible for ensuring that the `msg` object when marshalled is formed according to the requirements of the protocol binding in use.

**Parameters:**

- `msg` - An object that will form the message or payload of the message used to invoke the operation.

**Returns:**

The response message or message payload to the operation invocation.

**Throws:**

- `WebServiceException` - If a fault occurs during communication with the service
- `WebServiceException` - If there is any error in the configuration of the Dispatch instance
invokeAsync

Response<T> invokeAsync(T msg)

Invoke a service operation asynchronously. The method returns without waiting for the response to the operation invocation, the results of the operation are obtained by polling the returned Response. The client is responsible for ensuring that the msg object when marshalled is formed according to the requirements of the protocol binding in use.

Parameters:
msg - An object that will form the message or payload of the message used to invoke the operation.

Returns:
The response message or message payload to the operation invocation.

Throws:
WebServiceException - If there is any error in the configuration of the Dispatch instance

invokeAsync

Future<?> invokeAsync(T msg, AsyncHandler<T> handler)

Invoke a service operation asynchronously. The method returns without waiting for the response to the operation invocation, the results of the operation are communicated to the client via the passed in handler. The client is responsible for ensuring that the msg object when marshalled is formed according to the requirements of the protocol binding in use.

Parameters:
msg - An object that will form the message or payload of the message used to invoke the operation.
handler - The handler object that will receive the response to the
invokeOneWay

void invokeOneWay(T msg)

Invokes a service operation using the one-way interaction mode. The operation invocation is logically non-blocking, subject to the capabilities of the underlying protocol, no results are returned. When the protocol in use is SOAP/HTTP, this method must block until an HTTP response code has been received or an error occurs. The client is responsible for ensuring that the msg object when marshalled is formed according to the requirements of the protocol binding in use.

Parameters:

msg - An object that will form the message or payload of the message used to invoke the operation.

Throws:

WebServiceException - If there is any error in the configuration of the Dispatch instance or if an error occurs during the invocation.
javax.resource.spi Interface
DissociatableManagedConnection

public interface DissociatableManagedConnection

ManagedConnection
version 1.0

This is a mix-in interface that may be optionally implemented by a ManagedConnection implementation. An implementation of this interface must support the lazy connection association optimization.

Version:
1.0
Author:
Ram Jeyaraman

Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void dissociateConnections()</td>
<td>This method is called by an application server (that is capable of lazy connection association optimization) in order to dissociate a ManagedConnection instance from all of its connection handles.</td>
</tr>
</tbody>
</table>

Method Detail

public void dissociateConnections() throws ResourceException
dissociateConnections

```java
void dissociateConnections()
    throws ResourceException
```

This method is called by an application server (that is capable of lazy connection association optimization) in order to dissociate a ManagedConnection instance from all of its connection handles.

**Throws:**
- `ResourceException` - generic exception if operation fails.
- `ResourceAdapterInternalException` - resource adapter internal error condition
- `IllegalStateException` - Illegal state for calling connection cleanup. Example - if a localtransaction is in progress that doesn't allow connection cleanup.
javax.xml.bind.annotation Interface
DomHandler<ElementT,ResultT extends Result>

All Known Implementing Classes:
   W3CDomHandler

public interface DomHandler<ElementT,ResultT extends Result>

Implemented by: W3CDomHandler

DOM

   XmlAnyElement   XML   W3C DOM

XML  DOM  JAXB

   since   JAXB2.0

Converts an element (and its descendants) from/to DOM (or similar) representation.

Implementations of this interface will be used in conjunction with XmlAnyElement annotation to map an element of XML into a representation of infoset such as W3C DOM.

Implementations hide how a portion of XML is converted into/from such DOM-like representation, allowing JAXB providers to work with arbitrary such library.

This interface is intended to be implemented by library writers and consumed by JAXB providers. None of those methods are intended to be called from applications.

Since:
## Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>createUnmarshaller(ValidationEventHandler errorHandler)</code></td>
<td>When a JAXB provider needs to unmarshal a part of a document into an infoset representation, it first calls this method to create a <code>Result</code> object.</td>
</tr>
<tr>
<td><code>getElement(ResultT rt)</code></td>
<td>Once the portion is sent to the <code>Result</code>.</td>
</tr>
<tr>
<td><code>marshal(ElementT n, ValidationEventHandler errorHandler)</code></td>
<td>This method is called when a JAXB provider needs to marshal an element to XML.</td>
</tr>
</tbody>
</table>

## Method Detail

```java
public javax.xml.transform.Result
createUnmarshaller(ValidationEventHandler errorHandler)
```

When a JAXB provider needs to unmarshal a part of a document into an infoset representation, it first calls this method to create a `Result` object.

```java
return null
```

```java
createUnmarshaller
```

When a JAXB provider needs to unmarshal a part of a document into an infoset representation, it first calls this method to create a `Result` object.
an infoset representation, it first calls this method to create a Result object.

A JAXB provider will then send a portion of the XML into the given result. Such a portion always form a subtree of the whole XML document rooted at an element.

**Parameters:**

- `errorHandler` - if any error happens between the invocation of this method and the invocation of `getElement(Result)`, they must be reported to this handler. The caller must provide a non-null error handler. The Result object created from this method may hold a reference to this error handler.

**Returns:**

null if the operation fails. The error must have been reported to the error handler.

---

getElement

```java
ElementT getElement(ResultT rt)
```

Once the portion is sent to the Result. This method is called by a JAXB provider to obtain the unmarshalled element representation.

Multiple invocations of this method may return different objects. This method can be invoked only when the whole sub-tree are fed to the Result object.

**Parameters:**

- `rt` - The Result object created by `createUnmarshaller(ValidationEventHandler)`.

**Returns:**

null if the operation fails. The error must have been reported to the error handler.
marshal

Source marshal(ElementT n, ValidationEventHandler errorHandler)

This method is called when a JAXB provider needs to marshal an element to XML.

If non-null, the returned Source must contain a whole document rooted at one element, which will then be weaved into a bigger document that the JAXB provider is marshalling.

Parameters:

errorHandler - Receives any errors happened during the process of converting an element into a Source. The caller must provide a non-null error handler.

Returns:

null if there was an error. The error should have been reported to the handler.
javax.faces.convert Class DoubleConverter

java.lang.Object
   \ javax.faces.convert.DoubleConverter

All Implemented Interfaces:
   Converter

public class DoubleConverter

Throws ConverterException: NullPointerException

Throws NullPointerException: NullPointerException

getAsObject

public Object getAsObject(FacesContext context, UIComponent component, String value)

Description copied from interface: Converter

Convert the specified string value, which is associated with the specified UIComponent, into a model data object that is appropriate for being stored during the Apply Request Values phase of the request processing lifecycle.

Specified by:
getAsObject in interface Converter

Parameters:
context - FacesContext for the request being processed
component - UIComponent with which this model object value is associated
value - String value to be converted (may be null)

Returns:
null if the value to convert is null, otherwise the result of the
public String getAsString(FacesContext context, UIComponent component, Object value)

Throws  ConverterException: if conversion cannot be successfully performed
Throws  NullPointerException - if context or component is null

Description copied from interface: Converter

Convert the specified model object value, which is associated with the specified UIComponent, into a String that is suitable for being included in the response generated during the Render Response phase of the request processing lifecycle.

Specified by:
getAsString in interface Converter

Parameters:
context - FacesContext for the request being processed
component - UIComponent with which this model object value is associated
value - Model object value to be converted (may be null)

Returns:
a zero-length String if value is null, otherwise the result of the conversion

Throws:
ConverterException - if conversion cannot be successfully performed
performed

NullPointerException - if context or component is null

• Validator maximum MAXIMUM_MESSAGE_ID
  javax.faces.validator.ValidatorException
• Validator minimum MINIMUM_MESSAGE_ID
  javax.faces.validator.ValidatorException

ValidatorException ID javax.faces.Number Converter Locale

DoubleRangeValidator is a Validator that checks the value of the corresponding component against specified minimum and maximum values. The following algorithm is implemented:

• If the passed value is null, exit immediately.
• If the current component value is not a floating point type, or a String that is convertible to double, throw a `ValidatorException` containing a `TYPE_MESSAGE_ID` message.

• If both a `maximum` and `minimum` property has been configured on this `Validator`, check the component value against both limits. If the component value is not within this specified range, throw a `ValidatorException` containing a `NOT_IN_RANGE_MESSAGE_ID` message.

• If a `maximum` property has been configured on this `Validator`, check the component value against this limit. If the component value is greater than the specified maximum, throw a `ValidatorException` containing a `MAXIMUM_MESSAGE_ID` message.

• If a `minimum` property has been configured on this `Validator`, check the component value against this limit. If the component value is less than the specified minimum, throw a `ValidatorException` containing a `MINIMUM_MESSAGE_ID` message.

For all of the above cases that cause a `ValidatorException` to be thrown, if there are parameters to the message that match up with validator parameters, the values of these parameters must be converted using the `Converter` registered in the application under the converter id `javax.faces.Number`. This allows the values to be localized according to the current `Locale`.

public DoubleRangeValidator()

\texttt{Validator}

\end{verbatim}

\textbf{DoubleRangeValidator}

\begin{verbatim}
public DoubleRangeValidator()

\end{verbatim}
Construct a validator with no preconfigured limits.

```
public DoubleRangeValidator(double maximum)
```

Validator

```
maximum
```

DoubleRangeValidator

```
public DoubleRangeValidator(double maximum)
```

Construct a validator with the specified preconfigured limit.

Parameters:

- `maximum`: Maximum value to allow

```
public DoubleRangeValidator(double maximum, double minimum)
```

Validator

```
maximum
minimum
```

DoubleRangeValidator

```
public DoubleRangeValidator(double maximum, double minimum)
```

Construct a validator with the specified preconfigured limits.

Parameters:

- `maximum`: Maximum value to allow
**Minimum** - Minimum value to allow

### Method Detail

#### public double getMaxMaximum()

- **Validator** Double.MAX_VALUE

#### getMaxMaximum

**public double getMaxMaximum()**

Return the maximum value to be enforced by this **Validator** or Double.MAX_VALUE if it has not been set.

#### public void setMaximum(double maximum)

- **Validator**

#### setMaximum

**public void setMaximum(double maximum)**

Set the maximum value to be enforced by this **Validator**.

**Parameters:**
- maximum - The new maximum value

#### public double getMinimum()
**Validator**    Double.MIN_VALUE

### getMinimum

```java
public double getMinimum()
```

Return the minimum value to be enforced by this `Validator`, or `Double.MIN_VALUE` if it has not been set.

### setMinimum

```java
public void setMinimum(double minimum)
```

Set the minimum value to be enforced by this `Validator`.

**Parameters:**
- `minimum` - The new minimum value

### validate

```java
public void validate(FacesContext context, UIComponent component, Object value) throws ValidatorException
```

Throws `NullPointerException`: `context`, `component`, `null`

Throws `ValidatorException`: `Null Pointer Exception`
public void validate(FacesContext context, UIComponent component, Object value) throws ValidatorException

Description copied from interface: Validator

Perform the correctness checks implemented by this Validator against the specified UIComponent. If any violations are found, a ValidatorException will be thrown containing the FacesMessage describing the failure.

Specified by:
validate in interface Validator

Parameters:
context - FacesContext for the request we are processing
component - UIComponent we are checking for correctness
value - the value to validate

Throws:
NullPointerException - if context or component is null
ValidatorException - if validation fails

public boolean equals(Object otherObj)

equals

public boolean equals(Object otherObj)

Overrides:
equals in class Object

public int hashCode()

hashCode
public int hashCode()

Overrides:
hashCode in class Object

public Object saveState(FacesContext context)

saveState

public Object saveState(FacesContext context)

Description copied from interface: StateHolder

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.saveState(javax.faces.context.FacesContext) method on all those instances as well. This method must not save the state of children and facets. That is done via the StateManager.

This method must not alter the state of the implementing object. In other words, after executing this code:

    Object state = component.saveState(facesContext);

component should be the same as before executing it.

The return from this method must be Serializable

Specified by:
saveState in interface StateHolder

public void restoreState(FacesContext context, Object state)
**restoreState**

```java
public void restoreState(FacesContext context, Object state)
```

Description copied from interface: `StateHolder`

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the `StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object)` method on all those instances as well.

**Specified by:**
- `restoreState` in interface `StateHolder`

---

**public boolean isTransient()**

**isTransient**

```java
public boolean isTransient()
```

Description copied from interface: `StateHolder`

If true, the Object implementing this interface must not participate in state saving or restoring.

**Specified by:**
- `isTransient` in interface `StateHolder`

---

**public void setTransient(boolean transientValue)**
**setTransient**

public void **setTransient**(boolean transientValue)

**Description copied from interface:** StateHolder

Denotes whether or not the Object implementing this interface must or must not participate in state saving or restoring.

**Specified by:**

setTransient in interface StateHolder

**Parameters:**

transientValue - boolean pass true if this Object will participate in state saving or restoring, otherwise pass false.

PS:
javax.xml.stream.events Interface DTD

All Superinterfaces:
   XMLEvent, XMLStreamConstants

public interface DTD
extends XMLEvent

Implements: XMLEvent

DTD

version 1.0

This is the top level interface for events dealing with DTDs

Version: 1.0

Author: Copyright (c) 2003 by BEA Systems. All Rights Reserved.

Field Summary

Fields inherited from interface javax.xml.stream.XMLStreamConstants
ATTRIBUTE, CDATA, CHARACTERS, COMMENT, DTD, END_DOCUMENT, END_ELEMENT, ENTITY_DECLARATION, ENTITY_REFERENCE, NAMESPACE, NOTATION_DECLARATION, PROCESSING_INSTRUCTION, SPACE, START_DOCUMENT, START_ELEMENT

Method Summary

getString

getDocumentTypeDeclaration()

Returns the entire Document Type Declaration as a string,
getEntities()  
Return a List containing the general entities, both external and internal, declared in the DTD.

getNotations()  
Return a List containing the notations declared in the DTD.

getProcessedDTD()  
Returns an implementation defined representation of the DTD.

Methods inherited from interface javax.xml.stream.events.XMLEvent
asCharacters, asEndElement, asStartElement, getEventType, getLocation, getSchemaType, isAttribute, isCharacters, isEndDocument, isEndElement, isEntityReference, isNamespace, isProcessingInstruction, isStartDocument, isStartElement, writeAsEncodedUnicode

Method Detail

public String getDocumentTypeDeclaration()
DTD null null XML 1.0
doctypedecl

getDocumentTypeDeclaration

String getDocumentTypeDeclaration()

Returns the entire Document Type Declaration as a string, including the internal DTD subset. This may be null if there is not an internal subset. If it is not null it must return the entire Document Type Declaration which matches the doctypedecl production in the XML 1.0 specification
public Object getProcessedDTD()

Object getProcessedDTD()

Returns an implementation defined representation of the DTD. This method may return null if no representation is available.

public java.util.List<E> getNotations()

List DTD NotationDeclaration

return NotationDeclaration

See also javax.xml.stream.events.NotationDeclaration

getNotations

List getNotations()

Return a List containing the notations declared in the DTD. This list must contain NotationDeclaration events.

Returns:
an unordered list of NotationDeclaration events

See Also:
NotationDeclaration

public java.util.List<E> getEntities()

DTD EntityDeclaration

return EntityDeclaration

See also javax.xml.stream.events.EntityDeclaration
getEntities

List getEntities()

Return a List containing the general entities, both external and internal, declared in the DTD. This list must contain EntityDeclaration events.

Returns:
an unordered list of EntityDeclaration events

See Also:
EntityDeclaration

PS:
public interface DynamicAttributes

setDynamicAttribute()

since 2.0

For a tag to declare that it accepts dynamic attributes, it must implement this interface. The entry for the tag in the Tag Library Descriptor must also be configured to indicate dynamic attributes are accepted. For any attribute that is not declared in the Tag Library Descriptor for this tag, instead of getting an error at translation time, the setDynamicAttribute() method is called, with the name and value of the attribute. It is the responsibility of the tag to remember the names and values of the dynamic attributes.

Since:
JSP 2.0

<table>
<thead>
<tr>
<th>Method Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>void setDynamicAttribute(String uri, String localName, Object value)</td>
</tr>
<tr>
<td>Called when a tag declared to accept dynamic attributes is passed an attribute that is not declared in the Tag Library Descriptor.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Method Detail</th>
</tr>
</thead>
<tbody>
<tr>
<td>public void setDynamicAttribute(String uri, String</td>
</tr>
</tbody>
</table>
localName, Object value) throws JspException

Throws  JspException: doStartTag() doTag()

setDynamicAttribute

void setDynamicAttribute(String uri,
              String localName,
              Object value)
throws JspException

Called when a tag declared to accept dynamic attributes is passed an attribute that is not declared in the Tag Library Descriptor.

Parameters:
uri - the namespace of the attribute, or null if in the default namespace.
localName - the name of the attribute being set.
value - the value of the attribute

Throws:
JspException - if the tag handler wishes to signal that it does not accept the given attribute. The container must not call doStartTag() or doTag() for this tag.
PS:
javax.faces.component Interface EditableValueHolder

All Superinterfaces:
ValueHolder

All Known Implementing Classes:
HtmlInputHidden, HtmlInputSecret, HtmlInputText,
HtmlInputTextarea, HtmlSelectBooleanCheckbox,
HtmlSelectManyCheckbox, HtmlSelectManyListbox,
HtmlSelectManyMenu, HtmlSelectOneListbox, HtmlSelectOneMenu,
HtmlSelectOneRadio, UIInput, UISelectBoolean, UISelectMany,
UISelectOne

public interface EditableValueHolder
extends ValueHolder

Implements: ValueHolder
Implemented by: UIInput

EditableValueHolder is an extension of ValueHolder that describes additional features supported by editable components, including ValueChangeEvent and Validators.

Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void addValidator(Validator validator)</td>
<td>Add a Validator instance to the set associated with the component.</td>
</tr>
<tr>
<td>void addValueChangeListener(ValueChangeEvent listener)</td>
<td></td>
</tr>
</tbody>
</table>
void Add a new ValueChangeListener to the set of listeners interested in being notified when ValueChangeEvent{s} occur.

Object getSubmittedValue() Return the submittedValue value of this component.

MethodBinding getValidator() Deprecated. getValidators() should be used instead.

Validator[] getValidators() Return the set of registered Validators for this component instance.

MethodBinding getValueChangeListener() Deprecated. Use getValueChangeListeners() instead.

ValueChangeListener[] getValueChangeListeners() Return the set of registered ValueChangeListener component instance.

boolean isImmediate() Return the "immediate" state for this component.

boolean isLocalValueSet() Return the "local value set" state for this component.

boolean isRequired() Return the "required field" state for this component.

boolean isValid() Return a flag indicating whether the local value of this component is valid (no conversion error has occurred).

void removeValidator(Validator validator) Remove a Validator instance from the set associated with this component, if it was previously associated.

void removeValueChangedListener(ValueChangeListener listener) Remove an existing ValueChangeListener (if any) from the set of listeners interested in being notified when ValueChangeEvent{s} occur.

void setImmediate(boolean immediate) Set the "immediate" state for this component.

void setLocalValueSet(boolean localValueSet) Sets the "local value set" state for this component.

void setRequired(boolean required)
Set the "required field" state for this component.

```java
void setSubmittedValue(Object submittedValue)
```

Set the submittedValue value of this component.

```java
void setValid(boolean valid)
```

Set a flag indicating whether the local value of the component is valid (no conversion error has occurred).

```java
void setValidator(MethodBinding validatorBinding)
```

Deprecated. Use `addValidator(javax.faces.validator.Validator)` instead, obtaining the argument `Validator` by creating an instance of `MethodExpressionValidator`.

```java
void setValueChangeListener(MethodBinding valueChangeMethod)
```

Deprecated. Use `addValueChangeListener(javax.faces.event.ValueChangeListener)` instead, obtaining the argument `ValueChangeListener` by creating an instance of `MethodExpressionValueChangeListener`.

Methods inherited from interface `javax.faces.component.ValueHolder`

- `getConverter`, `getLocalValue`, `getValue`, `setConverter`, `setValue`

### Method Detail

#### public Object getSubmittedValue()

```java
getSubmittedValue Renderer encodeBegin() /
encodeEnd()
```

getSubmittedValue

```java
Object getSubmittedValue()
```

Return the submittedValue value of this component. This method
should only be used by the `encodeBegin()` and/or `encodeEnd()` methods of this component, or its corresponding `Renderer`.

---

**public void setSubmittedValue(Object submittedValue)**

submittedValue

*Renderer* `decode()` `validate()`

---

**setSubmittedValue**

```java
void setSubmittedValue(Object submittedValue)
```

Set the `submittedValue` value of this component. This method should only be used by the `decode()` and `validate()` method of this component, or its corresponding `Renderer`.

**Parameters:**
- `submittedValue` - The new submitted value

---

**public boolean isLocalValueSet()**

"local value set" `setValue()` `true`

---

**isLocalValueSet**

```java
boolean isLocalValueSet()
```

Return the "local value set" state for this component. Calls to `setValue()` automatically reset this property to `true`.

---

**public void setLocalValueSet(boolean localValueSet)**
"local value set"

**setLocalValueSet**

```java
void setLocalValueSet(boolean localValueSet)
```

Sets the "local value set" state for this component.

---

**isValid**

```java
boolean isValid()
```

Return a flag indicating whether the local value of this component is valid (no conversion error has occurred).

---

**setValid**

```java
void setValid(boolean valid)
```

Set a flag indicating whether the local value of this component is valid (no conversion error has occurred).
Parameters:
valid - The new valid flag

public boolean isRequired()

"required field"

isRequired

boolean isRequired()

Return the "required field" state for this component.

public void setRequired(boolean required)

"required field"

required "required field"

setRequired

void setRequired(boolean required)

Set the "required field" state for this component.

Parameters:
required - The new "required field" state

public boolean isImmediate()

"immediate"
**isImmediate**

boolean isImmediate()

    Return the "immediate" state for this component.

---

**public void setImmediate(boolean immediate)**

"immediate" true ValueChangeEvent
false

    immediate "immediate"

**setImmediate**

void setImmediate(boolean immediate)

    Set the "immediate" state for this component. When set to true, the component's value will be converted and validated immediately in the Apply Request Values phase, and ValueChangeEvent's will be delivered in that phase as well. The default value for this property must be false.

**Parameters:**

    immediate - The new "immediate" state

---

**public MethodBinding getValidator()**

    #setValidator null #setValidator #setValidator MethodBinding

    immediate
getValidator

MethodBinding getValidator()

Deprecated. getValidators() should be used instead.

If setValidator(javax.faces.el.MethodBinding) was not previously called for this instance, this method must return null. If it was called, this method must return the exact MethodBinding instance that was passed to setValidator(javax.faces.el.MethodBinding).

This method will be called during the Process Validations or Apply Request Values phases (depending on the value of the immediate property).

public void setValidator(MethodBinding validatorBinding)

javax.faces.validator.Validator validatorBinding

#getValidators setValidator

immediate

void javax.faces.context.FacesContext UIComponent Object

validatorBinding MethodBinding

#addValidator

deprecated javax.faces.validator.MethodExpressionValidator Validator

setValidator

void setValidator(MethodBinding validatorBinding)
Deprecated. Use `addValidator(javax.faces.validator.Validator)` instead, obtaining the argument `Validator` by creating an instance of `MethodExpressionValidator`.

Wrap the argument `validatorBinding` in an implementation of `Validator` and store it in the internal data structure that backs the `getValidators()` method, taking care to over-write any instance that was stored by a previous call to `setValidator`.

The argument method will be called during the `Process Validations` or `Apply Request Values` phases (depending on the value of the `immediate` property).

Any method referenced by such an expression must be public, with a return type of `void`, and accept parameters of type `FacesContext`, `UIComponent`, and `Object`.

**Parameters:**

- `validatorBinding` - The new MethodBinding instance

```java
public MethodBinding getValueChangeListener()
```

```java
#setValueChangeListener null #setValueChangeListener
#setValueChangeListener MethodBinding

deprecated

#getValueChangeListeners
```

**getValueChangeListener**

```java
MethodBinding getValueChangeListener()
```

**Deprecated.** Use `getValueChangeListeners()` instead.

If `setValueChangeListener(javax.faces.el.MethodBinding)` was not previously called for this instance, this method must return `null`. If it was called, this method must return the exact `MethodBinding` instance that was passed to
public void setValueChangeListener(MethodBinding valueChangeMethod)

    ValueChangeListener valueChangeMethod
    #getValueChangeListeners setValueChangeListener
    immediate

    void javax.faces.event.ValueChangeEvent valueChangeMethod

    deprecated javax.faces.event.MethodExpressionValueChangeListener
    #addValueChangeListener
    ValueChangeListener

setValueChangeListener

    void setValueChangeListener(MethodBinding valueChangeMethod)

    Deprecated. Use addValueChangeListener(javax.faces.event.ValueChangeListener) instead, obtaining the argument ValueChangeListener by creating an instance of MethodExpressionValueChangeListener.

    Wrap the argument valueChangeMethod in an implementation of ValueChangeListener and store it in the internal data structure that backs the getValueChangeListeners() method, taking care to overwrite any instance that was stored by a previous call to setValueChangeListener.

    This argument method will be called during the Process Validations or Apply Request Values phases (depending on the value of the immediate property).
Any method referenced by such an expression must be public, with a return type of void, and accept a parameter of type ValueChangeEvent.

**Parameters:**
valueChangeMethod - The new method binding instance

---

```java
public void addValidator(Validator validator)
```

**Validator**

- **validator**

  **Throws**: NullPointerException: validator null

---

```java
addValidator
```

Add a Validator instance to the set associated with this component.

**Parameters:**
validator - The Validator to add

**Throws:**
NullPointerException - if validator is null

---

```java
public Validator[] getValidators()
```

**Validator**

- **getValidators**

---

```java
getValidators
```

**Validator[] getValidators**
Return the set of registered `Validator` s for this component instance. If there are no registered validators, a zero-length array is returned.

```java
public void removeValidator(Validator validator)
```

Remove a `Validator` instance from the set associated with this component, if it was previously associated. Otherwise, do nothing.

**Parameters:**
- `validator` - The `Validator` to remove

```java
public void addValueChangeListener(ValueChangeListener listener)
```

Add a new `ValueChangeListener` to the set of listeners interested in being notified when `ValueChangeEvent` s occur.

**Throws:** `NullPointerException` if `null`
Parameters:
   listener - The `ValueChangeListener` to be added

Throws:
   `NullPointerException` - if listener is null

```java
public ValueChangeListener[] getValueChangeListeners()
```

Return the set of registered `ValueChangeListener`s for this component instance. If there are no registered listeners, a zero-length array is returned.

```java
public void removeValueChangeListener(ValueChangeListener listener)
```

Remove an existing `ValueChangeListener` (if any) from the set of listeners interested in being notified when `ValueChangeEvent`s occur.
Parameters:
   listener - The ValueChangeListener to be removed

Throws:
   NullPointerException - if listener is null
javax.resource.spi  Class EISSystemException

java.lang.Object
  ▼ java.lang.Throwable
       ▼ java.lang.Exception
            ▼ javax.resource.ResourceException
                 ▼ javax.resource.spi.EISSystemException

All Implemented Interfaces:
  Serializable

public class EISSystemException
  extends ResourceException

  Extends: Throwable > Exception > ResourceException

EISSystemException  EIS  EIS  EIS
  version  1.0

An EISSystemException is used to indicate any EIS specific system-level error conditions. The common error conditions are: failure or inactivity of an EIS instance, communication failure and EIS specific error in the creation of a new physical connection.

Version:
  1.0

Author:
  Rahul Sharma, Ram Jeyaraman

public EISSystemException()

Constructs a new instance with null as its detail message.

-----------------------------------------------

public EISSystemException(String message)

message

EISSystemException

public EISSystemException(String message)

Constructs a new instance with the specified detail message.

Parameters:
message - the detail message.

-----------------------------------------------

public EISSystemException(Throwable cause)

cause  throwable

EISSystemException

public EISSystemException(Throwable cause)

Constructs a new throwable with the specified cause.

Parameters:
cause - a chained exception of type Throwable.

-----------------------------------------------

public EISSystemException(String message, Throwable cause)

cause  throwable
EISSystemException

public EISSystemException(String message, Throwable cause)

Constructs a new throwable with the specified detail message and cause.

Parameters:
message - the detail message.
cause - a chained exception of type Throwable.

public EISSystemException(String message, String errorCode)

Constructs a new throwable with the specified detail message and an error code.

Parameters:
message - a description of the exception.
errorCode - a string specifying the vendor specific error code.

</table>
abstract public String name()
(java:comp/env) ejb

name

public abstract String name

The logical name of the ejb reference within the declaring component's (java:comp/env) environment.

Default: 

abstract public String description()

description

public abstract String description

Default: 

abstract public String beanName()
 Enterprise Java Bean  ejb-name EJB

beanName

public abstract String beanName

The ejb-name of the Enterprise Java Bean to which this reference is mapped. Only applicable if the target EJB is defined within the same application or stand-alone module as the declaring component.
abstract public Class<T> beanInterface()
EJB [ Home Home ]

beanInterface

public abstract Class beanInterface

Holds one of the following interface types of the target EJB: [ Local business interface, Remote business interface, Local Home interface, Remote Home interface ]

Default:
java.lang.Object.class

abstract public String mappedName()
ejb EJB JNDI

mappedName

public abstract String mappedName

The product specific name of the EJB component to which this ejb reference should be mapped. This mapped name is often a global JNDI name, but may be a name of any form. Application servers are not required to support any particular form or type of mapped name, nor the ability to use mapped names. The mapped name is product-dependent and often installation-dependent. No use of a mapped name is portable.

### Constructor Detail

**public EJBAccessException()**

EJBAccessException

**public EJBAccessException(String message)**

EJBAccessException

```java
public EJBAccessException(String message)
```

Constructs an EJBAccessException with the specified detailed
javax.ejb Interface EJBContext

All Known Subinterfaces:

   EntityContext, MessageDrivenContext, SessionContext

```
public interface EJBContext

Implemented by: EntityContext, MessageDrivenContext, SessionContext
```

EJBContext Bean

SessionContextEntityContext MessageDrivenContext Bean

The EJBContext interface provides an instance with access to the container-provided runtime context of an enterprise Bean instance.

This interface is extended by the SessionContext, EntityContext, and MessageDrivenContext interfaces to provide additional methods specific to the enterprise interface Bean type.

### Method Summary

<table>
<thead>
<tr>
<th>Identity</th>
<th>getCallerIdentity()</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Deprecated. Use Principal getCallerPrincipal() instead.</td>
</tr>
</tbody>
</table>

<table>

<tr>
<td></td>
<td>Obtain the enterprise bean's remote home interface.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>EJBLocalHome</th>
<th>getEJBLocalHome()</th>
</tr>
</thead>
</table>
Obtain the enterprise bean's local home interface.

Properties

getEnvironment()  
Deprecated. Use the JNDI naming context java:comp/env to access enterprise bean's environment.

boolean getRollbackOnly()  
Test if the transaction has been marked for rollback only.

TimerService
getTimerService()  
Get access to the EJB Timer Service.

UserTransaction
getUserTransaction()  
Obtain the transaction demarcation interface.

boolean isCallerInRole(Identity role)  
Deprecated. Use boolean isCallerInRole(String roleName) instead.

boolean isCallerInRole(String roleName)  
Test if the caller has a given security role.

Object lookup(String name)  
Lookup a resource within the component's private naming context.

void setRollbackOnly()  
Mark the current transaction for rollback.

Method Detail

public EJBHome getEJBHome()
Bean home
    return Bean home
    Throws IllegalStateException: Bean home

getEJBHome

EJBHome getEJBHome()
Obtain the enterprise bean's remote home interface.

**Returns:**
The enterprise bean's remote home interface.

**Throws:**
*IllegalStateException* - if the enterprise bean does not have a remote home interface.

```java
public EJBLocalHome getEJBLocalHome()
```

**Bean home**

```java
return Bean home
```

**Throws**
*IllegalStateException:* Bean home

---

getEJBLocalHome

```java
EJBLocalHome getEJBLocalHome()
```

Obtain the enterprise bean's local home interface.

**Returns:**
The enterprise bean's local home interface.

**Throws:**
*IllegalStateException* - if the enterprise bean does not have a local home interface.

---

```java
public java.util.Properties getEnvironment()
```

**Bean**

```java
return Bean
```

**deprecated**
*JNDI java:comp/env Bean*
getEnvironment

Properties getEnvironment()

**Deprecated. Use the JNDI naming context java:comp/env to access enterprise bean's environment.**

Obtain the enterprise bean's environment properties.

**Note:** If the enterprise bean has no environment properties this method returns an empty java.util.Properties object. This method never returns null.

**Returns:**

The environment properties for the enterprise bean.

---

public java.security.Identity getCallerIdentity()

java.security.Identity EJB 1.1 Container
null Bean getCallerPrincipal

return Identity

deprecated Principal getCallerPrincipal()

---

getCallerIdentity

Identity getCallerIdentity()

**Deprecated. Use Principal getCallerPrincipal() instead.**

Obtain the java.security.Identity of the caller. This method is deprecated in EJB 1.1. The Container is allowed to return alway null from this method. The enterprise bean should use the getCallerPrincipal method instead.

**Returns:**

The Identity object that identifies the caller.
public java.security.Principal getCallerPrincipal()
java.security.Principal
    return Principal null
    Throws IllegalStateException: Container

getCallerPrincipal

Principal getCallerPrincipal()

Obtain the java.security.Principal that identifies the caller.

Returns:
The Principal object that identifies the caller. This method never returns null.

Throws:
IllegalStateException - The Container throws the exception if the instance is not allowed to call this method.

public boolean isCallerInRole(java.security.Identity role)

ejb 1.1 bean isCallerInRole(String roleName)

role java.security.Identity
return true
deprecated boolean isCallerInRole(String roleName)

isCallerInRole

boolean isCallerInRole(Identity role)

Deprecated. Use boolean isCallerInRole(String roleName) instead.
Test if the caller has a given role.

This method is deprecated in EJB 1.1. The enterprise bean should use the isCallerInRole(String roleName) method instead.

**Parameters:**
role - The java.security.Identity of the role to be tested.

**Returns:**
True if the caller has the specified role.

---

```java
public boolean isCallerInRole(String roleName)
```

**(roleName**

return true

**Throws**
IllegalStateException: Container

---

**isCallerInRole**

boolean isCallerInRole(String roleName)

Test if the caller has a given security role.

**Parameters:**
roleName - The name of the security role. The role must be one of the security roles that is defined in the deployment descriptor.

**Returns:**
True if the caller has the specified role.

**Throws:**
IllegalStateException - The Container throws the exception if the instance is not allowed to call this method.

---

```java
public UserTransaction getUserTransaction() throws
IllegalStateException
```

Bean Bean UserTransaction Bean

Bean Bean Bean
getUserTransaction

```java
UserTransaction getUserTransaction() throws IllegalStateException
```

Obtain the transaction demarcation interface. Only enterprise beans with bean-managed transactions are allowed to use the UserTransaction interface. As entity beans must always use container-managed transactions, only session beans or message-driven beans with bean-managed transactions are allowed to invoke this method.

**Returns:**

The UserTransaction interface that the enterprise bean instance can use for transaction demarcation.

**Throws:**

`IllegalStateException` - The Container throws the exception if the instance is not allowed to use the UserTransaction interface (i.e. the instance is of a bean with container-managed transactions).

```java
public void setRollbackOnly() throws IllegalStateException
```

Mark the current transaction for rollback. The transaction will

```java
void setRollbackOnly() throws IllegalStateException
```
become permanently marked for rollback. A transaction marked for rollback can never commit. Only enterprise beans with container-managed transactions are allowed to use this method.

**Throws:**

`IllegalStateException` - The Container throws the exception if the instance is not allowed to use this method (i.e. the instance is of a bean with bean-managed transactions).

```java
public boolean getRollbackOnly() throws
IllegalStateException
Bean
return true false
Throws
IllegalStateException: Bean Bean Container
```

**getRollbackOnly**

```java
boolean getRollbackOnly() throws IllegalStateException
```

Test if the transaction has been marked for rollback only. An enterprise bean instance can use this operation, for example, to test after an exception has been caught, whether it is fruitless to continue computation on behalf of the current transaction. Only enterprise beans with container-managed transactions are allowed to use this method.

**Returns:**

True if the current transaction is marked for rollback, false otherwise.

**Throws:**

`IllegalStateException` - The Container throws the exception if the instance is not allowed to use this method (i.e. the instance is of a bean with bean-managed transactions).
public TimerService getTimerService() throws IllegalStateException
EJB Timer Service

Throws
IllegalStateException: Bean Bean Container

getTimerService

TimerService getTimerService()
throws IllegalStateException

Get access to the EJB Timer Service.

Throws:
IllegalStateException - The Container throws the exception if the instance is not allowed to use this method (e.g. if the bean is a stateful session bean)

-----------------------------------------------

public Object lookup(String name)

name java:comp/env

Throws IllegalArgumentException: Container

lookup

Object lookup(String name)

Lookup a resource within the component's private naming context.

Parameters:
name - Name of the entry (relative to java:comp/env).

Throws:
IllegalArgumentException - The Container throws the exception if the given name does not match an entry within the component's environment.

Constructor Detail

public EJBException()
EJBException

EJBException
public EJBException()

Constructs an EJBException with no detail message.

public EJBException(String message)
EJBException

EJBException
public EJBException(String message)

Constructs an EJBException with the specified detailed message.

public EJBException(Exception ex)
EJBException

EJBException
public EJBException(Exception ex)

Constructs an EJBException that embeds the originally thrown exception.

public EJBException(String message, Exception ex)

EJBException

Constructs an EJBException that embeds the originally thrown exception with the specified detail message.

Method Detail

public Exception getCausedByException()

EJBException

gCausedByException

public Exception getCausedByException()

Obtain the exception that caused the EJBException being thrown.

public String getMessage()

getMessage
public String getMessage()

    Returns the detail message, including the message from the nested exception if there is one.

    Overrides:
            getMessage in class Throwable

public void printStackTrace(java.io.PrintStream ps)
    ps

printStackTrace

public void printStackTrace(PrintStream ps)

    Prints the composite message and the embedded stack trace to the specified stream ps.

    Overrides:
            printStackTrace in class Throwable

Parameters:
            ps - the print stream

public void printStackTrace()
            System.err

printStackTrace

public void printStackTrace()

    Prints the composite message to System.err.

    Overrides:
            printStackTrace in class Throwable
public void printStackTrace(java.io.PrintWriter pw)
        pw

printStackTrace

public void printStackTrace(PrintWriter pw)

    Prints the composite message and the embedded stack trace to the specified print writer pw.

Overrides:
    printStackTrace in class Throwable

Parameters:
    pw - the print writer

PS:
javax.ejb Interface EJBHome

All Superinterfaces:
Remote

All Known Subinterfaces:
ManagementHome

public interface EJBHome
extends Remote

Implements: java.rmi.Remote
Implemented by: ManagementHome

EJBHome Bean home Bean home EJB
Bean home Bean home

home Bean Bean

The EJBHome interface must be extended by all enterprise Beans' remote home interfaces. An enterprise Bean's remote home interface defines the methods that allow a remote client to create, find, and remove EJB objects, as well as home business methods that are not specific to a bean instance (Session Beans do not have finders and home methods).

The remote home interface is defined by the enterprise Bean provider and implemented by the enterprise Bean container.

Method Summary

<table>
<thead>
<tr>
<th>EJBMetaData</th>
<th>getEJBMetaData()</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Obtain the EJBMetaData interface for the enterprise Bean.</td>
</tr>
<tr>
<td>Method</td>

<td>-------------</td>
</tr>
<tr>
<td><code>getHomeHandle()</code></td>
<td>Obtain a handle for the remote home object.</td>
</tr>
<tr>
<td><code>void remove(Handle handle)</code></td>
<td>Remove an EJB object identified by its handle.</td>
</tr>
<tr>
<td><code>void remove(Object primaryKey)</code></td>
<td>Remove an EJB object identified by its primary key.</td>
</tr>
</tbody>
</table>

## Method Detail

```java
public void remove(Handle handle) throws java.rmi.RemoteException, RemoveException
EJB
```

**Throws:**
- `RemoveException`: Bean
- `java.rmi.RemoteException`: 

```java
void remove(Handle handle) throws RemoteException, RemoveException
```

Remove an EJB object identified by its handle.

**Throws:**
- `RemoveException`: Thrown if the enterprise Bean or the container does not allow the client to remove the object.
- `RemoteException`: Thrown when the method failed due to a system-level failure.

```java
public void remove(Object primaryKey) throws java.rmi.RemoteException, RemoveException
EJB
```

Bean Bean  RemoveException
  Throws  RemoveException:  Bean
  Throws  java.rmi.RemoteException:

remove

void remove(Object primaryKey)
  throws RemoteException,
  RemoveException

Remove an EJB object identified by its primary key.

This method can be used only for an entity bean. An attempt to call
this method on a session bean will result in a RemoveException.

Throws:
  RemoveException - Thrown if the enterprise Bean or the container
does not allow the client to remove the object.
  RemoteException - Thrown when the method failed due to a
system-level failure.

public EJBMetaData getEJBMetaData() throws
java.rmi.RemoteException
Bean  EJBMetaData EJBMetaData  Bean

EJBMetaData
  return  Bean  EJBMetaData
  Throws  java.rmi.RemoteException:

gEtEJBMetaData

EJBMetaData  getEJBMetaData()
  throws  RemoteException
Obtain the EJBMetaData interface for the enterprise Bean. The EJBMetaData interface allows the client to obtain information about the enterprise Bean.

The information obtainable via the EJBMetaData interface is intended to be used by tools.

**Returns:**

The enterprise Bean's EJBMetaData interface.

**Throws:**

RemoteException - Thrown when the method failed due to a system-level failure.

---

```java
public HomeHandle getHomeHandle() throws java.rmi.RemoteException

home home Java
```

**getHomeHandle**

HomeHandle getHomeHandle()

Throws RemoteException:

Obtain a handle for the remote home object. The handle can be used at later time to re-obtain a reference to the remote home object, possibly in a different Java Virtual Machine.

**Returns:**

A handle for the remote home object.

**Throws:**

RemoteException - Thrown when the method failed due to a system-level failure.

PS:
**javax.ejb** Interface **EJBLocalHome**

```java
public interface EJBLocalHome

EJBLocalHome Bean home Bean home EJB
Bean home Bean home

home Bean Bean
```

The EJBLocalHome interface must be extended by all enterprise Beans' local home interfaces. An enterprise Bean's local home interface defines the methods that allow local clients to create, find, and remove EJB objects, as well as home business methods that are not specific to a bean instance (session Beans do not have finders and home business methods).

The local home interface is defined by the enterprise Bean provider and implemented by the enterprise Bean container.

### Method Detail

```java
public void remove(Object primaryKey) throws RemoveException, EJBException
EJB
```
Bean Bean RemoveException

Throws  RemoveException:  Bean

Throws  EJBEexception:

remove

void remove(Object primaryKey)
throws RemoveException,
EJBEexception

Remove an EJB object identified by its primary key.

This method can only be used by local clients of an entity bean. An attempt to call this method on a session bean will result in a RemoveException.

Throws:

RemoveException - Thrown if the enterprise Bean or the container does not allow the client to remove the object.
EJBEexception - Thrown when the method failed due to a system-level failure.

public interface EJBLocalObject

EJBLocalObject Bean Bean EJB Bean
Bean Bean Bean

The EJBLocalObject interface must be extended by all enterprise Beans' local interfaces. An enterprise Bean's local interface provides the local client view of an EJB object. An enterprise Bean's local interface defines the business methods callable by local clients.

The enterprise Bean's local interface is defined by the enterprise Bean provider and implemented by the enterprise Bean container.

### Method Summary

</tbody>
</table>

### Method Detail
public EJBLocalHome getEJBLocalHome() throws EJBException

Bean home home Bean createfinder
remove home

  return Bean home
  Throws EJBException:

getEJBLocalHome

EJBLocalHome getEJBLocalHome()
  throws EJBException

Obtain the enterprise Bean's local home interface. The local home interface defines the enterprise Bean's create, finder, remove, and home business methods that are available to local clients.

Returns:
  A reference to the enterprise Bean's local home interface.

Throws:
  EJBException - Thrown when the method failed due to a system-level failure.

public Object getPrimaryKey() throws EJBException

Bean Bean EJBException

  return EJB
  Throws EJBException: Bean

getPrimaryKey

Object getPrimaryKey()
  throws EJBException
Obtain the primary key of the EJB local object.

This method can be called on an entity bean. An attempt to invoke this method on a session Bean will result in an EJBException.

**Returns:**
The EJB local object's primary key.
**Throws:**
- `EJBException` - Thrown when the method failed due to a system-level failure or when invoked on a session bean.

```java
public void remove() throws RemoveException, EJBException
```

Remove the EJB local object.

**Throws:**
- `RemoveException` - The enterprise Bean or the container does not allow destruction of the object.
- `EJBException` - Thrown when the method failed due to a system-level failure.

```java
public boolean isIdentical(EJBLocalObject obj) throws EJBException
```

```java
void remove()
 throws RemoveException, EJBException
```

```java
void remove()
 throws RemoveException, EJBException
```
boolean isIdentical(EJBLocalObject obj) throws EJBException

Test if a given EJB local object is identical to the invoked EJB local object.

**Parameters:**

obj - An object to test for identity with the invoked object.

**Returns:**

True if the given EJB local object is identical to the invoked object, false otherwise.

**Throws:**

EJBException - Thrown when the method failed due to a system-level failure.

The EJBMetaData interface allows a client to obtain the enterprise Bean's meta-data information.

The meta-data is intended for development tools used for building applications that use deployed enterprise Beans, and for clients using a scripting language to access the enterprise Bean.

Note that the EJBMetaData is not a remote interface. The class that implements this interface (this class is typically generated by container tools) must be serializable, and must be a valid RMI/IDL value type.

Class

Obtain the Class object for the enterprise Bean's remote interface.

boolean isSession()

Test if the enterprise Bean's type is "session".

boolean isStatelessSession()

Test if the enterprise Bean's type is "stateless session".

Method Detail

public EJBHome getEJBHome()
Bean home
return Bean home

getEJBHome

EJBHome getEJBHome()

Obtain the remote home interface of the enterprise Bean.

Returns:
the remote home interface of the enterprise Bean.

public Class<T> getHomeInterfaceClass()
Bean home Class
return Bean home Class

getHomeInterfaceClass

Class getHomeInterfaceClass()

Obtain the Class object for the enterprise Bean's remote home interface.
Returns:
the Class object for the enterprise Bean's remote home interface.

public Class<T> getRemoteInterfaceClass()
Bean Class
return Bean Class

getRemoteInterfaceClass

Class getRemoteInterfaceClass()

Obtain the Class object for the enterprise Bean's remote interface.

Returns:
the Class object for the enterprise Bean's remote interface.

public Class<T> getPrimaryKeyClass()
Bean Class
return Bean Class

getPrimaryKeyClass

Class getPrimaryKeyClass()

Obtain the Class object for the enterprise Bean's primary key class.

Returns:
the Class object for the enterprise Bean's primary key class.

public boolean isSession()
Bean “”
isSession

boolean isSession()

Test if the enterprise Bean's type is "session".

Returns:
    True if the type of the enterprise Bean is session bean.

isStatelessSession

boolean isStatelessSession()

Test if the enterprise Bean's type is "stateless session".

Returns:
    True if the type of the enterprise Bean is stateless session.
javax.security.jacc  **Class EJBMethodPermission**

**java.lang.Object**
- **java.security.Permission**
  - **javax.security.jacc.EJBMethodPermission**

**All Implemented Interfaces:**
- **Serializable, Guard**

```java
public final class EJBMethodPermission
extends Permission
implements Serializable

Extends: java.security.Permission
Implements: java.io.Serializable

EJB

EJBMethodPermission EJB ejb-name

EJBMethodPermission actions EJB

newPermissionCollection

See also java.security.Permission

Class for EJB method permissions.

The name of an EJBMethodPermission contains the value of the ejb-name element in the application's deployment descriptor that identifies the target EJB.

The actions of an EJBMethodPermission identifies the methods of the EJB to which the permission applies.

Implementations of this class MAY implement newPermissionCollection
or inherit its implementation from the super class.

**Author:**
Ron Monzillo, Gary Ellison

Constructor Detail

```java
public EJBMethodPermission(String name, String actions)
EJBMethodPermission

EJB  ejb-name

actions  methodSpecactions

methodNameSpec ::= methodName | emptyString

methodInterfaceName ::= String

methodInterfaceSpec ::= methodInterfaceName | emptyString

typeName ::= typeName | typeName []

methodParams ::= typeName | methodParams comma typeName

methodParamsSpec ::= emptyString | methodParams

methodSpec ::= null | methodNameSpec |
methodSpec ::= methodNameSpec comma methodInterfaceName |
methodSpec ::= methodNameSpec comma methodInterfaceSpec comma methodParamsSpec |
```

MethodInterfaceName  String  EJB  method-intf
EJB  EJB  method-intf
EJBMethodPermission

```java
class EJBMethodPermission {
    public EJBMethodPermission(String name, String actions) {
        // Implementation...
    }
}
```

Creates a new EJBMethodPermission with the specified name and actions.

The name contains the value of the ejb-name element corresponding to an EJB in the application's deployment descriptor.

The actions contains a methodSpec. The syntax of the actions
parameter is defined as follows:

```
methodNameSpec ::= methodName | emptyString
methodInterfaceName ::= String
methodInterfaceSpec ::= methodInterfaceName | emptyString
typeName ::= typeName | typeName []
methodParams ::= typeName | methodParams comma typeName
methodParamsSpec ::= emptyString | methodParams
methodSpec ::= null |
    methodNameSpec |
    methodNameSpec comma methodInterfaceName |
    methodNameSpec comma methodInterfaceSpec comma methodParamsSpec
```

A MethodInterfaceName is a non-empty String and should contain a method-intf value as defined for use in EJB deployment descriptors. An implementation must be flexible such that it supports additional interface names especially if they are standardized by the EJB Specification. The EJB Specification currently defines the following method-intf values:

```
{ "Home", "LocalHome", "Remote", "Local", "ServiceEndpoint"
```

A null or empty string methodSpec indicates that the permission applies to all methods of the EJB. A methodSpec with a methodNameSpec of the empty string matches all methods of the EJB that match the methodInterface and methodParams elements of the methodSpec.

A methodSpec with a methodInterfaceSpec of the empty string matches all methods of the EJB that match the methodNameSpec and methodParamsSpec elements of the methodSpec.

A methodSpec without a methodParamsSpec matches all methods of the EJB that match the methodNameSpec and methodInterface elements of the methodSpec.
The order of the typeNames in methodParams array must match the order of occurrence of the corresponding parameters in the method signature of the target method(s). Each typeName in the methodParams must contain the canonical form of the corresponding parameter’s typeName as defined by the getActions method. A methodSpec with an empty methodParamsSpec matches all 0 argument methods of the EJB that match the methodNameSpec and methodInterfaceSpec elements of the methodSpec.

**Parameters:**
- `name` - of the EJB to which the permission pertains.
- `actions` - identifies the methods of the EJB to which the permission pertains.

```java
public EJBMethodPermission(String EJBName, String methodName, String methodInterface, String[] methodParams)
```

- `EJBName` - `EJBNamemethodName methodInterface methodParams actions EJBMethodPermission`
- `methodName` - `EJB name``
- `methodInterface` - `EJB null ***`
- `methodParams` - `typeName methodParams null`

**EJBMethodPermission**

```java
public EJBMethodPermission(String EJBName, String methodName,
                          String methodInterface,
                          String[] methodParams)
```
Creates a new EJBMethodPermission with name corresponding to the EJBName and actions composed from methodName, methodInterface, and methodParams.

Parameters:

EJBName - The string representation of the name of the EJB as it appears in the corresponding ejb-name element in the deployment descriptor.

methodName - A string that may be used to indicate the method of the EJB to which the permission pertains. A value of null or "" indicates that the permission pertains to all methods that match the other parameters of the permission specification without consideration of method name.

methodInterface - A string that may be used to specify the EJB interface to which the permission pertains. A value of null or "" indicates that the permission pertains to all methods that match the other parameters of the permission specification without consideration of the interface they occur on.

methodParams - An array of strings that may be used to specify (by typeNames) the parameter signature of the target methods. The order of the typeNames in methodParams array must match the order of occurrence of the corresponding parameters in the method signature of the target method(s). Each typeName in the methodParams array must contain the canonical form of the corresponding parameter's typeName as defined by the getActions method. An empty methodParams array is used to represent a method signature with no arguments. A value of null indicates that the permission pertains to all methods that match the other parameters of the permission specification without consideration of method signature.

public EJBMethodPermission(String EJBName, String methodInterface, Method method)
EJBMethodPermission

public EJBMethodPermission(String EJBName, String methodInterface, Method method)

Creates a new EJBMethodPermission with name corresponding to the EJBName and actions composed from methodInterface, and the Method object.

A container uses this constructor prior to checking if a caller has permission to call the method of an EJB.

Parameters:

EJBName - The string representation of the name of the EJB as it appears in the corresponding ejb-name element in the deployment descriptor.

methodInterface - A string that may be used to specify the EJB interface to which the permission pertains. A value of null or """, indicates that the permission pertains to all methods that match the other parameters of the permission specification without consideration of the interface they occur on.

method - an instance of the Java.lang.reflect.Method class corresponding to the method that the container is trying to
determine whether the caller has permission to access. This value must not be null.

### Method Detail

**public boolean equals(Object o)**

EJBMethodPermission EJBMethodPermission

**actions**

P1.implies(P2) && P2.implies(P1) Permission P1 P2

```
o EJBMethodPermission EJBMethodPermission
```

```
return EJBMethodPermission EJBMethodPermission
```

true

**equals**

**public boolean equals(Object o)**

Checks two EJBMethodPermission objects for equality. EJBMethodPermission objects are equivalent if they have case sensitive equivalent name and actions values.

Two Permission objects, P1 and P2, are equivalent if and only if P1.implies(P2) && P2.implies(P1).

**Specified by:**

equals in class Permission

**Parameters:**

- **o** - the EJBMethodPermission object being tested for equality with this EJBMethodPermission

**Returns:**
true if the argument EJBMethodPermission object is equivalent to this EJBMethodPermission.

public String getActions()
  EJBMethodPermission actions String
EJBMethodPermission actions

methodNameSpec ::= methodName | emptyString

methodInterfaceName ::= String

methodInterfaceSpec ::= methodInterfaceName | emptyString

typeName ::= typeName | typeName []

methodParams ::= typeName | methodParams comma typeName

methodParamsSpec ::= emptyString | methodParams

methodSpec ::= null |
  methodName |
  methodNameSpec comma methodInterfaceName |
  methodNameSpec comma methodInterfaceSpec comma methodParamsSpec

typeName Java typeName Java "[]"

MethodInterfaceName String EJB method-intf
EJB EJB method-intf

{ "Home", "LocalHome", "Remote", "Local", "ServiceEndpoint" :

  return EJBMethodPermission actions String
**getActions**

```java
public String getActions()
```

Returns a `String` containing a canonical representation of the actions of this `EJBMethodPermission`. The Canonical form of the actions of an `EJBMethodPermission` is described by the following syntax description.

```
methodNameSpec ::= methodName | emptyString
methodInterfaceName ::= String
methodInterfaceSpec ::= methodInterfaceName | emptyString
typeName ::= typeName | typeName []
methodParams ::= typeName | methodParams comma typeName
methodParamsSpec ::= emptyString | methodParams
methodSpec ::= null |
    methodName |
    methodNameSpec comma methodInterfaceName |
    methodNameSpec comma methodInterfaceSpec comma methodParamsSpec
```

The canonical form of each `typeName` must begin with the fully qualified Java name of the corresponding parameter's type. The canonical form of a `typeName` for an array parameter is the fully qualified Java name of the array's component type followed by as many instances of the string "[]" as there are dimensions to the array. No additional characters (e.g. blanks) may occur in the canonical form.

A `MethodInterfaceName` is a non-empty `String` and should contain a `method-intf` value as defined for use in EJB deployment descriptors. An implementation must be flexible such that it supports additional interface names especially if they are standardized by the EJB Specification. The EJB Specification currently defines the following `method-intf` values:

```
{ "Home", "LocalHome", "Remote", "Local", "ServiceEndpoint" }
```
Specified by:
getActions in class Permission

Returns:
a String containing the canonicalized actions of this EJBMethodPermission.

public int hashCode()
EJBMethodPermission

- Java EJBMethodPermission hashCode
  EJBMethodPermission hashCode
- equals EJBMethodPermission
  Permission hashCode

  return

hashCode

public int hashCode()

Returns the hash code value for this EJBMethodPermission. The properties of the returned hash code must be as follows:

- During the lifetime of a Java application, the hashCode method must return the same integer value every time it is called on a EJBMethodPermission object. The value returned by hashCode for a particular EJBMethodPermission need not remain consistent from one execution of an application to another.
- If two EJBMethodPermission objects are equal according to the equals method, then calling the hashCode method on each of the two Permission objects must produce the same integer result (within an application).
public boolean implies(java.security.Permission permission)
EJBMethodPermission "" Permission

- EJBMethodPermission
- EJBMethodPermission
- Permission actions
  EJBMethodPermission actions

Permission

- methodNameSpec null Permission
- methodNameSpec null Permission
- methodNameSpec null permission

actions

    permission ""EJBMethodPermission Permission
    return true false

implies

public boolean implies(Permission permission)

Determines if the argument Permission is "implied by" this EJBMethodPermission. For this to be the case,

- The argument must be an instance of EJBMethodPermission
with name equivalent to that of this EJBMethoMethodPermission, and
the methods to which the argument permission applies (as defined in its actions) must be a subset of the methods to which this EJBMethoMethodPermission applies (as defined in its actions).

The argument permission applies to a subset of the methods to which this permission applies if all of the following conditions are met.

- the method name component of the methodNameSpec of this permission is null, the empty string, or equivalent to the method name of the argument permission, and
- the method interface component of the methodNameSpec of this permission is null, the empty string, or equivalent to the method interface of the argument permission, and
- the method parameter list component of the methodNameSpec of this permission is null, the empty string, or equivalent to the method parameter list of the argument permission.

The name and actions comparisons described above are case sensitive.

**Specified by:**
implies in class Permission

**Parameters:**
permission - "this" EJBMethoMethodPermission is checked to see if it implies the argument permission.

**Returns:**
true if the specified permission is implied by this object, false if not.
PS:
javax.ejb Interface EJBObject

All Superinterfaces:
  Remote

All Known Subinterfaces:
  Management

public interface EJBObject
  extends Remote

Implements: java.rmi.Remote
Implemented by: Management

EJBObject Bean Bean EJB Bean
javax.ejb.EJBObject Bean
Bean Bean Bean

The EJBObject interface is extended by all enterprise Beans' remote interfaces. An enterprise Bean's remote interface provides the remote client view of an EJB object. An enterprise Bean's remote interface defines the business methods callable by a remote client.

The remote interface must extend the javax.ejb.EJBObject interface, and define the enterprise Bean specific business methods.

The enterprise Bean's remote interface is defined by the enterprise Bean provider and implemented by the enterprise Bean container.

Method Summary

| EJBHome | getEJBHome() |
Obtain the enterprise Bean's remote home interface.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>getHandle</strong></td>
<td>Obtain a handle for the EJB object.</td>
</tr>
<tr>
<td><strong>getPrimaryKey</strong></td>
<td>Obtain the primary key of the EJB object.</td>
</tr>
<tr>
<td><strong>isIdentical(EJBObject obj)</strong></td>
<td>Test if a given EJB object is identical to the invoked EJB object.</td>
</tr>
<tr>
<td><strong>remove()</strong></td>
<td>Remove the EJB object.</td>
</tr>
</tbody>
</table>

**Method Detail**

```java
public EJBHome getEJBHome() throws java.rmi.RemoteException

Bean home home Bean createfinder remove home

return Bean home

Throws java.rmi.RemoteException:
```

**getEJBHome**

```java
EJBHome getEJBHome() 

throws RemoteException
```

Obtain the enterprise Bean's remote home interface. The remote home interface defines the enterprise Bean's create, finder, remove, and home business methods.

**Returns:**
A reference to the enterprise Bean's home interface.

**Throws:**
RemoteException - Thrown when the method failed due to a system-level failure.
public Object getPrimaryKey() throws java.rmi.RemoteException
EJB

Bean Bean RemoteException
return EJB
Throws java.rmi.RemoteException: Bean

getByPrimaryKey

Object getPrimaryKey()
throws RemoteException

Obtain the primary key of the EJB object.

This method can be called on an entity bean. An attempt to invoke this method on a session bean will result in RemoteException.

Returns:
The EJB object's primary key.

Throws:
RemoteException - Thrown when the method failed due to a system-level failure or when invoked on a session bean.

public void remove() throws java.rmi.RemoteException, RemoveException
EJB

Throws java.rmi.RemoteException:
Throws RemoveException: Bean

remove
void remove()
    throws RemoteException,
        RemoveException

Remove the EJB object.

**Throws:**

- **RemoteException** - Thrown when the method failed due to a system-level failure.
- **RemoveException** - The enterprise Bean or the container does not allow destruction of the object.

---

```java
public Handle getHandle() throws java.rmi.RemoteException

EJB EJB Java
return EJB
```

Obtain a handle for the EJB object. The handle can be used at later time to re-obtain a reference to the EJB object, possibly in a different Java Virtual Machine.

**Returns:**

A handle for the EJB object.

**Throws:**

- **RemoteException** - Thrown when the method failed due to a system-level failure.

---

```java
public boolean isIdentical(EJBObject obj) throws java.rmi.RemoteException

EJB EJB
```
isIdentical

boolean isIdentical(EJBObject obj)
throws RemoteException

Test if a given EJB object is identical to the invoked EJB object.

Parameters:
   obj - An object to test for identity with the invoked object.

Returns:
   True if the given EJB object is identical to the invoked object, false otherwise.

Throws:
   RemoteException - Thrown when the method failed due to a system-level failure.
javax.security.jacc  **Class EJBRoleRefPermission**

`java.lang.Object`  
`java.security.Permission`  
`javax.security.jacc.EJBRoleRefPermission`

**All Implemented Interfaces:**  
`Serializable`, `Guard`

```java
public final class EJBRoleRefPermission

extends Permission
implements Serializable

Extends: java.security.Permission
Implements: java.io.Serializable

EJB isCallerInRole (String reference) EJBRoleRefPermission

EJBRoleRefPermission  EJB ejb-name

EJBRoleRefPermission  actions  EJBRoleRefPermission

newPermissionCollection

See also  java.security.Permission
```

Class for EJB *isCallerInRole (String reference)* permissions. An EJBRoleRefPermission is a named permission and has actions.

The name of an EJBRoleRefPermission contains the value of the ejb-name element in the application’s deployment descriptor that identifies the EJB in whose context the permission is being evaluated.

The actions of an EJBRoleRefPermission identifies the role reference to which the permission applies. An EJBRoleRefPermission is checked to
determine if the subject is a member of the role identified by the reference.

Implementations of this class MAY implement newPermissionCollection or inherit its implementation from the super class.

Methods inherited from class java.lang.Object:
- `clone`, `finalize`, `getClass`, `notify`, `notifyAll`, `wait`, `wait`, `wait`
Constructor Detail

public EJBRoleRefPermission(String name, String actions)

Creates a new EJBRoleRefPermission with the specified name and actions.

Parameters:

name - the ejb-name that identifies the EJB in whose context the role references are to be evaluated.

actions - identifies the role reference to which the permission pertains. The role reference is scoped to the EJB identified in the name parameter. The value of the role reference must not be null or the empty string.

Method Detail

public boolean equals(Object o)

P1.implies(P2) && P2.implies(P1) Permission P1 P2
equals

public boolean equals(Object o)

Checks two EJBRoleRefPermission objects for equality. EJBRoleRefPermission objects are equivalent if they have case equivalent name and actions values.

Two Permission objects, P1 and P2, are equivalent if and only if P1.implies(P2) && P2.implies(P1).

Specified by:
   equals in class Permission

Parameters:
   o - the EJBRoleRefPermission object being tested for equality with this EJBRoleRefPermission.

Returns:
   true if the argument EJBRoleRefPermission object is equivalent to this EJBRoleRefPermission.

public String getActions()
EJBRoleRefPermission actions String

return EJBRoleRefPermission actions String

getActions

public String getActions()
Returns a canonical String representation of the actions of this EJBRoleRefPermission.

**Specified by:**
getActions in class Permission

**Returns:**
a String containing the canonicalized actions of this EJBRoleRefPermission.

---

```java
public int hashCode()
EJBRoleRefPermission
```

- Java EJBRoleRefPermission hashCode
  EJBRoleRefPermission hashCode
- equals EJBRoleRefPermission
  Permission hashCode

  return

---

**hashCode**

```java
public int hashCode()
```

Returns the hash code value for this EJBRoleRefPermission. The properties of the returned hash code must be as follows:

- During the lifetime of a Java application, the hashCode method must return the same integer value, every time it is called on a EJBRoleRefPermission object. The value returned by hashCode for a particular EJBRoleRefPermission need not remain consistent from one execution of an application to another.
- If two EJBRoleRefPermission objects are equal according to the equals method, then calling the hashCode method on each of the two Permission objects must produce the same integer result (within an application).
public boolean implies(java.security.Permission permission)
EJBRoleRefPermission "" Permission

• EJBRoleRefPermission
• EJBRoleRefPermission
• EJBRoleRefPermission

actions

permission ""EJBRoleRefPermission Permission

return true false

implies

public boolean implies(Permission permission)

Determines if the argument Permission is "implied by" this EJBRoleRefPermission. For this to be the case,

• The argument must be an instance of EJBRoleRefPermission
• with name equivalent to that of this EJBRoleRefPermission, and
• with the role reference equivalent to that of this EJBRoleRefPermission applies.

The name and actions comparisons described above are case sensitive.

Specified by:
`implies` in class `Permission`

**Parameters:**
permission - "this" EJBRoleRefPermission is checked to see if it implies the argument permission.

**Returns:**
true if the specified permission is implied by this object, false if not.
javax.ejb  Annotation Type EJBs

@Target(value=TYPE)
@Retention(value=RUNTIME)
public @interface EJBs

Implements: Annotation
@Target(value=TYPE)
@Retention(value=RUNTIME)

TYPE-level @EJB

Declares multiple TYPE-level @EJB annotations.

javax.el Class ELContext

javax.lang.Object
   ↓ javax.el.ELContext

public abstract class ELContext
   extends Object

Expression   ELContextELContext

- base   ELResolver   base
- FunctionMapper  EL
- VariableMapper  EL
- ELResolver  Collection

Collection   ELResolver JSP  Faces

ELContext  JSP
ELContextListener  JspContext.getELContext()

ELContext  ELContext

since  JSP 2.1
See also  javax.el.ELContextListener, javax.el.ELContextEvent,
          javax.el.ELResolver, javax.el.FunctionMapper,
          javax.el.VariableMapper, javax.servlet.jsp.JspContext

Context information for expression evaluation.

To evaluate an Expression, an ELContext must be provided. The
ELContext holds:
• a reference to the base **ELResolver** that will be consulted to resolve model objects and their properties
• a reference to **FunctionMapper** that will be used to resolve EL Functions.
• a reference to **VariableMapper** that will be used to resolve EL Variables.
• a collection of all the relevant context objects for use by **ELResolver**
• state information during the evaluation of an expression, such as whether a property has been resolved yet

The collection of context objects is necessary because each **ELResolver** may need access to a different context object. For example, JSP and Faces resolvers need access to a **JspContext** and a **FacesContext**, respectively.

Creation of **ELContext** objects is controlled through the underlying technology. For example, in JSP the **JspContext.getELContext()** factory method is used. Some technologies provide the ability to add an **ELContextListener** so that applications and frameworks can ensure their own context objects are attached to any newly created **ELContext**.

Because it stores state during expression evaluation, an **ELContext** object is not thread-safe. Care should be taken to never share an **ELContext** instance between two or more threads.

**Since:**
JSP 2.1

**See Also:**
**ELContextListener**, **ELContextEvent**, **ELResolver**, **FunctionMapper**, **VariableMapper**, **JspContext**

public ELContext()

### Method Detail

**public void setPropertyResolved(boolean resolved)**

ELResolver (base, property)

<table>
<thead>
<tr>
<th>Method Reference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>resolved</code></td>
<td>true</td>
</tr>
</tbody>
</table>

See also: [javax.el.CompositeELResolver](https://docs.oracle.com/javase/8/docs/api/javax/el/CompositeELResolver.html)

**setPropertyResolved**

public void `setPropertyResolved`(boolean resolved)

Called to indicate that a ELResolver has successfully resolved a given (base, property) pair.

The CompositeELResolver checks this property to determine whether it should consider or skip other component resolvers.

**Parameters:**
- `resolved`: true if the property has been resolved, or false if not.

**See Also:** [CompositeELResolver](https://docs.oracle.com/javase/8/docs/api/javax/el/CompositeELResolver.html)

**public boolean isPropertyResolved()**

ELResolver (base, property)

<table>
<thead>
<tr>
<th>Method Reference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>return</code></td>
<td>true</td>
</tr>
</tbody>
</table>
isPropertyResolved

public boolean isPropertyResolved()

Returns whether an ELResolver has successfully resolved a given (base, property) pair.

The CompositeELResolver checks this property to determine whether it should consider or skip other component resolvers.

Returns:
true if the property has been resolved, or false if not.
See Also:
CompositeELResolver

putContext

public void putContext(Class<T> key, Object contextObject)

ELContext

ELContext Collection ELResolver Collection

contextObject key

key contextObject ELResolver Collection

Throws

NullPointerException: key null contextObject null

putContext

public void putContext(Class key,
Object contextObject)
Associates a context object with this ELContext.

The ELContext maintains a collection of context objects relevant to the evaluation of an expression. These context objects are used by ELResolvers. This method is used to add a context object to that collection.

By convention, the contextObject will be of the type specified by the key. However, this is not required and the key is used strictly as a unique identifier.

**Parameters:**
- **key** - The key used by an ELResolver to identify this context object.
- **contextObject** - The context object to add to the collection.

**Throws:**
- NullPointerException - if key is null or contextObject is null.

**public Object getContext(Class<T> key)**

**ELContext** Collection    ELResolver Collection

key

    key    ELContext
return null

Throws null

NullPointerException: key null

**getContext**

public Object getContext(Class key)

Returns the context object associated with the given key.
The ELContext maintains a collection of context objects relevant to the evaluation of an expression. These context objects are used by ELResolvers. This method is used to retrieve the context with the given key from the collection.

By convention, the object returned will be of the type specified by the key. However, this is not required and the key is used strictly as a unique identifier.

**Parameters:**
key - The unique identifier that was used to associate the context object with this ELContext.

**Returns:**
The context object associated with the given key, or null if no such context was found.

**Throws:**
NullPointerException - if key is null.

```java
abstract public ELResolver getELResolver()

ELResolver

getELResolver

public abstract ELResolver getELResolver()

Retrieves the ELResolver associated with this context.

The ELContext maintains a reference to the ELResolver that will be consulted to resolve variables and properties during an expression evaluation. This method retrieves the reference to the resolver.
Once an `ELContext` is constructed, the reference to the `ELResolver` associated with the context cannot be changed.

**Returns:**

The resolver to be consulted for variable and property resolution during expression evaluation.

---

**abstract public** `FunctionMapper` `getFunctionMapper()`

```java
ELContext FunctionMapper
return EL
```

**getFunctionMapper**

```java
public abstract FunctionMapper getFunctionMapper()
```

Retrieves the `FunctionMapper` associated with this `ELContext`.

**Returns:**

The function mapper to be consulted for the resolution of EL functions.

---

**public** `java.util.Locale` `getLocale()`

```java
#setLocale Locale null Locale Locale
Locale
return Locale
```

**getLocale**

```java
public Locale getLocale()
```

Get the `Locale` stored by a previous invocation to `setLocale(java.util.Locale)`. If this method returns non `null`, this `Locale` must be used for all localization needs in the implementation. The `Locale` must not be cached to allow for applications that change
Locale dynamically.

**Returns:**
The `Locale` in which this instance is operating. Used primarily for message localization.

```java
public void setLocale(java.util.Locale locale)
locale.setLocale(Locale.getDefault(), JSP EL)
Locale.getDefault();
```

**setLocale**

```java
public void setLocale(Locale locale)
    Locale.setLocale(Locale.getDefault());
```

Set the `Locale` for this instance. This method may be called by the party creating the instance, such as JavaServer Faces or JSP, to enable the EL implementation to provide localized messages to the user. If no `Locale` is set, the implementation must use the locale returned by `Locale.getDefault()`.

**abstract public** `VariableMapper` `getVariableMapper()`

```java
ELContext VariableMapper return
EL
```

**getVariableMapper**

```java
public abstract VariableMapper getVariableMapper()
```

Retrieves the `VariableMapper` associated with this `ELContext`.

**Returns:**
The variable mapper to be consulted for the resolution of EL variables.

ELContextEvent

ELContext

source

ELContext

ELContextEvent

public ELContextEvent(ELContext source)

Constructs an ELContextEvent object to indicate that an ELContext has been created.

Parameters:

source - the ELContext that was created.
public **ELContext** getELContext()

    ELContext #getSource

    return ELContext

---

**getELContext**

public **ELContext** getELContext()

    Returns the **ELContext** that was created. This is a type-safe equivalent of the **EventObject.getSource()** method.

    **Returns:**
    
    the **ELContext** that was created.

Method Detail

public void contextCreated(ELContextEvent ece)
ElContext
contextCreated

void contextCreated(ELContextEvent ece)

Invoked when a new ELContext has been created.

Parameters:

ece - the notification event.
This is an element marker interface. Under certain circumstances, it is necessary for the binding compiler to generate derived java content classes that implement this interface. In those cases, client applications must supply element instances rather than types of elements. For more detail, see section 5.7 "Element Declaration" and 5.7.1 "Bind to Java Element Interface" of the specification.

$employee.lastName  base  employee  property  "lastName"
${y[x]}  base  y  property  x

   ELResolver  ELContext  ELResolver
   CompositeELResolver

   \#getValue\#getType\#setValue  \#isReadOnly  ELResolver  (base,
   property)  base  (base, property)
Enables customization of variable and property resolution behavior for EL expression evaluation.

While evaluating an expression, the ELResolver associated with the ELContext is consulted to do the initial resolution of the first variable of an expression. It is also consulted when a . or [ ] operator is encountered, except for the last such operator in a method expression, in which case the resolution rules are hard coded.

For example, in the EL expression ${employee.lastName}, the ELResolver determines what object employee refers to, and what it means to get the lastName property on that object.

Most methods in this class accept a base and property parameter. In the case of variable resolution (e.g. determining what employee refers to in ${employee.lastName}), the base parameter will be null and the property parameter will always be of type String. In this case, if the property is not a String, the behavior of the ELResolver is undefined.

In the case of property resolution, the base parameter identifies the base object and the property object identifies the property on that base. For example, in the expression ${employee.lastName}, base is the result of the variable resolution for employee and property is the string "lastName". In the expression ${y[x]}, base is the result of the variable resolution for y and property is the result of the variable resolution for x.

Though only a single ELResolver is associated with an ELContext, there are usually multiple resolvers considered for any given variable or property resolution. ELResolverS are combined together using CompositeELResolverS, to define rich semantics for evaluating an
expression.

For the `getValue(javax.el.ELContext, java.lang.Object, java.lang.Object)`, `getType(javax.el.ELContext, java.lang.Object, java.lang.Object)`, `setValue(javax.el.ELContext, java.lang.Object, java.lang.Object, java.lang.Object)` and `isReadOnly(javax.el.ELContext, java.lang.Object, java.lang.Object)` methods, an `ELResolver` is not responsible for resolving all possible (base, property) pairs. In fact, most resolvers will only handle a base of a single type. To indicate that a resolver has successfully resolved a particular (base, property) pair, it must set the `propertyResolved` property of the `ELContext` to true. If it could not handle the given pair, it must leave this property alone. The caller must ignore the return value of the method if `propertyResolved` is false.

The `getFeatureDescriptors(javax.el.ELContext, java.lang.Object)` and `getCommonPropertyType(javax.el.ELContext, java.lang.Object)` methods are primarily designed for design-time tool support, but must handle invocation at runtime as well. The `Beans.isDesignTime()` method can be used to determine if the resolver is being consulted at design-time or runtime.

Since:  
JSP 2.1

getValue

public abstract Object getValue(ELContext context, Object base, Object property)

Attempts to resolve the given property object on the given base object.

If this resolver handles the given (base, property) pair, the propertyResolved property of the ELContext object must be set to
true by the resolver, before returning. If this property is not true after this method is called, the caller should ignore the return value.

**Parameters:**
context - The context of this evaluation.
base - The base object whose property value is to be returned, or null to resolve a top-level variable.
property - The property or variable to be resolved.

**Returns:**
If the propertyResolved property of ELContext was set to true, then the result of the variable or property resolution; otherwise undefined.

**Throws:**
NullPointerException - if context is null
PropertyNotFoundException - if the given (base, property) pair is handled by this ELResolver but the specified variable or property does not exist or is not readable.
ELException - if an exception was thrown while performing the property or variable resolution. The thrown exception must be included as the cause property of this exception, if available.

abstract public Class<T> getType(ELContext context, Object base, Object property)

(base, property) ELContext propertyResolved
true true

g getValue().getClass() ArrayELResolver getType

context base property
null

return ELContext propertyResolved true

Throws NullPointerException: context null
Throws `PropertyNotFoundException`: ELResolver (base, property)

Throws `ELException`: cause

**getType**

```java
public abstract Class<? super T> getType(ELContext context,
                                     Object base,
                                     Object property)
```

For a given base and property, attempts to identify the most general type that is acceptable for an object to be passed as the value parameter in a future call to the `setValue(javax.el.ELContext,

If this resolver handles the given (base, property) pair, the `propertyResolved` property of the ELContext object must be set to `true` by the resolver, before returning. If this property is not `true` after this method is called, the caller should ignore the return value.

This is not always the same as `getValue().getClass()`. For example, in the case of an `ArrayELResolver`, the `getType` method will return the element type of the array, which might be a superclass of the type of the actual element that is currently in the specified array element.

**Parameters:**
- context - The context of this evaluation.
- base - The base object whose property value is to be analyzed, or `null` to analyze a top-level variable.
- property - The property or variable to return the acceptable type for.

**Returns:**
- If the `propertyResolved` property of ELContext was set to `true`, then the most general acceptable type; otherwise undefined.

**Throws:**
- `NullPointerException` - if `context` is `null`.
- `PropertyNotFoundException` - if the given (base, property) pair is handled by this ELResolver but the specified variable or property references are not found.
abstract public void setValue(ELContext context, Object base, Object property, Object value)

(base, property) ELContext propertyResolved
true true

context base
base null
property
value

Throws NullPointerException: context null
Throws PropertyNotFoundException: ELResolver (base, property)
Throws PropertyNotWritableException: ELResolver (base, property)
Throws ELException: cause

setValue

public abstract void setValue(ELContext context,
Object base,
Object property,
Object value)

Attempts to set the value of the given property object on the given base object.

If this resolver handles the given (base, property) pair, the propertyResolved property of the ELContext object must be set to true by the resolver, before returning. If this property is not true after
this method is called, the caller can safely assume no value has been set.

**Parameters:**
- context - The context of this evaluation.
- base - The base object whose property value is to be set, or null to set a top-level variable.
- property - The property or variable to be set.
- value - The value to set the property or variable to.

**Throws:**
- NullPointerException - if context is null
- PropertyNotFoundException - if the given (base, property) pair is handled by this ELResolver but the specified variable or property does not exist.
- PropertyNotWritableException - if the given (base, property) pair is handled by this ELResolver but the specified variable or property is not writable.
- ELException - if an exception was thrown while attempting to set the property or variable. The thrown exception must be included as the cause property of this exception, if available.

```java
abstract public boolean isReadOnly(ELContext context, Object base, Object property)
    base  property  #setValue
(base, property)  ELContext  propertyResolved
true   true

context
base  base  null
property
return  ELContext  propertyResolved  true  true  false
Throws  NullPointerException:  context  null
Throws  PropertyNotFoundException:  ELResolver (base, property)
Throws  ELException:  cause
```
**isReadOnly**

```java
public abstract boolean isReadOnly(ELContext context, Object base, Object property)
```

For a given `base` and `property`, attempts to determine whether a call to `setValue(javax.el.ELContext, java.lang.Object, java.lang.Object, java.lang.Object)` will always fail.

If this resolver handles the given `(base, property)` pair, the `propertyResolved` property of the `ELContext` object must be set to `true` by the resolver, before returning. If this property is not `true` after this method is called, the caller should ignore the return value.

**Parameters:**
- **context** - The context of this evaluation.
- **base** - The base object whose property value is to be analyzed, or `null` to analyze a top-level variable.
- **property** - The property or variable to return the read-only status for.

**Returns:**
- If the `propertyResolved` property of `ELContext` was set to `true`, then `true` if the property is read-only or `false` if not; otherwise undefined.

**Throws:**
- `NullPointerException` - if `context` is `null`
- `PropertyNotFoundException` - if the given `(base, property)` pair is handled by this `ELResolver` but the specified variable or property does not exist.
- `ELException` - if an exception was thrown while performing the property or variable resolution. The thrown exception must be included as the cause property of this exception, if available.

---

```java
abstract public java.util.Iterator<E>
getFeatureDescriptors(ELContext context, Object base)
```
getFeatureDescriptors

```java
public abstract Iterator<FeatureDescriptor> getFeatureDescriptors(ELContext base) {
    // Returns information about the set of variables or properties that can be resolved for the given base object. One use for this method is to assist tools in auto-completion.
```

If the base parameter is null, the resolver must enumerate the list of top-level variables it can resolve.

The Iterator returned must contain zero or more instances of FeatureDescriptor, in no guaranteed order. In the case of primitive types such as int, the value null must be returned. This is to prevent the useless iteration through all possible primitive values. A return value of null indicates that this resolver does not handle the given base object or that the results are too complex to represent with this method and the getCommonPropertyType(javax.el.ELContext, java.lang.Object) method should be used instead.

Each FeatureDescriptor will contain information about a single variable or property. In addition to the standard properties, the FeatureDescriptor must have two named attributes (as set by the setValue method):

- **TYPE** - The value of this named attribute must be an instance of java.lang.Class and specify the runtime type of the variable or property.
- **RESOLVABLE_AT_DESIGN_TIME** - The value of this named attribute must be an instance of java.lang.Boolean and indicates whether it is safe to attempt to resolve this property at design-time. For instance, it may be unsafe to attempt a resolution at design time if the ELResolver needs access to a resource that is only available at runtime and no acceptable simulated value can be provided.

The caller should be aware that the Iterator returned might iterate through a very large or even infinitely large set of properties. Care should be taken by the caller to not get stuck in an infinite loop.

This is a "best-effort" list. Not all ELResolvers will return completely accurate results, but all must be callable at both design-time and runtime (i.e. whether or not Beans.isDesignTime() returns true), without causing errors.

The propertyResolved property of the ELContext is not relevant to this method. The results of all ELResolvers are concatenated in the case
of composite resolvers.

**Parameters:**
- `context` - The context of this evaluation.
- `base` - The base object whose set of valid properties is to be enumerated, or `null` to enumerate the set of top-level variables that this resolver can evaluate.

**Returns:**
- An `Iterator` containing zero or more (possibly infinitely more) `FeatureDescriptor` objects, or `null` if this resolver does not handle the given `base` object or that the results are too complex to represent with this method.

**See Also:**
- `FeatureDescriptor`

---

**abstract public Class<T>**

**getCommonPropertyType(ELContext context, Object base)**

```java
Base property
```

`ArrayELResolver`  `int`  `property`

`Integer.class`

```java
context
base
null
```

**getCommonPropertyType**

```java
public abstract Class<? super T> getCommonPropertyType(ELContext context, Object base)
```

Returns the most general type that this resolver accepts for the `property` argument, given a `base` object. One use for this method is to assist tools in auto-completion.
This assists tools in auto-completion and also provides a way to express that the resolver accepts a primitive value, such as an integer index into an array. For example, the `ArrayELResolver` will accept any `int` as a property, so the return value would be `Integer.class`.

**Parameters:**
- `context` - The context of this evaluation.
- `base` - The base object to return the most general property type for, or `null` to enumerate the set of top-level variables that this resolver can evaluate.

**Returns:**
- `null` if this `ELResolver` does not know how to handle the given base object; otherwise `Object.class` if any type of property is accepted; otherwise the most general property type accepted for the given base.

<td><strong>setType(String type)</strong>&lt;br&gt;Sets the type for this object.</td>
</tr>
</tbody>
</table>

### Method Detail

```java
public String getAddress() throws JAXRException
null
```
getAddress

`String getAddress()`

Throws: `JAXRException`

Returns the email address for this object. Default is a NULL String.

Capability Level: 0

Returns:
- the actual email address (e.g. john.doe@acme.com)

Throws:
- `JAXRException` - If the JAXR provider encounters an internal error

public void setAddress(String address) throws `JAXRException`

setAddress

`void setAddress(String address)`

Throws: `JAXRException`

Sets the email address for this object.
Capability Level: 0

Parameters:
address - the actual email address (e.g. john.doe@acme.com)

Throws:
  JAXRException - If the JAXR provider encounters an internal error

public String getType() throws JAXRException
NULL
0

    return "Home" "Office"

Throws  JAXRException: JAXR

get Type

String getType() throws JAXRException

Gets the type for this object. Default is a NULL String.

Capability Level: 0

Returns:
the usage type for this object which is an arbitrary value (e.g.
"Home" or "Office")

Throws:
  JAXRException - If the JAXR provider encounters an internal error

public void setType(String type) throws JAXRException
setType

void setType(String type)
throws JAXRException

Sets the type for this object.

Capability Level: 0

Parameters:
  type - the usage type for this object which is an arbitrary value (e.g. "Home" or "Office")

Throws:
  JAXRException - If the JAXR provider encounters an internal error
javax.persistence Annotation Type Embeddable

@Target(value=TYPE)  
@Retention(value=RUNTIME)  
public @interface Embeddable

**Implements**: Annotation  
@Target(value=TYPE)  
@Retention(value=RUNTIME)

**Transient**  
since Java Persistence 1.0

Defines a class whose instances are stored as an intrinsic part of an owning entity and share the identity of the entity. Each of the persistent properties or fields of the embedded object is mapped to the database table for the entity. Only Basic, Column, Lob, Temporal, and Enumerated mapping annotations may portably be used to map the persistent fields or properties of classes annotated as Embeddable.

Note that the Transient annotation may be used to designate the non-persistent state of an embeddable class.

**Since**:  
Java Persistence 1.0

Submit a bug or feature

Copyright 2007 Sun Microsystems, Inc. All rights reserved. Use is subject
to license terms.

PS:
javax.persistence  Annotation Type Embedded

@Target(value={METHOD, FIELD})
@Retention(value=RUNTIME)
public @interface Embedded

**Implements:** Annotation
@Target(value={METHOD, FIELD})
@Retention(value=RUNTIME)

@Embedded
@AttributeOverrides(
    @AttributeOverride(name="startDate",
                        column=@Column("EMP_START")),
    @AttributeOverride(name="endDate",
                        column=@Column("EMP_END")))

public EmploymentPeriod getEmploymentPeriod() { ... }

**since**  Java Persistence 1.0

Defines a persistent field or property of an entity whose value is an instance of an embeddable class. The embeddable class must be annotated as **Embeddable**.

Example:

@Embedded
@AttributeOverrides(
    @AttributeOverride(name="startDate",
                        column=@Column("EMP_START")),
    @AttributeOverride(name="endDate",
                        column=@Column("EMP_END")))

public EmploymentPeriod getEmploymentPeriod() { ... }

Since:
javax.persistence Annotation Type EmbeddedId

@Target(value={METHOD, FIELD})
@Retention(value=RUNTIME)
public @interface EmbeddedId

Implements: Annotation
@Target(value={METHOD, FIELD})
@Retention(value=RUNTIME)

@EmbeddedId
protected EmployeePK empPK;

since Java Persistence 1.0

Is applied to a persistent field or property of an entity class or mapped superclass to denote a composite primary key that is an embeddable class. The embeddable class must be annotated as Embeddable.

Example:

@EmbeddedId
protected EmployeePK empPK;

Since:
Java Persistence 1.0

PS:
javax.xml.ws Class Endpoint

java.lang.Object
   javax.xml.ws.Endpoint

public abstract class Endpoint
   extends Object

Web

   Binding
   publish stop

Executor ThreadPoolExecutor

Binding

WSDL XMLSchema JAX-WS
since JAX-WS 2.0
See javax.xml.ws.Binding, javax.xml.ws.BindingType,
javax.xml.ws.soap.SOAPBinding,
java.util.concurrent.Executor

A Web service endpoint.

Endpoints are created using the static methods defined in this class. An endpoint is always tied to one Binding and one implementor, both set at endpoint creation time.

An endpoint is either in a published or an unpublished state. The publish methods can be used to start publishing an endpoint, at which point it starts accepting incoming requests. Conversely, the stop method can be used to stop accepting incoming requests and take the endpoint down.
Once stopped, an endpoint cannot be published again.

An `Executor` may be set on the endpoint in order to gain better control over the threads used to dispatch incoming requests. For instance, thread pooling with certain parameters can be enabled by creating a `ThreadPoolExecutor` and registering it with the endpoint.

Handler chains can be set using the contained `Binding`.

An endpoint may have a list of metadata documents, such as WSDL and XMLSchema documents, bound to it. At publishing time, the JAX-WS implementation will try to reuse as much of that metadata as possible instead of generating new one based on the annotations present on the implementor.

**Since:**  
JAX-WS 2.0

Constructor Detail

public Endpoint()

Endpoint

public Endpoint()

<table>
<thead>
<tr>
<th>Method Detail</th>
</tr>
</thead>
</table>

public static Endpoint create(Object implementor)

BindingType  SOAP 1.1 / HTTP

javax.xml.ws.Endpoint#publish(String)
javax.xml.ws.Endpoint#publish(Object)

Implementor

return

create

public static Endpoint create(Object implementor)

Creates an endpoint with the specified implementor object. If there is a binding specified via a BindingType annotation then it MUST be used else a default of SOAP 1.1 / HTTP binding MUST be used.

The newly created endpoint may be published by calling one of the javax.xml.ws.Endpoint#publish(String) and javax.xml.ws.Endpoint#publish(Object) methods.

Parameters:
implementor - The endpoint implementor.

Returns:
The newly created endpoint.
public static Endpoint create(String bindingId, Object implementor)

javax.xml.ws.Endpoint#publish(String)
javax.xml.ws.Endpoint#publish(Object)

bindingId URI bindingID null BindingType
implementor SOAP 1.1 / HTTP

create

public static Endpoint create(String bindingId, Object implementor)

Creates an endpoint with the specified binding type and implementor object.

The newly created endpoint may be published by calling one of the
javax.xml.ws.Endpoint#publish(String) and
javax.xml.ws.Endpoint#publish(Object) methods.

Parameters:
  bindingId - A URI specifying the binding to use. If the bindingID
  is null and no binding is specified via a BindingType annotation
  then a default SOAP 1.1 / HTTP binding MUST be used.
  implementor - The endpoint implementor.

Returns:
The newly created endpoint.

abstract public Binding getBinding()

return
getBinding

public abstract Binding getBinding()

Returns the binding for this endpoint.

Returns:
The binding for this endpoint

abstract public Object getImplementor()

return

getImplementor

public abstract Object getImplementor()

Returns the implementation object for this endpoint.

Returns:
The implementor for this endpoint

abstract public void publish(String address)

JAX-WS
javax.xml.ws.Endpoint#publish(Object)

address URI

Throws IllegalArgumentException: URI

Throws IllegalStateException: IllegalStateException:

publish
public abstract void publish(String address)

Publishes this endpoint at the given address. The necessary server infrastructure will be created and configured by the JAX-WS implementation using some default configuration. In order to get more control over the server configuration, please use the javax.xml.ws.Endpoint#publish(Object) method instead.

**Parameters:**
- address - A URI specifying the address to use. The address must be compatible with the binding specified at the time the endpoint was created.

**Throws:**
- IllegalArgumentException - If the provided address URI is not usable in conjunction with the endpoint's binding.
- IllegalStateException - If the endpoint has been published already or it has been stopped.

public static Endpoint publish(String address, Object implementor)

**JAX-WS**
javax.xml.ws.Endpoint#create(String,Object)
javax.xml.ws.Endpoint#publish(Object)

address / URI http URI SOAP 1.1/HTTP URI

implementor

return

publish

public static Endpoint publish(String address, Object implementor)
Creates and publishes an endpoint for the specified implementor object at the given address.

The necessary server infrastructure will be created and configured by the JAX-WS implementation using some default configuration. In order to get more control over the server configuration, please use the javax.xml.ws.Endpoint#create(String,Object) and javax.xml.ws.Endpoint#publish(Object) method instead.

**Parameters:**
- **address** - A URI specifying the address and transport/protocol to use. A http: URI must result in the SOAP 1.1/HTTP binding being used. Implementations may support other URI schemes.
- **implementor** - The endpoint implementor.

**Returns:**
The newly created endpoint.

---

```java
abstract public void publish(Object serverContext)
```

**Throws**
- `IllegalArgumentException`:  
- `IllegalStateException`:  

---

**publish**

```java
public abstract void publish(Object serverContext)
```

Publishes this endpoint at the provided server context. A server context encapsulates the server infrastructure and addressing information for a particular transport. For a call to this method to succeed, the server context passed as an argument to it must be compatible with the endpoint's binding.

**Parameters:**
- **serverContext** - An object representing a server context to be used for publishing the endpoint.
Throws:

**IllegalArgumentException** - If the provided server context is not supported by the implementation or turns out to be unusable in conjunction with the endpoint's binding.

**IllegalStateException** - If the endpoint has been published already or it has been stopped.

abstract public void stop()

stop

public abstract void stop()

Stops publishing this endpoint. If the endpoint is not in a published state, this method has not effect.

abstract public boolean isPublished()

ture

return true

isPublished

public abstract boolean isPublished()

Returns true if the endpoint is in the published state.

Returns:

ture if the endpoint is in the published state.

abstract public java.util.List<E> getMetadata()

return List<javax.xml.transform.Source>
getMetadata

public abstract List<Source> getMetadata()

Returns a list of metadata documents for the service.

Returns:
List<javax.xml.transform.Source> A list of metadata documents for the service

setMetadata

public abstract void setMetadata(List<Source> metadata)

Sets the metadata for this endpoint.

Parameters:
metadata - A list of XML document sources containing metadata information for the endpoint (e.g. WSDL or XML Schema documents)

Throws:
IllegalStateException - If the endpoint has already been published.

abstract public java.util.concurrent.Executor getExecutor()

Endpoint
return java.util.concurrent.Executor
See also java.util.concurrent.Executor

getExecutor
public abstract Executor getExecutor()

Returns the executor for this Endpoint instance. The executor is used to dispatch an incoming request to the implementor object.

Returns:
The java.util.concurrent.Executor to be used to dispatch a request.

See Also:
Executor

abstract public void setExecutor(java.util.concurrent.Executor executor)

Sets the executor for this Endpoint instance. The executor is used to dispatch an incoming request to the implementor object. If this Endpoint is published using the publish(Object) method and the specified server context defines its own threading behavior, the executor may be ignored.

Parameters:

executor - The java.util.concurrent.Executor to be used to dispatch a request.

Throws:

SecurityException - If the instance does not support setting an executor for security reasons (e.g. the necessary permissions are missing).
abstract public java.util.Map<K, V> getProperties()

    Endpoint
    return Map<String, Object>

getProperties

public abstract Map<String, Object> getProperties()

    Returns the property bag for this Endpoint instance.

    Returns:
    Map<String, Object> The property bag associated with this instance.

setProperties

public abstract void setProperties(Map<String, Object> properties)

    Sets the property bag for this Endpoint instance.

    Parameters:
    properties - The property bag associated with this instance.
PS:
javax.ejb

Interface EnterpriseBean

All Superinterfaces:
Serializable

All Known Subinterfaces:
EntityBean, MessageDrivenBean, SessionBean

public interface EnterpriseBean
extends Serializable

Implements: java.io.Serializable
Implemented by: EntityBean, MessageDrivenBean, SessionBean

Bean EnterpriseBean SessionBean EntityBean MessageDrivenBean

The EnterpriseBean interface must be implemented by every enterprise Bean class. It is a common superinterface for the SessionBean, EntityBean and MessageDrivenBean interfaces.

**abstract public String name()**

Java Persistence

**name**

```java
public abstract String name
```

The name of an entity. Defaults to the unqualified name of the entity.
class. This name is used to refer to the entity in queries. The name must not be a reserved literal in the Java Persistence query language.

Default:

"""
javax.ejb Interface EntityBean

All Superinterfaces:
   EnterpriseBean, Serializable

public interface EntityBean
extends EnterpriseBean

Implements: EnterpriseBean

EntityBean Bean EntityBean Bean

The EntityBean interface is implemented by every entity enterprise Bean class. The container uses the EntityBean methods to notify the enterprise Bean instances of the instance's life cycle events.

### Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void ejbActivate()</td>
<td>A container invokes this method when the instance is taken out of the pool of available instances to become associated with a specific EJB object.</td>
</tr>
<tr>
<td>void ejbLoad()</td>
<td>A container invokes this method to instruct the instance to synchronize its state by loading its state from the underlying database.</td>
</tr>
<tr>
<td>void ejbPassivate()</td>
<td>A container invokes this method on an instance before the instance becomes disassociated with a specific EJB object.</td>

<tr>
<td>void ejbRemove()</td>
<td>A container invokes this method before it removes the EJB object that is currently associated with the instance.</td>
</tr>
<tr>
<td>ejbStore()</td>
<td></td>
</tr>
</tbody>
</table>
A container invokes this method to instruct the instance to synchronize its state by storing it to the underlying database.

void setEntityContext(EntityContext ctx)
    Set the associated entity context.

void unsetEntityContext()
    Unset the associated entity context.

Method Detail

public void setEntityContext(EntityContext ctx) throws EJBException, java.rmi.RemoteException

    ctx   EntityContext
    Throws   EJBException:
        java.rmi.RemoteException: EJB 1.0 Bean EJB
    Throws 1.1 Bean javax.ejb.EJBException EJB2.0
        Bean javax.ejb.EJBException

setEntityContext

void setEntityContext(EntityContext ctx)
    throws EJBException,
            RemoteException

    Set the associated entity context. The container invokes this method on an instance after the instance has been created.

    This method is called in an unspecified transaction context.

Parameters:
    ctx - An EntityContext interface for the instance. The instance should store the reference to the context in an instance variable.
Throws:

- **EJBException** - Thrown by the method to indicate a failure caused by a system-level error.
- **RemoteException** - This exception is defined in the method signature to provide backward compatibility for enterprise beans written for the EJB 1.0 specification. Enterprise beans written for the EJB 1.1 specification should throw the `javax.ejb.EJBException` instead of this exception. Enterprise beans written for the EJB 2.0 and higher specifications must throw the `javax.ejb.EJBException` instead of this exception.

```java
public void unsetEntityContext() throws EJBException, java.rmi.RemoteException
```

Java `finalize()`

Throws: **EJBException**

- `java.rmi.RemoteException`: EJB 1.0 Bean EJB

Throws: 1.1 Bean `javax.ejb.EJBException` EJB 2.0 Bean `javax.ejb.EJBException`

```java
unsetEntityContext
```

Unset the associated entity context. The container calls this method before removing the instance.

This is the last method that the container invokes on the instance. The Java garbage collector will eventually invoke the `finalize()` method on the instance.
This method is called in an unspecified transaction context.

**Throws:**

- **EJBException** - Thrown by the method to indicate a failure caused by a system-level error.
- **RemoteException** - This exception is defined in the method signature to provide backward compatibility for enterprise beans written for the EJB 1.0 specification. Enterprise beans written for the EJB 1.1 specification should throw the `javax.ejb.EJBException` instead of this exception. Enterprise beans written for the EJB2.0 and higher specifications must throw the `javax.ejb.EJBException` instead of this exception.

```java
public void ejbRemove() throws RemoveException, EJBException, java.rmi.RemoteException {
    // Implementation...
}
```

A container invokes this method before it removes the EJB object that is currently associated with the instance. This method is invoked when a client invokes a remove operation on the enterprise Bean's home interface or the EJB object's remote interface. This method transitions the instance from the ready state to the pool of available
instances.

This method is called in the transaction context of the remove operation.

**Throws:**

- **RemoveException** - The enterprise Bean does not allow destruction of the object.
- **EJBException** - Thrown by the method to indicate a failure caused by a system-level error.
- **RemoteException** - This exception is defined in the method signature to provide backward compatibility for enterprise beans written for the EJB 1.0 specification. Enterprise beans written for the EJB 1.1 specification should throw the javax.ejb.EJBException instead of this exception. Enterprise beans written for the EJB2.0 and higher specifications must throw the javax.ejb.EJBException instead of this exception.

```java
public void ejbActivate() throws EJBException, java.rmi.RemoteException
EJB
```

**Throws**

- **EJBException**:
  - java.rmi.RemoteException: EJB 1.0 Bean EJB

**Throws 1.1**

- Bean javax.ejb.EJBException EJB2.0
  - Bean javax.ejb.EJBException

**ejbActivate**

```java
void ejbActivate() throws EJBException, RemoteException
```

A container invokes this method when the instance is taken out of the pool of available instances to become associated with a specific
EJB object. This method transitions the instance to the ready state.

This method executes in an unspecified transaction context.

**Throws:**

- **EJBException** - Thrown by the method to indicate a failure caused by a system-level error.
- **RemoteException** - This exception is defined in the method signature to provide backward compatibility for enterprise beans written for the EJB 1.0 specification. Enterprise beans written for the EJB 1.1 specification should throw the javax.ejb.EJBException instead of this exception. Enterprise beans written for the EJB2.0 and higher specifications must throw the javax.ejb.EJBException instead of this exception.

```java
public void ejbPassivate() throws EJBException, java.rmi.RemoteException
```

A container invokes this method on an instance before the instance becomes disassociated with a specific EJB object. After this method completes, the container will place the instance into the pool of available instances.
This method executes in an unspecified transaction context.

**Throws:**
- **EJBException** - Thrown by the method to indicate a failure caused by a system-level error.
- **RemoteException** - This exception is defined in the method signature to provide backward compatibility for enterprise beans written for the EJB 1.0 specification. Enterprise beans written for the EJB 1.1 specification should throw the javax.ejb.EJBException instead of this exception. Enterprise beans written for the EJB2.0 and higher specifications must throw the javax.ejb.EJBException instead of this exception.

```java
public void ejbLoad() throws EJBException, java.rmi.RemoteException
```

**A container invokes this method to instruct the instance to synchronize its state by loading it state from the underlying database.**

This method always executes in the transaction context determined by the value of the transaction attribute in the deployment descriptor.
Throws:

- **EJBException** - Thrown by the method to indicate a failure caused by a system-level error.
- **RemoteException** - This exception is defined in the method signature to provide backward compatibility for enterprise beans written for the EJB 1.0 specification. Enterprise beans written for the EJB 1.1 specification should throw the `javax.ejb.EJBException` instead of this exception. Enterprise beans written for the EJB2.0 and higher specifications must throw the `javax.ejb.EJBException` instead of this exception.

```java
public void ejbStore() throws EJBException, java.rmi.RemoteException
```

A container invokes this method to instruct the instance to synchronize its state by storing it to the underlying database.

This method always executes in the transaction context determined by the value of the transaction attribute in the deployment descriptor.

**Throws:**

- **EJBException** - Thrown by the method to indicate a failure caused by a system-level error.
RemoteException - This exception is defined in the method signature to provide backward compatibility for enterprise beans written for the EJB 1.0 specification. Enterprise beans written for the EJB 1.1 specification should throw the `javax.ejb.EJBException` instead of this exception. Enterprise beans written for the EJB2.0 and higher specifications must throw the `javax.ejb.EJBException` instead of this exception.

javax.ejb  Interface EntityContext

All Superinterfaces:
   EJBContext

public interface EntityContext
   extends EJBContext

Implements: EJBContext

EntityContext  Bean  EntityContext  Bean

EntityContext  EntityContext  getPrimaryKey()
EJB

The EntityContext interface provides an instance with access to the container-provided runtime context of an entity enterprise Bean instance. The container passes the EntityContext interface to an entity enterprise Bean instance after the instance has been created.

The EntityContext interface remains associated with the instance for the lifetime of the instance. Note that the information that the instance obtains using the EntityContext interface (such as the result of the getPrimaryKey() method) may change, as the container assigns the instance to different EJB objects during the instance's life cycle.

---

Method Summary

<table>
<thead>
<tr>
<th>EJBLocalObject</th>
<th>getEJBLocalObject()</th>
<th>Obtain a reference to the EJB local object that is currently associated with the instance.</th>
</tr>
</thead>
<tbody>
<tr>
<td>EJBObject</td>
<td>getEJBObject()</td>
<td>Obtain a reference to the EJB object that is currently</td>
</tr>
</tbody>
</table>
**getPrimaryKey()**

Obtain the primary key of the EJB object that is currently associated with this instance.

---

**Methods inherited from interface javax.ejb.EJBContext**

- `getCallerIdentity`, `getCallerPrincipal`, `getEJBHome`, `getEJBLocalHome`, `getEnvironment`, `getRollbackOnly`, `getTimerService`, `getUserTransaction`, `isCallerInRole`, `isCallerInRole`, `lookup`, `setRollbackOnly`

---

**Method Detail**

```java
public EJBLocalObject getEJBLocalObject() throws IllegalStateException

EJB Bean

ejbActivate

ejbPassivate

ejbPostCreate

ejbRemove

ejbLoad

ejbStore

return

Throws

IllegalStateException:

getEJBLocalObject

EJBLocalObject getEJBLocalObject() throws IllegalStateException

Obtain a reference to the EJB local object that is currently associated with the instance.

An instance of an entity enterprise Bean can call this method only
when the instance is associated with an EJB local object identity, i.e. in the ejbActivate, ejbPassivate, ejbPostCreate, ejbRemove, ejbLoad, ejbStore, and business methods.

An instance can use this method, for example, when it wants to pass a reference to itself in a method argument or result.

**Returns:**

The EJB local object currently associated with the instance.

**Throws:**

*IllegalStateException* - if the instance invokes this method while the instance is in a state that does not allow the instance to invoke this method, or if the instance does not have a local interface.

```
public EJBObject getEJBObject() throws IllegalStateException

EJB Bean EJB ejbActivate ejbPassivate ejbPostCreate ejbRemove ejbLoad ejbStore

return EJB

Throws IllegalStateException:
```

**getEJBObject**

```
EJBObject getEJBObject()

throws IllegalStateException

Obtain a reference to the EJB object that is currently associated with the instance.

An instance of an entity enterprise Bean can call this method only
```
when the instance is associated with an EJB object identity, i.e. in the ejbActivate, ejbPassivate, ejbPostCreate, ejbRemove, ejbLoad, ejbStore, and business methods.

An instance can use this method, for example, when it wants to pass a reference to itself in a method argument or result.

**Returns:**

The EJB object currently associated with the instance.

**Throws:**

*IllegalStateException* - Thrown if the instance invokes this method while the instance is in a state that does not allow the instance to invoke this method, or if the instance does not have a remote interface.

```java
public Object getPrimaryKey() throws IllegalStateException

EJB

Bean EJB

ejbActivate

ejbPassivate

ejbPostCreate

ejbRemove

ejbLoad

ejbStore

getEJBObject().getPrimaryKey()

return

Throws

IllegalStateException:

getPrimarykey

Object getPrimarykey()

throws IllegalStateException

Obtain the primary key of the EJB object that is currently associated with this instance.

An instance of an entity enterprise Bean can call this method only when the instance is associated with an EJB object identity, i.e. in
the ejbActivate, ejbPassivate, ejbPostCreate, ejbRemove, ejbLoad, ejbStore, and business methods.

**Note**: The result of this method is that same as the result of getEJBObject().getPrimaryKey.

**Returns**: The primary key currently associated with the instance.

**Throws**: 

- `IllegalStateException` - Thrown if the instance invokes this method while the instance is in a state that does not allow the instance to invoke this method.

---

**Method Detail**

generic method: String getPublicId()

null

    return null

getPublicId

**String**  getPublicId()

The entity's public identifier, or null if none was given

Returns:
public String getSystemId()

        return ID null

getSystemId

String getSystemId()

The entity's system identifier.

Returns:
the system ID for this declaration or null

public String getName()

        return null

getName

String getName()

The entity's name

Returns:
the name, may not be null

public String getNotationName()

        return
getNotationName

String getNotationName()

The name of the associated notation.

Returns:
the notation name

public String getReplacementText()

null

return null

getReplacementText

String getReplacementText()

The replacement text of the entity. This method will only return non-null if this is an internal entity.

Returns:
null or the replacement text

public String getBaseURI()

URI null

return URI null

getBaseURI

String getBaseURI()

Get the base URI for this reference or null if this information is not available
Returns:
the base URI or null

javax.persistence  Class EntityExistsException

javax.lang.Object
  java.lang.Throwable
    java.lang.Exception
      java.lang.RuntimeException
        javax.persistence.PersistenceException
          javax.persistence.EntityExistsException

All Implemented Interfaces:
  Serializable

public class EntityExistsException
  extends PersistenceException

Extends: Throwable > Exception > RuntimeException > PersistenceException

EntityManager.persist(Object)

  since    Java Persistence 1.0
  See also persist(Object)

Thrown by the persistence provider when EntityManager.persist(Object) is called and the entity already exists. The current transaction, if one is active, will be marked for rollback.

Since:
  Java Persistence 1.0

See Also:
  EntityManager.persist(Object), Serialized Form

Constructor Summary

EntityExistsException()
  Constructs a new EntityExistsException exception with null as
EntityExistsException(String message)

Constructs a new EntityExistsException exception with the specified detail message.

EntityExistsException(String message, Throwable cause)

Constructs a new EntityExistsException exception with the specified detail message and cause.

EntityExistsException(Throwable cause)

Constructs a new EntityExistsException exception with the specified cause.

### Method Summary

Methods inherited from class java.lang.Throwable

- finalize
- getClass
- hashCode
- notify
- notifyAll
- wait
- wait
- wait

### Constructor Detail

public EntityExistsException()

null EntityExistsException

EntityExistsException

public EntityExistsException()  

Constructs a new EntityExistsException exception with null as its detail message.
public EntityExistsException(String message)
    throws IllegalArgumentException

    Constructs a new EntityExistsException exception with the specified detail message.

    Parameters:
    message - the detail message.

public EntityExistsException(String message, Throwable cause)
    throws IllegalArgumentException

    Constructs a new EntityExistsException exception with the specified detail message and cause.

    Parameters:
    message - the detail message.
    cause - the cause.
public EntityExistsException(Throwables cause)

Constructs a new EntityExistsException exception with the specified cause.

Parameters:
cause - the cause.
javax.persistence  Annotation Type EntityListeners

@Target(value=TYPE)
@Retention(value=RUNTIME)
public @interface EntityListeners

**Implements:** Annotation
@Target(value=TYPE)
@Retention(value=RUNTIME)

since Java Persistence 1.0

Specifies the callback listener classes to be used for an entity or mapped superclass. This annotation may be applied to an entity class or mapped superclass.

**Since:**
Java Persistence 1.0

---

abstract public Class<T>[] value()

value
public abstract Class[] value

The callback listener classes
javax.persistence  **Interface EntityManager**

```java
public interface EntityManager
```

**EntityManager**  **EntityManager API**

```java
since Java Persistence 1.0
```

Interface used to interact with the persistence context.

An EntityManager instance is associated with a persistence context. A persistence context is a set of entity instances in which for any persistent entity identity there is a unique entity instance. Within the persistence context, the entity instances and their lifecycle are managed. This interface defines the methods that are used to interact with the persistence context. The EntityManager API is used to create and remove persistent entity instances, to find entities by their primary key, and to query over entities.

The set of entities that can be managed by a given EntityManager instance is defined by a persistence unit. A persistence unit defines the set of all classes that are related or grouped by the application, and which must be colocated in their mapping to a single database.

**Since:**
Java Persistence 1.0

`find(Class<T> entityClass, Object primaryKey)`
Find by primary key.  
Synchronize the persistence context to the underlying database.

`Object getDelegate()`
Return the underlying provider object for the EntityManager, if available.

`FlushModeType getFlushMode()`
Get the flush mode that applies to all objects contained in the persistence context.

`getReference(Class<T> entityClass, Object primaryKey)`
Get an instance, whose state may be lazily fetched.

`EntityTransaction`  
Returns the resource-level transaction object.

`boolean isOpen()`
Determine whether the EntityManager is open.  

```java
void joinTransaction()
```

Indicate to the EntityManager that a JTA transaction is active.  

```java
void lock(Object entity, LockModeType lockMode)
```

Set the lock mode for an entity object contained in the persistence context.

```java
<T> T merge(T entity)
```

Merge the state of the given entity into the current persistence context.

```java
void persist(Object entity)
```

Make an entity instance managed and persistent.

```java
void refresh(Object entity)
```

Refresh the state of the instance from the database, overwriting changes made to the entity, if any.

```java
void remove(Object entity)
```

Remove the entity instance.

```java
void setFlushMode(FlushModeType flushMode)
```

Set the flush mode that applies to all objects contained in the persistence context.

---

**Method Detail**

**public void persist(Object entity)**

- `entity`  
- Throws `EntityExistsException`: EntityExistsException  
- Throws `PersistenceException`: EntityExistsException  
- Throws `IllegalArgumentException`: IllegalStateException: EntityManager  
- Throws `TransactionRequiredException`: PersistenceContextType.TRANSACTION

**persist**

```java
void persist(Object entity)
```

Make an entity instance managed and persistent.
Parameters:
   entity -

Throws:
   EntityExistsException  - if the entity already exists. (The EntityExistsException may be thrown when the persist operation is invoked, or the EntityExistsException or another PersistenceException may be thrown at flush or commit time.)
   IllegalStateException  - if this EntityManager has been closed.
   IllegalArgumentException  - if not an entity
   TransactionRequiredException  - if invoked on a container-managed entity manager of type PersistenceContextType.TRANSACTION and there is no transaction.

merge

<T> T merge(T entity)

Merge the state of the given entity into the current persistence context.

Parameters:
   entity -

Returns:
   the instance that the state was merged to

Throws:
   IllegalStateException  - if this EntityManager has been closed.
   IllegalArgumentException  - if instance is not an entity or is a removed entity
   TransactionRequiredException  - if invoked on a container-managed entity manager of type PersistenceContextType.TRANSACTION and there is no transaction.

public void remove(Object entity)
remove

```java
void remove(Object entity)
```

Remove the entity instance.

**Parameters:**
- `entity` -

**Throws:**
- `IllegalStateException` - if this EntityManager has been closed.
- `IllegalArgumentException` - if not an entity or if a detached entity
- `TransactionRequiredException` - if invoked on a container-managed entity manager of type `PersistenceContextType.TRANSACTION` and there is no transaction.

find

```java
<T> T find(Class<T> entityClass, Object primaryKey)
```

Find by primary key.

**Parameters:**
- `entityClass` -
- `primaryKey` -

**Returns:**
the found entity instance or null if the entity does not exist
Throws:

- `IllegalArgumentException` - if the first argument does not denote an entity type or the second argument is not a valid type for that entity's primary key
- `IllegalStateException` - if this EntityManager has been closed.

getReference

```java
<T> T getReference(Class<T> entityClass, Object primaryKey)
```

Get an instance, whose state may be lazily fetched. If the requested instance does not exist in the database, throws `EntityNotFoundException` when the instance state is first accessed. (The persistence provider runtime is permitted to throw `EntityNotFoundException` when `getReference(java.lang.Class, java.lang.Object)` is called.) The application should not expect that the instance state will be available upon detachment, unless it was accessed by the application while the entity manager was open.

Parameters:
- `entityClass` - the entity type
- `primaryKey` - the primary key

Returns:
- the found entity instance

Throws:

- `IllegalArgumentException` - if the first argument does not denote an entity type or the second argument is not a valid type for that entity's primary key
- `IllegalStateException` - if this EntityManager has been closed.
- `EntityNotFoundException` - if the entity state cannot be accessed

public void flush()}

Throws

- `IllegalStateException`: EntityManager
flush

void flush()

Synchronize the persistence context to the underlying database.

Throws:

- `IllegalStateException` - if this EntityManager has been closed.
- `TransactionRequiredException` - if there is no transaction
- `PersistenceException` - if the flush fails

public void setFlushMode(FlushModeType flushMode)

flushMode

Throws `IllegalStateException`: EntityManager

setFlushMode

void setFlushMode(FlushModeType flushMode)

Set the flush mode that applies to all objects contained in the persistence context.

Parameters:

flushMode -

Throws:

- `IllegalStateException` - if this EntityManager has been closed.

public FlushModeType getFlushMode()

return
getFlushMode

FlushModeType getFlushMode()

Get the flush mode that applies to all objects contained in the persistence context.

Returns:
  flush mode

Throws:
  EntityManager

public void lock(Object entity, LockModeType lockMode)

entity
lockMode

Throws:  EntityManager
Throws:  PersistenceException:
Throws:  IllegalArgumentException:
Throws:  TransactionRequiredException:

lock

void lock(Object entity, LockModeType lockMode)

Set the lock mode for an entity object contained in the persistence context.

Parameters:
  entity -
  lockMode -

Throws:
**IllegalStateException** - if this EntityManager has been closed.

**PersistenceException** - if an unsupported lock call is made

**IllegalArgumentException** - if the instance is not an entity or is a detached entity

**TransactionRequiredException** - if there is no transaction

---

**public void refresh(Object entity)**

- **entity**
- **Throws**
  - `IllegalStateException`: EntityManager
  - `IllegalArgumentException`: 
  - `TransactionRequiredException`: PersistenceContextType.TRANSACTION
  - `EntityNotFoundException`: 

---

**refresh**

**void refresh(Object entity)**

Refresh the state of the instance from the database, overwriting changes made to the entity, if any.

**Parameters:**
- **entity**

**Throws:**
- `IllegalStateException` - if this EntityManager has been closed.
- `IllegalArgumentException` - if not an entity or entity is not managed
- `TransactionRequiredException` - if invoked on a container-managed entity manager of type PersistenceContextType.TRANSACTION and there is no transaction.
- `EntityNotFoundException` - if the entity no longer exists in the database.

---
public void clear()

Throws: IllegalStateException - EntityManager

clear

void clear()

Clear the persistence context, causing all managed entities to become detached. Changes made to entities that have not been flushed to the database will not be persisted.

Throws:
IllegalArgumentException - if not an entity

public boolean contains(Object entity)

entity
return true

Throws: IllegalStateException: EntityManager

contains

boolean contains(Object entity)

Check if the instance belongs to the current persistence context.

Parameters:
entity -

Returns:
true if the instance belongs to the current persistence context.

Throws:
IllegalArgumentException - if not an entity
public Query createQuery(String qlString)

Create an instance of Query for executing a Java Persistence query language statement.

Parameters:
qlString - a Java Persistence query language query string

Returns:
the new query instance

Throws:
IllegalStateException - if this EntityManager has been closed.
IllegalArgumentException - if query string is not valid

createNamedQuery

Query createNamedQuery(String name)

Create a named query using the specified SQL query statement.

Parameters:
name - SQL query statement

Returns:
the new query instance

Throws:
IllegalStateException - if this EntityManager has been closed.
IllegalArgumentException - if query string is not valid
Create an instance of Query for executing a named query (in the Java Persistence query language or in native SQL).

**Parameters:**
- name - the name of a query defined in metadata

**Returns:**
- the new query instance

**Throws:**
- `IllegalStateException` - if this EntityManager has been closed.
- `IllegalArgumentException` - if a query has not been defined with the given name

```java
public Query createNativeQuery(String sqlString)
```

Create an instance of Query for executing a native SQL statement, e.g., for update or delete.

**Parameters:**
- sqlString - a native SQL query string

**Returns:**
- the new query instance

**Throws:**
- `IllegalStateException` - if this EntityManager has been closed.

```java
public Query createNativeQuery(String sqlString, Class<T> resultClass)
```
Creates an instance of Query for executing a native SQL query.

Parameters:
- `sqlString` - a native SQL query string
- `resultSetMapping` - the class of the resulting instance(s)

Returns:
the new query instance

Throws:
- `IllegalStateException` - if this EntityManager has been closed.

```java
public Query createNativeQuery(String sqlString, String resultSetMapping)
```

Create an instance of Query for executing a native SQL query.

```java
Query createNativeQuery(String sqlString, String resultSetMapping)
```
**Parameters:**
- sqlString - a native SQL query string
- resultSetMapping - the name of the result set mapping

**Returns:**
the new query instance

**Throws:**
- **IllegalStateException** - if this EntityManager has been closed.

---

**public void joinTransaction()**

Indicate to the EntityManager that a JTA transaction is active. This method should be called on a JTA application managed EntityManager that was created outside the scope of the active transaction to associate it with the current JTA transaction.

**Throws:**
- **IllegalStateException** - if this EntityManager has been closed.
- **TransactionRequiredException** - if there is no transaction.

---

**public Object getDelegate()**

**Throws**
- **IllegalStateException** - if this EntityManager has been closed.
Object getDelegate()

Return the underlying provider object for the EntityManager, if available. The result of this method is implementation specific.

Throws:
   IllegalStateException - if this EntityManager has been closed.

public void close()
EntityManager close EntityManager Query
getTransaction isOpen false
IllegalStateException EntityManager
   Throws  IllegalStateException: EntityManager

close

void close()

Close an application-managed EntityManager. After the close method has been invoked, all methods on the EntityManager instance and any Query objects obtained from it will throw the IllegalStateException except for getTransaction and isOpen (which will return false). If this method is called when the EntityManager is associated with an active transaction, the persistence context remains managed until the transaction completes.

Throws:
   IllegalStateException - if the EntityManager is container-managed or has been already closed..

public boolean isOpen()
EntityManager
   return EntityManager true
boolean isOpen()

Determine whether the EntityManager is open.

Returns: true until the EntityManager has been closed.

public EntityTransaction getTransaction()

EntityTransaction

return EntityTransaction

Throws IllegalArgumentException: JTA EntityManager

getTransaction

EntityTransaction getTransaction()

Returns the resource-level transaction object. The EntityTransaction instance may be used serially to begin and commit multiple transactions.

Returns: EntityTransaction instance

Throws: IllegalArgumentException - if invoked on a JTA EntityManager.
PS:
The `EntityManagerFactory` interface is used by the application to obtain an application-managed entity manager. When the application has finished using the entity manager factory, and/or at application shutdown, the application should close the entity manager factory. Once an `EntityManagerFactory` has been closed, all its entity managers are considered to be in the closed state.

**Since:**
Java Persistence 1.0

<table>
<thead>
<tr>
<th>Method Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>close()</strong></td>
</tr>
<tr>
<td><code>createEntityManager()</code></td>
</tr>
<tr>
<td><code>createEntityManager(Map map)</code></td>
</tr>
<tr>
<td><strong>isOpen()</strong></td>
</tr>
</tbody>
</table>
Method Detail

```
public EntityManager createEntityManager()
EntityManager EntityManager isOpen true

createEntityManager

EntityManager createEntityManager()

Create a new EntityManager. This method returns a new EntityManager instance each time it is invoked. The isOpen method will return true on the returned instance.

public EntityManager createEntityManager(java.util.Map<K, V> map)
Map EntityManager EntityManager isOpen true

createEntityManager

EntityManager createEntityManager(Map map)

Create a new EntityManager with the specified Map of properties. This method returns a new EntityManager instance each time it is invoked. The isOpen method will return true on the returned instance.

public void close()
IllegalStateException isOpen false
EntityManagerFactory
```
close

void close()

Close the factory, releasing any resources that it holds. After a factory instance is closed, all methods invoked on it will throw an IllegalStateException, except for isOpen, which will return false. Once an EntityManagerFactory has been closed, all its entity managers are considered to be in the closed state.

public boolean isOpen()

Indicates whether or not this factory is open. Returns true until a call to close has been made.
javax.persistence  **Class EntityNotFoundException**

</table>

Method Summary

Methods inherited from class `java.lang.Throwable`:
- `fillInStackTrace`, `getCause`, `getLocalizedMessage`, `getMessage`, `getStackTrace`, `initCause`, `printStackTrace`, `printStackTrace`, `printStackTrace`, `setStackTrace`, `toString`

Methods inherited from class `java.lang.Object`:
- `clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `wait`, `wait`, `wait`

Constructor Detail

```java
public EntityNotFoundException()
null EntityNotFoundException
```

```java
public EntityNotFoundException()
Constructs a new EntityNotFoundException exception with null as its detail message.
```
public EntityNotFoundException(String message)

EntityNotFoundException
message

Constructs a new EntityNotFoundException exception with the specified detail message.

Parameters:
message - the detail message.
javax.xml.stream.events Interface EntityReference

All Superinterfaces:
   XMLEvent, XMLStreamConstants

public interface EntityReference
extends XMLEvent

Implements: XMLEvent

javax.xml.stream.isReplacingEntityReferences false
javax.xml.stream.isReplacingEntityReferences true
javax.xml.stream.isReplacingEntityReferences true(2)
javax.xml.stream.isReplacingEntityReferences false
EntityReference

   version 1.0

An interface for handling Entity events. This event reports entities that
have not been resolved and reports their replacement text unprocessed
(if available). This event will be reported if
javax.xml.stream.isReplacingEntityReferences is set to false. If
javax.xml.stream.isReplacingEntityReferences is set to true entity
references will be resolved transparently. Entities are handled in two
possible ways: (1) If javax.xml.stream.isReplacingEntityReferences is set
to true all entity references are resolved and reported as markup
transparently. (2) If javax.xml.stream.isReplacingEntityReferences is set
to false Entity references are reported as an EntityReference Event.

<tbody>
<tr>
<td>EntityDeclaration</td>
<td>getDeclaration()</td>
<td>Return the declaration of this entity.</td>
</tr>
<tr>
<td>String</td>
<td>getName()</td>
<td>The name of the entity</td>
</tr>
</tbody>
</table>

### Method Detail

```java
public EntityDeclaration getDeclaration()
```

**getDeclaration**

```java
EntityDeclaration getDeclaration()
```

Return the declaration of this entity.
public String getName()

        return null

getName

String getName()

The name of the entity

Returns:
    the entity's name, may not be null

javax.persistence\n
Annotation Type EntityResult

@Target(value={})
@Retention(value=RUNTIME)
public @interface EntityResult

Implements: Annotation
@Target(value={})
@Retention(value=RUNTIME)

SQL SELECT SQL

Query q = em.createNativeQuery(
    "SELECT o.id, o.quantity, o.item, i.id, i.name, i.description
    "FROM Order o, Item i " +
    "WHERE (o.quantity > 25) AND (o.item = i.id)",
    "OrderItemResults");
@SqlResultSetMapping(name="OrderItemResults",
    entities={
        @EntityResult(entityClass=com.acme.Order.class),
        @EntityResult(entityClass=com.acme.Item.class)
    })

since Java Persistence 1.0

References an entity in the SELECT clause of a SQL query. If this annotation is used, the SQL statement should select all of the columns that are mapped to the entity object. This should include foreign key columns to related entities. The results obtained when insufficient data is available are undefined.

Example
Query q = em.createNativeQuery(
    "SELECT o.id, o.quantity, o.item, i.id, i.name, i.description
    "FROM Order o, Item i " +
    "WHERE (o.quantity > 25) AND (o.item = i.id)",
    "OrderItemResults");
@SqlResultSetMapping(name="OrderItemResults",
    entities={

@EntityResult(entityClass=com.acme.Order.class),
@EntityResult(entityClass=com.acme.Item.class)
}

Since:
Java Persistence 1.0

</thead>
<tbody>
<tr>
<td></td>
<td>Maps the columns specified in the SELECT list of the query to the properties or fields of the entity class.</td>
</tr>
</tbody>
</table>

## Element Detail

```java
abstract public Class<T> entityClass()
```

**entityClass**

```java
public abstract Class entityClass
```

The class of the result
abstract public FieldResult[] fields()

SELECT

fields

public abstract FieldResult[] fields

Maps the columns specified in the SELECT list of the query to the properties or fields of the entity class.

Default:

{}

abstract public String discriminatorColumn()

SELECT

discriminatorColumn

public abstract String discriminatorColumn

Specifies the column name (or alias) of the column in the SELECT list that is used to determine the type of the entity instance.

Default:

""
PS:
javax.persistence Interface EntityTransaction

public interface EntityTransaction

EntityTransaction getTransaction
EntityManager.getTransaction() EntityTransaction

since Java Persistence 1.0 en

The EntityTransaction interface is used to control resource transactions on resource-local entity managers. The EntityManager.getTransaction() method returns the EntityTransaction interface.

Since:
Java Persistence 1.0

<table>
<thead>
<tr>
<th>Method Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>begin()</strong></td>

<tr>
<td><strong>setRollbackOnly()</strong></td>
</tr>
</tbody>
</table>
Method Detail

public void begin()

   Throws           IllegalStateException:   isActive() true

begin

void begin()

Start the resource transaction.

Throws:
IllegalStateException - if isActive() is true.

public void commit()

   Throws           IllegalStateException:   isActive() false
   Throws         RollbackException:

commit

void commit()

Commit the current transaction, writing any unflushed changes to the database.

Throws:
IllegalStateException - if isActive() is false.
RollbackException - if the commit fails.
public void rollback()

Throws IllegalStateException: #isActive() false
Throws PersistenceException:

rollback

void rollback()

Roll back the current transaction

Throws:
IllegalStateException - if isActive() is false.
PersistenceException - if an unexpected error condition is encountered.

public void setRollbackOnly()

Throws IllegalStateException: #isActive() false

setRollbackOnly

void setRollbackOnly()

Mark the current transaction so that the only possible outcome of the transaction is for the transaction to be rolled back.

Throws:
IllegalStateException - if isActive() is false.

public boolean getRollbackOnly()

Throws IllegalStateException: #isActive() false
**getRollbackOnly**

boolean `getRollbackOnly()`

Determine whether the current transaction has been marked for rollback.

**Throws:**

`IllegalStateException` - if `isActive()` is false.

---

**public boolean isActive()**

Throws `PersistenceException`:

---

**isActive**

boolean `isActive()`

Indicate whether a transaction is in progress.

**Throws:**

`PersistenceException` - if an unexpected error condition is encountered.

```
CONVERTER_ID

public static final String CONVERTER_ID

The standard converter id for this converter.

See Also:
Constant Field Values

ENUM_ID

public static final String ENUM_ID

The message identifier of the FacesMessage to be created if the conversion to Enum fails. The message format string for this message may optionally include the following placeholders:

- {0} replaced by the unconverted value.
- {1} replaced by one of the enum constants or the empty string if none can be found.
- {2} replaced by a String whose value is the label of the input component that produced this message.

See Also:
Constant Field Values

ENUM_NO_CLASS_ID

public static final String ENUM_NO_CLASS_ID
The message identifier of the `FacesMessage` to be created if the conversion to `Enum` fails and no target class has been provided. The message format string for this message may optionally include the following placeholders:

- `{0}` replaced by the unconverted value.
- `{1}` replaced by a string whose value is the label of the input component that produced this message.

See Also:
Constant Field Values

### Constructor Detail

**public EnumConverter()**

**EnumConverter**

**public EnumConverter()**

**public EnumConverter(Class<T> targetClass)**

**EnumConverter**

**public EnumConverter(Class targetClass)**

### Method Detail

**public Object getAsObject(FacesContext context, UIComponent component, String value)**

| value | 
|--------|--------|--------|--------|--------|
| null 0 | #ENUM_NO_CLASS_ID | null value | ConverterException | Enum.valueOf |
getAsObject

public Object getAsObject(FacesContext context, UIComponent component, String value)

Convert the value argument to one of the enum constants of the class provided in our constructor. If no target class argument has been provided to the constructor of this instance, throw a ConverterException containing the ENUM_NO_CLASS_ID message with proper parameters. If the value argument is null or it has a length of zero, return null. Otherwise, perform the equivalent of Enum.valueOf using target class and value and return the Object. If the conversion fails, throw a ConverterException containing the ENUM_ID message with proper parameters.

Specified by:
getAsObject in interface Converter

Parameters:
context - the FacesContext for this request.
component - the UIComponent to which this value will be applied.
value - the String value to be converted to Object.

Returns:
null if the value to convert is null, otherwise the result of the conversion

Throws:
ConverterException - if conversion cannot be successfully performed
NullPointerException - if context or component is null
public String getAsString(FacesContext context, UIComponent component, Object value)

value String #ENUM_NO_CLASS_ID
ConverterException value null null
(value.toString()) ConverterException #ENUM_ID

Throws ConverterException: NullPointerExcpetion
Throws NullPointerExcpetion: NullPointerExcpetion context
component null

gAsString

public String getAsString(FacesContext context, UIComponent component, Object value)

Convert the enum constant given by the value argument into a String. If no target class argument has been provided to the constructor of this instance, throw a ConverterException containing the ENUM_NO_CLASS_ID message with proper parameters. If the value, argument is null, return null. If the value is an instance of the provided target class, return its string value (value.toString()). Otherwise, throw a ConverterException containing the ENUM_ID message with proper parameters.

Specified by:
getAsString in interface Converter

Parameters:
context - FacesContext for the request being processed
component - UIComponent with which this model object value is associated
value - Model object value to be converted (may be null)

Returns:
a zero-length String if value is null, otherwise the result of the conversion
Throws:

- `ConverterException` - if conversion cannot be successfully performed
- `NullPointerException` - if context or component is null

public void restoreState(FacesContext facesContext, Object object)

Description copied from interface: StateHolder

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the `StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object)` method on all those instances as well.

Specified by:

`restoreState` in interface StateHolder

public Object saveState(FacesContext facesContext)

saveState

public Object saveState(FacesContext facesContext)

Description copied from interface: StateHolder
Gets the state of the instance as a **Serializable** Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a **UIComponent** with event handlers, validators, etc.) this method must call the `StateHolder.saveState(javax.faces.context.FacesContext)` method on all those instances as well. **This method must not save the state of children and facets.** That is done via the `StateManager`.

This method must not alter the state of the implementing object. In other words, after executing this code:

```
Object state = component.saveState(facesContext);
```

`component` should be the same as before executing it.

The return from this method must be **Serializable**

**Specified by:**

`saveState` in interface `StateHolder`

---

**public void setTransient(boolean b)**

**setTransient**

```
public void setTransient(boolean b)
```

**Description copied from interface: **`StateHolder`

Denotes whether or not the Object implementing this interface must or must not participate in state saving or restoring.

**Specified by:**

`setTransient` in interface `StateHolder`

**Parameters:**

- `b` - boolean pass `true` if this Object will participate in state saving or restoring, otherwise pass `false`.  

public boolean isTransient()

isTransient

public boolean isTransient()

Description copied from interface: StateHolder

If true, the Object implementing this interface must not participate in state saving or restoring.

Specified by:

isTransient in interface StateHolder
javax.persistence  Annotation Type Enumerated

@Target(value={METHOD, FIELD})
@Retention(value=RUNTIME)
public interface Enumerated

Implements: Annotation
@Target(value={METHOD, FIELD})
@Retention(value=RUNTIME)

public enum EmployeeStatus {FULL_TIME, PART_TIME, CONTRACT}

public enum SalaryRate {JUNIOR, SENIOR, MANAGER, EXECUTIVE}

@Entity
public class Employee {
    public EmployeeStatus getStatus() {...}
    @Enumerated(STRING)
    public SalaryRate getPayScale() {...}
}

since Java Persistence 1.0

Specifies that a persistent property or field should be persisted as an enumerated type. It may be used in conjunction with the 
Basic annotation.

Example:

public enum EmployeeStatus {FULL_TIME, PART_TIME, CONTRACT}

public enum SalaryRate {JUNIOR, SENIOR, MANAGER, EXECUTIVE}

@Entity
public class Employee {
    public EmployeeStatus getStatus() {...}
    @Enumerated(STRING)
    public SalaryRate getPayScale() {...}
Since:
Java Persistence 1.0

**Optional Element Summary**

<table>
<thead>
<tr>
<th>EnumType</th>
<th>value</th>
</tr>

PS:
javax.persistence Enum EnumType

java.lang.Object
  ↓ java.lang.Enum<EEnumType>
  ↓ javax.persistence.EnumType

All Implemented Interfaces:
      Serializable, Comparable<EnumType>

public enum EnumType
  extends Enum<EEnumType>

Extends: Enum<E>

since Java Persistence 1.0

Defines mapping for the enumerated types. The constants of this enumerated type specify how persistent property or field should be persisted as an enumerated type.

Since:
      Java Persistence 1.0

---

**Enum Constant Summary**

| ORDINAL | Persist enumerated type property or field as an integer |
| STRING  | Persist enumerated type property or field as a string |

---

**Method Summary**

<p>| valueOf(String name) |</p>
<table>
<thead>
<tr>
<th>static EnumType</th>
<th>Returns the enum constant of this type with the specified name.</th>
</tr>
</thead>
<tbody>
<tr>
<td>static EnumType[]</td>
<td>Returns an array containing the constants of this enum type, in the order they're declared.</td>
</tr>
</tbody>
</table>

Methods inherited from class java.lang.Object
finalize, getClass, notify, notifyAll, wait, wait, wait

Enum Constant Detail

ORDINAL

public static final EnumType ORDINAL

Persist enumerated type property or field as an integer

STRING

public static final EnumType STRING

Persist enumerated type property or field as a string

Method Detail

final public static EnumType[] values()
values

public static final EnumType[] values()

Returns an array containing the constants of this enum type, in the order they're declared. This method may be used to iterate over the constants as follows:

for(EnumType c : EnumType.values())
    System.out.println(c);

Returns:
an array containing the constants of this enum type, in the order they're declared

valueOf

public static EnumType valueOf(String name)

valueOf

public static EnumType valueOf(String name)

Returns the enum constant of this type with the specified name. The string must match *exactly* an identifier used to declare an enum constant in this type. (Extraneous whitespace characters are not permitted.)

Parameters:
name - the name of the enum constant to be returned.

Returns:
the enum constant with the specified name

Throws:
IllegalArgumentException - if this enum type has no constant with the specified name
javax.servlet.jsp Class ErrorData

java.lang.Object
   \--- javax.servlet.jsp.ErrorData

public final class ErrorData
extends Object

JSP isErrorPage "true"
   since 2.0
   See also getErrorData

Contains information about an error, for error pages. The information contained in this instance is meaningless if not used in the context of an error page. To indicate a JSP is an error page, the page author must set the isErrorPage attribute of the page directive to "true".

Since:
   JSP 2.0
See Also:
   PageContext.getErrorData()

Constructor Summary

| ErrorData( | Throwable throwable, int statusCode, String uri, String servletName) |

clon, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

**Constructor Detail**

```java
public ErrorData(Throwable throwable, int statusCode, String uri, String servletName)
```

Creates a new ErrorData object.

**Parameters:**

- `throwable` - The Throwable that is the cause of the error
- `statusCode` - The status code of the error
- `uri` - The request URI
- `servletName` - The name of the servlet invoked

**ErrorData**

```java
public ErrorData(Throwable throwable, int statusCode, String uri, String servletName)
```
public Throwable getThrowable()
  Throwable

  return Throwable

getThrowable

public Throwable getThrowable()

  Returns the Throwable that caused the error.

  Returns:
    The Throwable that caused the error

getStatusCode

public int getStatusCode()

  return

getStatusCode

public int getStatusCode()

  Returns the status code of the error.

  Returns:
    The status code of the error

getRequestURI

public String getRequestURI()
  URI

  return URI
getRequestURI

public String getRequestURI()  

Returns the request URI.

Returns: 
The request URI

getServletName

public String getServletName()  
servlet 

return servlet

getServletName

public String getServletName()  

Returns the name of the servlet invoked.

Returns: 
The name of the servlet invoked
javax.faces.el  Class EvaluationException

java.lang.Object  
  └ java.lang.Throwable
      └ java.lang.Exception
          └ java.lang.RuntimeException
              └ javax.faces.FacesException
                  └ javax.faces.el.EvaluationException

All Implemented Interfaces:
  Serializable

Direct Known Subclasses:
  MethodNotFoundException, PropertyNotFoundException, ReferenceSyntaxException

Deprecated. This has been replaced by ELException.

Extends: Throwable > Exception > RuntimeException > FacesException
Extended by: MethodNotFoundException, PropertyNotFoundException, ReferenceSyntaxException

MethodBinding    ValueBinding

deprecated       javax.el.ELException

class EvaluationException

extends FacesException

An exception reporting an error that occurred during the evaluation of an expression in a MethodBinding or ValueBinding.

See Also:
  Serialized Form

EvaluationException

public EvaluationException()

    Deprecated.

    Construct a new exception with no detail message or root cause.

public EvaluationException(String message)

    message

EvaluationException

public EvaluationException(String message)

    Deprecated.

    Construct a new exception with the specified detail message and no root cause.

    Parameters:
    message - The detail message for this exception

public EvaluationException(Throwable cause)

    (cause == null ? null : cause.toString())
    cause
EvaluationException

public EvaluationException(Throwable cause)

    Deprecated.

    Construct a new exception with the specified root cause. The detail message will be set to (cause == null ? null : cause.toString())

    Parameters:
    cause - The root cause for this exception

public EvaluationException(String message, Throwable cause)

    message
    cause

EvaluationException

public EvaluationException(String message, Throwable cause)

    Deprecated.

    Construct a new exception with the specified detail message and root cause.

    Parameters:
    message - The detail message for this exception
    cause - The root cause for this exception

PS:
javax.xml.stream  Interface EventFilter

public interface EventFilter

XMLEventReader

version 1.0

This interface declares a simple filter interface that one can create to filter XMLEventReaders

Version:
  1.0
Author:
  Copyright (c) 2003 by BEA Systems. All Rights Reserved.

### Method Summary

<table>
<thead>
<tr>
<th>boolean accept(XMLEvent event)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tests whether this event is part of this stream.</td>
</tr>
</tbody>
</table>

### Method Detail

public boolean accept(XMLEvent event)
true false
event
return true false

accept
boolean accept(XMLEvent event)

Tests whether this event is part of this stream. This method will return true if this filter accepts this event and false otherwise.

**Parameters:**

   event - the event to test

**Returns:**

   true if this filter accepts this event, false otherwise
javax.xml.stream.util  Class EventReaderDelegate

java.lang.Object
  └─javax.xml.stream.util.EventReaderDelegate

All Implemented Interfaces:
   Iterator, XMLEventReader

public class EventReaderDelegate
  extends Object
  implements XMLEventReader

Implements: XMLEventReader

XMLEventReader  XMLEventReader  XMLEventReader

version  1.0

See   javax.xml.stream.XMLEventReader,
also   javax.xml.stream.util.StreamReaderDelegate

This is the base class for deriving an XMLEventReader filter. This class is
designed to sit between an XMLEventReader and an application's
XMLEventReader. By default each method does nothing but call the
corresponding method on the parent interface.

Version:
  1.0
Author:
  Copyright (c) 2003 by BEA Systems. All Rights Reserved.
See Also:
   XMLEventReader, StreamReaderDelegate

Constructor Summary
### EventReaderDelegate()
Construct an empty filter with no parent.

### EventReaderDelegate(XMLEventReader reader)
Construct an empty filter with the specified parent.

### Methods inherited from class java.lang.Object
clone, equals, finalize, getClass, hashCode, notify, notifyAll,
public EventReaderDelegate()

EventReaderDelegate

public EventReaderDelegate()

Construct an empty filter with no parent.

public EventReaderDelegate(XMLEventReader reader)

reader

EventReaderDelegate

public EventReaderDelegate(XMLEventReader reader)

Construct an filter with the specified parent.

Parameters:
reader - the parent

public void setParent(XMLEventReader reader)

reader
**setParent**

```java
public void setParent(XMLEventReader reader)
```

Set the parent of this instance.

**Parameters:**
reader - the new parent

**getParent**

```java
public XMLEventReader getParent()
```

```java
return null
```

**getParent**

```java
public XMLEventReader getParent()
```

Get the parent of this instance.

**Returns:**
the parent or null if none is set

**nextEvent**

```java
public XMLEvent nextEvent() throws XMLStreamException
```

**Description copied from interface: XMLEventReader**
Get the next XMLEvent

**Specified by:**
nextEvent in interface XMLEventReader

Throws:
XMLStreamException - if there is an error with the underlying XML.

See Also:
XMLEvent

---

public Object next()

next

public Object next()

Specified by:
next in interface Iterator

---

public boolean hasNext()

hasNext

public boolean hasNext()

Description copied from interface: XMLEventReader
Check if there are more events. Returns true if there are more events and false otherwise.

Specified by:
hasNext in interface Iterator
Specified by:
hasNext in interface XMLEventReader

Returns:
true if the event reader has more events, false otherwise
public XMLEvent peek() throws XMLStreamException

peek

public XMLEvent peek()
    throws XMLStreamException

    Description copied from interface: XMLEventReader
    Check the next XMLEvent without reading it from the stream.
    Returns null if the stream is at EOF or has no more XMLEvents. A
    call to peek() will be equal to the next return of next().

    Specified by:
        peek in interface XMLEventReader
    Throws:
        XMLStreamException
    See Also:
        XMLEvent

public void close() throws XMLStreamException

close

public void close()
    throws XMLStreamException

    Description copied from interface: XMLEventReader
    Frees any resources associated with this Reader. This method does
    not close the underlying input source.

    Specified by:
        close in interface XMLEventReader
    Throws:
        XMLStreamException - if there are errors freeing associated
        resources
public String getElementText() throws XMLStreamException

g getElementText

**public String getElementText() throws XMLStreamException**

Description copied from interface: [XMLEventReader](https://docs.oracle.com/en/java/javase/11/docs/api/java.xml.stream/XMLEventReader.html)
Reads the content of a text-only element. Precondition: the current event is START_ELEMENT. Postcondition: The current event is the corresponding END_ELEMENT.

Specified by:
- `getElementText` in interface [XMLEventReader](https://docs.oracle.com/en/java/javase/11/docs/api/java.xml.stream/XMLEventReader.html)

Throws:
- [XMLStreamException](https://docs.oracle.com/en/java/javase/11/docs/api/java.xml.stream/XMLStreamException.html) - if the current event is not a START_ELEMENT or if a non text element is encountered

public [XMLEvent](https://docs.oracle.com/en/java/javase/11/docs/api/java.xml.stream/XMLEvent.html) nextTag() throws XMLStreamException

**nextTag**

**public [XMLEvent](https://docs.oracle.com/en/java/javase/11/docs/api/java.xml.stream/XMLEvent.html) nextTag() throws XMLStreamException**

Description copied from interface: [XMLEventReader](https://docs.oracle.com/en/java/javase/11/docs/api/java.xml.stream/XMLEventReader.html)
Skips any insignificant space events until a START_ELEMENT or END_ELEMENT is reached. If anything other than space characters are encountered, an exception is thrown. This method should be used when processing element-only content because the parser is not able to recognize ignorable whitespace if the DTD is missing or not interpreted.

Specified by:
- `nextTag` in interface [XMLEventReader](https://docs.oracle.com/en/java/javase/11/docs/api/java.xml.stream/XMLEventReader.html)
Throws:

**XMLStreamException** - if anything other than space characters are encountered

---

```java
public Object getProperty(String name) throws IllegalArgumentException
```

**getProperty**

```java
public Object getProperty(String name)
```

Throws **IllegalArgumentException** - if the property is not supported

---

```java
public void remove()
```

**remove**

```java
public void remove()
```

Specified by: **remove** in interface **Iterator**
public interface ExceptionListener

JMS Connection Connection ExceptionListener
onException JMSException

JMS

version 1.0 - 9 March 1998
See also setExceptionListener(ExceptionListener)

If a JMS provider detects a serious problem with a Connection object, it informs the Connection object's ExceptionListener, if one has been registered. It does this by calling the listener's onException method, passing it a JMSException argument describing the problem.

An exception listener allows a client to be notified of a problem asynchronously. Some connections only consume messages, so they would have no other way to learn that their connection has failed.

A JMS provider should attempt to resolve connection problems itself before it notifies the client of them.

Version:
1.0 - 9 March 1998

PS:
javax.resource.spi.work  Class ExecutionContext

java.lang.Object  
   \javax.resource.spi.work.ExecutionContext

public class ExecutionContext
extends Object

Work  ExecutionContext

ExecutionContext

•
•  ExecutionContext  ExecutionContext

version  1.0

This class models an execution context (transaction, security, etc) with which the Work instance must be executed. This class is provided as a convenience for easily creating ExecutionContext instances by extending this class and overriding only those methods of interest.

Some reasons why it is better for ExecutionContext to be a class rather than an interface:

• There is no need for a resource adapter to implement this class. It only needs to implement the context information like transaction, etc.
• The resource adapter code does not have to change when the ExecutionContext class evolves. For example, more context types could be added to the ExecutionContext class (in the future) without forcing resource adapter implementations to change.

Version:  
1.0

Constructor Detail

public ExecutionContext()

ExecutionContext

public ExecutionContext()
public void setXid(Xid xid)

    xid

setXid

public void setXid(Xid xid)

    set a transaction context.

    Parameters:
    xid - transaction context.

----------------------------------------

public Xid getXid()

getXid

public Xid getXid()  

----------------------------------------

public void setTransactionTimeout(long timeout) throws NotSupportedException

    timeout  0
    Throws   NotSupportedException:

setTransactionTimeout

public void setTransactionTimeout(long timeout)  
    throws NotSupportedException

    Set the transaction timeout value for a imported transaction.

    Parameters:
timeout - transaction timeout value in seconds. Only positive non-zero values are accepted. Other values are illegal and are rejected with a NotSupportedException.

Throws:

NotSupportedException - thrown to indicate an illegal timeout value.

public long getTransactionTimeout()

return -1 (getTransactionTimeout)

getTransactionTimeout

public long getTransactionTimeout()

Get the transaction timeout value for a imported transaction.

Returns:

the specified transaction timeout value in seconds. When no timeout value or an illegal timeout value had been specified, a value of -1 (WorkManager.UNKNOWN) is returned; such a transaction is excluded from regular timeout processing.
javax.el Class Expression

java.lang.Object
   \ javax.el.Expression

All Implemented Interfaces:
   Serializable

Direct Known Subclasses:
   MethodExpression, ValueExpression

public abstract class Expression
   extends Object
   implements Serializable

Implements: java.io.Serializable
Extended by: MethodExpression, ValueExpression

   ValueExpression    MethodExpression

   equals()    hashCode()

   Serializable

Expression   String/   FunctionMapper

   since   JSP 2.1

Base class for the expression subclasses ValueExpression and MethodExpression, implementing characteristics common to both.

All expressions must implement the equals() and hashCode() methods so that two expressions can be compared for equality. They are redefined abstract in this class to force their implementation in subclasses.

All expressions must also be Serializable so that they can be saved and
Expressions are also designed to be immutable so that only one instance needs to be created for any given expression String / FunctionMapper. This allows a container to pre-create expressions and not have to re-parse them each time they are evaluated.

**Since:**
JSP 2.1

**See Also:**
Serialized Form

</table>

### Methods inherited from class java.lang.Object

*clone, finalize, getClass, notify, notifyAll, toString, wait, wait*
### Constructor Detail

**public Expression()**

### Method Detail

**abstract public String getExpressionString()**

```java
Expression String

getExpressionString

public abstract String getExpressionString()

Returns the original String used to create this Expression, unmodified.

This is used for debugging purposes but also for the purposes of comparison (e.g. to ensure the expression in a configuration file has not changed).

This method does not provide sufficient information to re-create an expression. Two different expressions can have exactly the same expression string but different function mappings. Serialization should be used to save and restore the state of an Expression.
Returns:
The original expression String.

abstract public boolean equals(Object obj)

Determines whether the specified object is equal to this Expression.

The result is true if and only if the argument is not null, is an Expression object that is of the same type (ValueExpression or MethodExpression), and has an identical parsed representation.

Note that two expressions can be equal if their expression Strings are different. For example, ${fn1:foo()} and ${fn2:foo()} are equal if their corresponding FunctionMappers mapped fn1:foo and fn2:foo to the same method.

Overrides:
equals in class Object

Parameters:
obj - the Object to test for equality.

Returns:
true if obj equals this Expression; false otherwise.

See Also:
Hashtable, Object.equals(java.lang.Object)

---

abstract public int hashCode()

Expression

String #equals equals(Object)
hashCode hashCode

return Expression

See also equals, java.util.Hashtable, hashCode()

---

hashCode

public abstract int hashCode()

Returns the hash code for this Expression.

See the note in the equals(java.lang.Object) method on how two expressions can be equal if their expression Strings are different. Recall that if two objects are equal according to the equals(Object) method, then calling the hashCode method on each of the two objects must produce the same integer result. Implementations must take special note and implement hashCode correctly.

Overrides: 
hashCode in class Object

Returns:
The hash code for this Expression.

See Also:
equals(java.lang.Object), Hashtable, Object.hashCode()
isLiteralText

public abstract boolean isLiteralText()

Returns whether this expression was created from only literal text.

This method must return true if and only if the expression string this expression was created from contained no unescaped EL delimiters (${...} or #{...}).

Returns:
true if this expression was created from only literal text; false otherwise.
Class Expression

`javax.servlet.jsp.el` Expression

`java.lang.Object`<br>`javax.servlet.jsp.el.Expression`

**Deprecated.** As of JSP 2.1, replaced by `ValueExpression`

Expression ExpressionEvaluator

Expression evaluate() ELParseException

```
public abstract class Expression
extends Object
```

The abstract class for a prepared expression.

An instance of an Expression can be obtained via from an ExpressionEvaluator instance.

An Expression may or not have done a syntactic parse of the expression. A client invoking the evaluate() method should be ready for the case where ELParseException exceptions are raised.

**Since:**

JSP 2.0

Constructor Detail

public Expression()

Expression

public Expression()

Deprecated.

Method Detail

abstract public Object evaluate(VariableResolver vResolver) throws ELException

ELParseException   ELException

vResolver VariableResolver Objects

return

Throws ELException:

evaluate
public abstract Object evaluate(VariableResolver vResolver) throws ELException

 Deprecated. Evaluates an expression that was previously prepared. In some implementations preparing an expression involves full syntactic validation, but others may not do so. Evaluating the expression may raise an ELParseException as well as other ELExceptions due to run-time evaluation.

 Parameters:
 vResolver - A VariableResolver instance that can be used at runtime to resolve the name of implicit objects into Objects.

 Returns:
 The result of the expression evaluation.

 Throws:
 ELException - Thrown if the expression evaluation failed.
Class ExpressionEvaluator

ExpressionEvaluator JspContext / PageContext

parseExpression() evaluate() ExpressionEvaluator

transient ExpressionEvaluator

'${' '}' EL EL "abc${1+1}def${1+1}ghi"

"${1+1}${1+1}" ELEException

EL

- ${person.lastName}
- ${8 * 8}
- ${my:reverse('hello')}

since 2.0

public abstract class ExpressionEvaluator

extends Object

The abstract base class for an expression-language evaluator. Classes that implement an expression language expose their functionality via this abstract class.

An instance of the ExpressionEvaluator can be obtained via the JspContext / PageContext
The `parseExpression()` and `evaluate()` methods must be thread-safe. That is, multiple threads may call these methods on the same `ExpressionEvaluator` object simultaneously. Implementations should synchronize access if they depend on transient state. Implementations should not, however, assume that only one object of each `ExpressionEvaluator` type will be instantiated; global caching should therefore be static.

Only a single EL expression, starting with '${' and ending with '}', can be parsed or evaluated at a time. EL expressions cannot be mixed with static text. For example, attempting to parse or evaluate "abc${1+1}def${1+1}ghi" or even "${1+1}${1+1}" will cause an `ELException` to be thrown.

The following are examples of syntactically legal EL expressions:

- `${person.lastName}
- `${8 * 8}
- `${my:reverse('hello')}

**Since:**

JSP 2.0

\textbf{Throws} \texttt{ELException}

parseExpression

\textbf{public abstract \texttt{Expression}} parseExpression(String expression,
Deprecated.
Prepare an expression for later evaluation. This method should perform syntactic validation of the expression; if in doing so it detects errors, it should raise an ELParseException.

Parameters:
- `expression`: The expression to be evaluated.
- `expectedType`: The expected type of the result of the evaluation.
- `fMapper`: A FunctionMapper to resolve functions found in the expression. It can be null, in which case no functions are supported for this invocation. The ExpressionEvaluator must not hold on to the FunctionMapper reference after returning from `parseExpression()`. The Expression object returned must invoke the same functions regardless of whether the mappings in the provided FunctionMapper instance change between calling `ExpressionEvaluator.parseExpression()` and `Expression.evaluate()`.

Returns:
The Expression object encapsulating the arguments.

Throws:
- `ELException` - Thrown if parsing errors were found.

```java
abstract public Object evaluate(String expression, Class<T> expectedType, VariableResolver vResolver, FunctionMapper fMapper) throws ELException
```
public abstract Object evaluate(String expression, Class expectedType, VariableResolver vResolver, FunctionMapper fMapper)
    throws ELException

Deprecated.
Evaluates an expression. This method may perform some syntactic validation and, if so, it should raise an ELParseException error if it encounters syntactic errors. EL evaluation errors should cause an ELException to be raised.

Parameters:
expression - The expression to be evaluated.
extendedType - The expected type of the result of the evaluation
vResolver - A VariableResolver instance that can be used at runtime to resolve the name of implicit objects into Objects.
fMapper - A FunctionMapper to resolve functions found in the expression. It can be null, in which case no functions are supported for this invocation.

Returns:
The result of the expression evaluation.

Throws:
ELException - Thrown if the expression evaluation failed.

### Constructor Detail

**public ExpressionFactory()**

**ExpressionFactory**

**public ExpressionFactory()**

### Method Detail

**public static ExpressionFactory newInstance()**

```
ExpressionFactory<ExpressionFactory>
```

- **Services API JAR**
  
  META-INF/services/javax.el.ExpressionFactory

- **JRE "lib/el.properties"**
  
  java.util.Properties.load(InputStream)

  "javax.el.ExpressionFactory"

- **javax.el.ExpressionFactory**
newInstance
public static ExpressionFactory newInstance()

Creates a new instance of a ExpressionFactory. This method uses the following ordered lookup procedure to determine the ExpressionFactory implementation class to load:

- Use the Services API (as detailed in the JAR specification). If a resource with the name of META-INF/services/javax.el.ExpressionFactory exists, then its first line, if present, is used as the UTF-8 encoded name of the implementation class.
- Use the properties file "lib/el.properties" in the JRE directory. If this file exists and it is readable by the java.util.Properties.load(InputStream) method, and it contains an entry whose key is "javax.el.ExpressionFactory", then the value of that entry is used as the name of the implementation class.
- Use the javax.el.ExpressionFactory system property. If a system property with this name is defined, then its value is used as the name of the implementation class.
- Use a platform default implementation.

public static ExpressionFactory newInstance(java.util.Properties properties)

ExpressionFactory newInstance() properties null java.util.Properties

"javax.el"
• `javax.el.cacheSize`

    `properties`    null

`newInstance`

```java
public static ExpressionFactory newInstance(Properties properties)
```

Create a new instance of a `ExpressionFactory`, with optional properties. This method uses the same lookup procedure as the one used in `newInstance()`.

If the argument `properties` is not null, and if the implementation contains a constructor with a single parameter of type `java.util.Properties`, then the constructor is used to create the instance.

Properties are optional and can be ignored by an implementation.

The name of a property should start with "javax.el."

The following are some suggested names for properties.

• `javax.el.cacheSize`

**Parameters:**

- `properties` - Properties passed to the implementation. If null, then no properties.

`createValueExpression`

```java
public abstract ValueExpression createValueExpression(ELContext context, String expression, Class<?> expectedType)
```

Parses an expression into a `ValueExpression` for later evaluation.
Use this method for expressions that refer to values.

This method should perform syntactic validation of the expression. If in doing so it detects errors, it should raise an `ELException`.

**Parameters:**
- `context` - The EL context used to parse the expression. The `FunctionMapper` and `VariableMapper` stored in the ELContext are used to resolve functions and variables found in the expression. They can be `null`, in which case functions or variables are not supported for this expression. The object returned must invoke the same functions and access the same variable mappings regardless of whether the mappings in the provided `FunctionMapper` and `VariableMapper` instances change between calling `ExpressionFactory.createValueExpression()` and any method on `ValueExpression`.

Note that within the EL, the `${}` and `#{}` syntaxes are treated identically. This includes the use of `VariableMapper` and `FunctionMapper` at expression creation time. Each is invoked if not null, independent of whether the `#{}` or `${}` syntax is used for the expression.

- `expression` - The expression to parse
- `expectedType` - The type the result of the expression will be coerced to after evaluation.

**Returns:**
- The parsed expression

**Throws:**
- `NullPointerException` - Thrown if `expectedType` is null.
- `ELException` - Thrown if there are syntactical errors in the provided expression.

---

```java
createValueExpression

public abstract ValueExpression createValueExpression(Object instance, Class<?> expectedType)
```
Creates a ValueExpression that wraps an object instance. This method can be used to pass any object as a ValueExpression. The wrapper ValueExpression is read only, and returns the wrapped object via its getValue() method, optionally coerced.

**Parameters:**
- `instance` - The object instance to be wrapped.
- `expectedType` - The type the result of the expression will be coerced to after evaluation. There will be no coercion if it is `Object.class`.

**Throws:**
- `NullPointerException` - Thrown if `expectedType` is null.

---

createMethodExpression

```java
public abstract MethodExpression createMethodExpression(ELContext context, String expression, Class<? extends MethodExpression> expectedReturnType, Class<?> expectedParamTypes)
```

 Parses an expression into a `MethodExpression` for later evaluation. Use this method for expressions that refer to methods.

If the expression is a String literal, a `MethodExpression` is created, which when invoked, returns the String literal, coerced to `expectedReturnType`. An ELException is thrown if `expectedReturnType` is void or if the coercion of the String literal to the `expectedReturnType` yields an error (see Section "1.16 Type Conversion").

This method should perform syntactic validation of the expression. If in doing so it detects errors, it should raise an ELException.

**Parameters:**
- `context` - The EL context used to parse the expression. The `FunctionMapper` and `VariableMapper` stored in the ELContext are used to resolve functions and variables found in the expression.
They can be `null`, in which case functions or variables are not supported for this expression. The object returned must invoke the same functions and access the same variable mappings regardless of whether the mappings in the provided FunctionMapper and VariableMapper instances change between calling `ExpressionFactory.createMethodExpression()` and any method on `MethodExpression`.

Note that within the EL, the `{}$` and `#{}` syntaxes are treated identically. This includes the use of VariableMapper and FunctionMapper at expression creation time. Each is invoked if not null, independent of whether the `#{}` or `{}` syntax is used for the expression.

- `expression` - The expression to parse
- `expectedReturnType` - The expected return type for the method to be found. After evaluating the expression, the `MethodExpression` must check that the return type of the actual method matches this type. Passing in a value of `null` indicates the caller does not care what the return type is, and the check is disabled.
- `expectedParamTypes` - The expected parameter types for the method to be found. Must be an array with no elements if there are no parameters expected. It is illegal to pass `null`.

**Returns:**
The parsed expression

**Throws:**

- `ELException` - Thrown if there are syntactical errors in the provided expression.
- `NullPointerException` - if `paramTypes` is `null`.

---

coerceToType

```java
public abstract Object coerceToType(Object obj,
                                     Class<?> targetType)
```

Coerces an object to a specific type according to the EL type
conversion rules.

An `EL Exception` is thrown if an error results from applying the conversion rules.

**Parameters:**
- `obj` - The object to coerce.
- `targetType` - The target type for the coercion.

**Throws:**
- `EL Exception` - thrown if an error results from applying the conversion rules.

Slot
addSlots

```java
void addSlots(Collection slots)
throws JAXRException
```

Adds more Slots to this object.

**Capability Level:** 0

**Parameters:**
- `slots` - the Collection of Slot objects being added to this object

**Throws:**
- `JAXRException` - If the JAXR provider encounters an internal error

---

```java
public void removeSlot(String slotName) throws JAXRException
SlotSlot
```

---

```java
slotName Slot
Throws JAXRException: JAXR
```
removeSlot

```java
void removeSlot(String slotName)
    throws JAXRException
```

Removes a Slot from this object. The Slot is identified by its name.

**Capability Level: 0**

**Parameters:**
- `slotName` - the name for the Slot object being removed from this object

**Throws:**
- `JAXRException` - If the JAXR provider encounters an internal error

---

public void removeSlots(java.util.Collection<E> slotNames)
    throws JAXRException
SlotSlot

```java
0
```

removeSlots

```java
void removeSlots(Collection slotNames)
    throws JAXRException
```

Removes specified Slots from this object. The Slots are identified by
its name.

**Capability Level: 0**

**Parameters:**
- `slotNames` - the Collection of names for Slot objects being removed from this object. Must be a Collection of Strings

**Throws:**
- `JAXRException` - If the JAXR provider encounters an internal error

```java
public Slot getSlot(String slotName) throws JAXRException
{
    slotName = slot
    0

    slotName Slot
    Throws JAXRException: JAXR
}
```

**getSlot**

```java
Slot getSlot(String slotName) throws JAXRException
{
    Gets the slot specified by slotName.

    **Capability Level: 0**

    **Parameters:**
    - `slotName` - the name of the desired Slot object

    **Throws:**
    - `JAXRException` - If the JAXR provider encounters an internal error
```
public java.util.Collection<E> getSlots() throws JAXRException

Slot

0

return Slot CollectionCollection null

Throws JAXRException: JAXR

supplierCardinality 0..*

associates <{Slot}>

undirected

supplierRole slots

link aggregationByValue

getSlots

Collection getSlots() throws JAXRException

Returns the Slots associated with this object.

Capability Level: 0

Returns: Collection of Slot instances. The Collection may be empty but not null.

Throws: JAXRException - If the JAXR provider encounters an internal error

PS:
javax.faces.context Class ExternalContext

java.lang.Object
  ↓ javax.faces.context.ExternalContext

public abstract class ExternalContext
  extends Object

Faces API  JavaServer Faces  Servlet  Portlet

  Servlet     Portlet

This class allows the Faces API to be unaware of the nature of its containing application environment. In particular, this class allows JavaServer Faces based applications to run in either a Servlet or a Portlet environment.

In the method descriptions below, paragraphs starting with Servlet: and Portlet: denote behavior that is specific to that particular environment.

<td>Return the value of the specified application initialization parameter (if any).</td>
</tr>
</tbody>
</table>
abstract Map getInitParameterMap()  
Return an immutable Map whose keys are the set of application initialization parameter names configured for this application, and whose values are the corresponding parameter values.

abstract String getRemoteUser()  
Return the login name of the user making the current request if any; otherwise, return null.

abstract Object getRequest()  
Return the environment-specific object instance for the current request.

String getRequestMethod()  
Return the character encoding currently being used to interpret this request.

String getContentType()  
Return the MIME Content-Type for this request.

abstract String getServletPath()  
Return the portion of the request URI that identifies the web application context for this request.

abstract Map<String, Object> getCookieMap()  
Return an immutable Map whose keys are the set of cookie names included in the current request, and whose values (of type javax.servlet.http.Cookie) are the first (or only) cookie for each cookie name returned by the underlying request.

abstract Map<String, String> getHeaderMap()  
Return an immutable Map whose keys are the set of request header names included in the current request, and whose values (of type String) are the first (or only) value for each header name returned by the underlying request.

abstract Map<String, String[]> getHeaderValuesMap()  
Return an immutable Map whose keys are the set of request header names included in the current request, and whose values (of type String[]) are all of the value for each header name returned by the
underlying request.

<table>

<tr>
<td><code>getSessionMap()</code></td>
<td>Return a mutable Map representing the session scope attributes for the current application.</td>
</tr>
<tr>
<td><code>getUserPrincipal()</code></td>
<td>Return the Principal object containing the name of the current authenticated user, if any; otherwise, return null.</td>
</tr>
<tr>
<td><code>isUserInRole(String role)</code></td>
<td>Return true if the currently authenticated user is included in the specified role.</td>
</tr>
<tr>
<td><code>log(String message)</code></td>
<td>Log the specified message to the application object.</td>
</tr>
</tbody>
</table>
abstract void log(String message, Throwable exception)
    Log the specified message and exception to the application object.

abstract void redirect(String url)
    Redirect a request to the specified URL, and cause the responseComplete() method to be called on the FacesContext instance for the current request.

void setRequest(Object request)
    Set the environment-specific request to be returned by subsequent calls to getRequest().

void setRequestCharacterEncoding(String encoding)
    Overrides the name of the character encoding used in the body of this request.

void setResponse(Object response)
    Set the environment-specific response to be returned by subsequent calls to getResponse().

void setResponseCharacterEncoding(String encoding)
    Sets the character encoding (MIME charset) of the response being sent to the client, for example, to UTF-8.

### Constructor Detail

**public** `ExternalContext()`

**ExternalContext**

**public** `ExternalContext()`

### Method Detail

**abstract public** `void dispatch(String path)` throws `java.io.IOException`

**Servlet** `javax.servlet.ServletContext`

- `getRequestDispatcher(path)`
- `forward()`

**Portlet** `javax.portlet.PortletContext`

- `getRequestDispatcher()`
- `include()`

**Throws**
- `FacesException`: 
- `ServletException`: 
- `PortletException`: 
- `IllegalArgumentException`: 
- `IllegalStateException`: 
- `portlet ActionRequest RenderRequest`: 
- `java.io.IOException`: `/`
- `NullPointerException`: `path null`

**dispatch**

**public abstract** `void dispatch(String path)`

**Throws** `IOException`
Dispatch a request to the specified resource to create output for this response.

**Servlet**: This must be accomplished by calling the `javax.servlet.ServletContext` method `getRequestDispatcher(path)`, and calling the `forward()` method on the resulting object.

**Portlet**: This must be accomplished by calling the `javax.portlet.PortletContext` method `getRequestDispatcher()`, and calling the `include()` method on the resulting object.

**Parameters:**
- `path` - Context relative path to the specified resource, which must start with a slash ("/") character

**Throws:**
- `FacesException` - thrown if a `ServletException` or `PortletException` occurs
- `IllegalArgumentException` - if no request dispatcher can be created for the specified path
- `IllegalStateException` - if this method is called in a portlet environment, and the current request is an `ActionRequest` instead of a `RenderRequest`
- `IOException` - if an input/output error occurs
- `NullPointerException` - if `path` is null

abstract public String encodeActionURL(String url)

**URL**

**Servlet**

`javax.servlet.http.HttpServletResponse` `encodeURL(url)`

**Portlet**

`javax.portlet.PortletResponse` `encodeURL(url)`

**url**

**URL**

**Throws**

`NullPointerException`: `url` null
**encodeActionURL**

```java
public abstract String encodeActionURL(String url)
```

Return the input URL, after performing any rewriting needed to ensure that it will correctly identify an addressable action in the current application.

*Servlet:* This must be the value returned by the `javax.servlet.http.HttpServletResponse` method `encodeURL(url)`.

*Portlet:* This must be the value returned by the `javax.portlet.PortletResponse` method `encodeURL(url)`.

**Parameters:**

- `url` - The input URL to be encoded

**Throws:**

- `NullPointerException` - if `url` is null

---

**abstract public String encodeNamespace(String name)**

*Servlet*

*Portlet*  

```java
javax.portlet.RenderResponse getNamespace()
```

**name**

**Throws**

- `IllegalArgumentException` - `portlet` is null
- `IOException` - `RenderResponse` cannot be used for this type of request

**encodeNamespace**
public abstract String encodeNamespace(String name)

Return the specified name, after prefixing it with a namespace that ensures that it will be unique within the context of a particular page.

Servlet: The input value must be returned unchanged.

Portlet: The returned value must be the input value prefixed by the value returned by the javax.portlet.RenderResponse method getNamespace().

Parameters:
**name** - Name to be encoded

Throws:
- IllegalStateException - if this method is called in a portlet environment, and the current response is an ActionResponse instead of a RenderResponse
- NullPointerException - if name is null

abstract public String encodeResourceURL(String url)

URL

Servlet javax.servlet.http.HttpServletResponse encodeURL(url)

Portlet javax.portlet.PortletResponse encodeURL(url)

url URL

Throws

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>NullPointerException</td>
</tr>
</tbody>
</table>

encodeResourceURL

public abstract String encodeResourceURL(String url)
Return the input URL, after performing any rewriting needed to ensure that it will correctly identify an addressable resource in the current application.

*Servlet:* This must be the value returned by the `javax.servlet.http.HttpServletResponse` method `encodeURL(url)`.

*Portlet:* This must be the value returned by the `javax.portlet.PortletResponse` method `encodeURL(url)`.

**Parameters:**
- `url` - The input URL to be encoded

**Throws:**
- `NullPointerException` - if `url` is null

```java
abstract public java.util.Map<K, V> getApplicationMap()
```

```java
Map clear() remove() put() putAll() get()
```

```java
Map Bean Bean
javax.annotation.PreDestroy void Bean
PreDestroy
```

```java
Servlet javax.servlet.ServletContext
getAttribute() getAttributeNames() removeAttribute() setAttribute()
```

```java
Portlet javax.portlet.PortletContext
getAttribute() getAttributeNames() removeAttribute() setAttribute()
```

```java
getApplicationMap
```
public abstract Map<String, Object> getApplicationMap()

Return a mutable Map representing the application scope attributes for the current application. The returned Map must implement the entire contract for a modifiable map as described in the JavaDocs for java.util.Map. Modifications made in the Map must cause the corresponding changes in the set of application scope attributes. Particularly the clear(), remove(), put(), putAll(), and get() operations must take the appropriate action on the underlying data structure.

For any of the Map methods that cause an element to be removed from the underlying data structure, the following action regarding managed-beans must be taken. If the element to be removed is a managed-bean, and it has one or more public no-argument void return methods annotated with javax.annotation.PreDestroy, each such method must be called before the element is removed from the underlying data structure. Elements that are not managed-beans, but do happen to have methods with that annotation must not have those methods called on removal. Any exception thrown by the PreDestroy annotated methods must be caught and not rethrown. The exception may be logged.

Servlet: This must be the set of attributes available via the javax.servlet.ServletContext methods getAttribute(), getAttributeNames(), removeAttribute(), and setAttribute().

Portlet: This must be the set of attributes available via the javax.portlet.PortletContext methods getAttribute(), getAttributeNames(), removeAttribute(), and setAttribute().

abstract public String getAuthType()

null BASIC_AUTHCLIENT_CERT_AUTHDIGEST_AUTH FORM_AUTH

Servlet javax.servlet.http.HttpServletRequest getAuthType()
Portlet  javax.portlet.http.PortletRequest
getAuthType()  

getAuthType

public abstract String getAuthType()

Return the name of the authentication scheme used to authenticate the current user, if any; otherwise, return null. For standard authentication schemes, the returned value will match one of the following constants: BASIC_AUTH, CLIENT_CERT_AUTH, DIGEST_AUTH, or FORM_AUTH.

Servlet: This must be the value returned by the javax.servlet.http.HttpServletRequest method getAuthType().

Portlet: This must be the value returned by the javax.portlet.http.PortletRequest method getAuthType().

abstract public Object getContext()

Servlet  javax.servlet.ServletContext
Portlet  javax.portlet.PortletContext

getContext

public abstract Object getContext()

Return the application environment object instance for the current application.
abstract public String getInitParameter(String name)

**Servlet**   javax.servlet.ServletContext
getInitParameter(name)

**Portlet**  javax.portlet.PortletContext
getInitParameter(name)

  *name*
  *Throws*       NullPointerException: name null

getInitParameter

public abstract String getInitParameter(String name)

Return the value of the specified application initialization parameter (if any).

**Servlet**: This must be the result of the javax.servlet.ServletContext method getInitParameter(name).

**Portlet**: This must be the result of the javax.portlet.PortletContext method getInitParameter(name).

**Parameters:**
  *name* - Name of the requested initialization parameter

**Throws:**
  *NullPointeException* - if name is null
abstract public java.util.Map<K, V> getInitParameterMap()

Map	Map	java.util.Map JavaDoc

Servlet	javax.servlet.ServletContext
getInitParameterNames/

Portlet	javax.portlet.PortletContext
getInitParameterNames/

getInitParameterMap

classmap getInitParameterMap()

public abstract Map getInitParameterMap()

Return an immutable Map whose keys are the set of application initialization parameter names configured for this application, and whose values are the corresponding parameter values. The returned Map must implement the entire contract for an unmodifiable map as described in the JavaDocs for java.util.Map.

Servlet: This result must be as if it were synthesized by calling the javax.servlet.ServletContext method getInitParameterNames, and putting each configured parameter name/value pair into the result.

Portlet: This result must be as if it were synthesized by calling the javax.portlet.PortletContext method getInitParameterNames, and putting each configured parameter name/value pair into the result.

abstract public String getRemoteUser()

null

Servlet	javax.servlet.http.HttpServletRequest
getRemoteUser()

**Portlet**  javax.portlet.http.PortletRequest
getRemoteUser()

getRemoteUser

```java
public abstract String getRemoteUser()
```

Return the login name of the user making the current request if any; otherwise, return `null`.

**Servlet:** This must be the value returned by the `javax.servlet.http.HttpServletRequest` method `getRemoteUser()`.

**Portlet:** This must be the value returned by the `javax.portlet.http.PortletRequest` method `getRemoteUser()`.

---

abstract public Object getRequest()

**Servlet**  javax.servlet.http.HttpServletRequest

**Portlet**  javax.portlet.PortletRequest  ActionRequest
RenderRequest

getRequest

```java
public abstract Object getRequest()
```

Return the environment-specific object instance for the current request.
Servlet: This must be the current request's javax.servlet.http.HttpServletRequest instance.

Portlet: This must be the current request's javax.portlet.PortletRequest instance, which will be either an ActionRequest or a RenderRequest depending upon when this method is called.

```
public void setRequest(Object request)

(requestCode)

UnsupportedOperationException

since 1.2
```

setRequest

-public void setRequest(Object request)

Set the environment-specific request to be returned by subsequent calls to getRequest(). This may be used to install a wrapper for the request.

The default implementation throws UnsupportedOperationException and is provided for the sole purpose of not breaking existing applications that extend this class.

Since:
1.2

```
public void setRequestCharacterEncoding(String encoding) throws java.io.UnsupportedEncodingException
```
Reader   Stream   IllegalStateException

**Servlet**   
javax.servlet.ServletRequest
setCharacterEncoding()

**Portlet**   
javax.portlet.ActionRequest
setCharacterEncoding()

UnsupportedOperationException

**setRequestCharacterEncoding**

```java
public void setRequestCharacterEncoding(String encoding)
    throws UnsupportedEncodingException
```

Overrides the name of the character encoding used in the body of this request.

Calling this method after the request has been accessed will have no effect, unless a Reader or Stream has been obtained from the request, in which case an IllegalStateException is thrown.

**Servlet:** This must call through to the javax.servlet.ServletRequest method setCharacterEncoding().

**Portlet:** This must call through to the javax.portlet.ActionRequest method setCharacterEncoding().

The default implementation throws UnsupportedOperationException and is provided for the sole purpose of not breaking existing applications that extend this class.

**Throws:**

UnsupportedEncodingException - if this is not a valid encoding
abstract public String getRequestContextPath()

Web URI

Servlet javax.servlet.http.HttpServletRequest
getContextPath()

Portlet javax.portlet.PortletRequest getPortletContextPath()

getRequestContextPath

public abstract String getRequestContextPath()

Return the portion of the request URI that identifies the web application context for this request.

Servlet: This must be the value returned by the javax.servlet.http.HttpServletRequest methodgetContextPath().

Portlet: This must be the value returned by the javax.portlet.PortletRequest methodgetPortletContextPath().

abstract public java.util.Map<K, V> getRequestCookieMap()

Map cookie javax.servlet.http.Cookie
cookie cookie java.util.Map JavaDoc

Servlet javax.servlet.http.HttpServletRequest
null 0

**Portlet** Map

### getRequestCookieMap

```java
public abstract Map&lt;String, Object&gt; getRequestCookieMap()
```

Return an immutable Map whose keys are the set of cookie names included in the current request, and whose values (of type javax.servlet.http.Cookie) are the first (or only) cookie for each cookie name returned by the underlying request. The returned Map must implement the entire contract for an unmodifiable map as described in the JavaDocs for java.util.Map.

*Servlet:* This must be the value returned by the javax.servlet.http.HttpServletRequest method get Cookies(), unless null was returned, in which case this must be a zero-length array.

*Portlet:* This must be an empty Map.

### getRequestHeaderMap

```java
abstract public java.util.Map&lt;K, V&gt; getRequestHeaderMap()
```

JavaDoc

*Servlet*  
javax.servlet.http.HttpServletRequest  
getHeader() getHeaderNames()

*Portlet*  
javax.portlet.PortletRequest  
getProperty() getPropertyName() HTTP portlet
getRequestHeaderMap

public abstract Map<String, String> getRequestHeaderMap()

Return an immutable Map whose keys are the set of request header names included in the current request, and whose values (of type String) are the first (or only) value for each header name returned by the underlying request. The returned Map must implement the entire contract for an unmodifiable map as described in the JavaDocs for java.util.Map. In addition, key comparisons must be performed in a case insensitive manner.

Servlet: This must be the set of headers available via the javax.servlet.http.HttpServletRequest methods getHeader() and getHeaderNames().

Portlet: This must be the set of properties available via the javax.portlet.PortletRequest methods getProperty() and getPropertyNames(). As such, HTTP headers will only be included if they were provided by the portlet container, and additional properties provided by the portlet container may also be included.

abstract public java.util.Map<K, V> getRequestHeaderValuesMap()

Map String[] Map java.util.Map

Servlet javax.servlet.http.HttpServletRequest
getHeaders() getHeaderNames()

Portlet javax.portlet.PortletRequest getProperties() getPropertyNames() HTTP portlet

getRequestHeaderValuesMap

public abstract Map<String, String[]> getRequestHeaderValuesMap()

Return an immutable Map whose keys are the set of request header names included in the current request, and whose values (of type String[]) are all of the value for each header name returned by the underlying request. The returned Map must implement the entire contract for an unmodifiable map as described in the JavaDocs for java.util.Map. In addition, key comparisons must be performed in a case insensitive manner.

Servlet: This must be the set of headers available via the javax.servlet.http.HttpServletRequest methods getHeaders() and getHeaderNames().

Portlet: This must be the set of properties available via the javax.portlet.PortletRequest methods getProperties() and getPropertyNames(). As such, HTTP headers will only be included if they were provided by the portlet container, and additional properties provided by the portlet container may also be included.

abstract public java.util.Locale getRequestLocale()

Locale

Servlet      javax.servlet.ServletRequest    getLocale()

Portlet      javax.portlet.PortletRequest   getLocale()

ggetRequestLocale

public abstract Locale getRequestLocale()
Return the preferred `Locale` in which the client will accept content.

**Servlet:** This must be the value returned by the `javax.servlet.ServletRequest` method `getLocale()`.

**Portlet:** This must be the value returned by the `javax.portlet.PortletRequest` method `getLocale()`.

```java
abstract public java.util.Iterator<E> getRequestLocales()

Locale   Iterator

Servlet   javax.servlet.ServletRequest   getLocales()
Portlet   javax.portlet.PortletRequest   getLocales()
```

**getRequestLocales**

```java
public abstract Iterator<Locale> getRequestLocales()
```

Return an `Iterator` over the preferred `Locales` specified in the request, in decreasing order of preference.

**Servlet:** This must be an `Iterator` over the values returned by the `javax.servlet.ServletRequest` method `getLocales()`.

**Portlet:** This must be an `Iterator` over the values returned by the `javax.portlet.PortletRequest` method `getLocales()`.

```java
abstract public java.util.Map<K, V> getRequestMap()

Map   Map   java.util.Map   JavaDoc   Map
```
clear() remove() put() putAll() get()

Map Bean Bean
javax.annotation.PreDestroy void Bean
PreDestroy

Servlet javax.servlet.ServletRequest
getAttribute() getAttributeNames() removeAttribute()
setAttribute()

Portlet javax.portlet.PortletRequest
getAttribute() getAttributeNames() removeAttribute()
setAttribute()

ggetRequestMap

public abstract Map<String, Object> getRequestMap()

Return a mutable Map representing the request scope attributes for the current application. The returned Map must implement the entire contract for a modifiable map as described in the JavaDocs for java.util.Map. Modifications made in the Map must cause the corresponding changes in the set of request scope attributes. Particularly the clear(), remove(), put(), putAll(), and get() operations must take the appropriate action on the underlying data structure.

For any of the Map methods that cause an element to be removed from the underlying data structure, the following action regarding managed-beans must be taken. If the element to be removed is a managed-bean, and it has one or more public no-argument void return methods annotated with javax.annotation.PreDestroy, each such method must be called before the element is removed from the underlying data structure. Elements that are not managed-beans, but do happen to have methods with that annotation must not have
those methods called on removal. Any exception thrown by the
PreDestroy annotated methods must by caught and not rethrown.
The exception may be logged.

Servlet: This must be the set of attributes available via the
javax.servlet.ServletRequest methods getAttribute(),
ggetAttributeNames(), removeAttribute(), and setAttribute().

Portlet: This must be the set of attributes available via the
javax.portlet.PortletRequest methods getAttribute(),
ggetAttributeNames(), removeAttribute(), and setAttribute().

abstract public java.util.Map<K, V>
getRequestParameterMap()

Map String Map java.util.Map

Servlet javax.servlet.ServletRequest getParameter()
getParameterNames()

Portlet javax.portlet.PortletRequest getParameter()
getParameterNames()

getRequestParameterMap

public abstract Map<String, String> getRequestParameterMap()

Return an immutable Map whose keys are the set of request
parameters names included in the current request, and whose
values (of type String) are the first (or only) value for each parameter
name returned by the underlying request. The returned Map must
implement the entire contract for an unmodifiable map as described
in the JavaDocs for java.util.Map.
**Servlet:** This must be the set of parameters available via the `javax.servlet.ServletRequest` methods `getParameter()` and `getParameterNames()`.

**Portlet:** This must be the set of parameters available via the `javax.portlet.PortletRequest` methods `getParameter()` and `getParameterNames()`.

```java
abstract public java.util.Iterator<E>
getRequestParameterNames()
```

**Iterator**

**Servlet** `javax.servlet.ServletRequest` `getParameterNames()` `Iterator`

**Portlet** `javax.portlet.PortletRequest` `getParameterNames()` `Iterator`

**getRequestParameterNames**

```java
public abstract Iterator<String> getRequestParameterNames()
```

Return an `Iterator` over the names of all request parameters included in the current request.

**Servlet:** This must be an `Iterator` over the values returned by the `javax.servlet.ServletRequest` method `getParameterNames()`.

**Portlet:** This must be an `Iterator` over the values returned by the `javax.portlet.PortletRequest` method `getParameterNames()`.

```java
abstract public java.util.Map<K, V>
getRequestParameterValuesMap()
```
**Map String[]**  
**Map java.util.Map**

**JavaDoc**

```java
public abstract Map<String[], String[]> getRequestParameterValuesMap()
```

Return an immutable Map whose keys are the set of request parameters names included in the current request, and whose values (of type String[]) are all of the values for each parameter name returned by the underlying request. The returned Map must implement the entire contract for an unmodifiable map as described in the JavaDocs for java.util.Map.

**Servlet**: This must be the set of parameters available via the javax.servlet.ServletRequest methods `getParameterValues()` and `getParameterNames()`.

**Portlet**: This must be the set of parameters available via the javax.portlet.PortletRequest methods `getParameterValues()` and `getParameterNames()`.

---

**abstract public String getRequestPathInfo()**

```java
URI null
```

**Servlet** javax.servlet.http.HttpServletRequest

`getPathInfo()`
**Portlet**

null

---

**getRequestPathInfo**

```java
public abstract String getRequestPathInfo()
```

Return the extra path information (if any) included in the request URI; otherwise, return null.

*Servlet:* This must be the value returned by the `javax.servlet.http.HttpServletRequest` method `getPathInfo()`.

*Portlet:* This must be null.

---

**abstract public String getRequestServletPath()**

```java
URI servlet null
```

*Servlet*  
`javax.servlet.http.HttpServletRequest`  
`getServletPath()`

*Portlet*  
null

---

**getRequestServletPath**

```java
public abstract String getRequestServletPath()
```

Return the servlet path information (if any) included in the request URI; otherwise, return null.

*Servlet:* This must be the value returned by the `javax.servlet.http.HttpServletRequest` method `getServletPath()`.
Portlet: This must be **null**.

```java
public String getRequestCharacterEncoding()
```

**Servlet**  
*javax.servlet.ServletRequest*  
`getCharacterEncoding()`

**Portlet**  
*javax.portlet.ActionRequest*  
`getCharacterEncoding()`

`UnsupportedOperationException`

since 1.2

**getRequestCharacterEncoding**

```java
public String getRequestCharacterEncoding()
```

Return the character encoding currently being used to interpret this request.

**Servlet**: This must return the value returned by the *javax.servlet.ServletRequest* method `getCharacterEncoding()`.

**Portlet**: This must return the value returned by the *javax.portlet.ActionRequest* method `getCharacterEncoding()`.

The default implementation throws `UnsupportedOperationException` and is provided for the sole purpose of not breaking existing applications that extend this class.

**Since**:  
1.2
public String getRequestContentType()

MIME null

Servlet javax.servlet.ServletRequest getContentType()

Portlet null

UnsupportedOperationException

since 1.2

getRequestContentType

public String getRequestContentType()

Return the MIME Content-Type for this request. If not available, return null.

Servlet: This must return the value returned by the javax.servlet.ServletRequest method getContentType().

Portlet: This must return null.

The default implementation throws UnsupportedOperationException and is provided for the sole purpose of not breaking existing applications that extend this class.

Since:

1.2

public String getResponseCharacterEncoding()
**getResponseCharacterEncoding**

```java
public String getResponseCharacterEncoding()
```

Returns the name of the character encoding (MIME charset) used for the body sent in this response.

**Servlet:** This must return the value returned by the `javax.servlet.ServletResponse` method `getCharacterEncoding()`.

**Portlet:** This must return `null`.

The default implementation throws `UnsupportedOperationException` and is provided for the sole purpose of not breaking existing applications that extend this class.

**Since:**

1.2

---

**public String getResponseContentType()**

**MIME**

null

**Servlet**

`javax.servlet.ServletResponse` `getContentType()`

**Portlet**

null
UnsupportedOperationException

since 1.2

generateResponseContent
type

public String generateResponseContent()

Return the MIME Content-Type for this response. If not available, return null.

Servlet: This must return the value returned by the
javax.servlet.ServletResponse method getContentType().

Portlet: This must return null.

The default implementation throws UnsupportedOperationException
and is provided for the sole purpose of not breaking existing
applications that extend this class.

Since:
1.2

abstract public java.net.URL getResource(String path)
throws java.net.MalformedURLException

URL null

Servlet javax.servlet.ServletContext
getResources(path)

Portlet javax.portlet.PortletContext getResourc

path ("/")

Throws java.net.MalformedURLException:
public abstract URL getResource(String path) throws MalformedURLException

Return a URL for the application resource mapped to the specified path, if it exists; otherwise, return null.

Servlet: This must be the value returned by the javax.servlet.ServletContext method getResource(path).

Portlet: This must be the value returned by the javax.portlet.PortletContext method getResource(path).

Parameters:
- path - The path to the requested resource, which must start with a slash ("/" character)

Throws:
- MalformedURLException - if the specified path is not in the correct form
- NullPointerException - if path is null

abstract public java.io.InputStream getResourceAsStream(String path)

InputStream null

Servlet javax.servlet.ServletContext
getResourcesAsStream(path)

Portlet javax.portlet.PortletContext
getResourcesAsStream(path)

path ("/")
Throws NullPointerException: path null

getResourceAsStream

public abstract InputStream getResourceAsStream(String path)

Return an InputStream for an application resource mapped to the specified path, if it exists; otherwise, return null.

Servlet: This must be the value returned by the javax.servlet.ServletContext method getResourceAsStream(path).

Portlet: This must be the value returned by the javax.portlet.PortletContext method getResourceAsStream(path).

Parameters:
   path - The path to the requested resource, which must start with a slash ("/") character

Throws:
   NullPointerException - if path is null

abstract public java.util.Set<E> getResourcePaths(String path)

Set

Servlet javax.servlet.ServletContext getResourcePaths(path)

Portlet javax.portlet.PortletContext getResourcePaths(path)

path ("/")

Throws NullPointerException: path null
**getResourcePaths**

```java
public abstract Set<String> getResourcePaths(String path)
```

Return the set of resource paths for all application resources whose resource path starts with the specified argument.

*Servlet:* This must be the value returned by the `javax.servlet.ServletContext` method `getResourcePaths(path)`.

*Portlet:* This must be the value returned by the `javax.portlet.PortletContext` method `getResourcePaths(path)`.

**Parameters:**
- `path` - Partial path used to match resources, which must start with a slash (`"/"`) character

**Throws:**
- `NullPointerException` - if `path` is null

---

**abstract public Object getResponse()**

*Servlet*  
```java
javax.servlet.http.HttpServletResponse
```

*Portlet*  
```java
javax.portlet.PortletResponse
```

`ActionResponse`  
`RenderResponse`

---

**getResponse**

```java
public abstract Object getResponse()
```

Return the environment-specific object instance for the current response.

*Servlet:* This is the current request's

Portlet: This is the current request's javax.portlet.PortletResponse instance, which will be either an ActionResponse or a RenderResponse depending upon when this method is called.

public void setResponse(Object response)

getResponse

UnsupportedOperationException

since 1.2

setResponse

public void setResponse(Object response)

Set the environment-specific response to be returned by subsequent calls to getResponse(). This may be used to install a wrapper for the response.

The default implementation throws UnsupportedOperationException and is provided for the sole purpose of not breaking existing applications that extend this class.

Since:

1.2

MIME UTF-8

Servlet javax.servlet.ServletResponse
setCharacterEncoding()

**Portlet**

UnsupportedOperationException

since 1.2

setResponseCharacterEncoding

public void setResponseCharacterEncoding(String encoding)

Sets the character encoding (MIME charset) of the response being sent to the client, for example, to UTF-8.

**Servlet:** This must call through to the `javax.servlet.ServletResponse` method `setCharacterEncoding()`.

**Portlet:** This method must take no action.

The default implementation throws `UnsupportedOperationException` and is provided for the sole purpose of not breaking existing applications that extend this class.

Since:

1.2

abstract public Object getSession(boolean create)

create true create false null

**Servlet** `javax.servlet.http.HttpServletRequest` `getSession(create)`

**Portlet** `javax.portlet.PortletRequest` `getPortletSession(create)`
getSession

public abstract Object getSession(boolean create)

    If the create parameter is true, create (if necessary) and return a session instance associated with the current request. If the create parameter is false return any existing session instance associated with the current request, or return null if there is no such session.

Servlet: This must return the result of calling getSession(create) on the underlying javax.servlet.http.HttpServletRequest instance.

Portlet: This must return the result of calling getPortletSession(create) on the underlying javax.portlet.PortletRequest instance.

Parameters:
create - Flag indicating whether or not a new session should be created if there is no session associated with the current request.

abstract public java.util.Map<K, V> getSessionMap()
**Portlet**  
`javax.portlet.PortletSession`  
`getAttribute()` `getAttributeNames()` `removeAttribute()`  
`setAttribute()`  
**PORTLET_SCOPE**

**getSessionMap**

```java
public abstract Map<String, Object> getSessionMap()
```

Return a mutable `Map` representing the session scope attributes for the current application. The returned `Map` must implement the entire contract for a modifiable map as described in the JavaDocs for `java.util.Map`. Modifications made in the `Map` must cause the corresponding changes in the set of session scope attributes. Particularly the `clear()`, `remove()`, `put()`, and `get()` operations must take the appropriate action on the underlying data structure. Accessing attributes via this `Map` must cause the creation of a session associated with the current request, if such a session does not already exist.

For any of the `Map` methods that cause an element to be removed from the underlying data structure, the following action regarding managed-beans must be taken. If the element to be removed is a managed-bean, and it has one or more public no-argument void return methods annotated with `javax.annotation.PreDestroy`, each such method must be called before the element is removed from the underlying data structure. Elements that are not managed-beans, but do happen to have methods with that annotation must not have those methods called on removal. Any exception thrown by the `PreDestroy` annotated methods must by caught and not rethrown. The exception may be logged.

**Servlet:** This must be the set of attributes available via the `javax.servlet.http.HttpServletSession` methods `getAttribute()`, `getAttributeNames()`, `removeAttribute()`, and `setAttribute()`.

**Portlet:** This must be the set of attributes available via the `javax.portlet.PortletSession` methods `getAttribute()`,
getAttributeNames(), removeAttribute(), and setAttribute(). All session attribute access must occur in PORTLET_SCOPE scope within the session.

abstract public java.security.Principal getUserPrincipal()

Principal null

Servlet javax.servlet.http.HttpServletRequest getUserPrincipal()

Portlet javax.portlet.http.PortletRequest getUserPrincipal()

g getUserPrincipal

public abstract Principal getUserPrincipal()

Return the Principal object containing the name of the current authenticated user, if any; otherwise, return null.

Servlet: This must be the value returned by the javax.servlet.http.HttpServletRequest method getUserPrincipal().

Portlet: This must be the value returned by the javax.portlet.http.PortletRequest method getUserPrincipal().

abstract public boolean isUserInRole(String role)

ture false

Servlet javax.servlet.http.HttpServletRequest
**isUserInRole**

```java
public abstract boolean isUserInRole(String role)
```

*Return true if the currently authenticated user is included in the specified role. Otherwise, return false.*

**Servlet:** This must be the value returned by the `javax.servlet.http.HttpServletRequest` method `isUserInRole(String role)`.

**Portlet:** This must be the value returned by the `javax.portlet.http.PortletRequest` method `isUserInRole(String role)`.

**Parameters:**
- `role` - Logical role name to be checked

**Throws:**
- `NullPointerException` - if `role` is `null`

---

**abstract public void log(String message)**

```java
Servlet javax.servlet.ServletContext log(String)
Portlet javax.portlet.PortletContext log(String)
```

*message*
Throws: NullPointerException: message null

log

```java
public abstract void log(String message)
```

Log the specified message to the application object.

**Servlet**: This must be performed by calling the `javax.servlet.ServletContext` method `log(String)`.

**Portlet**: This must be performed by calling the `javax.portlet.PortletContext` method `log(String)`.

**Parameters:**
- `message` - Message to be logged

**Throws:**
- `NullPointerException` - if message is null

abstract public void log(String message, Throwable exception)

**Servlet**
- `javax.servlet.ServletContext` log(String, Throwable)

**Portlet**
- `javax.portlet.PortletContext` log(String, Throwable)

- `message` exception
- **Throws** `NullPointerException`: message exception null
**Log**

```
public abstract void log(String message, Throwable exception)
```

Log the specified message and exception to the application object.

**Servlet:** This must be performed by calling the `javax.servlet.ServletContext` method `log(String, Throwable)`.

**Portlet:** This must be performed by calling the `javax.portlet.PortletContext` method `log(String, Throwable)`.

**Parameters:**
- message - Message to be logged
- exception - Exception to be logged

**Throws:**
- `NullPointerException` - if message or exception is null

---

**abstract public void redirect(String url) throws java.io.IOException**

**URL**

```
URL FacesContext responseComplete()
```

**Servlet**

```
javax.servlet.http.HttpServletResponse sendRedirect()
```

**Portlet**

```
javax.portlet.ActionResponse sendRedirect()
```

**Throws**
- `IllegalArgumentException`: url
- `IllegalStateException`: RenderResponse, ActionResponse
- `IllegalStateException`: portlet
- `IllegalStateException`: servlet
- `java.io.IOException`: /
public abstract void redirect(String url)
        throws IOException

Redirect a request to the specified URL, and cause the
responseComplete() method to be called on the FacesContext
instance for the current request.

Servlet: This must be accomplished by calling the
javax.servlet.http.HttpServletResponse method.sendRedirect().

Portlet: This must be accomplished by calling the
javax.portlet.ActionResponse method.sendRedirect().

Parameters:
url - Absolute URL to which the client should be redirected

Throws:
IllegalArgumentException - if the specified url is relative
IllegalStateException - if, in a portlet environment, the current
response object is a RenderResponse instead of an
ActionResponse
IllegalStateException - if, in a servlet environment, the current
response has already been committed
IOException - if an input/output error occurs

javax.xml.registry.infomodel  Interface ExternalIdentifier

All Superinterfaces:
   ExtensibleObject, RegistryObject

public interface ExternalIdentifier
   extends RegistryObject

Implements: RegistryObject

ExternalIdentifier  DUNS Social Security Number
RegistryObject  RegistryObject "DUNS" "Social Security Number"  DUNS  RegistryObject  0
ExternalIdentifier

See also  javax.xml.registry.infomodel.RegistryObject

ExternalIdentifier instances provide the additional identifier information to RegistryObjects such as DUNS number, Social Security Number, or an alias name of the organization. The attribute name inherited from RegistryObject is used to contain the identification scheme ("DUNS" "Social Security Number", etc.), and the attribute value contains the actual information (e.g. the actual DUNS number). Each RegistryObject may have 0 or more ExternalIdentifiers.

Author:
   Farrukh S. Najmi

   RegistryObject

Method Summary

+ ClassificationScheme getIdentificationScheme()  
   Gets the ClassificationScheme that is used as the scheme for identifying this object.
**RegistryObject**

### Methods

- **getRegistryObject()**
  - Gets the parent RegistryObject for this ExternalId.

- **getValue()**
  - Gets the value of an ExternalIdentifier.

- **setIdentificationScheme(ClassificationScheme identificationScheme)**
  - Sets the ClassificationScheme that is used as the scheme for identifying this object.

- **setValue(String value)**
  - Sets the value of an ExternalIdentifier.

---

**Methods inherited from interface**

**javax.xml.registry.infomodel.RegistryObject**

- addAssociation, addAssociations, addClassification, addClassifications, addExternalIdentifier, addExternalIdentifiers, addExternalLink, addExternalLinks, getAssociatedObjects, getAssociations, getAuditTrail, getClassifications, getDescription, getExternalIdentifiers, getExternalLinks, getKey, getLifeCycleManager, getName, getObjectType, getRegistryPackages, getSubmittingOrganization, removeAssociation, removeAssociations, removeClassification, removeClassifications, removeExternalIdentifier, removeExternalIdentifiers, removeExternalLink, removeExternalLinks, removeClassifications, setClassifications, setDescription, setExternalIdentifiers, setExternalLinks, setKey, setName, toXML

---

**Methods inherited from interface**

**javax.xml.registry.infomodel.ExtensibleObject**

- addSlot, addSlots, getSlot, getSlots, removeSlot, removeSlots

---

### Method Detail

**public RegistryObject getRegistryObject() throws JAXRException**

- `ExternalId` RegistryObject `registryObject`

**RegistryObject addExternalIdentifier**
getRegistryObject

```
public RegistryObject getRegistryObject() throws JAXRException
```

Gets the parent RegistryObject for this ExternalIdentifier. To set the registryObject call addExternalIdentifier on a RegistryObject.

**Capability Level: 0**

**Returns:**
- the RegistryObject that this object identifies

**Throws:**
- JAXRException - If the JAXR provider encounters an internal error

**See Also:**
- `RegistryObject.addExternalIdentifier(ExternalIdentifier ei)`

---

getValue

```
public String getValue() throws JAXRException
```

**getvalue**

```
String getValue()
```

**return**
- DUNS

**Throws**
- JAXRException: JAXR
throws `JAXRException`

Gets the value of an ExternalIdentifier.

**Capability Level: 0**

**Returns:**
the identification value defined by this object (e.g. a company's DUNS number)

**Throws:**
`JAXRException` - If the JAXR provider encounters an internal error

```java
public void setValue(String value) throws JAXRException

ExternalIdentifier

0

value    DUNS
Throws    JAXRException: JAXR
```

**setValue**

```java
void setValue(String value)
throws JAXRException
```

Sets the value of an ExternalIdentifier.

**Capability Level: 0**

**Parameters:**
value - the identification value defined by this object (e.g. a company's DUNS number)

**Throws:**
`JAXRException` - If the JAXR provider encounters an internal error
public ClassificationScheme getIdentificationScheme() throws JAXRException

ClassificationScheme 0

    return "DUNS" ClassificationScheme

Throws JAXRException: JAXR

supplierCardinality 0..*
clientCardinality 0..*
associationAsClass Classification

getIdentificationScheme

ClassificationScheme getIdentificationScheme() throws JAXRException

Gets the ClassificationScheme that is used as the identification scheme for identifying this object.

Capability Level: 0

Returns: the ClassificationScheme that is used as the identification scheme (e.g. "DUNS")

Throws: JAXRException - If the JAXR provider encounters an internal error

public void setIdentificationScheme(ClassificationScheme identificationScheme) throws JAXRException

ClassificationScheme 0
IdentificationScheme "DUNS" ClassificationScheme

Throws JAXRException: JAXR

setIdentificationScheme

void setIdentificationScheme(ClassificationScheme identificationScheme) throws JAXRException

Sets the ClassificationScheme that is used as the identification scheme for identifying this object.

Capability Level: 0

Parameters:
identificationScheme - the ClassificationScheme that is used as the identification scheme (e.g. "DUNS")

Throws:
JAXRException - If the JAXR provider encounters an internal error

PS:
javax.xml.registry.infomodel Interface ExternalLink

All Superinterfaces:
   ExtensibleObject, RegistryObject, URIValidator

public interface ExternalLink
extends RegistryObject, URIValidator

Implements: RegistryObject, URIValidator

ExternalLink URIRegistryObject ExternalLink
RegistryObject

Submitting Organization DTD Submitting
Organization ExternalLink

See also javax.xml.registry.infomodel.RegistryObject

ExternalLink instances model a named URI to content that may reside
outside the registry. RegistryObject may be associated with any number
of ExternalLinks to annotate a RegistryObject with external links to
external content.

Consider the case where a Submitting Organization submits a repository
item (e.g. a DTD) and wants to associate some external content to that
object (e.g. the Submitting Organization's home page). The ExternalLink
enables this capability.

Author:
   Farrukh S. Najmi
See Also:
   RegistryObject
**getExternalURI()**

- Gets URI to the an external resource.

**getLinkedObjects()**

- Gets the collection of RegistryObjects that are annotated by this ExternalLink.

**setExternalURI(String uri)**

- Sets URI for an external resource.

---

### Methods inherited from interface javax.xml.registry.infomodel.RegistryObject

- addAssociation, addAssociations, addClassification, addClassifications, addExternalIdentifier, addExternalIdentifiers, addExternalLink, addExternalLinks, getAssociatedObjects, getAssociations, getAuditTrail, getClassifications, getDescription, getExternalIdentifiers, getExternalLinks, getKey, getLifeCycleManager, getName, getObjectType, getRegistryPackages, getSubmittingOrganization, removeAssociation, removeAssociations, removeClassification, removeClassifications, removeExternalIdentifier, removeExternalIdentifiers, removeExternalLink, removeExternalLinks, setAssociations, setClassifications, setDescription, setExternalIdentifiers, setExternalLinks, setKey, setName, toXML

---

### Method Detail

**public java.util.Collection<E> getLinkedObjects() throws JAXRException**

ExternalLink RegistryObject Collection
getLinkedObjects

`Collection getLinkedObjects()`

Throws `JAXRException`

Gets the collection of RegistryObjects that are annotated by this ExternalLink.

**Capability Level:** 0

**Returns:**
Collection of RegistryObjects. Return an empty Collection if no RegistryObjects are annotated by this object.

**Throws:**
`JAXRException` - If the JAXR provider encounters an internal error

---

public `String getExternalURI()`

Throws `JAXRException`

URI NULL

---

getExternalURI

`String getExternalURI()`

Throws `JAXRException`
Gets URI to the an external resource. Default is a NULL String.

**Capability Level: 0**

**Returns:**
the URI String for this object (e.g. "http://java.sun.com")

**Throws:**
  JAXRException - If the JAXR provider encounters an internal error

```java
public void setExternalURI(String uri) throws JAXRException
```

**setExternalURI**

Sets URI for an external resource.

**Capability Level: 0**

**Parameters:**
  uri - the URI String for this object (e.g. "http://java.sun.com")

**Throws:**
  JAXRException - If the JAXR provider encounters an internal error

Methods inherited from interface `javax.xml.registry.infomodel.ExtensibleObject`
public String getMimeType() throws JAXRException

mime NULL

1

    return mime

Throws: JAXRException - JAXR

getMimeType

String getMimeType()

    throws JAXRException

Gets the mime type associated with this object. Default is a NULL String.

Capability Level: 1

Returns: the mime type associated with this object

Throws:
    JAXRException - If the JAXR provider encounters an internal error

public void setMimeType(String mimeType) throws
**JAXRException**

**mime**

1

```
   mimeType
   Returns
   JAXRException: JAXR
```

**setMimeType**

```java
void setMimeType(String mimeType)
throws JAXRException
```

Sets the mime type associated with this object.

**Capability Level:** 1

**Parameters:**
- `mimeType` - the mime type associated with this object

**Throws:**
- `JAXRException` - If the JAXR provider encounters an internal error

**public boolean isOpaque() throws JAXRException**

**ExtrinsicObject**

**Submitting Organization**

1

```
   return ExtrinsicObject
   Returns JAXRException: JAXR
   true false
```

**isOpaque**
boolean `isOpaque()`
throws `JAXRException`

Determines whether the ExtrinsicObject is opaque (not readable) by the registry operator.

In some situations, a Submitting Organization may submit content that is encrypted and not even readable by the registry. This attribute allows the registry to know whether this is the case.

**Capability Level: 1**

**Returns:**
true if the ExtrinsicObject is readable by the registry operator;
false otherwise

**Throws:**
`JAXRException` - If the JAXR provider encounters an internal error

---

**public void setOpaque(boolean isOpaque) throws JAXRException**

**ExtrinsicObject**

1

`isOpaque`  ExtrinsicObject  true  boo

**Throws**
`JAXRException`: JAXR

---

**setOpaque**

**void setOpaque(boolean isOpaque)**
throws `JAXRException`

Sets whether the ExtrinsicObject is opaque (not readable) by the registry.

**Capability Level: 1**
Parameters:
- isOpaque - boolean value set to true if the ExtrinsicObject is readable by the registry operator; false otherwise

Throws:
- JAXRException - If the JAXR provider encounters an internal error

public DataHandler getRepositoryItem() throws JAXRException

null

1

return DataHandler

Throws: JAXRException: JAXR

getRepositoryItem

DataHandler getRepositoryItem()

throws JAXRException

Gets the repository item for this object. Must not return null.

Capability Level: 1

Returns:
- the DataHandler for the repository item

Throws:
- JAXRException - If the JAXR provider encounters an internal error

public void setRepositoryItem(DataHandler repositoryItem) throws JAXRException
void setRepositoryItem(DataHandler repositoryItem) throws JAXRException

Sets the repository item for this object.

**Capability Level: 1**

**Parameters:**
- repositoryItem - the DataHandler for the repository item. Must not be null

**Throws:**
- JAXRException - If the JAXR provider encounters an internal error
javax.faces.context Class FacesContext

java.lang.Object
   - javax.faces.context.FacesContext

public abstract class FacesContext extends Object

FacesContext  JavaServer Faces

<table>
<thead>
<tr>
<th>Web</th>
<th>FacesContextFactory</th>

</tr>
</thead>
<tbody>
<tr>
<td>FacesContext</td>
<td>release()</td>
<td>FacesContext</td>
</tr>
<tr>
<td>servlet</td>
<td></td>
<td>Web</td>
</tr>
</tbody>
</table>

FacesContext contains all of the per-request state information related to the processing of a single JavaServer Faces request, and the rendering of the corresponding response. It is passed to, and potentially modified by, each phase of the request processing lifecycle.

A FacesContext instance is associated with a particular request at the beginning of request processing, by a call to the getFacesContext() method of the FacesContextFactory instance associated with the current web application. The instance remains active until its release() method is called, after which no further references to this instance are allowed. While a FacesContext instance is active, it must not be referenced from any thread other than the one upon which the servlet container executing this web application utilizes for the processing of this request.

Constructor Detail

public FacesContext()

FacesContext

public FacesContext()

Method Detail

Abstract public Application getApplication()
Web Application

Throws IllegalStateException:

getApplication

public abstract Application getApplication()

Return the Application instance associated with this web application.

Throws:

IllegalStateException - if this method is called after this instance has been released

abstract public java.util.Iterator<E> getClientIdsWithMessages()

javax.faces.application.FacesMessage Iterator
Iterator null Iterator #addMessage

Throws IllegalStateException:

ggetClientIdsWithMessages

public abstract Iterator<String> getClientIdsWithMessages()

Return an Iterator over the client identifiers for which at least one FacesMessage has been queued. If there are no such client identifiers, an empty Iterator is returned. If any messages have been queued that were not associated with any specific client identifier, a null value will be included in the iterated values. The elements in the Iterator must be returned in the order in which they were added with addMessage(java.lang.String, javax.faces.application.FacesMessage).
Throws:

- **IllegalStateException** - if this method is called after this instance has been released

```java
public ELContext getELContext()
```

Return the `ELContext` instance for this `FacesContext` instance. This `ELContext` instance has the same lifetime and scope as the `FacesContext` instance with which it is associated, and may be created lazily the first time this method is called for a given `FacesContext` instance. Upon creation of the `ELContext` instance, the implementation must take the following action:

- Call the `ELContext.putContext(java.lang.Class, FacesContext, ELContext)`
java.lang.Object method on the instance, passing in FacesContext.class and the this reference for the FacesContext instance itself.

- If the Collection returned by Application.getELContextListeners() is non-empty, create an instance of ELContextEvent and pass it to each ELContextListener instance in the Collection by calling the ELContextListener.contextCreated(javax.el.ELContextEvent) method.

The default implementation throws UnsupportedOperationException and is provided for the sole purpose of not breaking existing applications that extend this class.

**Throws:**
- IllegalStateException - if this method is called after this instance has been released

**Since:**
1.2

abstract public ExternalContext getExternalContext()

FacesContext ExternalContext

Throws IllegalStateException:

getExternalContext

public abstract ExternalContext getExternalContext()

Return the ExternalContext instance for this FacesContext instance.

**Throws:**
- IllegalStateException - if this method is called after this instance has been released
abstract public **FacesMessage.Severity** getMaximumSeverity()

```java
javax.faces.application.FacesMessage getMaximumSeverity()
```

Throws `IllegalStateException`: 

**getMaximumSeverity**

public abstract **FacesMessage.Severity** getMaximumSeverity()

Return the maximum severity level recorded on any **FacesMessage**s that has been queued, whether or not they are associated with any specific **UIComponent**. If no such messages have been queued, return `null`.

**Throws:**

`IllegalStateException` - if this method is called after this instance has been released

abstract public `java.util.Iterator<E>` getMessages()

```java
javax.faces.application.FacesMessage getMessages()
```

Throws `IllegalStateException`: 

**getMessages**

public abstract `Iterator<FacesMessage>` getMessages()

Return an `Iterator` over the **FacesMessage**s that have been queued, whether or not they are associated with any specific client identifier.
If no such messages have been queued, return an empty Iterator. The elements of the Iterator must be returned in the order in which they were added with calls to `addMessage(java.lang.String, javax.faces.application.FacesMessage)`.

**Throws:**

`IllegalStateException` - if this method is called after this instance has been released

abstract public java.util.Iterator<E> getMessages(String clientId)

```java
clientId null javax.faces.application.FacesMessage
clientId null javax.faces.application.FacesMessage
Iterator IteratorIterator #addMessage
```

`getMessages`

public abstract Iterator<FacesMessage> getMessages(String clientId)

Return an Iterator over the `FacesMessage`s that have been queued that are associated with the specified client identifier (if clientId is not null), or over the `FacesMessage`s that have been queued that are not associated with any specific client identifier (if clientId is null). If no such messages have been queued, return an empty Iterator. The elements of the Iterator must be returned in the order in which they were added with calls to `addMessage(java.lang.String, javax.faces.application.FacesMessage)`.

**Parameters:**

- `clientId` - The client identifier for which messages are requested, or null for messages not associated with any client identifier
abstract public RenderKit getRenderKit()

```java
UIViewRoot RenderKit UIViewRoot UIViewRoot
renderKitId RenderKit null
```

definition: getRenderKit

```java
public abstract RenderKit getRenderKit()
```

Return the RenderKit instance for the render kit identifier specified on our UIViewRoot, if there is one. If there is no current UIViewRoot, if the UIViewRoot does not have a specified renderKitId, or if there is no RenderKit for the specified identifier, return null instead.

abstract public boolean getRenderResponse()

```java
renderResponse() true
```

Throws: IllegalStateException

definition: getRenderResponse

```java
public abstract boolean getRenderResponse()
```

Return true if the renderResponse() method has been called for the current request.

Throws: IllegalStateException - if this method is called after this
abstract public boolean getResponseComplete()

responseComplete() true

Throws IllegalStateException:

getResponseComplete

public abstract boolean getResponseComplete()  

Return true if the responseComplete() method has been called for the current request.

Throws:  
_IllegalArgumentException_ - if this method is called after this instance has been released

abstract public ResponseStream getResponseStream()

ResponseStream ResponseStream ResponseWriter

Throws IllegalStateException:

getAddressStream

public abstract ResponseStream getResponseStream() 

Return the ResponseStream to which components should direct their binary output. Within a given response, components can use either the ResponseStream or the ResponseWriter, but not both.
abstract public void setResponseStream(ResponseStream responseStream)

Parameters:
responseStream - The new ResponseStream for this response

Throws:
NullPointerException - if responseStream is null
IllegalStateException - if this method is called after this instance has been released

abstract public ResponseWriter getResponseWriter()

Parameters:

Throws:
IllegalStateException:
getResponseWriter

public abstract ResponseWriter getResponseWriter()

Return the ResponseWriter to which components should direct their character-based output. Within a given response, components can use either the ResponseStream or the ResponseWriter, but not both.

**Throws:**

IllegalStateException - if this method is called after this instance has been released

---

abstract public void setResponseWriter(ResponseWriter responseWriter)

**Parameters:**

responseWriter - The new ResponseWriter for this response

**Throws:**

IllegalStateException: if this method is called after this instance has been released

NullPointerException: if responseWriter is null

---

setResponseWriter

public abstract void setResponseWriter(ResponseWriter responseWriter)

Set the ResponseWriter to which components should direct their character-based output.

**Parameters:**

responseWriter - The new ResponseWriter for this response

**Throws:**

IllegalStateException: if this method is called after this instance has been released

NullPointerException: if responseWriter is null
abstract public UIViewRoot getViewRoot()

Throws: IllegalStateException:

getViewRoot

public abstract UIViewRoot getViewRoot()

Return the root component that is associated with the this request.

Throws:

IllegalStateException - if this method is called after this instance has been released

abstract public void setViewRoot(UIViewRoot root)

Throws: IllegalStateException:

Throws: NullPointerException: root null

setViewRoot

public abstract void setViewRoot(UIViewRoot root)

Set the root component that is associated with this request. This method can only be called by the application handler (or a class that the handler calls), and only during the Invoke Application phase of the request processing lifecycle.

Parameters:

root - The new component UIViewRoot component
abstract public void addMessage(String clientId, FacesMessage message)

Parameters:
- clientId - The client identifier with which this message is associated (if any)
- message - The message to be appended

Throws:
- IllegalStateException - if this method is called after this instance has been released
- NullPointerException - if message is null
abstract public void release()

FacesContext Faces FacesContextFactory
FacesContext release() FacesContext
IllegalStateException

#setCurrentInstance null FacesContext

Throws IllegalStateException:

release

public abstract void release()

Release any resources associated with this FacesContext instance. Faces implementations may choose to pool instances in the associated FacesContextFactory to avoid repeated object creation and garbage collection. After release() is called on a FacesContext instance (until the FacesContext instance has been recycled by the implementation for re-use), calling any other methods will cause an IllegalStateException to be thrown.

The implementation must call
setCurrentInstance(javax.faces.context.FacesContext) passing null to remove the association between this thread and this dead FacesContext instance.

Throws:
IllegalStateException - if this method is called after this instance has been released

abstract public void renderResponse()

JavaServer faces

Throws IllegalStateException:
renderResponse

public abstract void renderResponse()

Signal the JavaServer faces implementation that, as soon as the current phase of the request processing lifecycle has been completed, control should be passed to the Render Response phase, bypassing any phases that have not been executed yet.

Throws:

IllegalStateException - if this method is called after this instance has been released

abstract public void responseComplete()

JavaServer Faces  HTTP  HTTP

Throws

IllegalStateException:

responseComplete

public abstract void responseComplete()

Signal the JavaServer Faces implementation that the HTTP response for this request has already been generated (such as an HTTP redirect), and that the request processing lifecycle should be terminated as soon as the current phase is completed.

Throws:

IllegalStateException - if this method is called after this instance has been released

public static FacesContext getCurrentInstance()
FacesContext

currentInstance

public static FacesContext getCurrentInstance()

Return the FacesContext instance for the request that is being processed by the current thread, if any.

protected static void setCurrentInstance(FacesContext context)

setCurrentInstance

protected static void setCurrentInstance(FacesContext context)

Set the FacesContext instance for the request that is being processed by the current thread.

Parameters:

context - The FacesContext instance for the current thread, or null if this thread no longer has a FacesContext instance.

javax.faces.context  **Class FacesContextFactory**

java.lang.Object  
  | javax.faces.context.FacesContextFactory

public abstract class **FacesContextFactory**
extends **Object**

**FacesContextFactory**

**FacesContext**  release()

JavaServer Faces Web  FacesContextFactory

FacesContextFactory factory = (FacesContextFactory)
FactoryFinder.getFactory(FactoryFinder.FACES_CONTEXT_FACTORY);

**FacesContextFactory** is a factory object that creates (if needed) and returns new **FacesContext** instances, initialized for the processing of the specified request and response objects. Implementations may take advantage of the calls to the release() method of the allocated **FacesContext** instances to pool and recycle them, rather than creating a new instance every time.

There must be one **FacesContextFactory** instance per web application that is utilizing JavaServer Faces. This instance can be acquired, in a portable manner, by calling:

```
FacesContextFactory factory = (FacesContextFactory)
FactoryFinder.getFactory(FactoryFinder.FACES_CONTEXT_FACTORY);
```

</tbody>
</table>

**getFacesContext**

```java
public abstract FacesContext getFacesContext(Object context, Object request, Object response, Lifecycle lifecycle)
    throws FacesException
```

Create (if needed) and return a `FacesContext` instance that is initialized for the processing of the specified request and response objects, utilizing the specified `Lifecycle` instance, for this web application.

The implementation of this method must ensure that calls to the `getCurrentInstance()` method of `FacesContext`, from the same thread that called this method, will return the same `FacesContext` instance until the `release()` method is called on that instance.

**Parameters:**
- `context` - In servlet environments, the `ServletContext` that is associated with this web application
- `request` - In servlet environments, the `ServletRequest` that is to be processed
- `response` - In servlet environments, the `ServletResponse` that is to be processed
- `lifecycle` - The `Lifecycle` instance being used to process this request

**Throws:**
- `FacesException` - if a `FacesContext` cannot be constructed for the
specified parameters

NullPointerException - if any of the parameters are null

PS:
javax.faces.event  Class FacesEvent

java.lang.Object
   └ java.util.EventObject
      └ javax.faces.event.FacesEvent

All Implemented Interfaces:
   Serializable

Direct Known Subclasses:
   ActionEvent, ValueChangeEvent

public abstract class FacesEvent
extends EventObject

Extends: java.util.EventObject
Extended by: ActionEvent, ValueChangeEvent

FacesEvent  UIComponent  FacesEvent

FacesEvent is the base class for user interface and application events that can be fired by UIComponent instances. Concrete event classes must subclass FacesEvent in order to be supported by the request processing lifecycle.

See Also:
   Serialized Form

Field Summary

Fields inherited from class java.util.EventObject
source
### Constructor Summary

**FacesEvent**

```java
(UICOMPONENT component)
```

Construct a new event object from the specified source component.

### Method Summary

#### `UICOMPONENT getComponent()`

Return the source `UICOMPONENT` that sent this event.

#### `PhaseId getPhaseId()`

Return the identifier of the request processing phase during which this event should be delivered.

#### `abstract boolean isAppropriateListener(FacesListener listener)`

Return `true` if this `FacesListener` is an instance of a listener class that this event supports.

#### `abstract void processListener(FacesListener listener)`

Broadcast this `FacesEvent` to the specified `FacesListener`, by whatever mechanism is appropriate.

#### `void queue()`

Convenience method to queue this event for broadcast at the end of the current request processing lifecycle phase.

#### `void setPhaseId(PhaseId phaseId)`

Set the `PhaseId` during which this event will be delivered.

### Methods inherited from class java.util.EventObject

### Constructor Detail
public FacesEvent(UIComponent component)

    component  UIComponent
    Throws    IllegalArgumentException: component null

FacesEvent
public FacesEvent(UIComponent component)

    Construct a new event object from the specified source component.

    Parameters:
    component - Source UIComponent for this event

    Throws:
    IllegalArgumentException - if component is null

Method Detail

public UIComponent getComponent()

    UIComponent

gGetComponent

public UIComponent getComponent()

    Return the source UIComponent that sent this event.

gGetComponent

public PhaseId getPhaseId()

    PhaseId PhaseId.ANY_PHASE
getPhasId

public PhaseId getPhaseId()

    Return the identifier of the request processing phase during which this event should be delivered. Legal values are the singleton instances defined by the PhaseId class, including PhaseId.ANY_PHASE, which is the default value.

public void setPhaseId(PhaseId phaseId)

    PhaseId

    Throws IllegalArgumentException: phaseId null

setPhaseId

public void setPhaseId(PhaseId phaseId)

    Set the PhaseId during which this event will be delivered.

    Throws: IllegalArgumentException - phaseId is null.

public void queue()

    Throws IllegalStateException: UIViewRoot
public void queue()

Convenience method to queue this event for broadcast at the end of
the current request processing lifecycle phase.

**Throws:**

*IllegalStateException* - if the source component for this event
is not a descendant of a *UIViewRoot*

---

abstract public boolean

**isAppropriateListener(FacesListener** listener)

**FacesListener** true "instanceof"

listener **FacesListener**

**isAppropriateListener**

public abstract boolean **isAppropriateListener(FacesListener** listener

Return true if this *FacesListener* is an instance of a listener class
that this event supports. Typically, this will be accomplished by an
"instanceof" check on the listener class.

**Parameters:**

listener - *FacesListener* to evaluate

---

abstract public void processListener(FacesListener** listener

**FacesEvent** **FacesListener** **FacesEvent**

listener **FacesEvent** **FacesListener**

**Throws** *AbortProcessingException*: JavaServer Face
processListener

public abstract void processListener(FacesListener listener)

Broadcast this FacesEvent to the specified FacesListener, by whatever mechanism is appropriate. Typically, this will be accomplished by calling an event processing method, and passing this FacesEvent as a parameter.

Parameters:

listener - FacesListener to send this FacesEvent to

Throws:

AbortProcessingException - Signal the JavaServer Faces implementation that no further processing on the current event should be performed

### Constructor Detail

**public FacesException()**

**FacesException**

**public FacesException()**
Construct a new exception with no detail message or root cause.

public FacesException(String message)

message

FacesException

public FacesException(String message)

Construct a new exception with the specified detail message and no root cause.

Parameters:
message - The detail message for this exception

public FacesException(Throwable cause)

(cause == null ? null : cause.toString())

cause

FacesException

public FacesException(Throwable cause)

Construct a new exception with the specified root cause. The detail message will be set to (cause == null ? null : cause.toString())

Parameters:
cause - The root cause for this exception
public FacesException(String message, Throwable cause)

Construct a new exception with the specified detail message and root cause.

Parameters:
message - The detail message for this exception
cause - The root cause for this exception

Method Detail

public Throwable getCause()

Return the cause of this exception, or null if the cause is nonexistent or unknown.

Overrides:
getCaue in class Throwable

FacesMessage

{messageId} ResourceBundle {messageId}_detail
ResourceBundle FacesMessage detail

FacesMessage summary detail

**FacesMessage** represents a single validation (or other) message, which
is typically associated with a particular component in the view. A 
FacesMessage instance may be created based on a specific messageId. 
The specification defines the set of messageId s for which there must be 
FacesMessage instances.

The implementation must take the following steps when creating 
FacesMessage instances given a messageId:

Call Application.getMessageBundle(). If non-null, locate the named 
ResourceBundle, using the Locale from the current UIViewRoot and 
see if it has a value for the argument messageId. If it does, treat the 
value as the summary of the FacesMessage. If it does not, or if 
Application.getMessageBundle() returned null, look in the 
ResourceBundle named by the value of the constant FACES_MESSAGES 
and see if it has a value for the argument messageId. If it does, treat 
the value as the summary of the FacesMessage. If it does not, there is 
no initialization information for the FacesMessage instance.

In all cases, if a ResourceBundle hit is found for the {messageId}, look 
for further hits under the key {messageId}_detail. Use this value, if 
present, as the detail for the returned FacesMessage.

Make sure to perform any parameter substitution required for the 
summary and detail of the FacesMessage.

## Field Detail

**FACES_MESSAGES**

```java
public static final String FACES_MESSAGES
```

ResourceBundle identifier for messages whose message identifiers are defined in the JavaServer Faces specification.

**See Also:**

Constant Field Values
SEVERITY_INFO

public static final FacesMessage.Severity SEVERITY_INFO

Message severity level indicating an informational message rather than an error.

SEVERITY_WARN

public static final FacesMessage.Severity SEVERITY_WARN

Message severity level indicating that an error might have occurred.

SEVERITY_ERROR

public static final FacesMessage.Severity SEVERITY_ERROR

Message severity level indicating that an error has occurred.

SEVERITY_FATAL

public static final FacesMessage.Severity SEVERITY_FATAL

Message severity level indicating that a serious error has occurred.

VALUES

public static final List VALUES
Immutable List of valid `FacesMessage.Severity` instances, in ascending order of their ordinal value.

VALUES_MAP

```java
public static final Map VALUES_MAP
```

Immutable Map of valid `FacesMessage.Severity` instances, keyed by name.

Constructor Detail

```java
public FacesMessage()
```

```java
javax.faces.application.FacesMessage Severity.INFO
```

FacesMessage

```java
public FacesMessage()
```

Construct a new `FacesMessage` with no initial values. The severity is set to Severity.INFO.

```java
javax.faces.application.FacesMessage null Severity.INFO
```

FacesMessage
public FacesMessage(String summary)

Construct a new FacesMessage with just a summary. The detail is null, the severity is set to Severity.INFO.

public FacesMessage(String summary, String detail)

javax.faces.application.FacesMessage Severity.INFO

summary
detail

Throws IllegalArgumentException:

FacesMessage

public FacesMessage(String summary, String detail)

Construct a new FacesMessage with the specified initial values. The severity is set to Severity.INFO.

Parameters:

summary - Localized summary message text
detail - Localized detail message text

Throws:

IllegalArgumentException - if the specified severity level is not one of the supported values

public FacesMessage(FacesMessage.Severity severity, String summary, String detail)

FacesMessage

severity
summary
detail

Throws IllegalArgumentException:

**FacesMessage**

```java
public FacesMessage(FacesMessage.Severity severity,
                     String summary,
                     String detail)
```

Construct a new FacesMessage with the specified initial values.

**Parameters:**
- severity - the severity
- summary - Localized summary message text
- detail - Localized detail message text

**Throws:**
- IllegalArgumentException - if the specified severity level is not one of the supported values

**Method Detail**

```java
public String getDetail()
```

**getDetail**

```java
public String getDetail()
```

Return the localized detail text. If no localized detail text has been defined for this message, return the localized summary text instead.

```java
public void setDetail(String detail)
```
setDetail

public void setDetail(String detail)

Set the localized detail text.

Parameters:
    detail - The new localized detail text

getSeverity

public FacesMessage.Severity getSeverity()

getSeverity

public FacesMessage.Severity getSeverity()

Return the severity level.

setSeverity

public void setSeverity(FacesMessage.Severity severity)

    severity
    Throws       IllegalArgumentException:
public void setSeverity(FacesMessage.Severity severity)

    Set the severity level.

    Parameters:
    severity - The new severity level

    Throws:
    IllegalArgumentException - if the specified severity level is not one of the supported values

public String getSummary()

getSummary

public String getSummary()

    Return the localized summary text.

public void setSummary(String summary)

    Set the localized summary text.

    Parameters:
    summary - The new localized summary text

javax.faces.application  **Class FacesMessage.Severity**

java.lang.Object
  ▼ javax.faces.application.FacesMessage.Severity

**All Implemented Interfaces:**  
  Comparable

**Enclosing class:**  
  FacesMessage

---

```java
public static class FacesMessage.Severity
  extends Object
  implements Comparable

Implements: Comparable<T>
Contained within: FacesMessage
```

Class used to represent message severity levels in a typesafe enumeration.

---

**Method Summary**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>int compareTo(Object other)</code></td>
<td>Compare this <code>FacesMessage.Severity</code> instance to the specified one.</td>
</tr>
<tr>
<td><code>int getOrdinal()</code></td>
<td>Return the ordinal value of this <code>FacesMessage.Severity</code> instance.</td>
</tr>
<tr>
<td><code>toString()</code></td>
<td></td>
</tr>
</tbody>
</table>
Return a String representation of this `FacesMessage.Severity` instance.

Methods inherited from class `java.lang.Object`
`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `wait`, `wait`, `wait`

Method Detail

public int compareTo(Object other)

```
javax.faces.application.FacesMessage.Severity
0
other
```

`compareTo`

public int compareTo(Object other)

Compare this `FacesMessage.Severity` instance to the specified one. Returns a negative integer, zero, or a positive integer if this object is less than, equal to, or greater than the specified object.

Specified by: `compareTo` in interface `Comparable`
Parameters:
other - The other object to be compared to

public int getOrdinal()

`FacesMessage.Severity`
getOrdinal

```java
public int getOrdinal()
```

Return the ordinal value of this `FacesMessage.Severity` instance.

---

toString

```java
public String toString()
```

Return a String representation of this `FacesMessage.Severity` instance.

**Overrides:**

`toString` in class `Object`
javax.faces.webapp  Class FacesServlet

java.lang.Object
  └─javax.faces.webapp.FacesServlet

All Implemented Interfaces:
  Servlet

public final class FacesServlet
extends Object
implements Servlet

Implements: Servlet

FacesServlet Web servlet JavaServer Faces

FacesServlet is a servlet that manages the request processing lifecycle for web applications that are utilizing JavaServer Faces to construct the user interface.

**Constructor Detail**

public FacesServlet()

FacesServlet

public FacesServlet()

---

**Method Detail**

public void destroy()
**destroy**

```java
public void destroy()
```

Release all resources acquired at startup time.

**Specified by:**
```
destroy in interface Servlet
```

---

**public ServletConfig getServletConfig()**

```java
servlet ServletConfig
```

**getServletConfig**

```java
public ServletConfig getServletConfig()
```

Return the ServletConfig instance for this servlet.

**Specified by:**
```
getServletConfig in interface Servlet
```

**Returns:**
the ServletConfig object that initializes this servlet

**See Also:**
```
Servlet.init(javax.servlet.ServletConfig)
```

---

**public String getServletInfo()**

```java
Servlet
```

**getServletInfo**

```java
public String getServletInfo()
```
Return information about this Servlet.

Specified by:
getServletInfo in interface Servlet

Returns:
a String containing servlet information

```
public void init(ServletConfig servletConfig) throws ServletException
```

Throws ServletException: Faces

init

```
public void init(ServletConfig servletConfig)
    throws ServletException
```

Acquire the factory instances we will require.

Specified by: init in interface Servlet

Parameters:
servletConfig - a ServletConfig object containing the servlet's configuration and initialization parameters

Throws:
ServletException - if, for any reason, the startup of this Faces application failed. This includes errors in the config file that is parsed before or during the processing of this init() method.

See Also:
UnavailableException, Servlet.getServletContext()

```
public void service(ServletRequest request, ServletResponse response) throws java.io.IOException,
```
ServletException

request  response  HttpServletRequest
HttpServletResponse

HttpServletResponse  sendError
HttpServletRequest.SC_NOT_FOUND

META-INF

request  servlet
response  servlet
Throws  java.io.IOException: /
Throws  ServletException: servlet

service

public void service(HttpServletRequest request,
  HttpServletResponse response)
  throws IOException,
  ServletException

Process an incoming request, and create the corresponding response, by executing the request processing lifecycle.

If the request and response arguments to this method are not instances of HttpServletRequest and HttpServletResponse, respectively, the results of invoking this method are undefined.

This method must respond to requests that start with the following strings by invoking the sendError method on the response argument (cast to HttpServletResponse), passing the code
HttpServletResponse.SC_NOT_FOUND as the argument.

/WEB-INF/
/WEB-INF
/META-INF/
/META-INF

Specified by:
service in interface Servlet

Parameters:
request - The servlet request we are processing
response - The servlet response we are creating

Throws:
IOException - if an input/output error occurs during processing
ServletException - if a servlet error occurs during processing
javax.faces.webapp Class FacetTag

java.lang.Object
   ▼ javax.servlet.jsp.tagext.TagSupport
      ▼ javax.faces.webapp.FacetTag

All Implemented Interfaces:
   Serializable, IterationTag, JspTag, Tag

public class FacetTag

extends TagSupport

Extends: TagSupport

FacetTag JSP javax.faces.component.UIComponent facet

FacetTag javax.faces.component.UIComponent UIComponentTag

FacetTag is the JSP mechanism for denoting a UIComponent is to be added as a facet to the component associated with its parent.

A FacetTag must have one and only one child. This child must be a UIComponentTag instance representing a single UIComponent instance.

See Also:
   Serialized Form

public FacetTag()

FacetTag

public FacetTag()

Method Detail

public String getName()

getName

public String getName()

Return the name to be assigned to this facet.

public void setName(String name)

setName

public void setName(String name)

Set the name to be assigned to this facet.
Parameters:
- name - The new facet name

public void release()

release

public void release()

Release any resources allocated by this tag instance.

Specified by:
- release in interface Tag

Overrides:
- release in class TagSupport

See Also:
- Tag.release()

public int doStartTag() throws JspException

EVAL_BODY_INCLUDE

doStartTag

public int doStartTag()
throws JspException

Return EVAL_BODY_INCLUDE to cause nested body content to be evaluated.

Specified by:
doStartTag in interface Tag

Overrides:
doStartTag in class TagSupport

Returns:
SKIP_BODY

Throws:
JspException - if an error occurs while processing this tag

See Also:
Tag.doStartTag()

public FactoryConfigurationError(Exception e)

    e

FactoryConfigurationError

public FactoryConfigurationError(Exception e)

    Construct an exception with a nested inner exception

    Parameters:
    e - the exception to nest

-----------------------------

public FactoryConfigurationError(Exception e, String msg)

    e

    msg

FactoryConfigurationError

public FactoryConfigurationError(Exception e, String msg)

    Construct an exception with a nested inner exception and a message

    Parameters:
    e - the exception to nest
    msg - the message to report

-----------------------------

public FactoryConfigurationError(String msg, Exception e)
FactoryConfigurationError

public FactoryConfigurationError(String msg, Exception e)

Construct an exception with a nested inner exception and a message

Parameters:
   msg - the message to report
   e - the exception to nest

public FactoryConfigurationError(String msg)

Construct an exception with associated message

Parameters:
   e - the exception to nest
   msg - the message to report

Method Detail

public Exception getException()
public Exception getException()

Return the nested exception (if any)

Returns:
the nested exception or null

public String getMessage()

return

ggetMessage

Report the message associated with this error

Overrides:
getMessage in class Throwable

Returns:
the string value of the message
PS:
javax.faces **Class FactoryFinder**

`java.lang.Object`
- `javax.faces.FactoryFinder`

```java
public final class FactoryFinder
extends Object
```

**FactoryFinder**  JavaServer Faces API

- **JavaServer Faces** Web  WEB-INF  factory
- `javax.faces.CONFIG_FILES`  `ServletContext`  `init` **JavaServer Faces**  factory
- **JavaServer Faces**  `ServletContext`  `jar`  **META-INF**  factory
- `META-INF/services/{factory-class-name}`  **Web**  **JAR**
- **JavaServer Faces**
  ```java
  javax.faces.context.FacesContextFactory
  Web  ClassLoader  jar  **META-INF/services/javax.faces.context.FacesContextFactory**
  FacesContextFactory  FactoryFinder  **JavaServer Faces**
  FacesContextFactory
  Factory
  Web  **JavaServer Faces**  Web  Web
  ```

**FactoryFinder** implements the standard discovery algorithm for all factory objects specified in the JavaServer Faces APIs. For a given factory class name, a corresponding implementation class is searched for
based on the following algorithm. Items are listed in order of decreasing search precedence:

- If the JavaServer Faces configuration file bundled into the `WEB-INF` directory of the webapp contains a `factory` entry of the given factory class name, that factory is used.
- If the JavaServer Faces configuration files named by the `javax.faces.CONFIG_FILES` ServletContext init parameter contain any `factory` entries of the given factory class name, those factories are used, with the last one taking precedence.
- If there are any JavaServer Faces configuration files bundled into the `META-INF` directory of any jars on the ServletContext's resource paths, the `factory` entries of the given factory class name in those files are used, with the last one taking precedence.
- If a `META-INF/services/{factory-class-name}` resource is visible to the web application class loader for the calling application (typically as a result of being present in the manifest of a JAR file), its first line is read and assumed to be the name of the factory implementation class to use.
- If none of the above steps yield a match, the JavaServer Faces implementation specific class is used.

If any of the factories found on any of the steps above happen to have a one-argument constructor, with argument the type being the abstract factory class, that constructor is invoked, and the previous match is passed to the constructor. For example, say the container vendor provided an implementation of `FacesContextFactory`, and identified it in `META-INF/services/javax.faces.context.FacesContextFactory` in a jar on the webapp ClassLoader. Also say this implementation provided by the container vendor had a one argument constructor that took a `FacesContextFactory` instance. The FactoryFinder system would call that one-argument constructor, passing the implementation of `FacesContextFactory` provided by the JavaServer Faces implementation.

If a Factory implementation does not provide a proper one-argument constructor, it must provide a zero-arguments constructor in order to be successfully instantiated.

Once the name of the factory implementation class is located, the web
application class loader for the calling application is requested to load this class, and a corresponding instance of the class will be created. A side effect of this rule is that each web application will receive its own instance of each factory class, whether the JavaServer Faces implementation is included within the web application or is made visible through the container’s facilities for shared libraries.

getFactory(java.lang.String) will find this mapping when searching for a match.

Methods inherited from class java.lang.Object
clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

Field Detail

APPLICATION_FACTORY
public static final String APPLICATION_FACTORY

The property name for the ApplicationFactory class name.

See Also:
Constant Field Values

FACES_CONTEXT_FACTORY
public static final String FACES_CONTEXT_FACTORY

The property name for the FacesContextFactory class name.

See Also:
Constant Field Values

LIFECYCLE_FACTORY
public static final String LIFECYCLE_FACTORY

The property name for the LifecycleFactory class name.

See Also:
Constant Field Values

public static final String RENDER_KIT_FACTORY

The property name for the RenderKitFactory class name.

See Also:
Constant Field Values

Method Detail

public static Object getFactory(String factoryName) throws FacesException

JavaServer Faces  Web

factoryName  JavaServer Faces
Throws  FacesException:  Web
Throws  FacesException:
Throws  FacesException:
Throws  IllegalArgumentException:  factoryName  JavaServer
Faces
Throws  IllegalStateException:
Throws  NullPointerException:  factoryname  null

getFactory
public static Object getFactory(String factoryName) throws FacesException

Create (if necessary) and return a per-web-application instance of the appropriate implementation class for the specified JavaServer Faces factory class, based on the discovery algorithm described in the class description.

Parameters:
  factoryName - Fully qualified name of the JavaServer Faces factory for which an implementation instance is requested

Throws:
  FacesException - if the web application class loader cannot be identified
  FacesException - if an instance of the configured factory implementation class cannot be loaded
  FacesException - if an instance of the configured factory implementation class cannot be instantiated
  IllegalArgumentException - if factoryName does not identify a standard JavaServer Faces factory name
  IllegalStateException - if there is no configured factory implementation class for the specified factory name
  NullPointerException - if factoryname is null

public static void setFactory(String factoryName, String implName)

getFactory()  factoryName

Faces

Throws  IllegalArgumentException:   factoryName  JavaServer Faces
  NullPointerException:   factoryname  null
**setFactory**

```java
public static void setFactory(String factoryName, String implName)
```

This method will store the argument `factoryName/implName` mapping in such a way that `getFactory(java.lang.String)` will find this mapping when searching for a match.

This method has no effect if `getFactory()` has already been called looking for a factory for this `factoryName`.

This method can be used by implementations to store a factory mapping while parsing the Faces configuration file.

**Throws:**

- `IllegalArgumentException` - if `factoryName` does not identify a standard JavaServer Faces factory name
- `NullPointerException` - if `factoryName` is null

---

**public static void releaseFactories() throws FacesException**

**Web**  
JavaServer Faces API  
Web

Throws  

`FacesException`: Web

---

**releaseFactories**

```java
public static void releaseFactories()
throws FacesException
```

Release any references to factory instances associated with the class loader for the calling web application. This method should be called as apart of web application shutdown in a container where the JavaServer Faces API classes are part of the container itself, rather
than being included inside the web application.

**Throws:**

*FacesException* - if the web application class loader cannot be identified
javax.xml.registry Interface FederatedConnection

All Superinterfaces: 
  Connection

public interface FederatedConnection
extends Connection

Implements: Connection

JAXR API

Represents a single logical connection to a federation or group of registry providers. This interface is used in support of the distributed query feature of the JAXR API.

Author:
  Farrukh S. Najmi

Method Summary

Methods inherited from interface javax.xml.registry.Connection
close, getCredentials, getRegistryService, isClosed, isSynchronous, setCredentials, setSynchronous

PS:
Clients use a FetchProfile to list the Message attributes that it wishes to prefetch from the server for a range of messages.

Messages obtained from a Folder are light-weight objects that typically start off as empty references to the actual messages. Such a Message object is filled in "on-demand" when the appropriate get*() methods are invoked on that particular Message. Certain server-based message
access protocols (Ex: IMAP) allow batch fetching of message attributes for a range of messages in a single request. Clients that want to use message attributes for a range of Messages (Example: to display the top-level headers in a headerlist) might want to use the optimization provided by such servers. The FetchProfile allows the client to indicate this desire to the server.

Note that implementations are not obligated to support FetchProfiles, since there might be cases where the backend service does not allow easy, efficient fetching of such profiles.

Sample code that illustrates the use of a FetchProfile is given below:

```java
Message[] msgs = folder.getMessages();

FetchProfile fp = new FetchProfile();
fp.add(FetchProfile.Item.ENVELOPE);
fp.add("X-mailer");
folder.fetch(msgs, fp);
```

**Author:**
John Mani, Bill Shannon

**See Also:**
Folder.fetch(javax.mail.Message[], javax.mail.FetchProfile)

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`
public void add(Envelope.Item item)

Add the given special item as one of the attributes to be prefetched.

Parameters:
item - the special item to be fetched
See Also: ENVELOPE, CONTENT_INFO, FLAGS

public void add(String headerName)

Add the specified header-field to the list of attributes to be prefetched.

Parameters:
headerName - header to be prefetched
public boolean contains(FetchProfile.Item item)
    
contains

public boolean contains(FetchProfile.Item item)
    
    Returns true if the fetch profile contains given special item.

public boolean contains(String headerName)
    
contains

public boolean contains(String headerName)
    
    Returns true if the fetch profile contains given header name.

public FetchProfile.Item[] getItems()
    
getItems

public FetchProfile.Item[] getItems()
    
    Get the items set in this profile.

    Returns:
    items set in this profile
public String[] getHeaderNames()

return

g.getHeaderNames

public String[] getHeaderNames()

Get the names of the header-fields set in this profile.

Returns:
headers set in this profile
This inner class is the base class of all items that can be requested in a FetchProfile. The items currently defined here are ENVELOPE, CONTENT_INFO and FLAGS. The UIDFolder interface defines the UID Item as well.

Note that this class only has a protected constructor, thereby restricting new Item types to either this class or subclasses. This effectively implements a enumeration of allowed Item types.

Constructor Summary

protected FetchProfile.Item(String name)

Constructor for an item.

Method Summary

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait

Field Detail

ENVELOPE

public static final FetchProfile.Item ENVELOPE

This is the Envelope item.

The Envelope is an aggregation of the common attributes of a Message. Implementations should include the following attributes: From, To, Cc, Bcc, ReplyTo, Subject and Date. More items may be included as well.
For implementations of the IMAP4 protocol (RFC 2060), the Envelope should include the ENVELOPE data item. More items may be included too.

CONTENT_INFO

public static final FetchProfile.Item CONTENT_INFO

This item is for fetching information about the content of the message.

This includes all the attributes that describe the content of the message. Implementations should include the following attributes: ContentType, ContentDisposition, ContentDescription, Size and LineCount. Other items may be included as well.

FLAGS

public static final FetchProfile.Item FLAGS

This is the Flags item.

Constructor Detail

protected FetchProfile.Item(String name)

FetchProfile.Item

protected FetchProfile.Item(String name)
Constructor for an item. The name is used only for debugging.
Description: Enum

**javax.persistence**

**Enum**

**FetchType**

**java.lang.Object**

**java.lang.Enum<FetchType>**

**javax.persistence.FetchType**

**All Implemented Interfaces:**

*Serializable, Comparable<FetchType>*

---

```java
public enum FetchType
    extends Enum<FetchType>

    Extends: Enum<E>

    EAGER      LAZY      LAZY

    @Basic(fetch=LAZY)
    protected String getName() { return name; }
```

**since**

Java Persistence 1.0

---

Defines strategies for fetching data from the database. The **EAGER** strategy is a requirement on the persistence provider runtime that data must be eagerly fetched. The **LAZY** strategy is a hint to the persistence provider runtime that data should be fetched lazily when it is first accessed. The implementation is permitted to eagerly fetch data for which the **LAZY** strategy hint has been specified. In particular, lazy fetching might only be available for **Basic** mappings for which property-based access is used.

Example:

```java
    @Basic(fetch=LAZY)
    protected String getName() { return name; }
```

**Since:**
Enum Constant Summary

**EAGER**
Defines that data must be eagerly fetched

**LAZY**
Defines that data can be lazily fetched

Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>valueOf(String name)</code></td>
<td>Returns the enum constant of this type with the specified name.</td>
</tr>
<tr>
<td><code>values()</code></td>
<td>Returns an array containing the constants of this enum type, in the order they're declared.</td>
</tr>
</tbody>
</table>

Methods inherited from class java.lang.**Enum**

clone, compareTo, equals, getDeclaringClass, hashCode, name, ordinal, toString, `valueOf`

Methods inherited from class java.lang.**Object**

finalize, getClass, notify, notifyAll, wait, wait, wait

Enum Constant Detail

**LAZY**

public static final **FetchType** **LAZY**

Defines that data can be lazily fetched
EAGER

public static final FetchType EAGER

Defines that data must be eagerly fetched

**Method Detail**

**final public static FetchType[] values()**

```java
public static final FetchType[] values()
```

Returns an array containing the constants of this enum type, in the order they're declared. This method may be used to iterate over the constants as follows:

```java
for(FetchType c : FetchType.values())
    System.out.println(c);
```

**Returns:**

an array containing the constants of this enum type, in the order they're declared

**public static FetchType.valueOf(String name)**

```java
public static FetchType.valueOf(String name)
```

Returns the enum constant of this type with the specified name. The
string must match exactly an identifier used to declare an enum constant in this type. (Extraneous whitespace characters are not permitted.)

Parameters:

   name - the name of the enum constant to be returned.

Returns:

   the enum constant with the specified name

Throws:

   IllegalArgumentException - if this enum type has no constant with the specified name
javax.persistence  Annotation Type FieldResult

@Target(value={})
@Retention(value=RUNTIME)
public @interface FieldResult

Implements: Annotation
@Target(value={})
@Retention(value=RUNTIME)

SELECT

Query q = em.createNativeQuery(
   "SELECT o.id AS order_id, " +
   "o.quantity AS order_quantity, " +
   "o.item AS order_item, " +
   "FROM Order o, Item i " +
   "WHERE (order_quantity > 25) AND (order_item = i.id)",
   "OrderResults");

@SqlResultSetMapping(name="OrderResults",
   entities={
      @EntityResult(entityClass=com.acme.Order.class,
         fields={
            @FieldResult(name="id", column="order_id"),
            @FieldResult(name="quantity", column="order_quantity",
            @FieldResult(name="item", column="order_item"))
         }
      })
)

since Java Persistence 1.0  

Is used to map the columns specified in the SELECT list of the query to the properties or fields of the entity class.

Example:
Query q = em.createNativeQuery(
   "SELECT o.id AS order_id, " +
   "o.quantity AS order_quantity, " +
   "o.item AS order_item, " +
   "FROM Order o, Item i " +
   "WHERE (order_quantity > 25) AND (order_item = i.id)",
   "OrderResults"),

   @ resultListMapping(name="OrderResults",
      entities={
         @EntityResult(entityClass=com.acme.Order.class,
            fields={
               @FieldResult(name="id", column="order_id"),
               @FieldResult(name="quantity", column="order_quantity",
               @FieldResult(name="item", column="order_item"))
            }
         })
   )
)
"OrderResults";

@SqlResultSetMapping(name="OrderResults",
   entities=
       @EntityResult(entityClass=com.acme.Order.class,
             fields={
                @FieldResult(name="id", column="order_id"),
                @FieldResult(name="quantity", column="order_quantity",
                @FieldResult(name="item", column="order_item"))
           })
   } }

javax.activation Class FileDataSource

java.lang.Object
  javax.activation.FileDataSource

All Implemented Interfaces:
  DataSource

public class FileDataSource
  extends Object
  implements DataSource

Implements: DataSource

FileDataSource  DataSource  FileTypeMap

FileDataSource

FileDataSource  FileTypeMap  setFileTypeMap
FileDataSource  FileTypeMap  FileTypeMap  FileDataSource
FileTypeMap  getDefaultFileTypeMap  FileTypeMap

See  javax.activation.DataSource,  javax.activation.FileTypeMap,
also  javax.activation.MimetypesFileTypeMap

The FileDataSource class implements a simple DataSource object that
encapsulates a file. It provides data typing services via a FileTypeMap
object.

FileDataSource Typing Semantics

The FileDataSource class delegates data typing of files to an object
subclassed from the FileTypeMap class. The setFileTypeMap method can
be used to explicitly set the FileTypeMap for an instance of
FileDataSource. If no FileTypeMap is set, the FileDataSource will call the
FileTypeMap's getDefaultFiletypeMap method to get the System's
default FileTypeMap.

See Also:

DataSource, FileTypeMap, MimetypesFileTypeMap

### Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait
Constructor Detail

public FileDataSource(java.io.File file)

File DataSource

file

FileDataSource

public FileDataSource(File file)

Creates a FileDataSource from a File object. Note: The file will not actually be opened until a method is called that requires the file to be opened.

Parameters:
file - the file

FileDataSource

public FileDataSource(String name)

FileDataSource

name

FileDataSource

public FileDataSource(String name)

Creates a FileDataSource from the specified path name. Note: The file will not actually be opened until a method is called that requires the file to be opened.

Parameters:
name - the system-dependent file name.
public java.io.InputStream getInputStream() throws java.io.IOException
InputStream IOException InputStream

public InputStream getInputStream() throws IOException

This method will return an InputStream representing the data and will throw an IOException if it cannot do so. This method will return a new instance of InputStream with each invocation.

Specified by:
getInputStream in interface DataSource

Returns:
an InputStream

 Throws:
IOException

public java.io.OutputStream getOutputStream() throws java.io.IOException
OutputStream IOException OutputStream

public OutputStream getOutputStream() throws IOException

This method will return an OutputStream representing the data and will throw an IOException if it cannot do so. This method will return a new instance of OutputStream with each invocation.
public String getContentType()

public String getName()
getName

public String getName()

    Return the name of this object. The FileDataSource will return the file name of the object.

    Specified by: getName in interface DataSource

    Returns: the name of the object.

    See Also: DataSource

getFile

public java.io.File getFile()

    Return the File object that corresponds to this FileDataSource.

    Returns: the File object for the file represented by this object.

setFileTypeMap

public void setFileTypeMap(FileTypeMap map)

    Set the type map for this FileDataSource.
public void setFileTypeMap(FileTypeMap map)

Set the FileTypeMap to use with this FileDataSource

Parameters:
map - The FileTypeMap for this object.
javax.activation Class FileTypeMap

java.lang.Object
  \--- javax.activation.FileTypeMap

Direct Known Subclasses:
  MimetypesFileTypeMap

public abstract class FileTypeMap extends Object

Extended by: MimetypesFileTypeMap

FileTypesMap getContentType File FileTypeMap
MimetypesFileTypeMap FileDataSource FileTypeMap
MimetypesFileTypeMap

See also
javax.activation.FileTypeMap,
javax.activation.FileDataSource,
javax.activation.MimetypesFileTypeMap

The FileTypeMap is an abstract class that provides a data typing interface for files. Implementations of this class will implement the
getContentType methods which will derive a content type from a file
name or a File object. FileTypeMaps could use any scheme to determine
the data type, from examining the file extension of a file (like the
MimetypesFileTypeMap) to opening the file and trying to derive its type
from the contents of the file. The FileDataSource class uses the default
FileTypeMap (a MimetypesFileTypeMap unless changed) to determine
the content type of files.

See Also:
FileTypesMap, FileDataSource, MimetypesFileTypeMap

</tr>
<tr>
<td>static <code>void setDefaultFileTypeMap(FileTypeMap map)</code></td>
<td>Sets the default <code>FileTypeMap</code> for the system.</td>
</tr>
</tbody>
</table>

### Constructor Detail

public `FileTypeMap()`

The default constructor.

### Method Detail

abstract public `String getContentType(java.io.File file)`
MIME

public abstract String getContentType(File file)

Return the type of the file object. This method should always return a valid MIME type.

Parameters:
  file - A file to be typed.

Returns:
The content type.

abstract public String getContentType(String filename)
MIME

public abstract String getContentType(String filename)

Return the type of the file passed in. This method should always return a valid MIME type.

Parameters:
  filename - the pathname of the file.

Returns:
The content type.

public static void setDefaultFileTypeMap(FileTypeMap map)
**File**

**TypeMap**

**get**

**Default**

**File**

**TypeMap**

\[
\text{map} \quad \text{FileTypeMap}
\]

**Throws**

SecurityException:

**setDefault**

**FileTypeMap**

public static void **setDefault**

**FileTypeMap**

(FileTypeMap map)

Sets the default FileTypeMap for the system. This instance will be returned to callers of getDefaultFileTypeMap.

Parameters:

map - The FileTypeMap.

Throws:

SecurityException - if the caller doesn't have permission to change the default

---

public static **FileTypeMap**

get**Default**FileTypeMap()

**FileTypeMap**

set**Default**FileTypeMap

MimetypesFileTypeMap

return

See also

**setDefault**FileTypeMap

---

**get**

**Default**

**File**

**TypeMap**

public static **FileTypeMap**

get**Default**FileTypeMap()

Return the default FileTypeMap for the system. If setDefaultFileTypeMap was called, return that instance, otherwise return an instance of MimetypesFileTypeMap.

Returns:

The default FileTypeMap

PS :
A filter is an object that performs filtering tasks on either the request to a resource (a servlet or static content), or on the response from a resource, or both.

Filters perform filtering in the `doFilter` method. Every Filter has access to a FilterConfig object from which it can obtain its initialization parameters, a reference to the ServletContext which it can use, for example, to load resources needed for filtering tasks.

Filters are configured in the deployment descriptor of a web application.
Examples that have been identified for this design are
1) Authentication Filters
2) Logging and Auditing Filters
3) Image conversion Filters
4) Data compression Filters
5) Encryption Filters
6) Tokenizing Filters
7) Filters that trigger resource access events
8) XSL/T filters
9) Mime-type chain Filter

Since:
Servlet 2.3

<table>
<thead>
<tr>
<th>Method Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>voiddestroy()</strong></td>
</tr>
<tr>
<td><strong>voiddoFilter(ServletRequest request, ServletResponse response, FilterChain chain)</strong></td>
</tr>
<tr>
<td><strong>voidinit(FilterConfig filterConfig)</strong></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Method Detail</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>public void init(FilterConfig filterConfig) throws ServletException</strong></td>
</tr>
<tr>
<td>Web servlet init init</td>
</tr>
</tbody>
</table>
void init(FilterConfig filterConfig) throws ServletException

Called by the web container to indicate to a filter that it is being placed into service. The servlet container calls the init method exactly once after instantiating the filter. The init method must complete successfully before the filter is asked to do any filtering work.

The web container cannot place the filter into service if the init method either
1. Throws a ServletException
2. Does not return within a time period defined by the web container

Throws:
ServletException

public void doFilter(HttpServletRequest request, HttpServletResponse response, FilterChain chain) throws java.io.IOException, ServletException, ServletException
/ Filter

- 1.
  2.
  3.
4. a) FilterChain (chain.doFilter())
4. b) /
5.
doFilter

```java
doFilter(ServletRequest request, ServletResponse response, FilterChain chain)
throws IOException, ServletException
```

The *doFilter* method of the Filter is called by the container each time a request/response pair is passed through the chain due to a client request for a resource at the end of the chain. The FilterChain passed in to this method allows the Filter to pass on the request and response to the next entity in the chain.

A typical implementation of this method would follow the following pattern:-
1. Examine the request
2. Optionally wrap the request object with a custom implementation to filter content or headers for input filtering
3. Optionally wrap the response object with a custom implementation to filter content or headers for output filtering
4. a) *Either* invoke the next entity in the chain using the FilterChain object (chain.doFilter()),
4. b) *or* not pass on the request/response pair to the next entity in the filter chain to block the request processing
5. Directly set headers on the response after invocation of the next entity in the filter chain.

`Throws:`
- IOException
- ServletException

```
public void destroy()
```

Web doFilter Web doFilter
void **dest**roy()

Called by the web container to indicate to a filter that it is being taken out of service. This method is only called once all threads within the filter's doFilter method have exited or after a timeout period has passed. After the web container calls this method, it will not call the doFilter method again on this instance of the filter.

This method gives the filter an opportunity to clean up any resources that are being held (for example, memory, file handles, threads) and make sure that any persistent state is synchronized with the filter's current state in memory.

javax.servlet Interface FilterChain

public interface FilterChain

FilterChain servlet FilterChain

since Servlet 2.3

See also javax.servlet.Filter

A FilterChain is an object provided by the servlet container to the developer giving a view into the invocation chain of a filtered request for a resource. Filters use the FilterChain to invoke the next filter in the chain, or if the calling filter is the last filter in the chain, to invoke the resource at the end of the chain.

Since: Servlet 2.3

</tbody>
</table>

Method Detail

public void doFilter(ServletRequest request, ServletResponse response) throws java.io.IOException,
ServletException

request
response
since 2.3

doFilter

void doFilter(ServletRequest request, ServletResponse response)
throws IOException, ServletException

Causes the next filter in the chain to be invoked, or if the calling filter is the last filter in the chain, causes the resource at the end of the chain to be invoked.

Parameters:
request - the request to pass along the chain.
response - the response to pass along the chain.

Throws:
IOException
ServletException

Since:
2.3
javax.servlet Interface FilterConfig

public interface FilterConfig

since Servlet 2.3

See also javax.servlet.Filter

A filter configuration object used by a servlet container to pass information to a filter during initialization.

Since:
Servlet 2.3

Method Detail

public String getFilterName()

getFilterName

String getFilterName()

Returns the filter-name of this filter as defined in the deployment descriptor.

public ServletContext getServletContext()

ServletContext return ServletContext servlet

See also javax.servlet.ServletContext

getServletContext

ServletContext getServletContext()

Returns a reference to the ServletContext in which the caller is executing.

Returns: a ServletContext object, used by the caller to interact with its servlet container

See Also: ServletContext
public String getInitParameter(String name)
    String null

    name String
    return String

getInitParameter

String getInitParameter(String name)

    Returns a String containing the value of the named initialization parameter, or null if the parameter does not exist.

Parameters:
    name - a String specifying the name of the initialization parameter

Returns:
    a String containing the value of the initialization parameter

public java.util Enumeration<E> getInitParameterNames()
    String Enumeration Enumeration
    return String Enumeration

getInitParameterNames

Enumeration getInitParameterNames()

    Returns the names of the filter's initialization parameters as an Enumeration of String objects, or an empty Enumeration if the filter has no initialization parameters.

Returns:
    an Enumeration of String objects containing the names of the filter's initialization parameters

    JAXRException String Throwable
    Throwable
        reason
        cause
FindException

public FindException(String reason, Throwable cause)

Constructs a JAXRException object with the given string as the reason for the exception being thrown and the given Throwable object as an embedded Throwable.

Parameters:
  reason - a description of what caused the exception
  cause - a Throwable object that is to be embedded in this JAXRException object

public FindException(Throwable cause)

    Throwable JAXRException
    cause Exception Throwable

FindException

public FindException(Throwable cause)

Constructs a JAXRException object initialized with the given Throwable object.

Parameters:
  cause - the Throwable that caused this Exception

javax.mail **Class Flags**

```
java.lang.Object
  \_ javax.mail.Flags

All Implemented Interfaces:
    Serializable, Cloneable
```

defined public class **Flags** extends **Object**
implements **Cloneable, Serializable**

**Implements:** Cloneable, java.io.Serializable  
**Inner classes:** **Flags.Flag**

```
Flags  Message Flags
      Flags.Flag  String

Folder

Flags  Flags
      JavaMail API
```

```java
Message m = folder.getMessage(1);
m.setFlag(Flags.Flag.DELETED, true); // set the DELETED flag

// Check if DELETED flag is set of this message
if (m.isSet(Flags.Flag.DELETED))
    System.out.println("DELETED message");

// Examine ALL system flags for this message
Flags flags = m.getFlags();
Flags.Flag[] sf = flags.getSystemFlags();
for (int i = 0; i < sf.length; i++) {
    if (sf[i] == Flags.Flag.DELETED)
        System.out.println("DELETED message");
```

else if (sf[i] == Flags.Flag.SEEN)
System.out.println("SEEN message");
......
......
}

See also

getPermanentFlags

The Flags class represents the set of flags on a Message. Flags are composed of predefined system flags, and user defined flags.

A System flag is represented by the Flags.Flag inner class. A User defined flag is represented as a String. User flags are case-independent.

A set of standard system flags are predefined. Most folder implementations are expected to support these flags. Some implementations may also support arbitrary user-defined flags. The getPermanentFlags method on a Folder returns a Flags object that holds all the flags that are supported by that folder implementation.

A Flags object is serializable so that (for example) the use of Flags objects in search terms can be serialized along with the search terms.

Warning: Serialized objects of this class may not be compatible with future JavaMail API releases. The current serialization support is appropriate for short term storage.

The below code sample illustrates how to set, examine and get the flags for a message.

```java
Message m = folder.getMessage(1);
m.setFlag(Flags.Flag.DELETED, true); // set the DELETED flag

// Check if DELETED flag is set of this message
if (m.isSet(Flags.Flag.DELETED))
    System.out.println("DELETED message");

// Examine ALL system flags for this message
Flags flags = m.getFlags();
Flags.Flag[] sf = flags.getSystemFlags();
```
for (int i = 0; i < sf.length; i++) {
    if (sf[i] == Flags.Flag.DELETED) {
        System.out.println("DELETED message");
    } else if (sf[i] == Flags.Flag.SEEN) {
        System.out.println("SEEN message");
    }
}

**Methods inherited from class java.lang.Object**

- `finalize`, `getClass`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`
public Flags()
Flags

Construct an empty Flags object.

public Flags(Flags flags)
Flags

flags

Construct a Flags object initialized with the given flags.

Parameters:
flags - the flags for initialization

public Flags(Flags.Flag flag)
Flags

flag

public Flags(Flags.Flag flag)
Construct a Flags object initialized with the given system flag.

Parameters:
flag - the flag for initialization

public Flags(String flag)

Construct a Flags object initialized with the given user flag.

Parameters:
flag - the flag for initialization

Method Detail

public void add(Flags.Flag flag)

Add the specified system flag to this Flags object.

Parameters:
flag - the flag to add
public void add(String flag)

Add the specified user flag to this Flags object.

Parameters:
flag - the flag to add

public void add(Flags f)

Add all the flags in the given Flags object to this Flags object.

Parameters:
f - Flags object

public void remove(Flags.Flag flag)

remove
public void remove(Flags.Flag flag)

    Remove the specified system flag from this Flags object.

    **Parameters:**
    flag - the flag to be removed

public void remove(String flag)

    Remove the specified user flag from this Flags object.

    **Parameters:**
    flag - the flag to be removed

public void remove(Flags f)

    Remove all flags in the given Flags object from this Flags object.

    **Parameters:**
    f - the flag to be removed
public boolean contains(Flags.Flag flag)
Flags
    return true false
contains

public boolean contains(Flags.Flag flag)
    Check whether the specified system flag is present in this Flags object.
    
    Returns:
    true of the given flag is present, otherwise false.

public boolean contains(String flag)
Flags
    return true false
contains

public boolean contains(String flag)
    Check whether the specified user flag is present in this Flags object.
    
    Returns:
    true of the given flag is present, otherwise false.

public boolean contains(Flags f)
Flags Flags
    return Flags true false
contains
public boolean contains(Flags f)

Check whether all the flags in the specified Flags object are present in this Flags object.

Returns:
true if all flags in the given Flags object are present, otherwise false.

public boolean equals(Object obj)

Check whether the two Flags objects are equal.

Overrides:
equals in class Object

Returns:
ture if they're equal

public int hashCode()

Compute a hash code for this Flags object.
Overrides:

- `hashCode` in class `Object`

Returns:

- the hash code

---

```java
public Flags.Flag[] getSystemFlags()
Flags 0
    return Flags.Flag
```

**getSystemFlags**

```java
public Flags.Flag[] getSystemFlags()
```

Return all the system flags in this Flags object. Returns an array of size zero if no flags are set.

**Returns:**

- array of Flags.Flag objects representing system flags

---

```java
public String[] getUserFlags()
Flags 0
    return String String
```

**getUserFlags**

```java
public String[] getUserFlags()
```

Return all the user flags in this Flags object. Returns an array of size zero if no flags are set.

**Returns:**

- array of Strings, each String represents a flag.
public Object clone()  
Flags

clone

public Object clone()

Returns a clone of this Flags object.

Overrides:
   clone in class Object
javax.mail Class Flags.Flag

java.lang.Object
  - javax.mail.Flags.Flag

Enclosing class:
  Flags

public static final class Flags.Flag
extends Object

Contained within: Flags

This inner class represents an individual system flag. A set of standard system flag objects are predefined here.

<table>

| clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait |

| Field Detail |

**ANSWERED**

```java
public static final Flags.Flag ANSWERED
```

This message has been answered. This flag is set by clients to indicate that this message has been answered to.

**DELETED**

```java
public static final Flags.Flag DELETED
```

This message is marked deleted. Clients set this flag to mark a message as deleted. The expunge operation on a folder removes all messages in that folder that are marked for deletion.

**DRAFT**
public static final Flags.Flag DRAFT

This message is a draft. This flag is set by clients to indicate that the message is a draft message.

---

FLAGGED

public static final Flags.Flag FLAGGED

This message is flagged. No semantic is defined for this flag. Clients alter this flag.

---

RECENT

public static final Flags.Flag RECENT

This message is recent. Folder implementations set this flag to indicate that this message is new to this folder, that is, it has arrived since the last time this folder was opened.

Clients cannot alter this flag.

---

SEEN

public static final Flags.Flag SEEN

This message is seen. This flag is implicitly set by the implementation when the this Message's content is returned to the client in some form. The getInputStream and getContent methods on Message cause this flag to be set.
Clients can alter this flag.

USER

public static final Flags.Flag USER

A special flag that indicates that this folder supports user defined flags.

The implementation sets this flag. Clients cannot alter this flag but can use it to determine if a folder supports user defined flags by using folder.getPermanentFlags().contains(Flags.Flag.USER).
javax.mail.search Class FlagTerm

**Field Detail**

protected boolean set

Indicates whether to test for the presence or absence of the specified Flag. If true, then test whether all the specified flags are present, else test whether all the specified flags are absent.
protected Flags flags

Flags object containing the flags to test.

**Constructor Detail**

public FlagTerm(Flags flags, boolean set)

Set FlagTerm

**FlagTerm**

public FlagTerm(Flags flags, boolean set)

Constructor.

**Parameters:**
flags - Flags object containing the flags to check for
set - the flag setting to check for

**Method Detail**

public Flags getFlags()

Flag getFlags

**getFlags**

public Flags getFlags()

Return the Flags to test.
public boolean getTestSet()
true

getTestSet

public boolean getTestSet()

    Return true if testing whether the flags are set.

----------------------------------------

public boolean match(Message msg)

    msg Message
    return true false

match

public boolean match(Message msg)

    The comparison method.

    Specified by:
    match in class SearchTerm

    Parameters:
    msg - The flag comparison is applied to this Message

    Returns:
    true if the comparison succeeds, otherwise false.

----------------------------------------

public boolean equals(Object obj)

equals
public boolean equals(Object obj)

Equality comparison.

Overrides:
equals in class Object

Method Detail

public Object getAsObject(FacesContext context, UIComponent component, String value)

Throws ConverterException: NullPointerException

Throws NullPointerException: NullPointerException

getAsObject

public Object getAsObject(FacesContext context, UIComponent component, String value)

Description copied from interface: Converter

Convert the specified string value, which is associated with the specified UIComponent, into a model data object that is appropriate for being stored during the Apply Request Values phase of the request processing lifecycle.

Specified by:
getAsObject in interface Converter

Parameters:
context - FacesContext for the request being processed
component - UIComponent with which this model object value is associated
value - String value to be converted (may be null)

Returns:
null if the value to convert is null, otherwise the result of the conversion

Throws:
ConverterException - if conversion cannot be successfully
public String getAsString(FacesContext context, UIComponent component, Object value)

Throws ConverterException: NullPointerException

Throws NullPointerException: NullPointerException

getAsString

public String getAsString(FacesContext context, UIComponent component, Object value)

Description copied from interface: Converter

Convert the specified model object value, which is associated with the specified UIComponent, into a String that is suitable for being included in the response generated during the Render Response phase of the request processing lifecycle.

Specified by:
getAsString in interface Converter

Parameters:
context - FacesContext for the request being processed
component - UIComponent with which this model object value is associated
value - Model object value to be converted (may be null)

Returns:
a zero-length String if value is null, otherwise the result of the conversion

Throws:
ConverterException - if conversion cannot be successfully performed
NullPointerException - if context or component is null

PS:
Flush mode setting.

When queries are executed within a transaction, if `FlushModeType.AUTO` is set on the `Query` object, or if the flush mode setting for the persistence context is `AUTO` (the default) and a flush mode setting has not been specified for the `Query` object, the persistence provider is responsible for ensuring that all updates to the state of all entities in the persistence context which could potentially affect the result of the query are visible to the processing of the query. The persistence provider implementation may achieve this by flushing those entities to the database or by some other means. If `FlushModeType.COMMIT` is set, the effect of updates made to entities in the persistence context upon queries is unspecified.
If there is no transaction active, the persistence provider must not flush to
the database.

Since:
Java Persistence 1.0

### Enum Constant Detail

COMMIT
public static final FlushModeType COMMIT

Flushing must occur only at transaction commit

AUTO

public static final FlushModeType AUTO

(Default) Flushing to occur at query execution

Method Detail

final public static FlushModeType[] values()

values

public static final FlushModeType[] values()

Returns an array containing the constants of this enum type, in the order they're declared. This method may be used to iterate over the constants as follows:

for(FlushModeType c : FlushModeType.values())
    System.out.println(c);

Returns:
    an array containing the constants of this enum type, in the order they're declared

public static FlushModeType valueOf(String name)

valueOf
public static FlushModeType valueOf(String name)

Returns the enum constant of this type with the specified name. The string must match exactly an identifier used to declare an enum constant in this type. (Extraneous whitespace characters are not permitted.)

Parameters:
   name - the name of the enum constant to be returned.

Returns:
   the enum constant with the specified name

Throws:
   IllegalArgumentException - if this enum type has no constant with the specified name

Folder Folder Message
Message Folder
Message Message

Folder is an abstract class that represents a folder for mail messages. Subclasses implement protocol specific Folders.
Folders can contain Messages, other Folders or both, thus providing a tree-like hierarchy rooted at the Store's default folder. (Note that some Folder implementations may not allow both Messages and other Folders in the same Folder).

The interpretation of folder names is implementation dependent. The different levels of hierarchy in a folder's full name are separated from each other by the hierarchy delimiter character.

The case-insensitive full folder name (that is, the full name relative to the default folder for a Store) **INBOX** is reserved to mean the "primary folder for this user on this server". Not all Stores will provide an INBOX folder, and not all users will have an INBOX folder at all times. The name **INBOX** is reserved to refer to this folder, when it exists, in Stores that provide it.

A Folder object obtained from a Store need not actually exist in the backend store. The `exists` method tests whether the folder exists or not. The `create` method creates a Folder.

A Folder is initially in the closed state. Certain methods are valid in this state; the documentation for those methods note this. A Folder is opened by calling its `open` method. All Folder methods, except `open`, `delete` and `renameTo`, are valid in this state.

The only way to get a Folder is by invoking the `getFolder` method on Store, Folder, or Session, or by invoking the `list` or `listSubscribed` methods on Folder. Folder objects returned by the above methods are not cached by the Store. Thus, invoking the `getFolder` method with the same folder name multiple times will return distinct Folder objects. Likewise for the `list` and `listSubscribed` methods.

The Message objects within the Folder are cached by the Folder. Thus, invoking `getMessage(msgno)` on the same message number multiple times will return the same Message object, until an expunge is done on this Folder.

Note that a Message's message number can change within a session if the containing Folder is expunged using the `expunge` method. Clients that use message numbers as references to messages should be aware
of this and should be prepared to deal with situation (probably by flushing out existing message number references and reloading them). Because of this complexity, it is better for clients to use Message objects as references to messages, rather than message numbers. Expunged Message objects still have to be pruned, but other Message objects in that folder are not affected by the expunge.

Methods inherited from class java.lang.**Object**
Field Detail

store

protected `Store` store

The parent store.

mode

protected `int` mode

The open mode of this folder. The open mode is `Folder.READ_ONLY`, `Folder.READ_WRITE`, or -1 if not known.

Since:

JavaMail 1.1

HOLDS_MESSAGES

public static final `int` HOLDS_MESSAGES

This folder can contain messages

See Also:

Constant Field Values
HOLDS_FOLDERS

public static final int HOLDS_FOLDERS

This folder can contain other folders

See Also:
Constant Field Values

READ_ONLY

public static final int READ_ONLY

The Folder is read only. The state and contents of this folder cannot be modified.

See Also:
Constant Field Values

READ_WRITE

public static final int READ_WRITE

The state and contents of this folder can be modified.

See Also:
Constant Field Values

Constructor Detail

protected Folder(Store store)
Folder

protected Folder(Store store)

Constructor that takes a Store object.

Parameters:
store - the Store that holds this folder

Method Detail

abstract public String getName()

Folder

Folder

return

getName

public abstract String getName()

Returns the name of this Folder.
This method can be invoked on a closed Folder.

Returns:
name of the Folder

abstract public String getFullName()

Folder Store
Folder

getFullName

```java
public abstract String getFullName()
```

Returns the full name of this Folder. If the folder resides under the root hierarchy of this Store, the returned name is relative to the root. Otherwise an absolute name, starting with the hierarchy delimiter, is returned.

This method can be invoked on a closed Folder.

**Returns:**
full name of the Folder

public **URLName** getURLName() throws **MessagingException**

```java
URLName getURLName() throws MessagingException
```

Return a URLName representing this folder. The returned URLName does *not* include the password used to access the store.

**Returns:**
the URLName representing this folder
Throws: MessagingException
Since: JavaMail 1.1
See Also: URLName

public Store getStore()
Folder Store Folder
    return Store

getStore

public Store getStore()

Returns the Store that owns this Folder object. This method can be invoked on a closed Folder.

Returns: the Store

abstract public Folder getParent() throws MessagingException
Folder null

getParent

public abstract Folder getParent()
    throws MessagingException
Returns the parent folder of this folder. This method can be invoked on a closed Folder. If this folder is the top of a folder hierarchy, this method returns null.

Note that since Folder objects are not cached, invoking this method returns a new distinct Folder object.

**Returns:**
- Parent folder

**Throws:**
- `MessagingException`

---

```java
abstract public boolean exists() throws MessagingException

Store Folder
return true false
Throws MessagingException:
See also create
```

**exists**

```java
public abstract boolean exists()
throws MessagingException
```

Tests if this folder physically exists on the Store. This method can be invoked on a closed Folder.

**Returns:**
- true if the folder exists, otherwise false

**Throws:**
- `MessagingException` - typically if the connection to the server is lost.

**See Also:**
- `create(int)`

---

```java
abstract public Folder[] list(String pattern) throws
```
MessagingException
Folder Folder Folder

Personal/
Finance/
Stocks
Bonus
StockOptions

"StockOptions"

Store Folder Folder

Folder

<table>
<thead>
<tr>
<th>pattern</th>
<th>return</th>
</tr>
</thead>
<tbody>
<tr>
<td>Folder</td>
<td>Folder</td>
</tr>
</tbody>
</table>

Throws FolderNotFoundException:
Throws MessagingException:
See also listSubscribed

list

public abstract Folder[] list(String pattern) throws MessagingException

Returns a list of Folders belonging to this Folder's namespace that match the specified pattern. Patterns may contain the wildcard characters "%", which matches any character except hierarchy
delimiters, and "*", which matches any character.

As an example, given the folder hierarchy:

```
Personal/
   Finance/
      Stocks
      Bonus
      StockOptions
   Jokes
```

list("*") on "Personal" will return the whole hierarchy.
list("%") on "Personal" will return "Finance" and "Jokes".
list("Jokes") on "Personal" will return "Jokes".
list("Stock*") on "Finance" will return "Stocks" and "StockOptions".

Folder objects are not cached by the Store, so invoking this method on the same pattern multiple times will return that many distinct Folder objects.

This method can be invoked on a closed Folder.

**Parameters:**
- pattern - the match pattern

**Returns:**
- array of matching Folder objects. An empty array is returned if no matching Folders exist.

**Throws:**
- `FolderNotFoundException` - if this folder does not exist.
- `MessagingException`

**See Also:**
- `listSubscribed(java.lang.String)`

---

```java
public Folder[] listSubscribed(String pattern) throws MessagingException
```

Folder Folder Folder
```
   list
```
Folder

```
public Folder[] listSubscribed(String pattern)
    throws MessagingException
```

Returns a list of subscribed Folders belonging to this Folder's namespace that match the specified pattern. If the folder does not support subscription, this method should resolve to `list`. (The default implementation provided here, does just this). The pattern can contain wildcards as for `list`.

Note that, at a given level of the folder hierarchy, a particular folder may not be subscribed, but folders underneath that folder in the folder hierarchy may be subscribed. In order to allow walking the folder hierarchy, such unsubscribed folders may be returned, indicating that a folder lower in the hierarchy is subscribed. The `isSubscribed` method on a folder will tell whether any particular folder is actually subscribed.

Folder objects are not cached by the Store, so invoking this method on the same pattern multiple times will return that many distinct Folder objects.

This method can be invoked on a closed Folder.

**Parameters:**

- `pattern` - the match pattern

**Returns:**
array of matching subscribed Folder objects. An empty array is returned if no matching subscribed folders exist.

**Throws:**
- [FolderNotFoundException](#) - if this folder does not exist.
- [MessagingException](#)

**See Also:**
- [list(java.lang.String)](#)

---

**public Folder[] list() throws MessagingException**

Folder

```
public Folder[] list() throws MessagingException
```

- **Return**
  - Folder Folder
  - Throws [FolderNotFoundException](#): 
    - Throws [MessagingException](#):
  - See also [list](#)

### list

**public Folder[] list()**

```
public Folder[] list() throws MessagingException
```

Convenience method that returns the list of folders under this Folder. This method just calls the list(String pattern) method with "%" as the match pattern. This method can be invoked on a closed Folder.

**Returns:**
- array of Folder objects under this Folder. An empty array is returned if no subfolders exist.

**Throws:**
- [FolderNotFoundException](#) - if this folder does not exist.
- [MessagingException](#)

**See Also:**
- [list(java.lang.String)](#)

---

**public Folder[] listSubscribed() throws MessagingException**

```java
public Folder[] listSubscribed() throws MessagingException
```
listSubscribed

public Folder[] listSubscribed() throws MessagingException

Convenience method that returns the list of subscribed folders under this Folder. This method just calls the listSubscribed(String pattern) method with ")%" as the match pattern. This method can be invoked on a closed Folder.

Returns:
array of subscribed Folder objects under this Folder. An empty array is returned if no subscribed subfolders exist.

Throws:
FolderNotFoundException - if this folder does not exist.
MessagingException

See Also:
listSubscribed(java.lang.String)

abstract public char getSeparator() throws MessagingException

getSeparator

public abstract char getSeparator()
throws MessagingException

Return the delimiter character that separates this Folder's pathname from the names of immediate subfolders. This method can be invoked on a closed Folder.

**Returns:**
Hierarchy separator character

**Throws:**
 FolderNotFoundException - if the implementation requires the folder to exist, but it does not
 MessagingException

---

abstract public int getType() throws MessagingException

Folder Folder

return

Throws
 FolderNotFoundException: 

See also
 HOLDS_FOLDERS, HOLDS_MESSAGES

---

getType

public abstract int getType()

throws MessagingException

Returns the type of this Folder, that is, whether this folder can hold messages or subfolders or both. The returned value is an integer bitfield with the appropriate bits set. This method can be invoked on a closed folder.

**Returns:**
integer with appropriate bits set

**Throws:**
 FolderNotFoundException - if this folder does not exist.
 MessagingException

**See Also:**
 HOLDS_FOLDERS, HOLDS_MESSAGES
abstract public boolean create(int type) throws MessagingException

Store

Folder Store FolderListener CREATED
FolderEvent

type
return true false

Throws MessagingException:

See HOLDs_FOLDERS, HOLDs_MESSAGES,
also javax.mail.event.FolderEvent

create

custom public abstract boolean create(int type)
throws MessagingException

Create this folder on the Store. When this folder is created, any folders in its path that do not exist are also created.

If the creation is successful, a CREATED FolderEvent is delivered to any FolderListeners registered on this Folder and this Store.

Parameters:

type - The type of this folder.

Returns:

ture if the creation succeeds, else false.

Throws:

MessagingException

See Also:

HOLDs_FOLDERS, HOLDs_MESSAGES, FolderEvent

public boolean isSubscribed()

Folder true
Folder

true

    return  Folder  true

isSubscribed

public boolean isSubscribed()

    Returns true if this Folder is subscribed.
    This method can be invoked on a closed Folder.
    The default implementation provided here just returns true.

    Returns:
        true if this Folder is subscribed

public void setSubscribed(boolean subscribe) throws MessagingException
Folder Store

MethodNotSupportedException

    subscribe  true  false
    Throws  FolderNotFoundException:
    Throws  MethodNotSupportedException: Store
    Throws  MessagingException:
public void setSubscribed(boolean subscribe) throws MessagingException

Subscribe or unsubscribe this Folder. Not all Stores support subscription.

This method can be invoked on a closed Folder.

The implementation provided here just throws the MethodNotSupportedException.

Parameters:
subscribe - true to subscribe, false to unsubscribe

Throws:
FolderNotFoundException - if this folder does not exist.
MethodNotSupported Exception - if this store does not support subscription
MessagingException

abstract public boolean hasNewMessages() throws MessagingException

FolderPath true Folder IMAP Folder "" Folder Folder RECENT

Folder

Message Folder

return Store Message true

Throws FolderNotFoundException:
Throws MessagingException:
Returns true if this Folder has new messages since the last time this indication was reset. When this indication is set or reset depends on the Folder implementation (and in the case of IMAP, depends on the server). This method can be used to implement a lightweight "check for new mail" operation on a Folder without opening it. (For example, a thread that monitors a mailbox and flags when it has new mail.) This method should indicate whether any messages in the Folder have the RECENT flag set.

Note that this is not an incremental check for new mail, i.e., it cannot be used to determine whether any new messages have arrived since the last time this method was invoked. To implement incremental checks, the Folder needs to be opened.

This method can be invoked on a closed Folder that can contain Messages.

**Returns:**
true if the Store has new Messages

**Throws:**
FolderNotFoundException - if this folder does not exist.
MessagingException

---

abstract public Folder getFolder(String name) throws MessagingException
Folder Store Folder

Store Folder

Store Folder Folder

Folder

name Folder

return Folder
Throws  MessagingException:

getFolder

public abstract Folder getFolder(String name) throws MessagingException

Return the Folder object corresponding to the given name. Note that this folder does not physically have to exist in the Store. The exists() method on a Folder indicates whether it really exists on the Store.

In some Stores, name can be an absolute path if it starts with the hierarchy delimiter. Otherwise, it is interpreted relative to this Folder.

Folder objects are not cached by the Store, so invoking this method on the same name multiple times will return that many distinct Folder objects.

This method can be invoked on a closed Folder.

Parameters:
name - name of the Folder

Returns:
Folder object

Throws:
MessagingException

abstract public boolean delete(boolean recurse) throws MessagingException
Folder Folder

recurse  true  false

• (type == HOLDS_MESSAGES)
Store  FolderEvent
(type == HOLDS_FOLDERS)
Store FolderEvent
false

Store FolderEvent
3

1. delete() false
2. delete() true exists() true
   Store FolderEvent
3. HOLDS_FOLDERS | HOLDS_MESSAGES
   HOLDS_FOLDERS delete() true
   exists() true
   Store FolderEvent

return Folder true
Throws FolderNotFoundException:
Throws IllegalStateException:
Throws MessagingException:
See also javax.mail.event.FolderEvent

delete

public abstract boolean delete(boolean recurse)
throws MessagingException

Delete this Folder. This method will succeed only on a closed Folder.

The recurse flag controls whether the deletion affects subfolders or not. If true, all subfolders are deleted, then this folder itself is deleted. If false, the behaviour is dependent on the folder type and is elaborated below:
The folder can contain only messages: (type == HOLDS_MESSAGES).
All messages within the folder are removed. The folder itself is then removed. An appropriate FolderEvent is generated by the Store and this folder.

The folder can contain only subfolders: (type == HOLDS_FOLDERS).
If this folder is empty (does not contain any subfolders at all), it is removed. An appropriate FolderEvent is generated by the Store and this folder.
If this folder contains any subfolders, the delete fails and returns false.

The folder can contain subfolders as well as messages:
If the folder is empty (no messages or subfolders), it is removed. If the folder contains no subfolders, but only messages, then all messages are removed. The folder itself is then removed. In both the above cases, an appropriate FolderEvent is generated by the Store and this folder.

If the folder contains subfolders there are 3 possible choices an implementation is free to do:

1. The operation fails, irrespective of whether this folder contains messages or not. Some implementations might elect to go with this simple approach. The delete() method returns false.
2. Any messages within the folder are removed. Subfolders are not removed. The folder itself is not removed or affected in any manner. The delete() method returns true. And the exists() method on this folder will return true indicating that this folder still exists.
   An appropriate FolderEvent is generated by the Store and this folder.
3. Any messages within the folder are removed. Subfolders are not removed. The folder itself changes its type from HOLDS_FOLDERS | HOLDS_MESSAGES to HOLDS_FOLDERS. Thus new messages cannot be added
to this folder, but new subfolders can be created underneath. The delete() method returns true indicating success. The exists() method on this folder will return true indicating that this folder still exists. An appropriate FolderEvent is generated by the Store and this folder.

**Returns:**
true if the Folder is deleted successfully

**Throws:**
- `FolderNotFoundException` - if this folder does not exist
- `IllegalStateException` - if this folder is not in the closed state.
- `MessagingException`

**See Also:**
`FolderEvent`

---

**abstract public boolean renameTo(Folder f) throws MessagingException**

```java
public abstract boolean renameTo(Folder f) throws MessagingException
```

#### Store FolderListener RENAMED FolderEvent

```java
f Folder
return Folder true
```

**Throws**
- `FolderNotFoundException`
- `IllegalStateException`
- `MessagingException`

**See also**
`javax.mail.event.FolderEvent`

---

**renameTo**

```java
public abstract boolean renameTo(Folder f) throws MessagingException
```

Rename this Folder. This method will succeed only on a closed Folder.
If the rename is successful, a RENAMED FolderEvent is delivered to FolderListeners registered on this folder and its containing Store.

**Parameters:**
- `f` - a folder representing the new name for this Folder

**Returns:**
- true if the Folder is renamed successfully

**Throws:**
- `FolderNotFoundException` - if this folder does not exist
- `IllegalStateException` - if this folder is not in the closed state.
- `MessagingException` -

**See Also:**
- `FolderEvent`

---

abstract public void open(int mode) throws `MessagingException`

Folder Message Folder

Folder ConnectionListener OPENED
ConnectionEvent

Store

- `mode`:
  - Folder READ_ONLY
  - READ_WRITE

Throws
- `FolderNotFoundException`:

Throws
- `IllegalStateException`:

Throws
- `MessagingException`:

See
- `READ_ONLY`, `READ_WRITE`, `getType()`, `javax.mail.event.ConnectionEvent`

also

---

open

public abstract void open(int mode)

throws `MessagingException`

Open this Folder. This method is valid only on Folders that can
contain Messages and that are closed.

If this folder is opened successfully, an OPENED ConnectionEvent is delivered to any ConnectionListeners registered on this Folder.

The effect of opening multiple connections to the same folder on a specific Store is implementation dependent. Some implementations allow multiple readers, but only one writer. Others allow multiple writers as well as readers.

**Parameters:**
- mode - open the Folder READ_ONLY or READ_WRITE

**Throws:**
- `FolderNotFoundException` - if this folder does not exist.
- `IllegalStateException` - if this folder is not in the closed state.
- `MessagingException`

**See Also:**
- `READ_ONLY`, `READ_WRITE`, `getType()`, `ConnectionEvent`

---

abstract public void close(boolean expunge) throws `MessagingException`

Folder Folder

Folder ConnectionListener CLOSED
ConnectionEvent MessagingException

expunge   ture
Throws    IllegalStateException:
Throws    `MessagingException`:
See also   `javax.mail.event.ConnectionEvent`

---

close

public abstract void close(boolean expunge) throws `MessagingException`
Close this Folder. This method is valid only on open Folders.

A CLOSED ConnectionEvent is delivered to any ConnectionListeners registered on this Folder. Note that the folder is closed even if this method terminates abnormally by throwing a MessagingException.

**Parameters:**
- expunge - expunges all deleted messages if this flag is true

**Throws:**
- `IllegalStateException` - if this folder is not opened
- `MessagingException`

**See Also:**
- `ConnectionEvent`

---

```java
abstract public boolean isOpen()
Folder 'open'
return Folder 'open' true
```

**isOpen**

```java
public abstract boolean isOpen()
```

Indicates whether this Folder is in the 'open' state.

**Returns:**
- true if this Folder is in the 'open' state.

---

```java
public int getMode()
```

 Returns: 
- `Folder.READ_ONLY`
- `Folder.READ_WRITE`
- `-1`

**Throws**
- `IllegalStateException:`

return since JavaMail 1.1
- en
**getMode**

```java
class Folder {
    public int getMode() {
        return null;
    }
}
```

**Returns:**
the open mode of this folder

**Throws:**
`IllegalStateException` - if this folder is not opened

**Since:**
JavaMail 1.1

---

**abstract public Flags getPermanentFlags()**

```java
public abstract Flags getPermanentFlags() {
    return null;
}
```

Get the permanent flags supported by this Folder. Returns a Flags object that contains all the flags supported.

The special flag `Flags.USER` indicates that this Folder supports arbitrary user-defined flags.

The supported permanent flags for a folder may not be available until
the folder is opened.

**Returns:**
permanent flags, or null if not known

```java
abstract public int getMessageCount() throws MessagingException
Folder

Folder -1

-1

    return -1

Throws FolderNotFoundException:
Throws MessagingException:
```

**getMessageCount**

```java
public abstract int getMessageCount() throws MessagingException
```

Get total number of messages in this Folder.

This method can be invoked on a closed folder. However, note that for some folder implementations, getting the total message count can be an expensive operation involving actually opening the folder. In such cases, a provider can choose not to support this functionality in the closed state, in which case this method must return -1.

Clients invoking this method on a closed folder must be aware that this is a potentially expensive operation. Clients must also be prepared to handle a return value of -1 in this case.

**Returns:**
total number of messages. -1 may be returned by certain
implementations if this method is invoked on a closed folder.

Throws:
- `FolderNotFoundException` - if this folder does not exist.
- `MessagingException`

---

```java
public int getNewMessageCount() throws MessagingException
```

Get the number of new messages in this Folder.

This method can be invoked on a closed folder. However, note that for some folder implementations, getting the new message count can be an expensive operation involving actually opening the folder. In such cases, a provider can choose not to support this functionality in the closed state, in which case this method must return -1.

Clients invoking this method on a closed folder must be aware that this is a potentially expensive operation. Clients must also be prepared to handle a return value of -1 in this case.
This implementation returns -1 if this folder is closed. Else this implementation gets each Message in the folder using getMessage(int) and checks whether its RECENT flag is set. The total number of messages that have this flag set is returned.

**Returns:**
number of new messages. -1 may be returned by certain implementations if this method is invoked on a closed folder.

**Throws:**
- `FolderNotFoundException` - if this folder does not exist.
- `MessagingException` -

```java
public int getUnreadMessageCount() throws MessagingException
{
    Folder
    Folder

    int

    return -1

    getUnreadMessageCount() throws MessagingException
{
    Get the total number of unread messages in this Folder.

    This method can be invoked on a closed folder. However, note that for some folder implementations, getting the unread message count can be an expensive operation involving actually opening the folder.
```
In such cases, a provider can choose not to support this functionality in the closed state, in which case this method must return -1.

Clients invoking this method on a closed folder must be aware that this is a potentially expensive operation. Clients must also be prepared to handle a return value of -1 in this case.

This implementation returns -1 if this folder is closed. Else this implementation gets each Message in the folder using getMessage(int) and checks whether its SEEN flag is set. The total number of messages that do not have this flag set is returned.

Returns:
  total number of unread messages. -1 may be returned by certain implementations if this method is invoked on a closed folder.

Throws:
  FolderNotFoundException - if this folder does not exist.
  MessagingException

```java
public int getDeletedMessageCount() throws MessagingException
{
    return -1;
}
```

\]

getMessage

public abstract Message getMessage(int msgnum) throws MessagingException

Get the Message object corresponding to the given message number. A Message object's message number is the relative position of this Message in its Folder. Messages are numbered starting at 1 through the total number of message in the folder. Note that the message number for a particular Message can change during a session if other messages in the Folder are deleted and the Folder is expunged.

Message objects are light-weight references to the actual message that get filled up on demand. Hence Folder implementations are expected to provide light-weight Message objects.

Unlike Folder objects, repeated calls to getMessage with the same message number will return the same Message object, as long as no messages in this folder have been expunged.

Since message numbers can change within a session if the folder is expunged, clients are advised not to use message numbers as references to messages. Use Message objects instead.
Parameters:
   msgnum - the message number

Returns:
   the Message object

Throws:
   FolderNotFoundException - if this folder does not exist.
   IllegalStateException - if this folder is not opened
   IndexOutOfBoundsException - if the message number is out of range.
   MessagingException

public Message[] getMessages(int start, int end) throws MessagingException

getMessage(index) Message

Message Folder Message

getMessages
public Message[] getMessages(int start, int end) throws MessagingException

Get the Message objects for message numbers ranging from start through end, both start and end inclusive. Note that message numbers start at 1, not 0.

Message objects are light-weight references to the actual message that get filled up on demand. Hence Folder implementations are expected to provide light-weight Message objects.

This implementation uses getMessage(index) to obtain the required Message objects. Note that the returned array must contain (end-start+1) Message objects.

Parameters:
  start - the number of the first message
  end - the number of the last message

Returns:
  the Message objects

Throws:
  FolderNotFoundException - if this folder does not exist.
  IllegalStateException - if this folder is not opened.
  IndexOutOfBoundsException - if the start or end message numbers are out of range.
  MessagingException

Message

Message Folder Message

getMessage(index) Message
Message
getMessages

public Message[] getMessages(int[] msgnums)
throws MessagingException

Get the Message objects for message numbers specified in the array.

Message objects are light-weight references to the actual message that get filled up on demand. Hence Folder implementations are expected to provide light-weight Message objects.

This implementation uses getMessage(index) to obtain the required Message objects. Note that the returned array must contain msgnums.length Message objects.

Parameters:
msgnums - the array of message numbers

Returns:
the array of Message objects.

Throws:
FolderNotFoundException - if this folder does not exist.
IllegalStateException - if this folder is not opened.
IndexOutOfBoundsException - if any message number in the given array is out of range.
MessagingException

getMessages

public Message[] getMessages()
throws MessagingException

Get all Message objects from this Folder. Returns an empty array if the folder is empty. Clients can use Message objects (instead of sequence numbers) as references to the messages within a folder; this method supplies the Message objects to the client. Folder implementations are expected to provide light-weight Message objects, which get filled on demand.

This implementation invokes getMessageCount() to get the current message count and then uses getMessage() to get Message objects from 1 till the message count.

Returns: array of Message objects, empty array if folder is empty.
Throws:
FolderNotFoundException - if this folder does not exist.
IllegalStateException - if this folder is not opened.
MessagingException
See Also:
abstract public void appendMessages(Message[] msgs) throws MessagingException
Message Folder MessageCountListener MessageCountEvent

Message Message
msgs Message
Throws FolderNotFoundException:
Throws MessagingException:

appendMessages

public abstract void appendMessages(Message[] msgs) throws MessagingException

Append given Messages to this folder. This method can be invoked on a closed Folder. An appropriate MessageCountEvent is delivered to any MessageCountListener registered on this folder when the messages arrive in the folder.

Folder implementations must not abort this operation if a Message in the given message array turns out to be an expunged Message.

Parameters:
msgs - array of Messages to be appended

Throws:
FolderNotFoundException - if this folder does not exist.
MessagingException - if the append failed.

public void fetch(Message[] msgs, FetchProfile fp) throws MessagingException
Message FetchProfile
SubjectFrom X-mailer

Message[] msgs = folder.getMessages();

FetchProfile fp = new FetchProfile();
fp.add(FetchProfile.Item.ENVELOPE);
fp.add("X-mailer");
folder.fetch(msgs, fp);

for (int i = 0; i < folder.getMessageCount(); i++) {
display(msg[i].getFrom());
display(msg[i].getSubject());
display(msg[i].getHeader("X-mailer"));
}

fetch

public void fetch(Message[] msgs,
                FetchProfile fp)
    throws MessagingException

Prefetch the items specified in the FetchProfile for the given Messages.

Clients use this method to indicate that the specified items are
needed en-masse for the given message range. Implementations
are expected to retrieve these items for the given message range in
an efficient manner. Note that this method is just a hint to the
implementation to prefetch the desired items.

An example is a client filling its header-view window with the Subject, From and X-mailer headers for all messages in the folder.

```java
Message[] msgs = folder.getMessage();
FetchProfile fp = new FetchProfile();
fp.add(FetchProfile.Item.ENVELOPE);
fp.add("X-mailer");
folder.fetch(msgs, fp);
for (int i = 0; i < folder.getMessageCount(); i++) {
    display(msg[i].getFrom());
    display(msg[i].getSubject());
    display(msg[i].getHeader("X-mailer"));
}
```

The implementation provided here just returns without doing anything useful. Providers wanting to provide a real implementation for this method should override this method.

**Parameters:**
- `msgs` - fetch items for these messages
- `fp` - the FetchProfile

**Throws:**
- `IllegalStateException` - if this folder is not opened
- `MessagingException` - if this folder is not opened

```java
public void setFlags(Message[] msgs, Flags flag, boolean value) throws MessagingException
Message MessageChangedListener
MessageMessageChangedEvent
```

```java
Message Folder Flag Message
Message.setFlags
```
setFlags

```java
public void setFlags(Message[] msgs,
                      Flags flag,
                      boolean value)
throws MessagingException
```

Set the specified flags on the messages specified in the array. This will result in appropriate MessageChangedEvents being delivered to any MessageChangedListener registered on this Message's containing folder.

Note that the specified Message objects **must** belong to this folder. Certain Folder implementations can optimize the operation of setting Flags for a group of messages, so clients might want to use this method, rather than invoking `Message.setFlags` for each Message.

This implementation degenerates to invoking `setFlags()` on each Message object. Specific Folder implementations that can optimize this case should do so. Also, an implementation must not abort the operation if a Message in the array turns out to be an expunged Message.

**Parameters:**
- `msgs` - the array of message objects
- `flag` - Flags object containing the flags to be set
- `value` - set the flags to this boolean value

**Throws:**

- `IllegalStateException`: READ_ONLY
- `MessagingException`
IllegalStateException - if this folder is not opened or if it has been opened READ_ONLY.
MessagingException

Throws IndexOutOfBoundsException:

Throws MessagingException:

See also setFlags, javax.mail.event.MessageChangedEvent

setFlags

public void setFlags(int start,
int end,
Flags flag,
boolean value)
throws MessagingException

Set the specified flags on the messages numbered from start
through end, both start and end inclusive. Note that message numbers start at 1, not 0. This will result in appropriate MessageChangedEvents being delivered to any MessageChangedListener registered on this Message's containing folder.

Certain Folder implementations can optimize the operation of setting Flags for a group of messages, so clients might want to use this method, rather than invoking Message.setFlags for each Message.

The default implementation uses getMessage(int) to get each Message object and then invokes setFlags on that object to set the flags. Specific Folder implementations that can optimize this case should do so. Also, an implementation must not abort the operation if a message number refers to an expunged message.

Parameters:
- start - the number of the first message
- end - the number of the last message
- flag - Flags object containing the flags to be set
- value - set the flags to this boolean value

Throws:
- IllegalStateException - if this folder is not opened or if it has been opened READ_ONLY.
- IndexOutOfBoundsException - if the start or end message numbers are out of range.
- MessagingException

See Also:
- Message.setFlags(javax.mail.Flags, boolean)
- MessageChangedEvent

```java
public void setFlags(int[] msgnums, Flags flag, boolean value) throws MessagingException
```

Folder  Flag  Message
**setFlags**

```java
public void setFlags(int[] msgnums, Flags flag, boolean value)
    throws MessagingException
```

Set the specified flags on the messages whose message numbers are in the array. This will result in appropriate MessageChangedEvents being delivered to any MessageChangedListener registered on this Message's containing folder.

Certain Folder implementations can optimize the operation of setting Flags for a group of messages, so clients might want to use this method, rather than invoking `Message.setFlags` for each Message.

The default implementation uses `getMessage(int)` to get each `Message` object and then invokes `setFlags` on that object to set the flags. Specific Folder implementations that can optimize this case should do so. Also, an implementation must not abort the operation if a message number refers to an expunged message.

**Parameters:**
- `msgnums` - the array of message numbers
- `flag` - Flags object containing the flags to be set
- `value` - set the flags to this boolean value
Throws:

- `IllegalStateException` - if this folder is not opened or if it has been opened READ_ONLY.
- `IndexOutOfBoundsException` - if any message number in the given array is out of range.
- `MessagingException`

See Also:

- `Message.setFlags(javax.mail.Flags, boolean)`
- `MessageChangedEvent`

```java
public void copyMessages(Message[] msgs, Folder folder)
    throws MessagingException
```

Copy the specified Messages from this Folder into another Folder. This operation appends these Messages to the destination Folder.
The destination Folder does not have to be opened. An appropriate MessageCountEvent is delivered to any MessageCountListener registered on the destination folder when the messages arrive in the folder.

Note that the specified Message objects must belong to this folder. Folder implementations might be able to optimize this method by doing server-side copies.

This implementation just invokes appendMessages() on the destination folder to append the given Messages. Specific folder implementations that support server-side copies should do so, if the destination folder's Store is the same as this folder's Store. Also, an implementation must not abort the operation if a Message in the array turns out to be an expunged Message.

Parameters:
- msgs - the array of message objects
- folder - the folder to copy the messages to

Throws:
- FolderNotFoundException - if the destination folder does not exist.
- IllegalStateException - if this folder is not opened.
- MessagingException

See Also:
appendMessages(javax.mail.Message[])
expunge

public abstract Message[] expunge()
throws MessagingException

Expunge (permanently remove) messages marked DELETED. Returns an array containing the expunged message objects. The getMessageNumber method on each of these message objects returns that Message's original (that is, prior to the expunge) sequence number. A MessageCountEvent containing the expunged messages is delivered to any MessageCountListeners registered on the folder.

Expunge causes the renumbering of Message objects subsequent to the expunged messages. Clients that use message numbers as references to messages should be aware of this and should be prepared to deal with the situation (probably by flushing out existing message number caches and reloading them). Because of this complexity, it is better for clients to use Message objects as references to messages, rather than message numbers. Any expunged Messages objects still have to be pruned, but other Messages in that folder are not affected by the expunge.

After a message is expunged, only the isExpunged and getMessageNumber methods are still valid on the corresponding Message object; other methods may throw MessageRemovedException

Returns: array of expunged Message objects
Throws: FolderNotFoundException - if this folder does not exist
public Message[] search(SearchTerm term) throws MessagingException

Folder

search(term, getMessages())

term

return

Throws SearchException:

Throws FolderNotFoundException:

Throws IllegalStateException:

Throws MessagingException:

See also javax.mail.search.SearchTerm

search

public Message[] search(SearchTerm term) throws MessagingException

Search this Folder for messages matching the specified search criterion. Returns an array containing the matching messages. Returns an empty array if no matches were found.

This implementation invokes search(term, getMessages()), to apply the search over all the messages in this folder. Providers that can implement server-side searching might want to override this method to provide a more efficient implementation.

Parameters:

term - the search criterion

Returns:
array of matching messages

Throws:

SearchException - if the search term is too complex for the implementation to handle.

NotFoundException - if this folder does not exist.

IllegalStateException - if this folder is not opened.

MessagingException

super.search()

term

msgs

return

Throws SearchException:

IllegalStateException:

MessagingException:

See also javax.mail.search.SearchTerm

search

public Message[] search(SearchTerm term, Message[] msgs) throws MessagingException

Search the given array of messages for those that match the specified search criterion. Returns an array containing the matching messages. Returns an empty array if no matches were found.
Note that the specified Message objects **must** belong to this folder.

This implementation iterates through the given array of messages, and applies the search criterion on each message by calling its `match()` method with the given term. The messages that succeed in the match are returned. Providers that can implement server-side searching might want to override this method to provide a more efficient implementation. If the search term is too complex or contains user-defined terms that cannot be executed on the server, providers may elect to either throw a `SearchException` or degenerate to client-side searching by calling `super.search()` to invoke this implementation.

**Parameters:**
- **term** - the search criterion
- **msgs** - the messages to be searched

**Returns:**
array of matching messages

**Throws:**
- `SearchException` - if the search term is too complex for the implementation to handle.
- `IllegalStateException` - if this folder is not opened
- `MessagingException`

**See Also:**
- `SearchTerm`

**addFolderListener**
public void addFolderListener(FolderListener l)

Add a listener for Folder events on this Folder.

The implementation provided here adds this listener to an internal list of FolderListeners.

Parameters:
- l - the Listener for Folder events

See Also:
FolderEvent

public void removeFolderListener(FolderListener l)

Remove a Folder event listener.

The implementation provided here removes this listener from the internal list of FolderListeners.

Parameters:
- l - the listener

See Also:
addFolderListener(javax.mail.event.FolderListener)

protected void notifyFolderListeners(int type)

Folder Store FolderListener Folder
notifyFolderListeners

protected void notifyFolderListeners(int type)

Notify all FolderListeners registered on this Folder and this folder's Store. Folder implementations are expected to use this method to broadcast Folder events.

The implementation provided here queues the event into an internal event queue. An event dispatcher thread dequeues events from the queue and dispatches them to the FolderListeners registered on this folder. The implementation also invokes notifyFolderListeners on this folder's Store to notify any FolderListeners registered on the store.

Parameters:

type - type of FolderEvent

See Also:

notifyFolderRenamedListeners(javax.mail.Folder)

protected void notifyFolderRenamedListeners(Folder folder)

FolderListener Store
notifyFolderRenamedListeners Store FolderListener
since

JavaMail 1.1
See also notifyFolderListeners

**notifyFolderRenamedListeners**

```java
protected void notifyFolderRenamedListeners(Folder folder)
```

Notify all FolderListeners registered on this Folder and this folder's Store about the renaming of this folder. Folder implementations are expected to use this method to broadcast Folder events indicating the renaming of folders.

The implementation provided here queues the event into an internal event queue. An event dispatcher thread dequeues events from the queue and dispatches them to the FolderListeners registered on this folder. The implementation also invokes `notifyFolderRenamedListeners` on this folder's Store to notify any FolderListeners registered on the store.

**Parameters:**

- `folder` - Folder representing the new name.

**Since:**

JavaMail 1.1

**See Also:**

addMessageCountListener

public void addMessageCountListener(MessageCountListener l)

Add a listener for MessageCount events on this Folder.

The implementation provided here adds this listener to an internal list of MessageCountListeners.

Parameters:
   l - the Listener for MessageCount events

See Also: MessageCountEvent

public void removeMessageCountListener(MessageCountListener l)

Remove a MessageCount listener.

The implementation provided here removes this listener from the internal list of MessageCountListeners.

Parameters:
   l - the listener

See Also: addMessageCountListener(javax.mail.event.MessageCountListener)
protected void notifyMessageAddedListeners(Message[] msgs)
MessageCountListener MessageCountListener

notifyMessageAddedListeners

protected void notifyMessageAddedListeners(Message[] msgs)

Notify all MessageCountListeners about the addition of messages into this folder. Folder implementations are expected to use this method to broadcast MessageCount events for indicating arrival of new messages.

The provided implementation queues the event into an internal event queue. An event dispatcher thread dequeues events from the queue and dispatches them to the registered MessageCountListeners. Note that the event dispatching occurs in a separate thread, thus avoiding potential deadlock problems.

protected void notifyMessageRemovedListeners(boolean removed, Message[] msgs)
MessageCountListener Folder MessageCount

MessageCountListener

notifyMessageRemovedListeners

protected void notifyMessageRemovedListeners(boolean removed, Message[] msgs)
Notify all MessageCountListeners about the removal of messages from this Folder. Folder implementations are expected to use this method to broadcast MessageCount events indicating removal of messages.

The provided implementation queues the event into an internal event queue. An event dispatcher thread dequeues events from the queue and dispatches them to the registered MessageCountListeners. Note that the event dispatching occurs in a separate thread, thus avoiding potential deadlock problems.

---

```java
public class FolderClosedException extends MessagingException

**Extends:** Throwable > Exception > MessagingException

Messaging Folder

Folder "closed" Folder Messaging "open" Folder

getAddress()
```

This exception is thrown when a method is invoked on a Messaging object and the Folder that owns that object has died due to some reason.

Following the exception, the Folder is reset to the "closed" state. All messaging objects owned by the Folder should be considered invalid. The Folder can be reopened using the "open" method to reestablish the lost connection.

The `getAddress()` method returns more detailed information about the error that caused this exception.

Folder Store

Store Folder IMAP

This class models Folder existence events. FolderEvents are delivered to FolderListeners registered on the affected Folder as well as the containing Store.

Service providers vary widely in their ability to notify clients of these events. At a minimum, service providers must notify listeners registered on the same Store or Folder object on which the operation occurs. Service providers may also notify listeners when changes are made through operations on other objects in the same virtual machine, or by other clients in the same or other hosts. Such notifications are not required and are typically not supported by mail protocols (including IMAP).

Constructor Summary

FolderEvent(Object source, Folder oldFolder, Folder newFolder, int type)

Constructor.

FolderEvent(Object source, Folder folder, int type)

Constructor.

---

Method Summary

void dispatch(Object listener)

Invokes the appropriate FolderListener method

Folder getFolder()
Return the affected folder.

**Folder.getNewFolder()**

If this event indicates that a folder is renamed, (i.e, the event type is RENAMED), then this method returns the Folder object representing the new name.

**Folder.getType()**

Return the type of this event.

**Methods inherited from class java.util.EventObject**

getSource, toString

**Methods inherited from class java.lang.Object**

clone, equals, finalize, getClass, hashCode, notify, notifyAll, wait, wait, wait

Constant Field Values

---

type

protected int type

The event type.

---

folder

protected transient Folder folder

The folder the event occurred on.

---

newFolder

protected transient Folder newFolder
The folder that represents the new name, in case of a RENAMED event.

Since:
JavaMail 1.1

Constructor Detail

public FolderEvent(Object source, Folder folder, int type)

Parameters:
source - The source of the event
folder - The affected folder
type - The event type

public FolderEvent(Object source, Folder oldFolder, Folder newFolder, int type)

RENAME
FolderEvent

public FolderEvent(Object source, Folder oldFolder, Folder newFolder, int type)

Constructor. Use for RENAMED events.

Parameters:
- source - The source of the event
- oldFolder - The folder that is renamed
- newFolder - The folder that represents the new name
- type - The event type

Since: JavaMail 1.1

Method Detail

public int getType()

    return

g getType

public int getType()

    Return the type of this event.

    Returns:
    type
public Folder getFolder()

    return
See also getNewFolder

getFolder

public Folder getFolder()

    Return the affected folder.

    Returns:
    the affected folder
See Also:
    getNewFolder()

public Folder getNewFolder()
RENAMED Folder

getFolder()

    return
since JavaMail 1.1
See also getFolder

getNewFolder

public Folder getNewFolder()

    If this event indicates that a folder is renamed, (i.e, the event type is
RENAMED), then this method returns the Folder object representing
the new name.

    The getFolder() method returns the folder that is renamed.
public void dispatch(Object listener)
FolderListener

dispatch

public void dispatch(Object listener)

Invokes the appropriate FolderListener method

Specified by: dispatch in class MailEvent
javax.mail.event Interface FolderListener

All Superinterfaces:
   EventListener

All Known Implementing Classes:
   FolderAdapter

public interface FolderListener

extends EventListener

Implements: java.util.EventListener
Implemented by: FolderAdapter

Folder Listener

This is the Listener interface for Folder events.

**FolderNotFoundException**

**public FolderNotFoundException()**

Constructs a MessagingException with no detail message.

---

**public FolderNotFoundException(Folder folder)**

---
MessagingException

folder - Folder
since JavaMail 1.2

FolderNotFoundException

public FolderNotFoundException(Folder folder)

Constructs a MessagingException with the specified folder.

Parameters:
folder - the Folder

Since:
JavaMail 1.2

public FolderNotFoundException(Folder folder, String s)
MessagingException

folder - Folder
s - String
since JavaMail 1.2

FolderNotFoundException

public FolderNotFoundException(Folder folder, String s)

Constructs a MessagingException with the specified folder and the specified detail message.

Parameters:
folder - the Folder
s - the detail message

Since:
JavaMail 1.2
public FolderNotFoundException(String s, Folder folder)  
    MessagingException

    public FolderNotFoundException(String s, Folder folder)

    Constructs a MessagingException with the specified detail message and the specified folder.

    Parameters:
    s - the detail message
    folder - the Folder

    getFolder

    public Folder getFolder()

    Returns the offending Folder object.

    Returns:
    the Folder object. Note that the returned value can be null.

**public FromFromStringTerm(String pattern)**

- `pattern`
FromStringTerm

public FromStringTerm(String pattern)

Constructor.

Parameters:
  pattern - the address pattern to be compared.

Method Detail

public boolean match(Message msg)

Check whether the address string specified in the constructor is a substring of the From address of this Message.

Specified by:
  match in class SearchTerm

Parameters:
  msg - The comparison is applied to this Message's From address.

Returns:
  true if the match succeeds, otherwise false.

public boolean equals(Object obj)
public boolean equals(Object obj)

Equality comparison.

Overrides:

equals in class AddressStringTerm
javax.mail.search  Class FromTerm

java.lang.Object

Constructor Detail

public FunctionMapper()

FunctionMapper

public FunctionMapper()

Method Detail

abstract public Method resolveFunction(String prefix, String localName)

java.lang.Method

null

prefix ""

localName

return

resolveFunction

public abstract Method resolveFunction(String prefix, String localName)

Resolves the specified prefix and local name into a java.lang.Method.

Returns null if no function could be found that matches the given
prefix and local name.

**Parameters:**
- `prefix` - the prefix of the function, or "" if no prefix. For example, "fn" in `${fn:method()}`, or "" in `${method()}`.
- `localName` - the short name of the function. For example, "method" in `${fn:method()}`.

**Returns:**
- the static method to invoke, or `null` if no match was found.
| SUMMARY: NESTED | FIELD | CONSTR | METHOD |
| FRAMES: NO FRAMES | DETAIL: FIELD | CONSTR | METHOD |
**Interface FunctionMapper**

**Deprecated. As of JSP 2.1, replaced by FunctionMapper**

The interface to a map between EL function names and methods.

Classes implementing this interface may, for instance, consult tag library information to resolve the map.

**Since:**

JSP 2.0

### Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>resolveFunction</strong></td>
<td>(String prefix, String localName)</td>
</tr>
</tbody>
</table>

**Deprecated.** Resolves the specified local name and prefix into a `Java.lang.Method`.

### Method Detail

```java
public Method resolveFunction(String prefix, String localName) {
    // Implementation
    return null;
}
```
resolveFunction

Method resolveFunction(String prefix, String localName)

Deprecated.
Resolves the specified local name and prefix into a Java.lang.Method. Returns null if the prefix and local name are not found.

Parameters:
prefix - the prefix of the function, or "" if no prefix.
localName - the short name of the function

Returns:
the result of the method mapping. Null means no entry found.
javax.annotation  Annotation Type Generated

@Documented
@Retention(value=SOURCE)
@Target(value={PACKAGE, TYPE, ANNOTATION_TYPE, METHOD, CONSTRUCTOR, FIELD, LOCAL_VARIABLE, PARAMETER})

public @interface Generated

<table>
<thead>
<tr>
<th>Implements: Annotation</th>
</tr>
</thead>
</table>
@Documented
@Retention(value=SOURCE)
@Target(value={PACKAGE, TYPE, ANNOTATION_TYPE, METHOD, CONSTRUCTOR, FIELD, LOCAL_VARIABLE, PARAMETER})

Generated com.company.package.classname

since 1.0

The Generated annotation is used to mark source code that has been generated. It can also be used to differentiate user written code from generated code in a single file. When used, the value element must have the name of the code generator. The recommended convention is to use the fully qualified name of the code generator in the value field. For example: com.company.package.classname. The date element is used to indicate the date the source was generated. The date element must follow the ISO 8601 standard. For example the date element would have the following value 2001-07-04T12:08:56.235-0700 which represents 2001-07-04 12:08:56 local time in the U.S. Pacific Time time zone. The comment element is a place holder for any comments that the code generator may want to include in the generated code.

Since: 1.0

Required Element Summary
This is used by the code generator to mark the generated classes and methods.

### Optional Element Summary

<table>
<thead>
<tr>
<th>Element</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comments</td>
<td>String</td>
<td>A place holder for any comments that the code generator may want to include in the generated code.</td>
</tr>
<tr>
<td>date</td>
<td>String</td>
<td>Date when the source was generated.</td>
</tr>
</tbody>
</table>

### Element Detail

**abstract public String[] value()**

**value**

```java
public abstract String[] value
```

This is used by the code generator to mark the generated classes and methods.

**abstract public String date()**

**date**

```java
public abstract String date
```

Date when the source was generated.
abstract public String comments()

comments

public abstract String comments

A place holder for any comments that the code generator may want to include in the generated code.

Default:

""

PS: 
### javax.persistence Annotation Type GeneratedValue

@Target(value={METHOD, FIELD})
@Retention(value=RUNTIME)
public @interface GeneratedValue

**Implements:** Annotation

@Target(value={METHOD, FIELD})
@Retention(value=RUNTIME)

```java
GeneratedValue

1

@Id
@GeneratedValue(strategy=SEQUENCE, generator="CUST_SEQ")
@Column(name="CUST_ID")
public Long getId() { return id; }
```

2

```java
@Id
@GeneratedValue(strategy=TABLE, generator="CUST_GEN")
@Column(name="CUST_ID")
Long id;
```

**since** Java Persistence 1.0

Provides for the specification of generation strategies for the values of primary keys. The `GeneratedValue` annotation may be applied to a primary key property or field of an entity or mapped superclass in conjunction with the `Id` annotation.

**Example 1:**

```java
@Id
@GeneratedValue(strategy=SEQUENCE, generator="CUST_SEQ")
@Column(name="CUST_ID")
```
public Long getId() { return id; }

Example 2:

@Id
@GeneratedValue(strategy=TABLE, generator="CUST_GEN")
@Column(name="CUST_ID")
Long id;

Since:
Java Persistence 1.0

---

Optional Element Summary

<table>
<thead>
<tr>
<th>generator</th>
<th>(Optional) The name of the primary key generator to use as specified in the SequenceGenerator or TableGenerator annotation.</th>
</tr>
</thead>
<tbody>
<tr>
<td>strategy</td>
<td>(Optional) The primary key generation strategy that the persistence provider must use to generate the annotated entity primary key.</td>
</tr>
</tbody>
</table>

abstract public GenerationType strategy()

strategy

public abstract GenerationType strategy

(Optional) The primary key generation strategy that the persistence provider must use to generate the annotated entity primary key.

Default:
AUTO
abstract public String generator()

  SequenceGenerator  TableGenerator

ID

generator

public abstract String generator

  (Optional) The name of the primary key generator to use as specified in the SequenceGenerator or TableGenerator annotation.

  Defaults to the id generator supplied by persistence provider.

  Default: ""

<tbody>
<tr>
<td>IDENTITY</td>
<td>Indicates that the persistence provider must assign primary keys for the entity using database identity column.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Sequence</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>SEQUENCE</td>
<td>Indicates that the persistence provider must assign primary keys for the entity using database sequence column.</td>
</tr>
</tbody>
</table>
Indicates that the persistence provider must assign primary keys for the entity using an underlying database table to ensure uniqueness.

### Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>valueOf(String name)</code></td>
<td>Returns the enum constant of this type with the specified name.</td>
</tr>
<tr>
<td><code>values()</code></td>
<td>Returns an array containing the constants of this enum type, in the order they're declared.</td>
</tr>
</tbody>
</table>

Methods inherited from class `java.lang.Enum`:
- `clone`, `compareTo`, `equals`, `getDeclaringClass`, `hashCode`, `name`, `ordinal`, `toString`, `valueOf`

Methods inherited from class `java.lang.Object`:
- `finalize`, `getClass`, `notify`, `notifyAll`, `wait`, `wait`, `wait`

### Enum Constant Detail

TABLE

```java
public static final GenerationType TABLE
```

Indicates that the persistence provider must assign primary keys for the entity using an underlying database table to ensure uniqueness.

SEQUENCE
public static final GenerationType SEQUENCE

Indicates that the persistence provider must assign primary keys for the entity using database sequence column.

IDENTITY

public static final GenerationType IDENTITY

Indicates that the persistence provider must assign primary keys for the entity using database identity column.

AUTO

public static final GenerationType AUTO

Indicates that the persistence provider should pick an appropriate strategy for the particular database. The AUTO generation strategy may expect a database resource to exist, or it may attempt to create one. A vendor may provide documentation on how to create such resources in the event that it does not support schema generation or cannot create the schema resource at runtime.

Method Detail

final public static GenerationType[] values()
Returns an array containing the constants of this enum type, in the order they're declared. This method may be used to iterate over the constants as follows:

```java
for(GenerationType c : GenerationType.values())
    System.out.println(c);
```

**Returns:**
- an array containing the constants of this enum type, in the order they're declared

---

**public static GenerationTypevalueOf(String name)**

`valueOf` method is used to get an enum constant of this type with the specified name. The string must match *exactly* an identifier used to declare an enum constant in this type. (Extraneous whitespace characters are not permitted.)

**Parameters:**
- `name` - the name of the enum constant to be returned.

**Returns:**
- the enum constant with the specified name

**Throws:**
- `IllegalArgumentException` - if this enum type has no constant with the specified name
PS:
javax.resource.spi.security Interface GenericCredential

**Deprecated.** The preferred way to represent generic credential information is via the `org.ietf.jgss.GSSCredential` interface in J2SE Version 1.4, which provides similar functionality.

```java
class GenericCredential
```

- EIS GenericCredential EIS
- EIS GSS-API GSS-API

**version** 0.7
**since** 0.7
**deprecated**

The preferred way to represent generic credential information is via the `org.ietf.jgss.GSSCredential` interface in J2SE Version 1.4, which provides similar functionality.

**See also** `javax.security.auth.Subject`, `java.security.Principal`

The interface `javax.resource.spi.security.GenericCredential` defines a security mechanism independent interface for accessing security credential of a resource principal.

The `GenericCredential` interface provides a Java wrapper over an underlying mechanism specific representation of a security credential. For example, the `GenericCredential` interface can be used to wrap...
Kerberos credentials.

The connector architecture does not define any standard format and requirements for security mechanism specific credentials. For example, a security credential wrapped by a GenericCredential interface can have a native representation specific to an operating system.

The GenericCredential interface enables a resource adapter to extract information about a security credential. The resource adapter can then manage EIS sign-on for a resource principal by either:

- using the credentials in an EIS specific manner if the underlying EIS supports the security mechanism type represented by the GenericCredential instance, or,
- using GSS-API if the resource adapter and underlying EIS instance support GSS-API.

**Since:** 0.7

**Version:** 0.7

### Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>equals(Object another)</code></td>
<td><strong>Deprecated.</strong> Tests if this GenericCredential instance refers to the same entity as the supplied object.</td>
</tr>
<tr>
<td><code>getCredentialData()</code></td>
<td><strong>Deprecated.</strong> Gets security data for a specific security mechanism represented by the GenericCredential.</td>
</tr>
<tr>
<td><code>getMechType()</code></td>
<td><strong>Deprecated.</strong> Returns the mechanism type for the GenericCredential instance.</td>
</tr>
</tbody>
</table>
### Method Detail

#### public String getName()

```java
GenericCredential
return
```

**getName**

```java
String getName()
```

**Deprecated.** Returns the name of the resource principal associated with a `GenericCredential` instance.

**Returns:**

Name of the principal

---

#### public String getMechType()

```java
GenericCredential GenericCredential GSS
(OID) GenericCredential OID
return
```

**getMechType**

```java
String getMechType()
```
Deprecated.
Returns the mechanism type for the GenericCredential instance. The mechanism type definition for GenericCredential should be consistent with the Object Identifier (OID) based representation specified in the GSS specification. In the GenericCredential interface, the mechanism type is returned as a stringified representation of the OID specification.

**Returns:**
mechanism type

---

```java
public byte[] getCredentialData() throws SecurityException

GenericCredential EIS
```

**Throws:**
`SecurityException`

---

getCredentialData

```java
byte[] getCredentialData() throws SecurityException
```

**Deprecated.**
Gets security data for a specific security mechanism represented by the GenericCredential. An example is authentication data required for establishing a secure association with an EIS instance on behalf of the associated resource principal.

The getCredentialData method returns the credential representation as an array of bytes. Note that the connector architecture does not define any standard format for the returned credential data.

**Returns:**
credential representation as an array of bytes.

**Throws:**
SecurityException - Failed operation due to security related error condition

public boolean equals(Object another)
GenericCredential
true false

equals

boolean equals(Object another)

Deprecated.
Tests if this GenericCredential instance refers to the same entity as the supplied object. The two credentials must be acquired over the same mechanisms and must refer to the same principal. Returns true if the two GenericCredentials refer to the same entity; false otherwise.

Overrides:
equals in class Object

public int hashCode()
GenericCredential
return

hashCode

int hashCode()

Deprecated.
Returns the hash code for this GenericCredential

Overrides:
hashCode in class Object
Returns:
hash code for this GenericCredential

PS:
javax.xml.rpc.handler Class GenericHandler

java.lang.Object

javax.xml.rpc.handler.GenericHandler

All Implemented Interfaces:
   Handler

public abstract class GenericHandler
    extends Object
    implements Handler

Implements: Handler

javax.xml.rpc.handler.GenericHandler Handler
   SOAP Message Handler
   GenericHandler Handler

GenericHandler Handler init destroy Handler

version 1.0

The javax.xml.rpc.handler.GenericHandler class implements the Handler interface. SOAP Message Handler developers should typically subclass GenericHandler class unless the Handler class needs another class as a superclass.

The GenericHandler class is a convenience abstract class that makes writing Handlers easy. This class provides default implementations of the lifecycle methods init and destroy and also different handle methods. A Handler developer should only override methods that it needs to specialize as part of the derived Handler implementation class.

Version:
   1.0

protected GenericHandler()

GenericHandler

protected GenericHandler()

Default constructor

### Method Detail

**public boolean handleRequest**(*MessageContext* context)

handleRequest  SOAP  true  SOAP  Handler

See also  handleRequest

**handleRequest**

**public boolean handleRequest**(*MessageContext* context)

- The `handleRequest` method processes the request SOAP message. The default implementation of this method returns `true`. This indicates that the handler chain should continue processing of the request SOAP message. This method should be overridden if the derived Handler class needs to specialize implementation of this method.

Specified by:  handleRequest in interface Handler

Parameters:
- `context` - `MessageContext` parameter provides access to the request message.

Returns:
- boolean Indicates the processing mode
  - `Return true` to indicate continued processing of the request
The HandlerChain takes the responsibility of invoking the next entity. The next entity may be the next handler in the HandlerChain or if this handler is the last handler in the chain, the next entity is the service endpoint object.

- Return `false` to indicate blocking of the request handler chain. In this case, further processing of the request handler chain is blocked and the target service endpoint is not dispatched. The JAX-RPC runtime system takes the responsibility of invoking the response handler chain next with the SOAPMessageContext. The Handler implementation class has the responsibility of setting the appropriate response SOAP message in either handleRequest and/or handleResponse method. In the default processing model, the response handler chain starts processing from the same Handler instance (that returned `false`) and goes backward in the execution sequence.

**See Also:**

`Handler.handleRequest(javax.xml.rpc.handler.MessageContext)`

---

```java
public boolean handleResponse(MessageContext context)
```

**See also**

- `handleResponse`

---

```java
public boolean handleResponse(MessageContext context)
```

The `handleResponse` method processes the response message. The default implementation of this method returns `true`. This indicates that the handler chain should continue processing of the response SOAP message. This method should be overridden if the derived Handler class needs to specialize implementation of this method.

**Specified by:**

- `handleResponse` in interface `Handler`
**Parameters:**

context - MessageContext parameter provides access to the response SOAP message

**Returns:**

boolean Indicates the processing mode

- Return `true` to indicate continued processing of the response handler chain. The HandlerChain invokes the `handleResponse` method on the next `Handler` in the handler chain.
- Return `false` to indicate blocking of the response handler chain. In this case, no other response handlers in the handler chain are invoked.

**See Also:**

`Handler.handleResponse(javax.xml.rpc.handler.MessageContext)`

---

```java
public boolean handleFault(MessageContext context)
```

**See also** `handleFault`

---

**handleFault**

```java
public boolean handleFault(MessageContext context)
```

The `handleFault` method processes the SOAP faults based on the SOAP message processing model. The default implementation of this method returns `true`. This indicates that the handler chain should continue processing of the SOAP fault. This method should be overridden if the derived Handler class needs to specialize implementation of this method.

**Specified by:**

`handleFault` in interface `Handler`

**Parameters:**

context - MessageContext parameter provides access to the SOAP message
Returns:
boolean Indicates the processing mode
  • Return true to indicate continued processing of SOAP Fault. The HandlerChain invokes the handleFault method on the next Handler in the handler chain.
  • Return false to indicate end of the SOAP fault processing. In this case, no other handlers in the handler chain are invoked.

See Also:
Handler.handleFault(javax.xml.rpc.handler.MessageContext)

public void init(HandlerInfo config)
init  Handler  Handler
  See also

init

public void init(HandlerInfo config)

The init method to enable the Handler instance to initialize itself. This method should be overridden if the derived Handler class needs to specialize implementation of this method.

Specified by:
init in interface Handler

See Also:
Handler.init(javax.xml.rpc.handler.HandlerInfo)

public void destroy()
destroy  Handler  Handler
  See also

destroy
public void destroy()

   The destroy method indicates the end of lifecycle for a Handler instance. This method should be overridden if the derived Handler class needs to specialize implementation of this method.

   Specified by:
       destroy in interface Handler

See Also:
    Handler.destroy()

abstract public javax.xml.namespace.QName[] getHeaders()

   Handler (header block)
   return QName

getHeaders

public abstract QName[] getHeaders()

   Gets the header blocks processed by this Handler instance.

   Specified by:
       getHeaders in interface Handler

Returns:
   Array of QNames of header blocks processed by this handler instance. QName is the qualified name of the outermost element of the Header block.
PS:
javax.servlet  **Class GenericServlet**

java.lang.Object  
    javax.servlet.GenericServlet

**All Implemented Interfaces:**  
    Serializable, Servlet, ServletConfig

**Direct Known Subclasses:**  
    HttpServlet

```java
public abstract class GenericServlet

extends Object
implements Servlet, ServletConfig, Serializable

Implements: Servlet, ServletConfig, java.io.Serializable
Extended by: HttpServlet

servlet Web  HTTP servlet
javax.servlet.http.HttpServlet

GenericServlet  Servlet  ServletConfig  servlet
GenericServlet  HttpServlet

GenericServlet  servlet  init  destroy  ServletConfig
                GenericServlet  log  ServletContext

servlet  service
```

Defines a generic, protocol-independent servlet. To write an HTTP servlet for use on the Web, extend HttpServlet instead.

GenericServlet implements the Servlet and ServletConfig interfaces. GenericServlet may be directly extended by a servlet, although it's more common to extend a protocol-specific subclass such as HttpServlet.
GenericServlet makes writing servlets easier. It provides simple versions of the lifecycle methods init and destroy and of the methods in the ServletConfig interface. GenericServlet also implements the log method, declared in the ServletContext interface.

To write a generic servlet, you need only override the abstract service method.

</tbody>
</table>
A convenience method which can be overridden so that there's no need to call super.init(config).

Called by the servlet container to indicate to a servlet that the servlet is being placed into service.

`service(ServletRequest req, ServletResponse res)`

Called by the servlet container to allow the servlet to respond to a request.

Methods inherited from class java.lang/Object

`clone`, `equals`, `finalize`, `getClass`, `hashCode`, `notify`, `notifyAll`, `toString`, `wait`, `wait`, `wait`
public GenericServlet()

Does nothing. All of the servlet initialization is done by one of the init methods.

Method Detail

public void destroy()

Called by the servlet container to indicate to a servlet that the servlet is being taken out of service. See Servlet.destroy().

Specified by:
destroy in interface Servlet

public String getInitParameter(String name)

Returns a string containing the value of the named initialization parameter, or null if the parameter does not exist. See
**ServletConfig.getInitParameter(java.lang.String)**

This method is supplied for convenience. It gets the value of the named parameter from the servlet's ServletConfig object.

**Specified by:**
getInitParameter in interface ServletConfig

**Parameters:**
- name - a String specifying the name of the initialization parameter

**Returns:**
- String a string containing the value of the initialization parameter

---

```java
public java.util.Enumeration<E> getInitParameterNames()
```

**getInitParameterNames**

```java
public Enumeration getInitParameterNames()
```

Returns the names of the servlet's initialization parameters as an Enumeration of String objects, or an empty Enumeration if the servlet has no initialization parameters. See ServletConfig.getInitParameterNames().

This method is supplied for convenience. It gets the parameter names from the servlet's ServletConfig object.

**Specified by:**
getInitParameterNames in interface ServletConfig
Returns:
Enumeration an enumeration of String objects containing the names of the servlet's initialization parameters

```java
public ServletConfig getServletConfig()

getServletConfig
```

public ServletConfig getServletConfig()

Returns this servlet's ServletConfig object.

Specified by:
getServletConfig in interface Servlet

Returns:
ServletConfig the ServletConfig object that initialized this servlet

See Also:
Servlet.init(javax.servlet.ServletConfig)

```java
public ServletContext getServletContext()

getServletContext
```

public ServletContext getServletContext()

Returns a reference to the ServletContext in which this servlet is
running. See `ServletConfig.getServletContext()`.

This method is supplied for convenience. It gets the context from the servlet's `ServletConfig` object.

**Specified by:**

`getServletContext` in interface `ServletConfig`

**Returns:**

`ServletContext` the `ServletContext` object passed to this servlet by the `init` method

**See Also:**

`ServletContext`

```java
public String getServletInfo()

servlet
    return String servlet

getServletInfo
```

Returns information about the servlet, such as author, version, and copyright. By default, this method returns an empty string. Override this method to have it return a meaningful value. See `Servlet.getServletInfo()`.

**Specified by:**

`getServletInfo` in interface `Servlet`

**Returns:**

String information about this servlet, by default an empty string

```java
public void init(ServletConfig config) throws ServletException

servlet  servlet
```

`Servlet#init`
public void init(ServletConfig config) throws ServletException

Called by the servlet container to indicate to a servlet that the servlet is being placed into service. See Servlet.init(javax.servlet.ServletConfig).

This implementation stores the ServletConfig object it receives from the servlet container for later use. When overriding this form of the method, call super.init(config).

Specified by:
init in interface Servlet

Parameters:
config - the ServletConfig object that contains configuration information for this servlet

Throws:
ServletException - if an exception occurs that interrupts the servlet's normal operation

See Also:
UnavailableException

---

public void init() throws ServletException

super.init(config)
Throws: ServletException: servlet

init

public void init() throws ServletException

A convenience method which can be overridden so that there's no need to call super.init(config).

Instead of overriding init(ServletConfig), simply override this method and it will be called by GenericServlet.init(ServletConfig config). The ServletConfig object can still be retrieved via getServletConfig().

Throws:
ServletException - if an exception occurs that interrupts the servlet's normal operation

log

public void log(String msg)

Writes the specified message to a servlet log file, prepended by the servlet's name. See ServletContext.log(String).

Parameters:
msg - a String specifying the message to be written to the log file

public void log(String message, Throwable t)
servlet Throwable servlet Throwable
log(String, Throwable)
message String
t java.lang.Throwable

log

public void log(String message, Throwable t)

Writes an explanatory message and a stack trace for a given Throwable exception to the servlet log file, prepended by the servlet's name. See ServletContext.log(String, Throwable).

Parameters:
message - a String that describes the error or exception
t - the java.lang.Throwable error or exception

abstract public void service(HttpServletRequest req, HttpServletResponse res) throws ServletException, java.io.IOException
servlet servlet

HttpServletRequest
req ServletRequest
res servlet

Throws ServletException: servlet
Throws java.io.IOException:

service

public abstract void service(HttpServletRequest req, HttpServletResponse res)
throws ServletException, IOException

Called by the servlet container to allow the servlet to respond to a request. See Servlet.service(javax.servlet.ServletRequest, javax.servlet.ServletResponse).

This method is declared abstract so subclasses, such as HttpServlet, must override it.

Specified by:
    service in interface Servlet

Parameters:
    req - the ServletRequest object that contains the client's request
    res - the ServletResponse object that will contain the servlet's response

Throws:
    ServletException - if an exception occurs that interferes with the servlet's normal operation occurred
    IOException - if an input or output exception occurs

public String getServletName()

    servlet ServletConfig#getServletName
    return servlet

getServletName

public String getServletName()

    Returns the name of this servlet instance. See ServletConfig.getServletName().

Specified by:
    getServletName in interface ServletConfig

Returns:
    the name of this servlet instance

PS:
```java
javax.ejb  Interface Handle

All Superinterfaces:
  Serializable

public interface Handle
  extends Serializable

Implements: java.io.Serializable

Handle  EJB  EJB  EJB ""

The Handle interface is implemented by all EJB object handles. A handle is an abstraction of a network reference to an EJB object. A handle is intended to be used as a "robust" persistent reference to an EJB object.

<table>
<thead>
<tr>
<th>Method Summary</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>
```
getEJBObject

EJBObject getEJBObject()

    throws RemoteException

Obtain the EJB object reference represented by this handle.

Returns:
    the EJB object reference represented by this handle.

Throws:
    RemoteException - The EJB object could not be obtained because of a system-level failure.

PS:
**javax.ejb.spi Interface HandleDelegate**

```java
public interface HandleDelegate
```

HandleDelegate EJB javax.ejb.Handle javax.ejb.HomeHandle
EJB EJBObj ect EJBHome

JNDI "java:comp/HandleDelegate" HandleDelegate

The HandleDelegate interface is implemented by the EJB container. It is used by portable implementations of javax.ejb.Handle and javax.ejb.HomeHandle. It is not used by EJB components or by client components. It provides methods to serialize and deserialize EJBObj ect and EJBHome references to streams.

The HandleDelegate object is obtained by JNDI lookup at the reserved name "java:comp/HandleDelegate".

**Method Summary**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>readEJBHome(ObjectInputStream istream)</code></td>
<td>Deserialize the EJBHome reference corresponding to a HomeHandle.</td>

</tr>
<tr>
<td><code>writeEJBObject(EJBObj ect ejbObj ect, ObjectOutputStream ostream)</code></td>
<td>Serialize the EJBObj ect reference corresponding to a</td>
</tr>
</tbody>
</table>
public void writeEJBObject(EJBOBJECT ejbObject, java.io.ObjectOutputStream ostream) throws java.io.IOException:
Handle EJBOBJECT

Handle writeObject ostream Handle writeObject

serialize the EJBObject reference corresponding to a Handle.

This method is called from the writeObject method of portable Handle implementation classes. The ostream object is the same object that was passed in to the Handle class's writeObject.

Parameters:
  ejbObject - The EJBObject reference to be serialized.
  ostream - The output stream.

Throws:
  IOException - The EJBObject could not be serialized because of a system-level failure.
public EJBObject readEJBObject(java.io.ObjectInputStream istream) throws java.io.IOException, ClassNotFoundException
Handle EJBObject

readEJBObject Handle readObject istream
Handle readObject readEJBObject istream
EJBObject EJBObject

    istream
return EJBObject

Throws java.io.IOException: EJBObject
Throws ClassNotFoundException: EJBObject

readEJBObject

EJBObject readEJBObject(ObjectInputStream istream)
throws IOException,
          ClassNotFoundException

Deserializes the EJBObj reference corresponding to a Handle.

readEJBObject is called from the readObject method of portable Handle implementation classes. The istream object is the same object that was passed in to the Handle class's readObject. When readEJBObject is called, istream must point to the location in the stream at which the EJBObj reference can be read. The container must ensure that the EJBObj reference is capable of performing invocations immediately after deserialization.

Parameters:
    istream - The input stream.

Returns:
    The deserialized EJBObj reference.

Throws:
    IOException - The EJBObj could not be deserialized because of a system-level failure.
ClassNotFoundException - The EJBObject could not be deserialized because some class could not be found.

```java
public void writeEJBHome(EJBHome ejbHome, java.io.ObjectOutputStream ostream) throws java.io.IOException
    HomeHandle HomeHandle writeObject ostream Handle
    writeObject ejbHome EJBHome
    ostream
    Throws java.io.IOException: EJBObject
```

**writeEJBHome**

```java
void writeEJBHome(EJBHome ejbHome, ObjectOutputStream ostream)
    throws IOException
```

Serialize the EJBHome reference corresponding to a HomeHandle.

This method is called from the writeObject method of portable HomeHandle implementation classes. The ostream object is the same object that was passed in to the Handle class's writeObject.

**Parameters:**
- `ejbHome` - The EJBHome reference to be serialized.
- `ostream` - The output stream.

**Throws:**
- `IOException` - The EJBObject could not be serialized because of a system-level failure.

```java
public EJBHome readEJBHome(java.io.ObjectInputStream
```
readEJBHome

Deserializes the EJBHome reference corresponding to a HomeHandle.

Parameters:
- istream - The input stream.

Returns:
- The deserialized EJBHome reference.

Throws:
- IOException - The EJBHome could not be deserialized because
of a system-level failure.

ClassNotFoundException - The EJBHome could not be deserialized because some class could not be found.
javax.xml.rpc.handler Interface Handler

All Known Implementing Classes:
   GenericHandler

public interface Handler

Implemented by: GenericHandler

javax.xml.rpc.handler.Handler SOAP SOAP
handleRequest handleResponse handleFault SOAPMessageContext
SOAPMessage SOAPMessage

version 1.0

The javax.xml.rpc.handler.Handler interface is required to be implemented by a SOAP message handler. The handleRequest, handleResponse and handleFault methods for a SOAP message handler get access to the SOAPMessage from the SOAPMessageContext. The implementation of these methods can modify the SOAPMessage including the headers and body elements.

Version:
   1.0

Author:
   Rahul Sharma

<table>
<thead>
<tr>
<th>Method Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>void</strong> destroy()</td>
</tr>
<tr>
<td><strong>QName[]</strong> getHeaders()</td>
</tr>
</tbody>
</table>
```java
boolean handleFault(MessageContext context)
    The handleFault method processes the SOAP faults based on the SOAP message processing model.

boolean handleRequest(MessageContext context)
    The handleRequest method processes the request message.

boolean handleResponse(MessageContext context)
    The handleResponse method processes the response SOAP message.

void init(HandlerInfo config)
    The init method enables the Handler instance to initialize itself.
```

### Method Detail

**public boolean handleRequest(MessageContext context)**

- **context**
  - MessageContext
  - boolean

- **return**
  - JAXRPCException: handleRequest
  - Throws
    - JAXRPCException
    - HandlerChain
    - HandlerChain
    - SOAP

- **Throws**
  - SOAPFaultException: SOAP Handler handleRequest / handleFault SOAP SOAP handleRequest SOAPFaultException HandlerChain SOAP HandlerChain handleFault HandlerChain handleFault Handler
  - handleRequest SOAPFaultException
handleRequest

boolean handleRequest(MessageContext context)

The handleRequest method processes the request message.

Parameters:
context - MessageContext parameter provides access to the request message.

Returns:
boolean Indicates the processing mode
- Return true to indicate continued processing of the request handler chain. The HandlerChain takes the responsibility of invoking the next entity. The next entity may be the next handler in the HandlerChain or if this handler is the last handler in the chain, the next entity is the service endpoint object.
- Return false to indicate blocking of the request handler chain. In this case, further processing of the request handler chain is blocked and the target service endpoint is not dispatched. The JAX-RPC runtime system takes the responsibility of invoking the response handler chain next with the SOAPMessageContext. The Handler implementation class has the responsibility of setting the appropriate response SOAP message in either handleRequest and/or handleResponse method. In the default processing model, the response handler chain starts processing from the same Handler instance (that returned false) and goes backward in the execution sequence.

Throws:
JAXRPCException - This exception indicates handler specific runtime error. If JAXRPCException is thrown by a handleRequest method, the HandlerChain terminates the further processing of this handler chain. On the server side, the HandlerChain generates a SOAP fault that indicates that the message could not be processed for reasons not directly attributable to the contents of the message itself but rather to a runtime error during the processing of the message. On the client side, the exception is propagated to the client code.
**SOAPFaultException** - This indicates a SOAP fault. The Handler implementation class has the responsibility of setting the SOAP fault in the SOAP message in either handleRequest and/or handleFault method. If SOAPFaultException is thrown by a server-side request handler's handleRequest method, the HandlerChain terminates the further processing of the request handlers in this handler chain and invokes the handleFault method on the HandlerChain with the SOAP message context. Next, the HandlerChain invokes the handleFault method on handlers registered in the handler chain, beginning with the Handler instance that threw the exception and going backward in execution. The client-side request handler's handleRequest method should not throw the SOAPFaultException.

```java
public boolean handleResponse(MessageContext context)

handleResponse SOAP
context MessageContext SOAP
    boolean

return
    true HandlerChain Handler handleResponse
    false

Throws JAXRPCException: handleResponse

JAXRPCException HandlerChain HandlerChain SOAP

handleResponse

boolean handleResponse(MessageContext context)

    The handleResponse method processes the response SOAP message.

Parameters:
    context - MessageContext parameter provides access to the response SOAP message
```
Returns:

boolean Indicates the processing mode

- Return true to indicate continued processing of the response handler chain. The HandlerChain invokes the handleResponse method on the next Handler in the handler chain.
- Return false to indicate blocking of the response handler chain. In this case, no other response handlers in the handler chain are invoked.

Throws:

JAXRPCException - Indicates handler specific runtime error. If JAXRPCException is thrown by a handleResponse method, the HandlerChain terminates the further processing of this handler chain. On the server side, the HandlerChain generates a SOAP fault that indicates that the message could not be processed for reasons not directly attributable to the contents of the message itself but rather to a runtime error during the processing of the message. On the client side, the runtime exception is propagated to the client code.

public boolean handleFault(MessageContext context) throws JAXRPCException

handleFault SOAP SOAP context MessageContext SOAP boolean

return

- true SOAP HandlerChain Handler handleFault
- false SOAP

JAXRPCException: handleFault JAXRPCException

Throws HandlerChain HandlerChain SOAP JAXRPCException

handleFault

boolean handleFault(MessageContext context)
The `handleFault` method processes the SOAP faults based on the SOAP message processing model.

**Parameters:**
- `context` - MessageContext parameter provides access to the SOAP message

**Returns:**
- boolean Indicates the processing mode
  - Return `true` to indicate continued processing of SOAP Fault. The HandlerChain invokes the `handleFault` method on the next `Handler` in the handler chain.
  - Return `false` to indicate end of the SOAP fault processing. In this case, no other handlers in the handler chain are invoked.

**Throws:**
- `JAXRPCException` - Indicates handler specific runtime error. If `JAXRPCException` is thrown by a `handleFault` method, the HandlerChain terminates the further processing of this handler chain. On the server side, the HandlerChain generates a SOAP fault that indicates that the message could not be processed for reasons not directly attributable to the contents of the message itself but rather to a runtime error during the processing of the message. On the client side, the `JAXRPCException` is propagated to the client code.

```java
public void init(HandlerInfo config)
```

```java
init Handler init HandlerInfo HandlerInfo
```

```java
init Handler SOAP HandlerInfo
```

```java
Throws JAXRPCException:
```

init
void init(HandlerInfo config)

The init method enables the Handler instance to initialize itself. The init method passes the handler configuration as a HandlerInfo instance. The HandlerInfo is used to configure the Handler (for example: setup access to an external resource or service) during the initialization.

In the init method, the Handler class may get access to any resources (for example; access to a logging service or database) and maintain these as part of its instance variables. Note that these instance variables must not have any state specific to the SOAP message processing performed in the various handle method.

**Parameters:**

HandlerInfo - Configuration for the initialization of this handler

**Throws:**

JAXRPCException - If initialization of the handler fails

public void destroy()

destroy Handler Handler
destroy cleanup

**Throws**

JAXRPCException:

void destroy()

The destroy method indicates the end of lifecycle for a Handler instance. The Handler implementation class should release its resources and perform cleanup in the implementation of the destroy method.

**Throws:**

JAXRPCException - If any error during destroy
public javax.xml.namespace.QName[] getHeaders()

return QName

getHeaders

QName[] getHeaders()

Gets the header blocks that can be processed by this Handler instance.

Returns:
Array of QNames of header blocks processed by this handler instance. QName is the qualified name of the outermost element of the Header block.

PS:
javax.xml.ws.handler  **Interface Handler<C extends MessageContext>**

All Known Subinterfaces:
   LogicalHandler<C>, SOAPHandler<T>

```java
public interface Handler<C extends MessageContext> {

    // Method Summary
    void close(MessageContext context)
    boolean handleMessage(C context)
    boolean handleFault(C context)
}
```

**Implemented by:** GenericHandler

javax.xml.rpc.handler.Handler  SOAP SOAP
handleRequest  handleResponse  handleFault  SOAPMessageContext
SOAPMessage  SOAPMessage

**version**  1.0

The `Handler` interface is the base interface for JAX-WS handlers.

**Since:**
   JAX-WS 2.0
Method Detail

handleMessage

boolean handleMessage(C context)

The handleMessage method is invoked for normal processing of inbound and outbound messages. Refer to the description of the handler framework in the JAX-WS specification for full details.

Parameters:

context - the message context.

Returns:

An indication of whether handler processing should continue for the current message
- Return true to continue processing.
- Return false to block processing.

Throws:

RuntimeException - Causes the JAX-WS runtime to cease handler processing and generate a fault.
ProtocolException - Causes the JAX-WS runtime to switch to fault message processing.

handleFault

boolean handleFault(C context)

The handleFault method is invoked for fault message processing. Refer to the description of the handler framework in the JAX-WS specification for full details.

Parameters:

context - the message context
Returns:
An indication of whether handler fault processing should continue for the current message
- Return true to continue processing.
- Return false to block processing.

Throws:
RuntimeException - Causes the JAX-WS runtime to cease handler fault processing and dispatch the fault.
ProtocolException - Causes the JAX-WS runtime to cease handler fault processing and dispatch the fault.

close

void close(MessageContext context)

Called at the conclusion of a message exchange pattern just prior to the JAX-WS runtime dispatching a message, fault or exception. Refer to the description of the handler framework in the JAX-WS specification for full details.

Parameters:
context - the message context
javax.jws  Annotation Type HandlerChain

@Retention(value=RUNTIME)
@Target(value={TYPE, METHOD, FIELD})
public @interface HandlerChain

**Implements**: Annotation
@Retention(value=RUNTIME)
@Target(value={TYPE, METHOD, FIELD})

Web Service  Java  Web Service
@SOAPMessageHandlers

Associates the Web Service with an externally defined handler chain. This annotation is typically used in scenarios where embedding the handler configuration directly in the Java source is not appropriate; for example, where the handler configuration needs to be shared across multiple Web Services, or where the handler chain consists of handlers for multiple transports. It is an error to combine this annotation with the @SOAPMessageHandlers annotation.

PS :
The javax.xml.rpc.handler.HandlerChain represents a list of handlers. All elements in the HandlerChain are of the type javax.xml.rpc.handler.Handler.

An implementation class for the HandlerChain interface abstracts the policy and mechanism for the invocation of the registered handlers.

Methods inherited from interface `java.util.List`:
- `add`, `add`, `addAll`, `addAll`, `clear`, `contains`, `containsAll`, `equals`, `get`, `hashCode`, `indexOf`, `isEmpty`, `iterator`, `lastIndexOf`, `listIterator`, `listIterator`, `remove`, `remove`, `removeAll`, `retainAll`, `set`, `size`, `subList`, `toArray`, `toArray`
**handleRequest**

boolean `handleRequest(MessageContext context)`

The `handleRequest` method initiates the request processing for this handler chain.

**Parameters:**
- `context` - `MessageContext` parameter provides access to the request SOAP message.

**Returns:**
- boolean Returns `true` if all handlers in chain have been processed. Returns `false` if a handler in the chain returned `false` from its `handleRequest` method.

**Throws:**
- `JAXRPCException` - if any processing error happens

**See Also:**
- `Handler.handleRequest(javax.xml.rpc.handler.MessageContext)`

---

**handleResponse**

`handleResponse(MessageContext context)`

`context` MessageContext SOAP

`return` boolean `true handleResponse`

**Throws**
- `JAXRPCException`: `handleResponse`

**See also**
- `handleResponse`

**handleResponse**

boolean `handleResponse(MessageContext context)`

The `handleResponse` method initiates the response processing for this handler chain.

**Parameters:**
- `context` - `MessageContext` parameter provides access to the response SOAP message.

**Returns:**
boolean Returns \texttt{true} if all handlers in chain have been processed. Returns \texttt{false} if a handler in the chain returned \texttt{false} from its \texttt{handleResponse} method.

\textbf{Throws:} \\
\texttt{JAXRPCException} - if any processing error happens

\textbf{See Also:} \\
\texttt{Handler.handleResponse\,(javax.xml.rpc.handler.MessageContext)}

\textbf{public boolean handleFault\,(messageContext context)}

\textbf{handleFault} \texttt{SOAP}

\texttt{context \quad MessageContext \quad SOAP}

\texttt{return \quad boolean \quad true handleFault}

\textbf{Throws:} \texttt{JAXRPCException}:

\textbf{See also} \texttt{handleFault}

**handleFault**

boolean \texttt{handleFault\,(messageContext context)}

The \texttt{handleFault} method initiates the SOAP fault processing for this handler chain.

\textbf{Parameters:}

\texttt{context} - \texttt{MessageContext} parameter provides access to the SOAP message.

\textbf{Returns:}

boolean Returns \texttt{true} if all handlers in chain have been processed. Returns \texttt{false} if a handler in the chain returned \texttt{false} from its \texttt{handleFault} method.

\textbf{Throws:}

\texttt{JAXRPCException} - if any processing error happens

\textbf{See Also:} \\
\texttt{Handler.handleFault\,(javax.xml.rpc.handler.MessageContext)}

**public void init\,(java.util.Map<\texttt{K, V}> config)**
**HandlerChain**

`config`

**Throws**

JAXRPCException:

### init

```java
void init(Map config)
```

Initializes the configuration for a HandlerChain.

**Parameters:**

- `config`: Configuration for the initialization of this handler chain

**Throws:**

JAXRPCException - If any error during initialization

### destroy

```java
public void destroy()
```

Indicates the end of lifecycle for a HandlerChain.

**Throws:**

JAXRPCException - If any error during destroy

### setRoles(String[] soapActorNames)

```java
public void setRoles(String[] soapActorNames)
```
setRoles

void setRoles(String[] soapActorNames)

Sets SOAP Actor roles for this HandlerChain. This specifies the set of roles in which this HandlerChain is to act for the SOAP message processing at this SOAP node. These roles assumed by a HandlerChain must be invariant during the processing of an individual SOAP message through the HandlerChain.

A HandlerChain always acts in the role of the special SOAP actor next. Refer to the SOAP specification for the URI name for this special SOAP actor. There is no need to set this special role using this method.

Parameters:

soapActorNames - URIs for SOAP actor name

See Also:

NamespaceConstants

getRoles

String[] getRoles()

public String[] getRoles()

HandlerChain SOAP SOAP SOAP

return URI SOAP (String[])

See also

javax.xml.rpc.NamespaceConstants
Gets SOAP actor roles registered for this HandlerChain at this SOAP node. The returned array includes the special SOAP actor next.

**Returns:**
String[] SOAP Actor roles as URIs

**See Also:**
NamespaceConstants
The `javax.xml.rpc.handler.HandlerInfo` represents information about a handler in the HandlerChain. A HandlerInfo instance is passed in the `Handler.init` method to initialize a `Handler` instance.

**Version:**
1.0

### Constructor Detail

**public HandlerInfo()**

**HandlerInfo**

**public HandlerInfo()**

Default constructor
public HandlerInfo(Class<T> handlerClass, java.util.Map<K, V> config, javax.xml.namespace.QName[] headers)

**HandlerInfo**

```
  handlerClass  Handler  Java
  config       java.util.Map
  headers      Handler  QName QName
```

**Constructor for HandlerInfo**

**Parameters:**
- `handlerClass` - Java Class for the Handler
- `config` - Handler Configuration as a java.util.Map
- `headers` - QNames for the header blocks processed by this Handler. QName is the qualified name of the outermost element of a header block

**Method Detail**

public void setHandlerClass(Class<T> handlerClass)

**setHandlerClass**

```
  handlerClass  Handler
```

**Sets the Handler class**

**Parameters:**
public Class<T> getHandlerClass()

```
Handler
```

return Handler

null handler

`getHandlerClass`

Public `Class` `getHandlerClass()`

Gets the Handler class

**Returns:**

Returns null if no Handler class has been set; otherwise the set handler class

`setHandlerConfig`

Public `void` `setHandlerConfig(java.util.Map<K, V> config)`

```
java.util.Map Handler
```

config

`setHandlerConfig`

Public `void` `setHandlerConfig(Map config)`

Sets the Handler configuration as `java.util.Map`

**Parameters:**

config - Configuration map

`getHandlerConfig`

Public `java.util.Map<K, V> getHandlerConfig()`

```
Handler
```

return Map
getHandlerConfig

public Map getHandlerConfig()

Gets the Handler configuration

Returns:
  Returns empty Map if no configuration map has been set; otherwise returns the set configuration map

public void setHeaders(javax.xml.namespace.QName[] headers)

Sets the header blocks processed by this Handler.

Parameters:
  headers - QNames of the header blocks. QName is the qualified name of the outermost element of the SOAP header block

public javax.xml.namespace.QName[] getHeaders()

getHeaders

public QName[] getHeaders()
Gets the header blocks processed by this Handler.

**Returns:**
Array of QNames for the header blocks. Returns `null` if no header blocks have been set using the `setHeaders` method.
**javax.xml.rpc.handler**  
**Interface HandlerRegistry**

**All Superinterfaces:**  
[Serializable](#)

---

```java
public interface HandlerRegistry
extends Serializable

Implements: java.io.Serializable
```

The `javax.xml.rpc.handler.HandlerRegistry` provides support for the programmatic configuration of handlers in a `HandlerRegistry`.

A handler chain is registered per service endpoint, as indicated by the qualified name of a port. The `getHandlerChain` returns the handler chain (as a `java.util.List`) for the specified service endpoint. The returned handler chain is configured using the `java.util.List` interface. Each element in this list is required to be of the Java type `javax.xml.rpc.handler.HandlerInfo`.

**Version:**

1.0

**Author:**

Rahul Sharma

**See Also:**

<th>setHandlerChain(QName portName, List chain)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Sets the handler chain for the specified service endpoint as a java.util.List.</td>
</tr>
</tbody>
</table>

Method Detail

public java.util.List<E>
getHandlerChain(javax.xml.namespace.QName portName)
javax.xml.rpc.handler.HandlerInfo

portName

return java.util.List

Throws IllegalArgumentException: portName

getHandlerChain

List getHandlerChain(QName portName)

Gets the handler chain for the specified service endpoint. The returned List is used to configure this specific handler chain in this HandlerRegistry. Each element in this list is required to be of the Java type javax.xml.rpc.handler.HandlerInfo.

Parameters:

portName - Qualified name of the target service endpoint

Returns:

java.util.List Handler chain

Throws:

IllegalArgumentException - If an invalid portName is specified
public void setHandlerChain(javax.xml.namespace.QName portName, java.util.List<E> chain)

java.util.List Java

javax.xml.rpc.handler.HandlerInfo

portName

chain

Throws JAXRPCException:

Throws UnsupportedOperationException:

Throws IllegalArgumentException: portName

setHandlerChain

void setHandlerChain(QName portName, List chain)

Sets the handler chain for the specified service endpoint as a java.util.List. Each element in this list is required to be of the Java type javax.xml.rpc.handler.HandlerInfo.

Parameters:

portName - Qualified name of the target service endpoint

chain - A List representing configuration for the handler chain

Throws:

JAXRPCException - If any error in the configuration of the handler chain

UnsupportedOperationException - If this set operation is not supported. This is done to avoid any overriding of a pre-configured handler chain.

IllegalArgumentException - If an invalid portName is specified
to license terms.

PS:
HandlerResolver is an interface implemented by an application to get control over the handler chain set on proxy/dispatch objects at the time of their creation.

A HandlerResolver may be set on a Service using the setHandlerResolver method.

When the runtime invokes a HandlerResolver, it will pass it a PortInfo object containing information about the port that the proxy/dispatch object will be accessing.

Since: JAX-WS 2.0

See Also: 

Service.setHandlerResolver(javax.xml.ws.handler.HandlerResolver)

</table>
public java.util.List<E> getHandlerChain(PortInfo portInfo)

getHandlerChain

List<Handler> getHandlerChain(PortInfo portInfo)

Gets the handler chain for the specified port.

Parameters:
portInfo - Contains information about the port being accessed.

Returns:
java.util.List Handler chain
javax.mail  **Class Header**

`java.lang.Object`  
- `javax.mail.Header`

**Direct Known Subclasses:**  
- `InternetHeaders.InternetHeader`

```java
public class Header
extends Object

Extended by: InternetHeaders.InternetHeader
```

Header /

The Header class stores a name/value pair to represent headers.

Constructor Detail

public HeaderTokenizer(String header, String delimiters, boolean skipComments)

rfc822

header

delimiters

ATOM

true

skipComments

RFC822

MI

HeaderTokenizer

public HeaderTokenizer(String header, String delimiters, boolean skipComments)

Constructor that takes a rfc822 style header.

Parameters:
The rfc822 header to be tokenized

delimiters - Set of delimiter characters to be used to delimit ATOMS. These are usually RFC822 or MIME

skipComments - If true, comments are skipped and not returned as tokens

public HeaderTokenizer(String header, String delimiters)

header

delimiters

HeaderTokenizer

public HeaderTokenizer(String header, String delimiters)

Constructor. Comments are ignored and not returned as tokens

Parameters:

header - The header that is tokenized
delimiters - The delimiters to be used

public HeaderTokenizer(String header)

RFC822 RFC822 ATOM

HeaderTokenizer

public HeaderTokenizer(String header)

Constructor. The RFC822 defined delimiters - RFC822 - are used to delimit ATOMS. Also comments are skipped and not returned as tokens
public HeaderTokenizer.Token next() throws ParseException
String

next()  EOF Token
    return  Token
    Throws  ParseException:

next

public HeaderTokenizer.Token next() throws ParseException

    Parses the next token from this String.

    Clients sit in a loop calling next() to parse successive tokens until an
    EOF Token is returned.

    Returns:
        the next Token

    Throws:
        ParseException - if the parse fails

public HeaderTokenizer.Token peek() throws ParseException

    return  Token
    Throws  ParseException:
**peek**

```java
public HeaderTokenizer.Token peek()
    throws ParseException
```

Peek at the next token, without actually removing the token from the parse stream. Invoking this method multiple times will return successive tokens, until `next()` is called.

**Returns:**
the next Token

**Throws:**
`ParseException` - if the parse fails

---

**public String getRemainder()**

```java
return (String) null
```

**getRemainder**

```java
public String getRemainder()
```

Return the rest of the Header.

**Returns:**
String rest of header. null is returned if we are already at end of header

### Constructor Detail

public HeaderTokenizer.Token(int type, String value)

<table>
<thead>
<tr>
<th>type</th>
<th>Token</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Token</td>
</tr>
</tbody>
</table>

### HeaderTokenizer.Token

public HeaderTokenizer.Token(int type, String value)

Constructor.
Parameters:
  type - Token type
  value - Token value

Method Detail

public int getType()

  • ATOM ASCII CTL"("<>"
  • QUOTEDSTRING ASCII
  • COMMENT "(" ")" ASCII
  • EOF

getType

public int getType()

  Return the type of the token. If the token represents a delimiter or a control character, the type is that character itself, converted to an integer. Otherwise, it's value is one of the following:
  • ATOM A sequence of ASCII characters delimited by either SPACE, CTL, "(" <= " or the specified SPECIALS
  • QUOTEDSTRING A sequence of ASCII characters within quotes
  • COMMENT A sequence of ASCII characters within "(" and ")".
  • EOF End of header

public String getValue()

  return

getValue
public String getValue()

Returns the value of the token just read. When the current token is a quoted string, this field contains the body of the string, without the quotes. When the current token is a comment, this field contains the body of the comment.

Returns:

token value
javax.transaction  **Class HeuristicCommitException**

`java.lang.Object`  
`   ↓ java.lang.Throwable`  
`      ↓ java.lang.Exception`  
`         ↓ javax.transaction.HeuristicCommitException`  

**All Implemented Interfaces:**  
  * Serializable*

---

```java
public class HeuristicCommitException

extends Exception

Extends: Throwable > Exception
```

This exception is thrown by the rollback operation on a resource to report that a heuristic decision was made and that all relevant updates have been committed.

**See Also:**  
  * Serialized Form*

Class HeuristicMixedException

java.lang.Object
   └ java.lang.Throwable
      └ java.lang.Exception
         └ javax.transaction.HeuristicMixedException

All Implemented Interfaces:
   Serializable

public class HeuristicMixedException
   extends Exception

Extends: Throwable > Exception

This exception is thrown to report that a heuristic decision was made and that some relevant updates have been committed and others have been rolled back.

See Also:
   Serialized Form

PS:
public final class HexBinaryAdapter
extends XmlAdapter<String, byte[]>

Extends: ">XmlAdapter

xs:hexBinary XmlAdapter

XML hexBinary since JAXB 2.0

This XmlAdapter binds byte[] to the hexBinary representation in XML.

Since:
JAXB 2.0
Author:
Kohsuke Kawaguchi

### Constructor Summary

| HexBinaryAdapter() |

### Method Summary

| String marshal(byte[] bytes) |

Convert a bound type to a value type.
Constructor Detail

public HexBinaryAdapter()

HexBinaryAdapter

public HexBinaryAdapter()

Method Detail

public byte[] unmarshal(String s)

unmarshal

public byte[] unmarshal(String s)

Description copied from class: XmlAdapter
Convert a value type to a bound type.

Specified by:
unmarshal in class XmlAdapter<String, byte[]>

Parameters:
 s - The value to be converted. Can be null.

public String marshal(byte[] bytes)
public String marshal(byte[] bytes)

Description copied from class: XmlAdapter
Convert a bound type to a value type.

Specified by:
    marshal in class XmlAdapter<String,byte[]>

Parameters:
    bytes - The value to be converted. Can be null.
javax.xml.rpc.holders Interface Holder

All Known Implementing Classes:

BigDecimalHolder, BigIntegerHolder, BooleanHolder,
BooleanWrapperHolder, ByteArrayHolder, ByteHolder,
ByteWrapperHolder, CalendarHolder, DoubleHolder,
DoubleWrapperHolder, FloatHolder, FloatWrapperHolder,
IntegerWrapperHolder, IntHolder, LongHolder, LongWrapperHolder,
ObjectHolder, QNameHolder, ShortHolder, ShortWrapperHolder,
StringHolder

java.xml.rpc.holders.Holder Holder Holder Holder Holder

version 1.0

The java.xml.rpc.holders.Holder interface represents the base interface for both standard and generated Holder classes. A generated Holder class is required to implement this Holder interface.

Version: 1.0

Author: Rahul Sharma

PS:
javax.xml.ws Class Holder<T>

java.lang.Object
   javax.xml.ws.Holder<T>

public final class Holder<T>
extends Object

Implemented by: BigDecimalHolder, BigIntegerHolder, BooleanHolder, BooleanWrapperHolder, ByteArrayHolder, ByteHolder, ByteWrapperHolder, CalendarHolder, DoubleHolder, DoubleWrapperHolder, FloatHolder, FloatWrapperHolder, IntegerWrapperHolder, IntHolder, LongHolder, LongWrapperHolder, ObjectHolder, QNameHolder, ShortHolder, ShortWrapperHolder, StringHolder

java.xml.rpc.holders.Holder

version 1.0

Holds a value of type T.

Since:
   JAX-WS 2.0

Field Summary

| T value | The value contained in the holder. |

Constructor Summary

Holder() Creates a new holder with a null value.
**Holder**(T value)
Create a new holder with the specified value.

**Method Summary**

Methods inherited from class java.lang.[Object](#)
clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

**Field Detail**

value

public T value

The value contained in the holder.

**Constructor Detail**

Holder

public Holder()

Creates a new holder with a null value.

---

Holder

public Holder(T value)
Create a new holder with the specified value.

**Parameters:**

value - The value to be stored in the holder.
javax.ejb

Interface HomeHandle

All Superinterfaces:
  Serializable

public interface HomeHandle
  extends Serializable

  Implements: java.io.Serializable

HomeHandle  home  home  home  ""

The HomeHandle interface is implemented by all home object handles. A handle is an abstraction of a network reference to a home object. A handle is intended to be used as a "robust" persistent reference to a home object.

Method Summary

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getEJBHome()</td>
<td>Obtain the home object represented by this handle.</td>
</tr>
</tbody>
</table>

Method Detail

public EJBHome getEJBHome() throws java.rmi.RemoteException

  return  home

  Throws  java.rmi.RemoteException: home
getEJBHome

EJBHome  getEJBHome()  throws RemoteException

Obtain the home object represented by this handle.

Returns:
the home object represented by this handle.

Throws:
RemoteException - The home object could not be obtained because of a system-level failure.

Field Detail

COMPONENT_TYPE

public static final String COMPONENT_TYPE

The standard component type for this component.

See Also:
 Constant Field Values

Constructor Detail

public HtmlColumnType

Method Detail

public String getFooterClass()
getFooterClass

public String getFooterClass()

Return the value of the footerClass property.

Contents: Space-separated list of CSS style class(es) that will be applied to any footer generated for this column.

public void setFooterClass(String footerClass)

setFooterClass

public void setFooterClass(String footerClass)

Set the value of the footerClass property.

public String getHeaderClass()

headerClass

CSS
**getHeaderClass**

public **String** getHeaderClass()

Return the value of the `headerClass` property.

Contents: Space-separated list of CSS style class(es) that will be applied to any header generated for this column.

---

**public void setHeaderClass(String headerClass)**

`headerClass`

---

**setHeaderClass**

public void **setHeaderClass(String headerClass)**

Set the value of the `headerClass` property.

---

**public Object saveState(FacesContext _context)**

**saveState**

public **Object** saveState( **FacesContext _context**)

Description copied from interface: **StateHolder**

Gets the state of the instance as a `Serializable` Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the `StateHolder.saveState(javax.faces.context.FacesContext)` method on all those instances as well. **This method must not save the**
state of children and facets. That is done via the `StateManager`

This method must not alter the state of the implementing object. In other words, after executing this code:

```java
Object state = component.saveState(facesContext);
```

`component` should be the same as before executing it.

The return from this method must be `Serializable`

**Specified by:**
`saveState` in interface `StateHolder`

**Overrides:**
`saveState` in class `UIComponentBase`

---

```java
public void restoreState(FacesContext _context, Object _state)
```

**restoreState**

```java
public void restoreState(FacesContext _context, Object _state)
```

**Description copied from interface: `StateHolder`**

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement `StateHolder` (such as a `UIComponent` with event handlers, validators, etc.) this method must call the `StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object)` method on all those instances as well.

**Specified by:**
`restoreState` in interface `StateHolder`
Overrides:

restoreState in class UIComponentBase
javax.faces.component.html Class HtmlCommandButton

java.lang.Object
  ▼ javax.faces.component.UIComponent
     ▼ javax.faces.component.UIComponentBase
        ▼ javax.faces.component.UICommand
           ▼ javax.faces.component.html.HtmlCommandButton

All Implemented Interfaces:
   ActionSource, ActionSource2, StateHolder

public class HtmlCommandButton
  extends UICommand

Extends: UIComponent > UIComponentBase > UICommand

submit  reset  HTML  input

    rendererType "javax.faces.Button"  setRenderType()

Represents an HTML input element for a button of type submit or reset. The label text is specified by the component value.

By default, the rendererType property must be set to "javax.faces.Button". This value can be changed by calling the setRendererType() method.

- [Constant Field Values](#)

### Constructor Detail

**public HtmlCommandButton()**

**HtmlCommandButton**

**public HtmlCommandButton()**
getAccesskey

public String getAccesskey()

accesskey

Return the value of the accesskey property.

Contents: Access key that, when pressed, transfers focus to this element.

setAccesskey

public void setAccesskey(String accesskey)

accesskey

Set the value of the accesskey property.
getAlt

public String getAlt()

    Return the value of the alt property.

    Contents: Alternate textual description of the element rendered by this component.

setAlt

public void setAlt(String alt)

    alt

getDir

public String getDir()

    dir

"LTR" left-to-right "RTL" right-to-left

gDir

public String getDir()
Return the value of the \texttt{dir} property.

Contents: Direction indication for text that does not inherit directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).

\begin{verbatim}
public void setDir(String dir)
    dir

setDir
public void setDir(String dir)
    Set the value of the \texttt{dir} property.
\end{verbatim}

\begin{verbatim}
public boolean isDisabled()
    disabled

false true disabled="disabled"

isDisabled
public boolean isDisabled()
    Return the value of the \texttt{disabled} property.

Contents: Flag indicating that this element must never receive focus or be included in a subsequent submit. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as disabled="disabled".
\end{verbatim}
public void setDisabled(boolean disabled)

disabled

setDisabled

public void setDisabled(boolean disabled)

Set the value of the disabled property.

g getImage

public String getImage()

image

URL URL "input" "image"
"type" "value"

g getImage

public String getImage()

Return the value of the image property.

Contents: Absolute or relative URL of the image to be displayed for this button. If specified, this "input" element will be of type "image". Otherwise, it will be of the type specified by the "type" property with a label specified by the "value" property.

public void setImage(String image)
public void setImage(String image)

Set the value of the image property.

public String getLabel()

label

public String getLabel()

Return the value of the label property.

Contents: A localized user presentable name for this component.

public void setLabel(String label)

label

public void setLabel(String label)
Set the value of the `label` property.

```java
public String getLang()
{
    lang
}
```

**getLang**

```java
public String getLang()
{
    return the value of the `lang` property.
    Contents: Code describing the language used in the generated markup for this component.
}
```

```java
public void setLang(String lang)
{
    lang
}
```

**setLang**

```java
public void setLang(String lang)
{
    Set the value of the `lang` property.
}
```

```java
public String getOnblur()
{
    onblur
}
```
getOnblur

public String getOnblur()

Return the value of the onblur property.

Contents: Javascript code executed when this element loses focus.

public void setOnblur(String onblur)

onblur

setOnblur

public void setOnblur(String onblur)

Set the value of the onblur property.

public String getOnchange()

onchange

Javascript

getOnchange

public String getOnchange()
Return the value of the `onchange` property.

Contents: Javascript code executed when this element loses focus and its value has been modified since gaining focus.

```java
public void setOnchange(String onchange)
```

`onchange`

---

```java
public void setOnchange(String onchange)
```

Set the value of the `onchange` property.

---

```java
public String getOnclick()
```

`onclick`

**Javascript**

```java
public String getOnclick()
```

Return the value of the `onclick` property.

Contents: Javascript code executed when a pointer button is clicked over this element.

---

```java
public void setOnclick(String onclick)
```
onclick

setOnonclick

public void setOnonclick(String onclick)

    Set the value of the onclick property.

public String getOndblclick()

    ondblclick

Javascript

getOndblclick

public String getOndblclick()

    Return the value of the ondblclick property.

    Contents: Javascript code executed when a pointer button is double clicked over this element.

public void setOndblclick(String ondblclick)

    ondblclick

setOndblclick

public void setOndblclick(String ondblclick)
Set the value of the ondblclick property.

public String getOnfocus()

 побсct

getOnfocus

public String getOnfocus()

Return the value of the onfocus property.

Contents: Javascript code executed when this element receives focus.

public void setOnfocus(String onfocus)

 побсct

setOnfocus

public void setOnfocus(String onfocus)

Set the value of the onfocus property.

public String getOnkeydown()

 побcдк drawbacks
Javascript

getonkeydown

class Javascript:

public String getOnkeydown()

    Return the value of the onkeydown property.

    Contents: Javascript code executed when a key is pressed down over this element.

-----------------------------------------------

public void setOnkeydown(String onkeydown)

    onkeydown

setOnkeydown

class Javascript:

public void setOnkeydown(String onkeydown)

    Set the value of the onkeydown property.

-----------------------------------------------

public String getOnkeypress()

    onkeypress

Javascript

getonkeypress

class Javascript:

public String getOnkeypress()

    getOnkeypress()
Return the value of the `onkeypress` property.

Contents: Javascript code executed when a key is pressed and released over this element.

```java
public void setOnkeypress(String onkeypress)

    onkeypress

setOnkeypress
```

```java
public void setOnkeypress(String onkeypress)

    Set the value of the `onkeypress` property.

public String getOnkeyup()

    onkeyup

Javascript

getOnkeyup
```

```java
public String getOnkeyup()

    Return the value of the `onkeyup` property.

    Contents: Javascript code executed when a key is released over this element.

public void setOnkeyup(String onkeyup)
onkeyup

setOnkeyup

public void setOnkeyup(String onkeyup)

    Set the value of the onkeyup property.

public String getOnmousedown()

    onmousedown

Javascript

getOnmousedown

public String getOnmousedown()

    Return the value of the onmousedown property.

    Contents: Javascript code executed when a pointer button is pressed down over this element.

public void setOnmousedown(String onmousedown)

    onmousedown

setOnmousedown

public void setOnmousedown(String onmousedown)
Set the value of the `onmousedown` property.

```java
public String getOnmousemove()

  onmousemove

Javascript

getOnmousemove
```

Public String getOnmousemove()

  Return the value of the `onmousemove` property.

  Contents: Javascript code executed when a pointer button is moved within this element.

```
public void setOnmousemove(String onmousemove)

  onmousemove

setOnmousemove
```

Public void setOnmousemove(String onmousemove)

  Set the value of the `onmousemove` property.

```
public String getOnmouseout()

  onmouseout
```
getOnmouseout

public String getOnmouseout()

   Return the value of the onmouseout property.

   Contents: Javascript code executed when a pointer button is moved away from this element.

public void setOnmouseout(String onmouseout)

   onmouseout

setOnmouseout

public void setOnmouseout(String onmouseout)

   Set the value of the onmouseout property.

public String getOnmouseover()

   onmouseover

getOnmouseover

public String getOnmouseover()
Return the value of the onmouseover property.

Contents: Javascript code executed when a pointer button is moved onto this element.

```
public void setOnmouseover(String onmouseover)
```

```
onmouseover
```

```
setOnmouseover
```

```
public void setOnmouseover(String onmouseover)
```

```
Set the value of the onmouseover property.
```

```
public String getOnmouseup()
```

```
onmouseup
```

```
Javascript
```

```
getOnmouseup
```

```
public String getOnmouseup()
```

```
Return the value of the onmouseup property.

Contents: Javascript code executed when a pointer button is released over this element.
```

```
public void setOnmouseup(String onmouseup)
```
setOnmouseup

public void setOnmouseup(String onmouseup)

    Set the value of the onmouseup property.

getOnselect

public String getOnselect()

    onSelect

Javascript

getOnselect

public String getOnselect()

    Return the value of the onSelect property.

    Contents: Javascript code executed when text within this element is selected by the user.

setOnselect

public void setOnselect(String onSelect)

    onSelect

setOnselect

public void setOnselect(String onSelect)
Set the value of the `onselect` property.

```java
public boolean isReadonly()
    {readonly
false true readonly="readonly"

isReadonly

public boolean isReadonly()
    Return the value of the `readonly` property.
    Contents: Flag indicating that this component will prohibit changes by the user. The element may receive focus unless it has also been disabled. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as `readonly="readonly"`.

public void setReadonly(boolean readonly)
    {readonly

setReadonly

public void setReadonly(boolean readonly)
    Set the value of the `readonly` property.
public String getStyle()

    style

    CSS

getStyle

public String getStyle()

    Return the value of the style property.

    Contents: CSS style(s) to be applied when this component is rendered.

public void setStyle(String style)

    style

setStyle

public void setStyle(String style)

    Set the value of the style property.

public String getStyleClass()

    styleClass

    CSS "class"
**getStyleClass**

public String getStyleClass()

Return the value of the `styleClass` property.

Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

**public void setStyleClass(String styleClass)**

`styleClass`

**setStyleClass**

public void setStyleClass(String `styleClass`)

Set the value of the `styleClass` property.

**public String getTabindex()**

`tabindex`

Tab 0 32767

**getTabindex**

public String getTabindex()
Return the value of the `tabindex` property.

Contents: Position of this element in the tabbing order for the current document. This value must be an integer between 0 and 32767.

```java
public void setTabindex(String tabindex)

setTabindex

public void setTabindex(String tabindex)

Set the value of the `tabindex` property.
```

```java
public String getTitle()

title

g getTitle

public String getTitle()

Return the value of the `title` property.

Contents: Advisory title information about markup elements generated for this component.

```java
public void setTitle(String title)
setTitle

public void setTitle(String title)

Set the value of the title property.

public String getType()

type

"submit" "reset" "submit"

getType

public String getType()

Return the value of the type property.

Contents: Type of button to create. Valid values are "submit" and "reset". If not specified, or not a valid value, the default value is "submit".

public void setType(String type)

type

setType
public void setType(String type)

Set the value of the type property.

public Object saveState(FacesContext _context)

saveState

public Object saveState(FacesContext _context)

Description copied from interface: StateHolder

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.saveState(javax.faces.context.FacesContext) method on all those instances as well. This method must not save the state of children and facets. That is done via theStateManager

This method must not alter the state of the implementing object. In other words, after executing this code:

Object state = component.saveState(facesContext);

component should be the same as before executing it.

The return from this method must be Serializable

Specified by:
saveState in interface StateHolder

Overrides:
saveState in class UICommand

public void restoreState(FacesContext _context, Object
`_state)``

**restoreState**

```java
public void restoreState(FacesContext _context,
                         Object _state)
```

Description copied from interface: **StateHolder**

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the `StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object)` method on all those instances as well.

**Specified by:**

`restoreState` in interface **StateHolder**

**Overrides:**

`restoreState` in class **UICommand**

PS:
javax.faces.component.html Class HtmlCommandLink

does not inherit from a class

public class HtmlCommandLink
extends UICommand

Extends: UIComponent > UIComponentBase > UICommand

HTML a JavaScript

\[
\text{rendererType } " \text{javax.faces.Link}" \text{ setRendererType()}
\]

Represents an HTML a element for a hyperlink that acts like a submit button. This component must be placed inside a form, and requires JavaScript to be enabled in the client.

By default, the rendererType property must be set to "javax.faces.Link". This value can be changed by calling the setRendererType() method.

Constructor Detail

public HtmlCommandLink()
public HtmlCommandLink()

### Method Detail

**getAccesskey**

```java
public String getAccesskey()
```

**accesskey**

**getAccesskey**

```java
public String getAccesskey()
```

Return the value of the `accesskey` property.

Contents: Access key that, when pressed, transfers focus to this element.

**setAccesskey**

```java
public void setAccesskey(String accesskey)
```

**accesskey**

**setAccesskey**

```java
public void setAccesskey(String accesskey)
```

Set the value of the `accesskey` property.
public String getCharset()

    charset

getCharset

public String getCharset()

    Return the value of the charset property.

    Contents: The character encoding of the resource designated by this hyperlink.

public void setCharset(String charset)

    charset

setCharset

public void setCharset(String charset)

    Set the value of the charset property.

public String getCoords()

    coords
getCoords

public String getCoords()

    Return the value of the coords property.

    Contents: The position and shape of the hot spot on the screen (for use in client-side image maps).

public void setCoords(String coords)

coords

setCoords

public void setCoords(String coords)

    Set the value of the coords property.

public String getDir()

dir

"LTR" left-to-right "RTL" right-to-left

getDir

public String getDir()

    Return the value of the dir property.
Contents: Direction indication for text that does not inherit directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).

```java
public void setDir(String dir)
```

`dir`

setDir

```java
public void setDir(String dir)
```

Set the value of the `dir` property.

```java
public boolean isDisabled()
```

`disabled`

isDisabled

```java
public boolean isDisabled()
```

Return the value of the `disabled` property.

Contents: Flag indicating that this element must never receive focus or be included in a subsequent submit.

```java
public void setDisabled(boolean disabled)
```
public void setDisabled(boolean disabled)

Set the value of the disabled property.

public String getHreflang()

Return the value of the hreflang property.

Contents: The language code of the resource designated by this hyperlink.

public void setHreflang(String hreflang)

public void setHreflang(String hreflang)
Set the value of the `hreflang` property.

```java
public String getLang()
```

`lang`

**getLang**

```java
public String getLang()
```

Return the value of the `lang` property.

Contents: Code describing the language used in the generated markup for this component.

```java
public void setLang(String lang)
```

`lang`

**setLang**

```java
public void setLang(String lang)
```

Set the value of the `lang` property.

```java
public String getOnblur()
```

`onblur`
getOnblur

```java
public String getOnblur()
```

Return the value of the `onblur` property.

Contents: Javascript code executed when this element loses focus.

---

public void setOnblur(String onblur)

```java
onblur
```

---

setOnblur

```java
public void setOnblur(String onblur)
```

Set the value of the `onblur` property.

---

public String getOnclick()

```java
onclick
```

---

getOnclick

```java
public String getOnclick()
```
Return the value of the onclick property.

Contents: Javascript code executed when a pointer button is clicked over this element.

```java
public void setOnclick(String onclick)
```

`onclick`

---

`setOnclick`

```java
public void setOnclick(String onclick)
```

Set the value of the onclick property.

---

`getOndblclick`

```java
public String getOndblclick()
```

`ondblclick`

Javascript

---

`getOndblclick`

```java
public String getOndblclick()
```

Return the value of the ondblclick property.

Contents: Javascript code executed when a pointer button is double clicked over this element.

```java
public void setOndblclick(String ondblclick)
```
**setOndblclick**

```
public void setOndblclick(String ondblclick)
```

Set the value of the ondblclick property.

**getOnfocus**

```
public String getOnfocus()
```

**getOnfocus**

```
public String getOnfocus()
```

Return the value of the onfocus property.

Contents: Javascript code executed when this element receives focus.

**setOnfocus(String onfocus)**

```
public void setOnfocus(String onfocus)
```

**setOnfocus**

```
public void setOnfocus(String onfocus)
```
Set the value of the `onfocus` property.

```java
public String getOnkeydown()
```

`onkeydown`

**Javascript**

**getOnkeydown**

```java
public String getOnkeydown()
```

Return the value of the `onkeydown` property.

Contents: Javascript code executed when a key is pressed down over this element.

```java
public void setOnkeydown(String onkeydown)
```

`onkeydown`

**setOnkeydown**

```java
public void setOnkeydown(String onkeydown)
```

Set the value of the `onkeydown` property.

```java
public String getOnkeypress()
```

`onkeypress`
Javascript

getOnkeypress

public String getOnkeypress()

    Return the value of the onkeypress property.

    Contents: Javascript code executed when a key is pressed and released over this element.

    public void setOnkeypress(String onkeypress)

        onkeypress

setOnkeypress

public void setOnkeypress(String onkeypress)

    Set the value of the onkeypress property.

public String getOnkeyup()

    onkeyup

Javascript

getOnkeyup

public String getOnkeyup()
Return the value of the `onkeyup` property.

Contents: Javascript code executed when a key is released over this element.

---

```java
public void setOnkeyup(String onkeyup)

    onkeyup
```

---

`setOnkeyup`

```java
public void setOnkeyup(String onkeyup)

    Set the value of the `onkeyup` property.
```

---

```java
public String getOnmousedown()

    onmousedown
```

---

`getOnmousedown`

```java
public String getOnmousedown()

    Return the value of the `onmousedown` property.

    Contents: Javascript code executed when a pointer button is pressed down over this element.
```

---

```java
public void setOnmousedown(String onmousedown)
```

onmousedown

setOnmousedown

public void setOnmousedown(String onmousedown)

Set the value of the onmousedown property.

public String getOnmousemove()

onmousemove

Javascript

getOnmousemove

public String getOnmousemove()

Return the value of the onmousemove property.

Contents: Javascript code executed when a pointer button is moved within this element.

public void setOnmousemove(String onmousemove)

onmousemove

setOnmousemove

public void setOnmousemove(String onmousemove)
Set the value of the onmousemove property.

```
public String getOnmouseout()
```

```
onmouseout
```

Javascript

```
public String getOnmouseout()
```

```
Return the value of the onmouseout property.

Contents: Javascript code executed when a pointer button is moved away from this element.

```
public void setOnmouseout(String onmouseout)
```

```
onmouseout
```

```
setOnmouseout
```

```
public void setOnmouseout(String onmouseout)
```

```
Set the value of the onmouseout property.

```
public String getOnmouseover()
```

```
onmouseover
```
Javascript

getOnmouseover

public String getOnmouseover()

    Return the value of the onmouseover property.

    Contents: Javascript code executed when a pointer button is moved onto this element.

----------------------------------------

public void setOnmouseover(String onmouseover)

    onmouseover

setOnmouseover

public void setOnmouseover(String onmouseover)

    Set the value of the onmouseover property.

----------------------------------------

public String getOnmouseup()

    onmouseup

Javascript

getOnmouseup

public String getOnmouseup()
Return the value of the `onmouseup` property.

Contents: Javascript code executed when a pointer button is released over this element.

---

```java
public void setOnmouseup(String onmouseup)
```

`onmouseup`

---

`setOnmouseup`

```java
public void setOnmouseup(String onmouseup)
```

Set the value of the `onmouseup` property.

---

```java
public String getRel()
```

`rel`

---

`getRel`

```java
public String getRel()
```

Return the value of the `rel` property.

Contents: The relationship from the current document to the anchor specified by this hyperlink. The value of this attribute is a space-separated list of link types.
public void setRel(String rel)

    rel

setRel

public void setRel(String rel)

    Set the value of the rel property.

public String getRev()

    rev

getRev

public String getRev()

    Return the value of the rev property.

    Contents: A reverse link from the anchor specified by this hyperlink to the current document. The value of this attribute is a space-separated list of link types.

public void setRev(String rev)

    rev
**setRev**

```java
public void setRev(String rev)
```

Set the value of the `rev` property.

**public String getShape()**

```java
shape
defaultrectcircle
poly
```

**getShape**

```java
public String getShape()
```

Return the value of the `shape` property.

Contents: The shape of the hot spot on the screen (for use in client-side image maps). Valid values are: default (entire region); rect (rectangular region); circle (circular region); and poly (polygonal region).

**public void setShape(String shape)**

```java
shape
```

**setShape**

```java
public void setShape(String shape)
```
public String getStyle()

style

CSS

getStyle

public String getStyle()

Return the value of the style property.

Contents: CSS style(s) to be applied when this component is rendered.

public void setStyle(String style)

style

setStyle

public void setStyle(String style)

Set the value of the style property.

public String getStyleClass()

styleClass
CSS "class"

getStyleClass

```java
public String getStyleClass()
```

Return the value of the `styleClass` property.

Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

```java
public void setStyleClass(String styleClass)
```

```java
styleClass
```

setStyleClass

```java
public void setStyleClass(String styleClass)
```

Set the value of the `styleClass` property.

```java
public String getTabindex()
```

```java
tabindex
```

Tab 0 32767

getTabindex
public String getTabindex()

    Return the value of the tabindex property.

    Contents: Position of this element in the tabbing order for the current document. This value must be an integer between 0 and 32767.

public void setTabindex(String tabindex)

    tabindex

setTabindex

public void setTabindex(String tabindex)

    Set the value of the tabindex property.

garget

public String getTarget()

    target

getTarget

public String getTarget()

    Return the value of the target property.

    Contents: Name of a frame where the resource retrieved via this hyperlink is to be displayed.
public void setTarget(String target)

target

setTarget

public void setTarget(String target)

Set the value of the target property.

public String getTitle()

title

ggetTitle

public String getTitle()

Return the value of the title property.

Contents: Advisory title information about markup elements generated for this component.

public void setTitle(String title)

setTitle
setTitle

public void setTitle(String title)

Set the value of the title property.

------------------

getType

public String getType()

type

------------------

public void setType(String type)

type

------------------

setType

public void setType(String type)

Set the value of the type property.
public Object saveState(FacesContext _context)

saveState

```java
public Object saveState(FacesContext _context)
```

**Description copied from interface:** StateHolder

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.saveState(javax.faces.context.FacesContext) method on all those instances as well. **This method must not save the state of children and facets.** That is done via the StateManager.

This method must not alter the state of the implementing object. In other words, after executing this code:

```java
Object state = component.saveState(facesContext);
```

component should be the same as before executing it.

The return from this method must be Serializable

**Specified by:**
saveState in interface StateHolder

**Overrides:**
saveState in class UICommand

public void restoreState(FacesContext _context, Object _state)

restoreState
public void restoreState(FacesContext _context,
Object _state)

Description copied from interface: StateHolder

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.restoreState(javax.faces.context.FacesContext,
java.lang.Object) method on all those instances as well.

Specified by: 
restoreState in interface StateHolder

Overrides: 
restoreState in class UICommand

javax.faces.component.html  Class HtmlDataTable

java.lang.Object
   ↓ javax.faces.component.UIComponent
      ↓ javax.faces.component.UIComponentBase
         ↓ javax.faces.component.UIData
            ↓ javax.faces.component.html.HtmlDataTable

All Implemented Interfaces:
   NamingContainer, StateHolder

public class HtmlDataTable
   extends UIData

Extends: UIComponent > UIComponentBase > UIData

HTML table UIColumn

   rendererType "javax.faces.Table"  setRendererType()

Represents a set of repeating data (segregated into columns by child UIColumn components) that will be rendered in an HTML table element.

By default, the rendererType property must be set to "javax.faces.Table". This value can be changed by calling the setRendererType() method.

Constructor Summary

HtmlDataTable()

Method Summary

String getBgcolor()
	Return the value of the bgcolor property.

int getBorder()
	Return the value of the border property.

String getCaptionClass()
	Return the value of the captionClass property.

String getCaptionStyle()
	Return the value of the captionStyle property.

String getCellpadding()
	Return the value of the cellpadding property.

String getCellspacing()
	Return the value of the cellspacing property.

String getColumnClasses()
	Return the value of the columnClasses property.

String getDir()
	Return the value of the dir property.

String getFooterClass()
	Return the value of the footerClass property.

String getFrame()
	Return the value of the frame property.

Field Detail

COMPONENT_TYPE

public static final String COMPONENT_TYPE

The standard component type for this component.

See Also:
### Constructor Detail

```java
public HtmlDataTable()
```

### Method Detail

```java
public String getBgcolor()
```

**getBgcolor**

```java
public String getBgcolor()
```

Return the value of the `bgcolor` property.

Contents: Name or code of the background color for this table.

```java
public void setBgcolor(String bgcolor)
```

**bgcolor**
**setBgcolor**

```java
public void setBgcolor(String bgcolor)
```

Set the value of the bgcolor property.

---

**public int getBorder()**

```java
border
```

---

**getBorder**

```java
public int getBorder()
```

Return the value of the border property.

Contents: Width (in pixels) of the border to be drawn around this table.

---

**public void setBorder(int border)**

```java
border
```

---

**setBorder**

```java
public void setBorder(int border)
```

Set the value of the border property.
public String getCaptionClass()

    captionClass

    CSS

getCaptionClass

public String getCaptionClass()

    Return the value of the captionClass property.

    Contents: Space-separated list of CSS style class(es) that will be applied to any caption generated for this table.

-----------------------------------------------

public void setCaptionClass(String captionClass)

    captionClass

setCaptionClass

public void setCaptionClass(String captionClass)

    Set the value of the captionClass property.

-----------------------------------------------

public String getCaptionStyle()

    captionStyle

    CSS
getCaptionStyle

public String getCaptionStyle()

Return the value of the captionStyle property.

Contents: CSS style(s) to be applied when this caption is rendered.

------------------------------

public void setCaptionStyle(String captionStyle)

captionStyle

setCaptionStyle

public void setCaptionStyle(String captionStyle)

Set the value of the captionStyle property.

------------------------------

public String getCellpadding()

cellpadding

getCellpadding

public String getCellpadding()

Return the value of the cellpadding property.
Contents: Definition of how much space the user agent should leave between the border of each cell and its contents.

public void setCellpadding(String cellpadding)

cellpadding

setCellpadding

public void setCellpadding(String cellpadding)

Set the value of the cellpadding property.

public String getCellspacing()

cellspacing

gCellspacing

public String getCellspacing()

Return the value of the cellspacing property.

Contents: Definition of how much space the user agent should leave between the left side of the table and the leftmost column, the top of the table and the top of the top side of the topmost row, and so on for the right and bottom of the table. It also specifies the amount of space to leave between cells.
public void setCellspacing(String cellspacing)

    cellspacing

setCellspacing

public void setCellspacing(String cellspacing)
    Set the value of the cellspacing property.

public String getColumnClasses()

columnClasses

CSS "columns" "class"
"columns" "columns"

getColumnClasses

public String getColumnClasses()
    Return the value of the columnClasses property.

Contents: Comma-delimited list of CSS style classes that will be applied to the columns of this table. A space separated list of classes may also be specified for any individual column. If the number of elements in this list is less than the number of columns specified in the "columns" attribute, no "class" attribute is output for each column greater than the number of elements in the list. If the number of elements in the list is greater than the number of columns specified in the "columns" attribute, the elements at the position in the list after the value of the "columns" attribute are ignored.
public void setColumnClasses(String columnClasses)

columnClasses

setColumnClasses

public void setColumnClasses(String columnClasses)

Set the value of the columnClasses property.

-----------------------------

gpublic String getDir()

dir

"LTR" left-to-right "RTL" right-to-left

getDir

gpublic String getDir()

Return the value of the dir property.

Contents: Direction indication for text that does not inherit directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).

-----------------------------

gpublic void setDir(String dir)

dir
**setDir**

public void setDir(String dir)

Set the value of the dir property.

**public String getFooterClass()**

footerClass

CSS

**getFooterClass**

public String getFooterClass()

Return the value of the footerClass property.

Contents: Space-separated list of CSS style class(es) that will be applied to any footer generated for this table.

**public void setFooterClass(String footerClass)**

footerClass

**setFooterClass**

public void setFooterClass(String footerClass)

Set the value of the footerClass property.
public String getFrame()

    frame

    none
    above
    below
    hsides
    vsides
    lhs
    rhs
    box
    border

getFrame

public String getFrame()

    Return the value of the frame property.

    Contents: Code specifying which sides of the frame surrounding this table will be visible. Valid values are: none (no sides, default value); above (top side only); below (bottom side only); hsides (top and bottom sides only); vsides (right and left sides only); lhs (left hand side only); rhs (right hand side only); box (all four sides); and border (all four sides).

public void setFrame(String frame)

    frame

setFrame

public void setFrame(String frame)

    Set the value of the frame property.

public String getHeaderClass()
Getter and Setter:

getHeaderClass

public String getHeaderClass()

Return the value of the headerClass property.

Contents: Space-separated list of CSS style class(es) that will be applied to any header generated for this table.

setHeaderClass

public void setHeaderClass(String headerClass)

Set the value of the headerClass property.

getLang

public String getLang()
**getLang**

public String getLang()

Return the value of the `lang` property.

Contents: Code describing the language used in the generated markup for this component.

---

**public void setLang(String lang)**

`lang`

---

**setLang**

public void setLang(String lang)

Set the value of the `lang` property.

---

**public String getOnclick()**

`onclick`

**Javascript**

---

**getOnclick**

public String getOnclick()

Return the value of the `onclick` property.

Contents: Javascript code executed when a pointer button is clicked.
setOnclick

public void setOnclick(String onclick)

onclick

getOndblclick

public String getOndblclick()

getOndblclick

public  String getOndblclick()

Return the value of the ondblclick property.

Contents: Javascript code executed when a pointer button is double clicked over this element.
**setOndblclick**

```java
public void setOndblclick(String ondblclick)
```

Set the value of the `ondblclick` property.

---

**public String getOnkeydown()**

```java
public String getOnkeydown()
```

`onkeydown`

**Javascript**

---

**getOnkeydown**

```java
public String getOnkeydown()
```

Return the value of the `onkeydown` property.

Contents: Javascript code executed when a key is pressed down over this element.

---

**public void setOnkeydown(String onkeydown)**

`onkeydown`

---

**setOnkeydown**

```java
public void setOnkeydown(String onkeydown)
```

Set the value of the `onkeydown` property.
public String getOnkeypress()

    onkeypress

Javascript

getOnkeypress

public String getOnkeypress()

    Return the value of the onkeypress property.
    Contents: Javascript code executed when a key is pressed and released over this element.

public void setOnkeypress(String onkeypress)

    onkeypress

setOnkeypress

public void setOnkeypress(String onkeypress)

    Set the value of the onkeypress property.

public String getOnkeyup()

    onkeyup

Javascript
getOnkeyup

```
public String getOnkeyup()

    Return the value of the onkeyup property.

    Contents: Javascript code executed when a key is released over this element.
```

---

public void setOnkeyup(String onkeyup)

    onkeyup

---

setOnkeyup

```
public void setOnkeyup(String onkeyup)

    Set the value of the onkeyup property.
```

---

public String getOnmousedown()

    onmousedown

Javascript

getOnmousedown

```
public String getOnmousedown()

    Return the value of the onmousedown property.
```
Contents: Javascript code executed when a pointer button is pressed down over this element.

```java
public void setOnmousedown(String onmousedown)

    onmousedown

setOnmousedown

public void setOnmousedown(String onmousedown)

    Set the value of the onmousedown property.

```
**setOnmousemove**

```java
public void setOnmousemove(String onmousemove)
```

Set the value of the `onmousemove` property.

---

**public String getOnmouseout()**

```java
onmouseout
```

**Javascript**

**getOnmouseout**

```java
public String getOnmouseout()
```

Return the value of the `onmouseout` property.

Contents: Javascript code executed when a pointer button is moved away from this element.

---

**public void setOnmouseout(String onmouseout)**

```java
onmouseout
```

**setOnmouseout**

```java
public void setOnmouseout(String onmouseout)
```

Set the value of the `onmouseout` property.
public String getOnmouseover()

    onmouseover

Javascript

getOnmouseover

public String getOnmouseover()

    Return the value of the onmouseover property.

    Contents: Javascript code executed when a pointer button is moved onto this element.

public void setOnmouseover(String onmouseover)

    onmouseover

setOnmouseover

public void setOnmouseover(String onmouseover)

    Set the value of the onmouseover property.

public String getOnmouseup()

    onmouseup

Javascript
getOnmouseup

public String getOnmouseup()

    Return the value of the onmouseup property.

    Contents: Javascript code executed when a pointer button is released over this element.

public void setOnmouseup(String onmouseup)

    onmouseup

setOnmouseup

public void setOnmouseup(String onmouseup)

    Set the value of the onmouseup property.

public String getRowClasses()

    rowClasses

CSS

getRowClasses

public String getRowClasses()

    Return the value of the rowclasses property.
Contents: Comma-delimited list of CSS style classes that will be applied to the rows of this table. A space separated list of classes may also be specified for any individual row. The styles are applied, in turn, to each row in the table. For example, if the list has two elements, the first style class in the list is applied to the first row, the second to the second row, the first to the third row, the second to the fourth row, etc. In other words, we keep iterating through the list until we reach the end, and then we start at the beginning again.

public void setRowClasses(String rowClasses)

    rowClasses

setRowClasses

public void setRowClasses(String rowClasses)

    Set the value of the rowClasses property.

public String getRules()

    rules

getRules

public String getRules()

    Return the value of the rules property.
Contents: Code specifying which rules will appear between cells within this table. Valid values are: none (no rules, default value); groups (between row groups); rows (between rows only); cols (between columns only); and all (between all rows and columns).

```java
public void setRules(String rules)
```

```
setRules
```

```java
public void setRules(String rules)
```

```
Set the value of the rules property.
```

```java
public String getStyle()
```

```
ggetStyle
```

```java
public String getStyle()
```

```
Return the value of the style property.
```

```
Contents: CSS style(s) to be applied when this component is rendered.
```

```java
public void setStyle(String style)
```
public void setStyle(String style)

Set the value of the style property.

public String getStyleClass()

styleClass

CSS "class"

public String getStyleClass()

Return the value of the styleClass property.

Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

public void setStyleClass(String styleClass)

styleClass

setStyleClass
public void setStyleClass(String styleClass)

    Set the value of the styleClass property.

public String getSummary()

    summary

    Braille

getSummary

public String getSummary()

    Return the value of the summary property.

    Contents: Summary of this table's purpose and structure, for user agents rendering to non-visual media such as speech and Braille.

public void setSummary(String summary)

    summary

setSummary

public void setSummary(String summary)

    Set the value of the summary property.

public String getTitle()
getTitle

public String getTitle()

    Return the value of the title property.

    Contents: Advisory title information about markup elements generated for this component.

_________________________________________________________________________

public void setTitle(String title)

    title

setTitle

public void setTitle(String title)

    Set the value of the title property.

_________________________________________________________________________

public String getWidth()

    width
**getWidth**

```java
public String getWidth()
```

Return the value of the width property.

Contents: Width of the entire table, for visual user agents.

---

**public void setWidth(String width)**

```java
setWidth
```

Set the value of the width property.

---

**public Object saveState(FacesContext _context)**

**saveState**

```java
saveState
```

Description copied from interface: StateHolder

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.saveState(FacesContext context) method on all those instances as well. **This method must not save the state of children and facets.** That is done via the StateManager.
This method must not alter the state of the implementing object. In other words, after executing this code:

```java
Object state = component.saveState(facesContext);
```

`component` should be the same as before executing it.

The return from this method must be Serializable.

**Specified by:**
- `saveState` in interface `StateHolder`

**Overrides:**
- `saveState` in class `UIData`

---

```java
public void restoreState(FacesContext _context, Object _state)
```

**Description copied from interface:** `StateHolder`

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the `StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object)` method on all those instances as well.

**Specified by:**
- `restoreState` in interface `StateHolder`

**Overrides:**
- `restoreState` in class `UIData`

All Implemented Interfaces:
   NamingContainer, StateHolder

public class HtmlForm
   extends UIForm

Extends: UIComponent > UIComponentBase > UIForm

HTML form input

   rendererType "javax.faces.Form"  setRendererType()

Represents an HTML form element. Child input components will be submitted unless they have been disabled.

By default, the rendererType property must be set to "javax.faces.Form". This value can be changed by calling the setRendererType() method.

Field Detail

COMPONENT_TYPE

public static final String COMPONENT_TYPE

The standard component type for this component.

See Also:
Constructor Detail

public HtmlForm()

Method Detail

public String getAccept()

   accept

getAccept

public String getAccept()

   Return the value of the accept property.

   Contents: List of content types that a server processing this form will handle correctly

public void setAccept(String accept)

   accept
**setAccept**

```java
public void setAccept(String accept)
```

Set the value of the accept property.

**public String getAcceptcharset()**

```java
acceptcharset
```

**getAcceptcharset**

```java
public String getAcceptcharset()
```

Return the value of the acceptcharset property.

Contents: List of character encodings for input data that are accepted by the server processing this form.

**public void setAcceptcharset(String acceptcharset)**

```java
acceptcharset
```

**setAcceptcharset**

```java
public void setAcceptcharset(String acceptcharset)
```

Set the value of the acceptcharset property.
public String getDir()

dir
"LTR" left-to-right "RTL" right-to-left

getDir

public String getDir()

    Return the value of the dir property.

    Contents: Direction indication for text that does not inherit
directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-
left).

    public void setDir(String dir)

dir

setDir

public void setDir(String dir)

    Set the value of the dir property.

    public String getEnctype()

tenctype

"application/x-www-form-urlencoded"
**getEnctype**

```java
public String getEnctype()
```

Return the value of the `enctype` property.

Contents: Content type used to submit the form to the server. If not specified, the default value is "application/x-www-form-urlencoded".

---

**public void setEnctype(String enctype)**

`enctype`

---

**setEnctype**

```java
public void setEnctype(String enctype)
```

Set the value of the `enctype` property.

---

**public String getLang()**

`lang`

---

**getLang**

```java
public String getLang()
```

Return the value of the `lang` property.
Contents: Code describing the language used in the generated markup for this component.

```
public void setLang(String lang)

lang

setLang

public void setLang(String lang)

Set the value of the lang property.
```

```
public String getOnclick()

onclick

Javascript

getOnclick

public String getOnclick()

Return the value of the onclick property.

Contents: Javascript code executed when a pointer button is clicked over this element.
```

```
public void setOnclick(String onclick)

onclick
```
**setOnclick**

public void setOnclick(String onclick)

Set the value of the onclick property.

---

**public String getOndblclick()**

ondblclick

**Javascript**

**getOndblclick**

public String getOndblclick()

Return the value of the ondblclick property.

Contents: Javascript code executed when a pointer button is double clicked over this element.

---

**public void setOndblclick(String ondblclick)**

ondblclick

**setOndblclick**

public void setOndblclick(String ondblclick)

Set the value of the ondblclick property.
public String getOnkeydown()

    onkeydown

Javascript

getOnkeydown

class javscript

public String getOnkeydown()

    Return the value of the onkeydown property.

    Contents: Javascript code executed when a key is pressed down over this element.

public void setOnkeydown(String onkeydown)

    onkeydown

setOnkeydown

class javscript

public void setOnkeydown(String onkeydown)

    Set the value of the onkeydown property.

public String getOnkeypress()

    onkeypress

Javascript
**getOnkeypress**

```java
public String getOnkeypress()
```

Return the value of the `onkeypress` property.

Contents: Javascript code executed when a key is pressed and released over this element.

**public void setOnkeypress(String onkeypress)**

```java
onkeypress
```

**setOnkeypress**

```java
public void setOnkeypress(String onkeypress)
```

Set the value of the `onkeypress` property.

**public String getOnkeyup()**

```java
onkeyup
```

**Javascript**

**getOnkeyup**

```java
public String getOnkeyup()
```

Return the value of the `onkeyup` property.
Contents: Javascript code executed when a key is released over this element.

---

public void setOnkeyup(String onkeyup)

    onkeyup

setOnkeyup

public void setOnkeyup(String onkeyup)

    Set the value of the onkeyup property.

---

public String getOnmousedown()

    onmousedown

Javascript

getOnmousedown

public  String  getOnmousedown()

    Return the value of the onmousedown property.

    Contents: Javascript code executed when a pointer button is pressed down over this element.

---

public void setOnmousedown(String onmousedown)

    onmousedown
setOnmousedown

public void setOnmousedown(String onmousedown)

    Set the value of the onmousedown property.

-----------------------------------------------

getOnmousemove

public String getOnmousemove()

    onmousemove

Javascript

getOnmousemove

public String getOnmousemove()

    Return the value of the onmousemove property.

    Contents: Javascript code executed when a pointer button is moved within this element.

-----------------------------------------------

setOnmousemove

public void setOnmousemove(String onmousemove)

    onmousemove

setOnmousemove

public void setOnmousemove(String onmousemove)

    Set the value of the onmousemove property.
public String getOnmouseout()

    onmouseout

Javascript

getOnmouseout

public String getOnmouseout()

    Return the value of the onmouseout property.
    Contents: Javascript code executed when a pointer button is moved away from this element.

public void setOnmouseout(String onmouseout)

    onmouseout

setOnmouseout

public void setOnmouseout(String onmouseout)

    Set the value of the onmouseout property.

public String getOnmouseover()

    onmouseover

Javascript
getOnmouseover

public String getOnmouseover()

    Return the value of the onmouseover property.

    Contents: Javascript code executed when a pointer button is moved onto this element.

public void setOnmouseover(String onmouseover)

    onmouseover

setOnmouseover

public void setOnmouseover(String onmouseover)

    Set the value of the onmouseover property.

public String getOnmouseup()

    onmouseup

Javascript

getOnmouseup

public String getOnmouseup()

    Return the value of the onmouseup property.
Contents: Javascript code executed when a pointer button is released over this element.

**public void setOnmouseup(String onmouseup)**

```
onmouseup
```

**setOnmouseup**

```
public void setOnmouseup(String onmouseup)
```

Set the value of the `onmouseup` property.

**public String getOnreset()**

```
onreset
```

**getOnreset**

```
public String getOnreset()
```

Return the value of the `onreset` property.

Contents: Javascript code executed when this form is reset.

**public void setOnreset(String onreset)**

```
onreset
```
**setOnreset**

public void setOnreset(String onreset)

Set the value of the onreset property.

---

**public String getOnsubmit()**

onsubmit

Javascript

**getOnsubmit**

public String getOnsubmit()

Return the value of the onsubmit property.

Contents: Javascript code executed when this form is submitted.

---

**public void setOnsubmit(String onsubmit)**

onsubmit

**setOnsubmit**

public void setOnsubmit(String onsubmit)

Set the value of the onsubmit property.
public String getStyle()

   style

CSS

gTextStyle

public String getStyle()

   Return the value of the style property.

   Contents: CSS style(s) to be applied when this component is rendered.

public void setStyle(String style)

   style

setStyle

public void setStyle(String style)

   Set the value of the style property.

public String getStyleClass()

   styleClass

CSS "class"
**getStyleClass**

public String getStyleClass()

Return the value of the `styleClass` property.

Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

**public void setStyleClass(String styleClass)**

`styleClass`

**setStyleClass**

public void `setStyleClass(String styleClass)`

Set the value of the `styleClass` property.

**public String getTarget()**

`target`

**getTarget**

public String `getTarget()`
Return the value of the target property.

Contents: Name of a frame where the response retrieved after this form submit is to be displayed.

public void setTarget(String target)

target

setDefault

public void setTarget(String target)

Set the value of the target property.

public String getTitle()

title

getTitle

public String getTitle()

Return the value of the title property.

Contents: Advisory title information about markup elements generated for this component.

public void setTitle(String title)
setTitle

public void setTitle(String title)

Set the value of the title property.

saveState

public Object saveState(FacesContext _context)

Description copied from interface: StateHolder

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.saveState(javax.faces.context.FacesContext) method on all those instances as well. This method must not save the state of children and facets. That is done via theStateManager

This method must not alter the state of the implementing object. In other words, after executing this code:

Object state = component.saveState(facesContext);

component should be the same as before executing it.

The return from this method must be Serializable

Specified by:
public void restoreState(FacesContext _context, Object _state)

Description copied from interface: StateHolder

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object) method on all those instances as well.

Specified by:
    restoreState in interface StateHolder

Overrides:
    restoreState in class UIComponentBase
PS:
javax.faces.component.html  Class HtmlGraphicImage

java.lang.Object  
  ↓  javax.faces.component.UIComponent  
    ↓  javax.faces.component.UIComponentBase  
      ↓  javax.faces.component.UIGraphic  
        ↓  javax.faces.component.html.HtmlGraphicImage

All Implemented Interfaces: 
  StateHolder

public class HtmlGraphicImage
  extends UIGraphic

Extends: UICOMPONENT > UICOMPONENTBASE > UIGRAPHIC

HTML  img

    rendererType "javax.faces.Image"  setRendererType()

Represents an HTML img element, used to retrieve and render a graphical image.

By default, the rendererType property must be set to "javax.faces.Image". This value can be changed by calling the setRendererType() method.

   Constant Field Values

Constructor Detail
public HtmlGraphicImage()

HtmlGraphicImage

public HtmlGraphicImage()

### Method Detail

**public String getAlt()**

`alt`

getAlt

**public String getAlt()**

Return the value of the alt property.

Contents: Alternate textual description of the element rendered by this component.

---

**public void setAlt(String alt)**

`alt`

setAlt

**public void setAlt(String alt)**
Set the value of the alt property.

```java
public String getDir()

  dir

 "LTR" left-to-right "RTL" right-to-left
```

getDir

```java
public String getDir()

  Return the value of the dir property.

  Contents: Direction indication for text that does not inherit
directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-
left).
```

```java
public void setDir(String dir)

  dir
```

setDir

```java
public void setDir(String dir)

  Set the value of the dir property.
```

```java
public String getHeight()

  height
```
**getHeigh**

```java
public String getHeight()

    Return the value of the height property.
    
    Contents: Override for the height of this image.
```

**public void setHeigh(String height)**

```java
height
```

**setHeigh**

```java
public void setHeight(String height)

    Set the value of the height property.
```

**public boolean isIsmap()**

```java
ismap

("a") false true ismap="ismap"
```

**isIsmap**

```java
public boolean isIsmap()
```
Return the value of the `ismap` property.

Contents: Flag indicating that this image is to be used as a server side image map. Such an image must be enclosed within a hyperlink ("a"). A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as `ismap="ismap"`.

```java
public void setIsmap(boolean ismap)

   ismap
```

`setIsmap`

```java
public void setIsmap(boolean ismap)

   Set the value of the `ismap` property.
```

```java
public String getLang()

   lang
```

`getLang`

```java
public String getLang()

   Return the value of the `lang` property.

   Contents: Code describing the language used in the generated markup for this component.
```
public void setLang(String lang)

lang

setLang

public void setLang(String lang)

Set the value of the lang property.

public String getLongdesc()

longdesc

URI

getLongdesc

public String getLongdesc()

Return the value of the longdesc property.

Contents: URI to a long description of the image represented by this element.

public void setLongdesc(String longdesc)

longdesc
**setLongdesc**

```java
public void setLongdesc(String longdesc)
```

Set the value of the longdesc property.

---

**public String getOnclick()**

```java
public String getOnclick()
```

Return the value of the onclick property.

Contents: Javascript code executed when a pointer button is clicked over this element.

---

**public void setOnclick(String onclick)**

```java
public void setOnclick(String onclick)
```

---

**setOnclick**

```java
public void setOnclick(String onclick)
```

Set the value of the onclick property.
public String getOndblclick()

    ondblclick

Javascript

---

getOndblclick

public String getOndblclick()

    Return the value of the ondblclick property.

    Contents: Javascript code executed when a pointer button is double clicked over this element.

---

public void setOndblclick(String ondblclick)

    ondblclick

---

setOndblclick

public void setOndblclick(String ondblclick)

    Set the value of the ondblclick property.

---

public String getOnkeydown()

    onkeydown

Javascript
**getOnkeydown**

```java
public String getOnkeydown()
```

Return the value of the `onkeydown` property.

Contents: Javascript code executed when a key is pressed down over this element.

---

**public void setOnkeydown(String onkeydown)**

```java
onkeydown
```

---

**setOnkeydown**

```java
public void setOnkeydown(String onkeydown)
```

Set the value of the `onkeydown` property.

---

**public String getOnkeypress()**

```java
onkeypress
```

---

**getOnkeypress**

```java
public String getOnkeypress()
```

Return the value of the `onkeypress` property.
Contents: Javascript code executed when a key is pressed and released over this element.

public void setOnkeypress(String onkeypress)

  onkeypress

setOnkeypress

public void setOnkeypress(String onkeypress)

  Set the value of the onkeypress property.

public String getOnkeyup()

  onkeyup

Javascript

getOnkeyup

public String getOnkeyup()

  Return the value of the onkeyup property.

  Contents: Javascript code executed when a key is released over this element.

public void setOnkeyup(String onkeyup)

  onkeyup
**setOnkeyup**

public void **setOnkeyup**(*String* onkeyup)

Set the value of the onkeyup property.

---

**public String getOnmousedown()**

*onmousedown*

**Javascript**

**getOnmousedown**

public **String** **getOnmousedown**()

Return the value of the onmousedown property.

Contents: Javascript code executed when a pointer button is pressed down over this element.

---

**public void setOnmousedown(String onmousedown)**

*onmousedown*

**setOnmousedown**

public void **setOnmousedown**(*String* onmousedown)

Set the value of the onmousedown property.
public String getOnmousemove()

  onmousemove

Javascript

getOnmousemove

public String getOnmousemove()

  Return the value of the onmousemove property.

  Contents: Javascript code executed when a pointer button is moved within this element.

public void setOnmousemove(String onmousemove)

  onmousemove

setOnmousemove

public void setOnmousemove(String onmousemove)

  Set the value of the onmousemove property.

public String getOnmouseout()

  onmouseout

Javascript
**getOnmouseout**

```java
public String getOnmouseout()
```

Return the value of the `onmouseout` property.

Contents: Javascript code executed when a pointer button is moved away from this element.

---

**public void setOnmouseout(String onmouseout)**

```
setOnmouseout
```

---

**setOnmouseover**

```java
public void setOnmouseover(String onmouseover)
```

Set the value of the `onmouseover` property.

---

**public String getOnmouseover()**

```
getOnmouseover
```

Javascript

---

**getOnmouseover**

```java
public String getOnmouseover()
```

Return the value of the `onmouseover` property.
Contents: Javascript code executed when a pointer button is moved onto this element.

public void setOnmouseover(String onmouseover)

  onmouseover

setOnmouseover

public void setOnmouseover(String onmouseover)

  Set the value of the onmouseover property.

public String getOnmouseup()

  onmouseup

Javascript

getOnmouseup

public String getOnmouseup()

  Return the value of the onmouseup property.

  Contents: Javascript code executed when a pointer button is released over this element.

public void setOnmouseup(String onmouseup)

  onmouseup
**setOnmouseup**

public void setOnmouseup(String onmouseup)

Set the value of the onmouseup property.

---

**public String getStyle()**

style

CSS

**getStyle**

public String getStyle()

Return the value of the style property.

Contents: CSS style(s) to be applied when this component is rendered.

---

**public void setStyle(String style)**

style

**setStyle**

public void setStyle(String style)

Set the value of the style property.
public String getStyleClass()

    styleClass

    CSS "class"

getStyleClass

public String getStyleClass()  

    Return the value of the styleClass property.

    Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

public void setStyleClass(String styleClass)

    styleClass

setStyleClass

public void setStyleClass(String styleClass)  

    Set the value of the styleClass property.

public String getTitle()

    title
**getTitle**

public String getTitle()

    Return the value of the title property.

    Contents: Advisory title information about markup elements generated for this component.

**public void setTitle(String title)**

    title

**setTitle**

public void setTitle(String title)

    Set the value of the title property.

**public String getUsemap()**

    usemap

HTML "map"

**getUsemap**

public String getUsemap()
Return the value of the usemap property.

Contents: The name of a client side image map (an HTML "map" element) for which this element provides the image.

```java
public void setUsemap(String usemap)
```

**setUsemap**

```java
public void setUsemap(String usemap)
```

Set the value of the usemap property.

```java
public String getWidth()
```

**getWidth**

```java
public String getWidth()
```

Return the value of the width property.

Contents: Override for the width of this image.

```java
public void setWidth(String width)
```
width

setWidth

```java
public void setWidth(String width)
```

Set the value of the width property.

public Object saveState(FacesContext _context)

saveState

```java
public Object saveState(FacesContext _context)
```

Description copied from interface: StateHolder

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.saveState(javax.faces.context.FacesContext) method on all those instances as well. **This method must not save the state of children and facets.** That is done via the StateManager

This method must not alter the state of the implementing object. In other words, after executing this code:

```java
Object state = component.saveState(facesContext);
```

component should be the same as before executing it.

The return from this method must be Serializable

Specified by:
public void restoreState(FacesContext _context, Object _state)

Description copied from interface: StateHolder

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object) method on all those instances as well.

Specified by:
    restoreState in interface StateHolder

Overrides:
    restoreState in class UIGraphic

All Implemented Interfaces:
    EditableValueHolder, StateHolder, ValueHolder

public class HtmlInputHidden
extends UIInput

Extends: UIComponent > UIComponentBase > UIOutput > UIInput

hidden HTML input

rendererType "javax.faces.Hidden" setRendererType()

Represents an HTML input element of type hidden.

By default, the rendererType property must be set to "javax.faces.Hidden". This value can be changed by calling the setRendererType() method.

Constructor Detail
public HtmlInputHidden()

HtmlInputHidden

public HtmlInputHidden()

Method Detail

public Object saveState(FacesContext _context)

saveState

public Object saveState(FacesContext _context)

Description copied from interface: StateHolder

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.saveState(javax.faces.context.FacesContext) method on all those instances as well. **This method must not save the state of children and facets.** That is done via the StateManager.

This method must not alter the state of the implementing object. In other words, after executing this code:

    Object state = component.saveState(facesContext);

component should be the same as before executing it.

The return from this method must be Serializable

Specified by: saveState in interface StateHolder
Overrides:

```java
saveState in class UIInput
```

```java
public void restoreState(FacesContext _context, Object _state)
```

**Description copied from interface:** StateHolder

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the `StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object)` method on all those instances as well.

**Specified by:**

```java
restoreState in interface StateHolder
```

**Overrides:**

```java
restoreState in class UIInput
```

public class HtmlInputSecret
extends UIInput

Extends: UIComponent > UIComponentBase > UIOutput > UIInput

password HTML input redisplay true
rendererType "javax.faces.Secret" setRendererType()

Represents an HTML input element of type password. On a redisplay, any previously entered value will not be rendered (for security reasons) unless the redisplay property is set to true.

By default, the rendererType property must be set to "javax.faces.Secret". This value can be changed by calling the setRendererType() method.

### Field Detail

**COMPONENT_TYPE**

```java
public static final String COMPONENT_TYPE
```

The standard component type for this component.

**See Also:**

[Constant Field Values](#)

### Constructor Detail

```java
public HtmlInputSecret()
```

**HtmlInputSecret**

```java
public HtmlInputSecret()
```

### Method Detail

```java
public String getAccesskey()
```

accesskey

getAccesskey
public String getAccesskey()

    Return the value of the accesskey property.
    Contents: Access key that, when pressed, transfers focus to this element.

public void setAccesskey(String accesskey)

    accesskey

setAccesskey

public void setAccesskey(String accesskey)

    Set the value of the accesskey property.

public String getAlt()

    alt

gGetAlt

public String getAlt()

    Return the value of the alt property.
    Contents: Alternate textual description of the element rendered by this component.
public void setAlt(String alt)

    alt

setAlt

public void setAlt(String alt)

    Set the value of the alt property.

public String getAutocomplete()

    autocomplete

"off" "off" "on"

getAutocomplete

public String getAutocomplete()

    Return the value of the autocomplete property.

    Contents: If the value of this attribute is "off", render "off" as the
    value of the attribute. This indicates that the browser should disable
    its autocomplete feature for this component. This is useful for
    components that perform autocompletion and do not want the
    browser interfering. If this attribute is not set or the value is "on",
    render nothing.

public void setAutocomplete(String autocomplete)

    autocomplete
setAutocomplete

public void setAutocomplete(String autocomplete)

    Set the value of the autocomplete property.

public String getDir()

dir

"LTR" left-to-right "RTL" right-to-left

getDir

public String getDir()

    Return the value of the dir property.

    Contents: Direction indication for text that does not inherit
directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-
left).

public void setDir(String dir)

dir

setDir

public void setDir(String dir)
Set the value of the dir property.

```java
public boolean isDisabled()
{
    disabled
    false true disabled="disabled"
}
```

isDisabled

```java
public boolean isDisabled()
{
    Return the value of the disabled property.
    Contents: Flag indicating that this element must never receive focus or be included in a subsequent submit. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as disabled="disabled".
}
```

```java
public void setDisabled(boolean disabled)
{
    disabled
}
```

setDisabled

```java
public void setDisabled(boolean disabled)
{
    Set the value of the disabled property.
}
```

```java
public String getLabel()
```
public String getLabel()

Return the value of the label property.

Contents: A localized user presentable name for this component.

public void setLabel(String label)

Set the value of the label property.

public String getLang()

getLang
public String getLang()

    Return the value of the lang property.

    Contents: Code describing the language used in the generated markup for this component.

    -----------------------------------------------

public void setLang(String lang)

    lang

setLang

public void setLang(String lang)

    Set the value of the lang property.

    -----------------------------------------------

public int getMaxlength()

    maxlength

getMaxlength

public int getMaxlength()

    Return the value of the maxlength property.

    Contents: The maximum number of characters that may be entered in this field.
public void setMaxlength(int maxlength)

setMaxlength

public void setMaxlength(int maxlength)

Set the value of the maxlength property.

public String getOnblur()

getOnblur

Javascript

public String getOnblur()

Return the value of the onblur property.

Contents: Javascript code executed when this element loses focus.

public void setOnblur(String onblur)

setOnblur

onblur
public void setOnblur(String onblur)

Set the value of the onblur property.

public String getOnchange()

onchange

Javascript

getOnchange

public String getOnchange()

Return the value of the onchange property.

Contents: Javascript code executed when this element loses focus and its value has been modified since gaining focus.

public void setOnchange(String onchange)

onchange

setOnchange

public void setOnchange(String onchange)

Set the value of the onchange property.

public String getOnclick()
onclick

Javascript

getOnclick

public String getOnclick()

Return the value of the onclick property.

Contents: Javascript code executed when a pointer button is clicked over this element.

public void setOnclick(String onclick)

onclick

setOnclick

public void setOnclick(String onclick)

Set the value of the onclick property.

public String getOndblclick()

 ondblclick

Javascript
**getOndblclick**

public String getOndblclick()

Return the value of the ondblclick property.

Contents: Javascript code executed when a pointer button is double clicked over this element.

---

**public void setOndblclick(String ondblclick)**

ondblclick

**setOndblclick**

public void setOndblclick(String ondblclick)

Set the value of the ondblclick property.

---

**public String getOnfocus()**

onfocus

**Javascript**

**getOnfocus**

public String getOnfocus()

Return the value of the onfocus property.

Contents: Javascript code executed when this element receives
public void setOnfocus(String onfocus)

    onfocus

setOnfocus

public void setOnfocus(String onfocus)

    Set the value of the onfocus property.

public String getOnkeydown()

    onkeydown

Javascript

getOnkeydown

public String getOnkeydown()

    Return the value of the onkeydown property.

    Contents: Javascript code executed when a key is pressed down over this element.

public void setOnkeydown(String onkeydown)

    onkeydown
setOnkeydown

public void setOnkeydown(String onkeydown)

Set the value of the onkeydown property.

---

public String getOnkeypress()

onkeypress

Javascript

getOnkeypress

public String getOnkeypress()

Return the value of the onkeypress property.

Contents: Javascript code executed when a key is pressed and released over this element.

---

public void setOnkeypress(String onkeypress)

onkeypress

setOnkeypress

public void setOnkeypress(String onkeypress)

Set the value of the onkeypress property.
public String getOnkeyup()

  onkeyup

Javascript

getOnkeyup

public String getOnkeyup()

  Return the value of the onkeyup property.

  Contents: Javascript code executed when a key is released over this element.

public void setOnkeyup(String onkeyup)

  onkeyup

setOnkeyup

public void setOnkeyup(String onkeyup)

  Set the value of the onkeyup property.

public String getOnmousedown()

  onmousedown

Javascript
getOnmousedown

```java
public String getOnmousedown()
```

Return the value of the `onmousedown` property.

Contents: Javascript code executed when a pointer button is pressed down over this element.

---

public void setOnmousedown(String onmousedown)

```java
onmousedown
```

---

setOnmousedown

```java
public void setOnmousedown(String onmousedown)
```

Set the value of the `onmousedown` property.

---

public String getOnmousemove()

```java
onmousemove
```

Javascript

---

getOnmousemove

```java
public String getOnmousemove()
```

Return the value of the `onmousemove` property.
public void setOnmousemove(String onmousemove)

setOnmousemove

public void setOnmousemove(String onmousemove)

Set the value of the onmousemove property.

public String getOnmouseout()

getOnmouseout

public String getOnmouseout()

Return the value of the onmouseout property.

Contents: Javascript code executed when a pointer button is moved away from this element.

public void setOnmouseout(String onmouseout)

setOnmouseout

onmouseout

onmouseout
**setOnmouseout**

```java
public void setOnmouseout(String onmouseout)
```

Set the value of the onmouseout property.

**getOnmouseover**

```java
public String getOnmouseover()
```

onmouseover

Javascript

**getOnmouseover**

```java
public String getOnmouseover()
```

Return the value of the onmouseover property.

Contents: Javascript code executed when a pointer button is moved onto this element.

**setOnmouseover**

```java
public void setOnmouseover(String onmouseover)
```

onmouseover

**setOnmouseover**

```java
public void setOnmouseover(String onmouseover)
```

Set the value of the onmouseover property.
public String getOnmouseup()

    onmouseup

Javascript

getOnmouseup

public String getOnmouseup()

    Return the value of the onmouseup property.

    Contents: Javascript code executed when a pointer button is released over this element.

public void setOnmouseup(String onmouseup)

    onmouseup

setOnmouseup

public void setOnmouseup(String onmouseup)

    Set the value of the onmouseup property.

public String getOnselect()

    onselect

Javascript
**getOnselect**

```java
public String getOnselect()
```

Return the value of the `onselect` property.

Contents: Javascript code executed when text within this element is selected by the user.

---

**public void setOnselect(String onselect)**

`onselect` setOnselect

---

**setOnselect**

```java
public void setOnselect(String onselect)
```

Set the value of the `onselect` property.

---

**public boolean isReadonly()**

`readonly`

false true readonly="readonly"

---

**isReadonly**

```java
public boolean isReadonly()
```
Return the value of the `readonly` property.

Contents: Flag indicating that this component will prohibit changes by the user. The element may receive focus unless it has also been disabled. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as `readonly="readonly"`.

```java
public void setReadonly(boolean readonly)

readonly
```

`setReadonly`

```java
public void setReadonly(boolean readonly)

Set the value of the `readonly` property.
```

```java
public boolean isRedisplay()

redisplay
```

`isRedisplay`

```java
public boolean isRedisplay()

Return the value of the `redisplay` property.

Contents: Flag indicating that any existing value in this field should be rendered when the form is created. Because this is a potential
```
security risk, password values are not displayed by default.

public void setRedisplay(boolean redisplay)

   redisplay

setRedisplay

public void setRedisplay(boolean redisplay)

   Set the value of the redisplay property.

public int getSize()

   size

getSize

public int getSize()

   Return the value of the size property.

   Contents: The number of characters used to determine the width of this field.

public void setSize(int size)

   size
**setSize**

```java
class PublicMethod {  
    public void setSize(int size) {  
        Set the value of the size property.  
    }  
}
```

**getStyle**

```java
class PublicMethod {  
    public String getStyle() {  
        style  
        Return the value of the style property.  
        Contents: CSS style(s) to be applied when this component is rendered.  
    }  
}
```

**setStyle**

```java
class PublicMethod {  
    public void setStyle(String style) {  
        style  
        Set the value of the style property.  
    }  
}
```
public String getStyleClass()

    styleClass

CSS "class"

getStyleClass

public String getStyleClass()

    Return the value of the styleClass property.

    Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

public void setStyleClass(String styleClass)

    styleClass

setStyleClass

public void setStyleClass(String styleClass)

    Set the value of the styleClass property.

public String getTabindex()

    tabindex
public String getTabindex()

    Return the value of the tabindex property.
    Contents: Position of this element in the tabbing order for the current document. This value must be an integer between 0 and 32767.

public void setTabindex(String tabindex)
    tabindex

public String getTitle()
    title

gTitle

public String getTitle()
Return the value of the title property.

Contents: Advisory title information about markup elements generated for this component.

---

**public void setTitle(String title)**

Set the value of the title property.

---

**public Object saveState(FacesContext _context)**

Description copied from interface: StateHolder

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.saveState(javax.faces.context.FacesContext) method on all those instances as well. **This method must not save the state of children and facets.** That is done via the StateManager

This method must not alter the state of the implementing object. In other words, after executing this code:
Object state = component.saveState(facesContext);

component should be the same as before executing it.

The return from this method must be Serializable

Specified by:  
   saveState in interface StateHolder

Overrides:  
   saveState in class UIInput

public void restoreState(FacesContext _context, Object _state)

restoreState

public void restoreState(FacesContext _context,  
                         Object _state)

Description copied from interface: StateHolder

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.restoreState(javax.faces.context.FacesContext,  
java.lang.Object) method on all those instances as well.

Specified by:  
   restoreState in interface StateHolder

Overrides:  
   restoreState in class UIInput

PS:
javax.faces.component.html Class HtmlInputText

java.lang.Object  
  ↓ java.lang.Object  
  ↓ javax.faces.component.UIComponent  
  ↓ javax.faces.component.UIComponentBase  
  ↓ javax.faces.component.UIOutput  
  ↓ javax.faces.component.UIInput  
  ↓ javax.faces.component.html.HtmlInputText

All Implemented Interfaces: EditableValueHolder, StateHolder, ValueHolder

public class HtmlInputText
extends UIInput

Extends: UIComponent > UIComponentBase > UIOutput > UIInput

text HTML input

rendererType "javax.faces.Text" setRendererType()

 Represents an HTML input element of type text.

By default, the rendererType property must be set to "javax.faces.Text". This value can be changed by calling the setRendererType() method.

**Field Detail**

COMPONENT_TYPE
public static final String COMPONENT_TYPE

The standard component type for this component.

See Also:
Constant Field Values

Constructor Detail

public HtmlInputText()

HtmlInputText

public HtmlInputText()

Method Detail

public String getAccesskey()

accesskey

getAccesskey

public String getAccesskey()

Return the value of the accesskey property.

Contents: Access key that, when pressed, transfers focus to this element.
public void setAccesskey(String accesskey)
    accesskey

setAccesskey

public void setAccesskey(String accesskey)
    Set the value of the accesskey property.

public String getAlt()
    alt

getAlt

public String getAlt()
    Return the value of the alt property.
    Contents: Alternate textual description of the element rendered by this component.

public void setAlt(String alt)
    alt
**setAlt**

```java
public void setAlt(String alt)
```

Set the value of the `alt` property.

---

**public String getAutocomplete()**

```java
autocomplete
"off" "off" "on"
```

---

**getAutocomplete**

```java
public String getAutocomplete()
```

Return the value of the `autocomplete` property.

Contents: If the value of this attribute is "off", render "off" as the value of the attribute. This indicates that the browser should disable its autocomplete feature for this component. This is useful for components that perform autocompletion and do not want the browser interfering. If this attribute is not set or the value is "on", render nothing.

---

**public void setAutocomplete(String autocomplete)**

```java
autocomplete
```

---

**setAutocomplete**

```java
public void setAutocomplete(String autocomplete)
```
Set the value of the `autocomplete` property.

```java
public String getDir()
{
    String dir = "LTR"; // left-to-right
    return dir;
}
```

**getDir**

```java
public String getDir()
{
    return "LTR"; // left-to-right
}
```

**Contents:** Direction indication for text that does not inherit directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).

```java
public void setDir(String dir)
{
    String dir = "LTR"; // left-to-right
}
```

**setDir**

```java
public void setDir(String dir)
{
    Set the value of the dir property.
}
```

```java
public boolean isDisabled()
{
    boolean disabled = true;
    return disabled;
}
```

**public boolean isDisabled()**
public boolean isDisabled()

    Return the value of the disabled property.

    Contents: Flag indicating that this element must never receive focus or be included in a subsequent submit. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as disabled=\"disabled\".

public void setDisabled(boolean disabled)

disabled

public void setDisabled(boolean disabled)

    Set the value of the disabled property.

public String getLabel()

    label

getLabel
public String getLabel()

    Return the value of the label property.

    Contents: A localized user presentable name for this component.

public void setLabel(String label)

    label

setLabel

public void setLabel(String label)

    Set the value of the label property.

public String getLang()

    lang

getLang

public String getLang()

    Return the value of the lang property.

    Contents: Code describing the language used in the generated markup for this component.
public void setLang(String lang)

    lang

setLang

public void setLang(String lang)

    Set the value of the lang property.

public int getMaxlength()

    maxlength

getMaxlength

public int getMaxlength()

    Return the value of the maxLength property.

    Contents: The maximum number of characters that may be entered in this field.

public void setMaxlength(int maxLength)

    maxLength
setMaxlength

public void setMaxlength(int maxlength)

    Set the value of the maxlen property.

-----------------------------------------------

getOnblur

public String getOnblur()

    onblur

Javascript

getOnblur

public String getOnblur()

    Return the value of the onblur property.
    Contents: Javascript code executed when this element loses focus.

-----------------------------------------------

setOnblur

public void setOnblur(String onblur)

    onblur

setOnblur

public void setOnblur(String onblur)

    Set the value of the onblur property.

-----------------------------------------------

public String getOnchange()
getOnchange

public String getOnchange()

Return the value of the onchange property.

Contents: Javascript code executed when this element loses focus and its value has been modified since gaining focus.

public void setOnchange(String onchange)

setOnchange

public void setOnchange(String onchange)

Set the value of the onchange property.

public String getOnclick()

getOnclick

Javascrip
getOnclick

public String getOnclick()

    Return the value of the onclick property.

    Contents: Javascript code executed when a pointer button is clicked over this element.

public void setOnclick(String onclick)

    onclick

setOnclick

public void setOnclick(String onclick)

    Set the value of the onclick property.

public String getOndblclick()

    ondblclick

Javascript

getOndblclick

public String getOndblclick()

    Return the value of the ondblclick property.

    Contents: Javascript code executed when a pointer button is double
public void setOndblclick(String ondblclick)

    ondblclick

setOndblclick

public void setOndblclick(String ondblclick)

    Set the value of the ondblclick property.

public String getOnfocus()

    onfocus

Javascript

getOnfocus

public String getOnfocus()

    Return the value of the onfocus property.

    Contents: Javascript code executed when this element receives focus.

public void setOnfocus(String onfocus)

    onfocus
setOnfocus

public void setOnfocus(String onfocus)

Set the value of the onfocus property.

public String getOnkeydown()

onkeydown

Javascript

getOnkeydown

public String getOnkeydown()

Return the value of the onkeydown property.

Contents: Javascript code executed when a key is pressed down over this element.

public void setOnkeydown(String onkeydown)

onkeydown

setOnkeydown

public void setOnkeydown(String onkeydown)

Set the value of the onkeydown property.
public String getOnkeypress()

   onkeypress

Javascript

getOnkeypress

public String getOnkeypress()

   Return the value of the onkeypress property.

   Contents: Javascript code executed when a key is pressed and released over this element.

public void setOnkeypress(String onkeypress)

   onkeypress

setOnkeypress

public void setOnkeypress(String onkeypress)

   Set the value of the onkeypress property.

public String getOnkeyup()

   onkeyup

Javascript
**getOnkeyup**

```java
public String getOnkeyup()
```

Return the value of the `onkeyup` property.

Contents: Javascript code executed when a key is released over this element.

**public void setOnkeyup(String onkeyup)**

```java
onkeyup
```

**setOnkeyup**

```java
public void setOnkeyup(String onkeyup)
```

Set the value of the `onkeyup` property.

**public String getOnmousedown()**

```java
onmousedown
```

**Javascrip**

**getOnmousedown**

```java
public String getOnmousedown()
```

Return the value of the `onmousedown` property.
Contents: Javascript code executed when a pointer button is pressed down over this element.

```java
public void setOnmousedown(String onmousedown)

  onmousedown

setOnmousedown

public void setOnmousedown(String onmousedown)

  Set the value of the onmousedown property.

public String getOnmousemove()

  onmousemove

Javascript

getOnmousemove

public String getOnmousemove()

  Return the value of the onmousemove property.

  Contents: Javascript code executed when a pointer button is moved within this element.

public void setOnmousemove(String onmousemove)

  onmousemove
```
**setOnmousemove**

public void **setOnmousemove**(String onmousemove)

Set the value of the **onmousemove** property.

---

**public String getOnmouseout()**

**onmouseout**

**Javascript**

**getOnmouseout**

public **String** **getOnmouseout**()

Return the value of the **onmouseout** property.

Contents: Javascript code executed when a pointer button is moved away from this element.

---

**public void setOnmouseout(String onmouseout)**

**onmouseout**

**setOnmouseout**

public void **setOnmouseout**(String onmouseout)

Set the value of the **onmouseout** property.
public String getOnmouseover()

  onmouseover

Javascript

getOnmouseover

public String getOnmouseover()

  Return the value of the onmouseover property.

  Contents: Javascript code executed when a pointer button is moved onto this element.

public void setOnmouseover(String onmouseover)

  onmouseover

setOnmouseover

public void setOnmouseover(String onmouseover)

  Set the value of the onmouseover property.

public String getOnmouseup()

  onmouseup

Javascript
**getOnmouseup**

```java
public String getOnmouseup()
```

Return the value of the `onmouseup` property.

Contents: Javascript code executed when a pointer button is released over this element.

---

**public void setOnmouseup(String onmouseup)**

```java
onmouseup
```

---

**setOnmouseup**

```java
public void setOnmouseup(String onmouseup)
```

Set the value of the `onmouseup` property.

---

**public String getOnselect()**

```java
onselect
```

**Javascript**

---

**getOnselect**

```java
public String getOnselect()
```

Return the value of the `onselect` property.
Contents: Javascript code executed when text within this element is selected by the user.

```java
public void setOnselect(String onSelect)
    onSelect

setOnselect
public void setOnselect(String onSelect)
    Set the value of the onSelect property.

public boolean isReadonly()
    readonly

false true readonly="readonly"

isReadonly
public boolean isReadonly()
    Return the value of the readonly property.

Contents: Flag indicating that this component will prohibit changes by the user. The element may receive focus unless it has also been disabled. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as readonly="readonly".
public void setReadonly(boolean readonly)

    readonly

setReadonly

public void setReadonly(boolean readonly)

    Set the value of the readonly property.

public int getSize()

    size

getSize

public int getSize()

    Return the value of the size property.

    Contents: The number of characters used to determine the width of this field.

public void setSize(int size)

    size
**setSize**

```java
public void setSize(int size)
```

Set the value of the size property.

---

**public String getStyle()**

**style**

CSS

**getStyle**

```java
public String getStyle()
```

Return the value of the style property.

Contents: CSS style(s) to be applied when this component is rendered.

---

**public void setStyle(String style)**

**style**

**setStyle**

```java
public void setStyle(String style)
```

Set the value of the style property.
public String getStyleClass()

    styleClass

CSS "class"

getStyleClass

public String getStyleClass()

    Return the value of the styleClass property.

    Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

public void setStyleClass(String styleClass)

    styleClass

setStyleClass

public void setStyleClass(String styleClass)

    Set the value of the styleClass property.

public String getTabindex()

    tabindex

Tab 0 32767
**getTabindex**

public **String** getTabindex()

Return the value of the `tabindex` property.

Contents: Position of this element in the tabbing order for the current document. This value must be an integer between 0 and 32767.

---

**public void setTabindex(String tabindex)**

tabindex

**setTabindex**

public void **setTabindex**(String `tabindex`)

Set the value of the `tabindex` property.

---

**public String getTitle()**

title

**getTitle**

public **String** getTitle()

Return the value of the `title` property.
Contents: Advisory title information about markup elements generated for this component.

---

public void setTitle(String title)

title

setTitle

public void setTitle(String title)

Set the value of the title property.

---

public Object saveState(FacesContext _context)

saveState

public Object saveState(FacesContext _context)

Description copied from interface: StateHolder

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.saveState(javax.faces.context.FacesContext) method on all those instances as well. This method must not save the state of children and facets. That is done via theStateManager

This method must not alter the state of the implementing object. In other words, after executing this code:

Object state = component.saveState(facesContext);
component should be the same as before executing it.

The return from this method must be Serializable

Specified by:
   saveState in interface StateHolder

Overrides:
   saveState in class UIInput

public void restoreState(FacesContext _context, Object _state)

Description copied from interface: StateHolder

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIClientComponent with event handlers, validators, etc.) this method must call the StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object) method on all those instances as well.

Specified by:
   restoreState in interface StateHolder

Overrides:
   restoreState in class UIInput

Field Detail

COMPONENT_TYPE

public static final String COMPONENT_TYPE

The standard component type for this component.

See Also:
Constant Field Values
Constructor Detail

public HtmlInputTextarea()

HtmlInputTextarea

public HtmlInputTextarea()

Method Detail

public String getAccesskey()

accesskey

getAccesskey

public String getAccesskey()

Return the value of the accesskey property.

Contents: Access key that, when pressed, transfers focus to this element.

public void setAccesskey(String accesskey)

accesskey

setAccesskey
public void setAccesskey(String accesskey)

    Set the value of the accesskey property.

public int getCols()

cols

getCols

public int getCols()

    Return the value of the cols property.

    Contents: The number of columns to be displayed.

public void setCols(int cols)

cols

setCols

public void setCols(int cols)

    Set the value of the cols property.

public String getDir()

dir
getDir

```java
public String getDir()

    Return the value of the dir property.
```

Contents: Direction indication for text that does not inherit directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).

---

public void setDir(String dir)

dir

---

setDir

```java
public void setDir(String dir)

    Set the value of the dir property.
```

---

public boolean isDisabled()

```java
    disabled

false true disabled="disabled"
```

---

isDisabled
public boolean isDisabled()

    Return the value of the disabled property.

    Contents: Flag indicating that this element must never receive focus or be included in a subsequent submit. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as disabled="disabled".

public void setDisabled(boolean disabled)

disabled

setDisabled

public void setDisabled(boolean disabled)

    Set the value of the disabled property.

public String getLabel()

    label

getLabel

public String getLabel()

    Return the value of the label property.

    Contents: A localized user presentable name for this component.
public void setLabel(String label)

setLabel

public void setLabel(String label)

Set the value of the label property.

public String getLang()

getLang

public String getLang()

Return the value of the lang property.

Contents: Code describing the language used in the generated markup for this component.

public void setLang(String lang)

setLang

public void setLang(String lang)

lang
**setLang**

```java
public void setLang(String lang)
```

Set the value of the `lang` property.

**public String getOnblur()**

```java
onblur
```

**Javascript**

**getOnblur**

```java
public String getOnblur()
```

Return the value of the `onblur` property.

Contents: Javascript code executed when this element loses focus.

**public void setOnblur(String onblur)**

```java
onblur
```

**setOnblur**

```java
public void setOnblur(String onblur)
```

Set the value of the `onblur` property.

**public String getOnchange()**
onchange

Javascript

getOnchange

public String getOnchange()

   Return the value of the onchange property.
   Contents: Javascript code executed when this element loses focus
   and its value has been modified since gaining focus.

public void setOnchange(String onchange)

   onchange

setOnchange

public void setOnchange(String onchange)

   Set the value of the onchange property.

public String getOnclick()

   onclick

Javascript
**getOnclick**

```java
public String getOnclick()
```

Return the value of the onclick property.

Contents: Javascript code executed when a pointer button is clicked over this element.

---

**public void setOnclick(String onclick)**

`onclick`

---

**setOnclick**

```java
public void setOnclick(String onclick)
```

Set the value of the onclick property.

---

**public String getOndblclick()**

`ondblclick`

**Javascript**

---

**getOndblclick**

```java
public String getOndblclick()
```

Return the value of the ondblclick property.

Contents: Javascript code executed when a pointer button is double
public void setOnDbLclick(String onDbLclick)

  onDbLclick

setOnDbLclick

public void setOnDbLclick(String onDbLclick)

  Set the value of the onDbLclick property.

public String getOnfocus()

  onFocus

Javascript

getOnfocus

public String getOnfocus()

  Return the value of the onFocus property.

  Contents: Javascript code executed when this element receives focus.

public void setOnfocus(String onFocus)

  onFocus
**setOnfocus**

```java
public void setOnfocus(String onFocus)
```

Set the value of the `onfocus` property.

---

**public String getOnkeydown()**

`onkeydown`

**Javascript**

**getOnkeydown**

```java
public String getOnkeydown()
```

Return the value of the `onkeydown` property.

Contents: Javascript code executed when a key is pressed down over this element.

---

**public void setOnkeydown(String onkeydown)**

`onkeydown`

**setOnkeydown**

```java
public void setOnkeydown(String onkeydown)
```

Set the value of the `onkeydown` property.
public String getOnkeypress()

   onkeypress

Javascript

getOnkeypress

public String getOnkeypress()

    Return the value of the onkeypress property.

    Contents: Javascript code executed when a key is pressed and released over this element.

public void setOnkeypress(String onkeypress)

   onkeypress

setOnkeypress

public void setOnkeypress(String onkeypress)

    Set the value of the onkeypress property.

public String getOnkeyup()

   onkeyup

Javascript
getOnkeyup

public String getOnkeyup()

Return the value of the onkeyup property.

Contents: Javascript code executed when a key is released over this element.

public void setOnkeyup(String onkeyup)

onkeyup

setOnkeyup

public void setOnkeyup(String onkeyup)

Set the value of the onkeyup property.

public String getOnmousedown()

onmousedown

Javascript

getOnmousedown

public String getOnmousedown()

Return the value of the onmousedown property.
Contents: Javascript code executed when a pointer button is pressed down over this element.

```java
public void setOnmousedown(String onmousedown)
    onmousedown
```

`setOnmousedown`

```java
public void setOnmousedown(String onmousedown)
    Set the value of the onmousedown property.
```

```java
public String getOnmousemove()
    onmousemove
```

`getOnmousemove`

```java
public String getOnmousemove()
    Return the value of the onmousemove property.
    Contents: Javascript code executed when a pointer button is moved within this element.
```

```java
public void setOnmousemove(String onmousemove)
    onmousemove
```

`setOnmousemove`
setOnmousemove

public void setOnmousemove(String onmousemove)

    Set the value of the onmousemove property.

getOnmouseout

public String getOnmouseout()

    onmouseout

Javascript

getOnmouseout

public String getOnmouseout()

    Return the value of the onmouseout property.

    Contents: Javascript code executed when a pointer button is moved away from this element.

public void setOnmouseout(String onmouseout)

    onmouseout

setOnmouseout

public void setOnmouseout(String onmouseout)

    Set the value of the onmouseout property.
public String getOnmouseover()

    onmouseover

Javascript

getOnmouseover

public String getOnmouseover()

    Return the value of the onmouseover property.

    Contents: Javascript code executed when a pointer button is moved onto this element.

public void setOnmouseover(String onmouseover)

    onmouseover

setOnmouseover

public void setOnmouseover(String onmouseover)

    Set the value of the onmouseover property.

public String getOnmouseup()

    onmouseup

Javascript
getOnmouseup

public String getOnmouseup()

Return the value of the onmouseup property.

Contents: Javascript code executed when a pointer button is released over this element.

public void setOnmouseup(String onmouseup)

onmouseup

setOnmouseup

public void setOnmouseup(String onmouseup)

Set the value of the onmouseup property.

public String getOnselect()

onselect

Javascript

getOnselect

public String getOnselect()

Return the value of the onselect property.
Contents: Javascript code executed when text within this element is selected by the user.

```java
public void setOnselect(String onSelect)
    onSelect
```

setOnselect

```java
public void setOnselect(String onSelect)
    Set the value of the onSelect property.
```

```java
public boolean isReadonly()
    readonly

false true readonly="readonly"
```

isReadonly

```java
public boolean isReadonly()
    Return the value of the readonly property.

Contents: Flag indicating that this component will prohibit changes by the user. The element may receive focus unless it has also been disabled. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as readonly="readonly".
```
public void setReadonly(boolean readonly)

    readonly

setReadonly

public void setReadonly(boolean readonly)
    Set the value of the readonly property.

public int getRows()

    rows

getRows

public int getRows()
    Return the value of the rows property.
    Contents: The number of rows to be displayed.

public void setRows(int rows)

    rows

setRows
public void setRows(int rows)
   
   Set the value of the rows property.

public String getStyle()
   
   style

CSS

getStyle

public String getStyle()
   
   Return the value of the style property.
   
   Contents: CSS style(s) to be applied when this component is rendered.

public void setStyle(String style)
   
   style

setStyle

public void setStyle(String style)
   
   Set the value of the style property.

public String getStyleClass()
getStyleClass

public String getStyleClass()

Return the value of the styleClass property.

Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

public void setStyleClass(String styleClass)

setStyleClass

public void setStyleClass(String styleClass)

Set the value of the styleClass property.

public String getTabindex()

tabindex

Tab 0 32767
getTabindex

public String getTabindex()

    Return the value of the \texttt{tabindex} property.

    Contents: Position of this element in the tabbing order for the current document. This value must be an integer between 0 and 32767.

_____________________________

public void setTabindex(String tabindex)

    \texttt{tabindex}

_____________________________

setTabindex

public void setTabindex(String \texttt{tabindex})

    Set the value of the \texttt{tabindex} property.

_____________________________

public String getTitle()

    \texttt{title}

_____________________________

getTitle

public String getTitle()

    Return the value of the \texttt{title} property.

    Contents: Advisory title information about markup elements
public void setTitle(String title)

title

setTitle

public void setTitle(String title)

Set the value of the title property.

public Object saveState(FacesContext _context)

saveState

public Object saveState(FacesContext _context)

Description copied from interface: StateHolder

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.saveState(javax.faces.context.FacesContext) method on all those instances as well. This method must not save the state of children and facets. That is done via theStateManager

This method must not alter the state of the implementing object. In other words, after executing this code:

    Object state = component.saveState(facesContext);
component should be the same as before executing it.

The return from this method must be `Serializable`

Specified by:
`saveState` in interface `StateHolder`

Overrides:
`saveState` in class `UIInput`

---

```java
public void restoreState(FacesContext _context, Object _state)
```

**restoreState**

```java
public void restoreState(FacesContext _context, Object _state)
```

Description copied from interface: `StateHolder`

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UICOMPONENT with event handlers, validators, etc.) this method must call the `StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object)` method on all those instances as well.

Specified by:
`restoreState` in interface `StateHolder`

Overrides:
`restoreState` in class `UIInput`

Method Detail

public String getDir()  
  
  "LTR" left-to-right "RTL" right-to-left

getDir

public String getDir()  
  
  Return the value of the dir property.
  
  Contents: Direction indication for text that does not inherit directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).

public void setDir(String dir)  
  
  dir
**setDir**

```java
public void setDir(String dir)
```

Set the value of the `dir` property.

---

**public String getErrorClass()**

```java
errorClass
"ERROR" CSS
```

**getErrorClass**

```java
public String getErrorClass()
```

Return the value of the `errorClass` property.

Contents: CSS style class to apply to any message with a severity class of "ERROR".

---

**public void setErrorClass(String errorClass)**

```java
errorClass
```

**setErrorClass**

```java
public void setErrorClass(String errorClass)
```

Set the value of the `errorClass` property.
public String getErrorStyle()

    errorStyle

"ERROR" CSS

g.getErrorStyle

public String getErrorStyle()

    Return the value of the errorStyle property.

    Contents: CSS style(s) to apply to any message with a severity class of "ERROR".

public void setErrorStyle(String errorStyle)

    errorStyle

setErrorStyle

public void setErrorStyle(String errorStyle)

    Set the value of the errorStyle property.

- `styleClass`

**CSS "class"**

---

**getStyleClass**

```java
public String getStyleClass()
```

Return the value of the `styleClass` property.
Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

```
public void setStyleClass(String styleClass)

styleClass
```

```
setStyleClass

public void setStyleClass(String styleClass)

    Set the value of the styleClass property.
```

```
public String getTitle()

title
```

```
getTitle

public String getTitle()

    Return the value of the title property.

    Contents: Advisory title information about markup elements generated for this component.
```

```
public void setTitle(String title)
```
setTitle

public void setTitle(String title)

Set the value of the title property.

public boolean isTooltip()

tooltip

isTooltip

public boolean isTooltip()

Return the value of the tooltip property.

Contents: Flag indicating whether the detail portion of the message should be displayed as a tooltip.

public void setTooltip(boolean tooltip)

tooltip

setTooltip

public void setTooltip(boolean tooltip)
Set the value of the `tooltip` property.

public String getWarnClass()

    warnClass

"WARN" CSS

getWarnClass

public String getWarnClass()

    Return the value of the `warnClass` property.

    Contents: CSS style class to apply to any message with a severity class of "WARN".

public void setWarnClass(String warnClass)

    warnClass

setWarnClass

public void setWarnClass(String warnClass)

    Set the value of the `warnClass` property.

public String getWarnStyle()

    warnStyle
"WARN" CSS

getWarnStyle

public String getWarnStyle()

    Return the value of the warnStyle property.

    Contents: CSS style(s) to apply to any message with a severity class of "WARN".

-----------------------------------------------

public void setWarnStyle(String warnStyle)

    warnStyle

-----------------------------------------------

setWarnStyle

public void setWarnStyle(String warnStyle)

    Set the value of the warnStyle property.

-----------------------------------------------

public Object saveState(FacesContext _context)

saveState

public Object saveState(FacesContext _context)

    Description copied from interface: StateHolder

    Gets the state of the instance as a Serializable Object.
If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the `StateHolder.saveState(javax.faces.context.FacesContext)` method on all those instances as well. **This method must not save the state of children and facets.** That is done via the `StateManager`.

This method must not alter the state of the implementing object. In other words, after executing this code:

```java
Object state = component.saveState(facesContext);
```

`component` should be the same as before executing it.

The return from this method must be `Serializable`

**Specified by:**
- `saveState` in interface `StateHolder`

**Overrides:**
- `saveState` in class `UIMessage`

```java
public void restoreState(FacesContext _context, Object _state)
```

**Description copied from interface:** `StateHolder`

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the
StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object) method on all those instances as well.

Specified by:
   restoreState in interface StateHolder

Overrides:
   restoreState in class UIMessage
javax.faces.component.html Class HtmlMessages

java.lang.Object
    ▼ javax.faces.component.UIComponent
        ▼ javax.faces.component.UIComponentBase
            ▼ javax.faces.component.UIMessages
                ▼ javax.faces.component.html.HtmlMessages

All Implemented Interfaces:
    StateHolder

public class HtmlMessages
    extends UIMessages

Extends: UIComponent > UIComponentBase > UIMessages

    rendererType "javax.faces.Messages"    setRendererType()

By default, the rendererType property must be set to "javax.faces.Messages". This value can be changed by calling the setRendererType() method.

public void setWarnClass(String warnClass)
    Set the value of the warnClass property.
```
public String getWarnStyle()

    warnStyle

"WARN"  CSS

getWarnStyle

public String getWarnStyle()

    Return the value of the warnStyle property.

    Contents: CSS style(s) to apply to any message with a severity class of "WARN".

public void setWarnStyle(String warnStyle)

    warnStyle

setWarnStyle

public void setWarnStyle(String warnStyle)

    Set the value of the warnStyle property.

public Object saveState(FacesContext _context)

saveState

public Object saveState(FacesContext _context)
**Description copied from interface: StateHolder**

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the `StateHolder.saveState(javax.faces.context.FacesContext)` method on all those instances as well. **This method must not save the state of children and facets.** That is done via the `StateManager`

This method must not alter the state of the implementing object. In other words, after executing this code:

```java
Object state = component.saveState(facesContext);
```

`component` should be the same as before executing it.

The return from this method must be Serializable

**Specified by:**
- `saveState` in interface `StateHolder`

**Overrides:**
- `saveState` in class `UIMessages`

```java
public void restoreState(FacesContext _context, Object _state)
```

**Description copied from interface: StateHolder**

Perform any processing required to restore the state from the entries in the state Object.
If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the `StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object)` method on all those instances as well.

**Specified by:**
- `restoreState` in interface `StateHolder`

**Overrides:**
- `restoreState` in class `UIMessages`
javax.faces.component.html  Class HtmlOutputFormat

java.lang.Object  
  ▼ javax.faces.component.UIComponent  
      ▼ javax.faces.component.UIComponentBase  
          ▼ javax.faces.component.UIOutput  
              ▼ javax.faces.component.html.HtmlOutputFormat

All Implemented Interfaces:
  StateHolder, ValueHolder

public class HtmlOutputFormat
extends UIOutput

Extends: UIComponent > UIComponentBase > UIOutput

  MessageFormat  UIParameter "dir" "lang"  
  span  span

  rendererType "javax.faces.Format"  setRendererType()

Represents a component that looks up a localized message in a resource bundle, optionally uses it as a MessageFormat pattern string and substitutes in parameter values from nested UIParameter components, and renders the result. If the "dir" or "lang" attributes are present, render a span element and pass them through as attributes on the span.

By default, the rendererType property must be set to "javax.faces.Format". This value can be changed by calling the setRendererType() method.

  Return the value of the lang property.

- **String getStyle()**
  Return the value of the style property.

- **String getStyleClass()**
  Return the value of the styleClass property.

- **String getTitle()**
  Return the value of the title property.

- **boolean isEscape()**
  Return the value of the escape property.

- **void restoreState(FacesContext _context, Object _state)**
  Perform any processing required to restore the state from the entries in the state Object.

- **Object saveState(FacesContext _context)**
  Gets the state of the instance as a Serializable Object.

- **void setDir(String dir)**
  Set the value of the dir property.

**Constructor Detail**

```java
public HtmlOutputFormat()
```

HtmlOutputFormat

```java
public HtmlOutputFormat()
```

**Method Detail**

```java
public String getDir()
```

```java
dir
```

"LTR"left-to-right "RTL"right-to-left

```java
getDir
```

```java
public String getDir()
```
Return the value of the `dir` property.

Contents: Direction indication for text that does not inherit directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).

```java
public void setDir(String dir)
```

`dir`

```java
setDir
```

```java
public void setDir(String dir)
```

Set the value of the `dir` property.

```java
public boolean isEscape()
```

`escape`

```java
HTML XML "true"
```

```java
isEscape
```

```java
public boolean isEscape()
```

Return the value of the `escape` property.

Contents: Flag indicating that characters that are sensitive in HTML and XML markup must be escaped. This flag is set to "true" by default.
**public void setEscape(boolean escape)**

    escape

**setEscape**

```java
public void setEscape(boolean escape)
```

Set the value of the escape property.

**public String getLang()**

    lang

**getLang**

```java
public String getLang()
```

Return the value of the lang property.

Contents: Code describing the language used in the generated markup for this component.

**public void setLang(String lang)**

    lang
**setLang**

```java
public void setLang(String lang)
```

Set the value of the `lang` property.

---

**public String getStyle()**

```java
public String getStyle()
```

- **style**

CSS

**getStyle**

```java
public String getStyle()
```

Return the value of the `style` property.

Contents: CSS style(s) to be applied when this component is rendered.

---

**public void setStyle(String style)**

```java
public void setStyle(String style)
```

**setStyle**

```java
public void setStyle(String style)
```

Set the value of the `style` property.
public String getStyleClass()

    styleClass

    CSS "class"

getStyleClass

public String getStyleClass()

    Return the value of the styleClass property.

    Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

public void setStyleClass(String styleClass)

    styleClass

setStyleClass

public void setStyleClass(String styleClass)

    Set the value of the styleClass property.

public String getTitle()

    title
**getTitle**

public String getTitle()

Return the value of the title property.

Contents: Advisory title information about markup elements generated for this component.

**public void setTitle(String title)**

setTitle

title

**setTitle**

public void setTitle(String title)

Set the value of the title property.

**public Object saveState(FacesContext _context)**

saveState

public Object saveState(FacesContext _context)

Description copied from interface: StateHolder

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the
**StateHolder.saveState(javax.faces.context.FacesContext)** method on all those instances as well. **This method must not save the state of children and facets.** That is done via the StateManager

This method must not alter the state of the implementing object. In other words, after executing this code:

```
Object state = component.saveState(facesContext);
```

**component** should be the same as before executing it.

The return from this method must be **Serializable**

**Specified by:**
- saveState in interface **StateHolder**

**Overrides:**
- saveState in class **UIOutput**

```
public void restoreState(FacesContext _context, Object _state)
```

**restoreState**

```
public void restoreState(FacesContext _context, Object _state)
```

**Description copied from interface: **StateHolder**

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object) method on all those instances as well.
Specified by:

`restoreState` in interface `StateHolder`

Overrides:

`restoreState` in class `UIOutput`
javax.faces.component.html  **Class HtmlOutputLabel**

**java.lang.Object**
- javax.faces.component.UIComponent
  - javax.faces.component.UIComponentBase
  - javax.faces.component.UIOutput
    - javax.faces.component.html.HtmlOutputLabel

**All Implemented Interfaces:**
- StateHolder, ValueHolder

---

public class **HtmlOutputLabel**

extends **UIOutput**

**Extends:** **UIComponent** > **UIComponentBase** > **UIOutput**

**HTML label**

    rendererType "javax.faces.Label"    setRendererType()

Represents an HTML label element, used to define an accessible label for a corresponding input element.

By default, the rendererType property must be set to "javax.faces.Label". This value can be changed by calling the setRendererType() method.

---

### Method Detail

#### public String getAccesskey()

accesskey

---

**getAccesskey**

public String getAccesskey()

Return the value of the accesskey property.

Contents: Access key that, when pressed, transfers focus to this element.

---

#### public void setAccesskey(String accesskey)

accesskey

---

**setAccesskey**

public void setAccesskey(String accesskey)
Set the value of the accesskey property.

```
public String getDir()
{
    dir
    "LTR"left-to-right "RTL"right-to-left
}
```

getDir

```
public String getDir()
{
    Return the value of the dir property.

    Contents: Direction indication for text that does not inherit directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).
}
```

```
public void setDir(String dir)
{
    dir
}
```

setDir

```
public void setDir(String dir)
{
    Set the value of the dir property.
}
```

```
public boolean isEscape()
```
isEscape

public boolean isEscape()

  Return the value of the escape property.

  Contents: Flag indicating that characters that are sensitive in HTML and XML markup must be escaped. If omitted, this flag is assumed to be "true".

-----------------------------------------------

public void setEscape(boolean escape)

  escape

setEscape

public void setEscape(boolean escape)

  Set the value of the escape property.

-----------------------------------------------

public String getFor()

  for
getFor

```java
public String getFor()
```

Return the value of the `for` property.

Contents: Client identifier of the component for which this element is a label.

---

setFor

```java
public void setFor(String _for)
```

for

---

getLang

```java
public String getLang()
```

lang

---

getLang

```java
public String getLang()
```

Return the value of the `lang` property.

Contents: Code describing the language used in the generated
public void setLang(String lang)

    lang

setLang

public void setLang(String lang)

    Set the value of the lang property.

public String getOnblur()

    onblur

Javascript

getOnblur

public String getOnblur()

    Return the value of the onblur property.

    Contents: Javascript code executed when this element loses focus.

public void setOnblur(String onblur)

    onblur
setOnblur

public void setOnblur(String onblur)

    Set the value of the onblur property.

public String getOnclick()

    onclick

Javascript

getOnclick

public String getOnclick()

    Return the value of the onclick property.

    Contents: Javascript code executed when a pointer button is clicked over this element.

public void setOnclick(String onclick)

    onclick

setOnclick

public void setOnclick(String onclick)

    Set the value of the onclick property.
public String getOndblclick()

    ondblclick

Javascript

getOndblclick

public String getOndblclick()

    Return the value of the ondblclick property.

    Contents: Javascript code executed when a pointer button is double clicked over this element.

---------------------------------------------

public void setOndblclick(String ondblclick)

    ondblclick

setOndblclick

public void setOndblclick(String ondblclick)

    Set the value of the ondblclick property.

---------------------------------------------

public String getOnfocus()

    onfocus

Javascript
getOnfocus

```java
public String getOnfocus()
```

Return the value of the `onfocus` property.

Contents: Javascript code executed when this element receives focus.

---

public void setOnfocus(String onFocus)

```java
onfocus
```

---

setOnfocus

```java
public void setOnfocus(String onFocus)
```

Set the value of the `onfocus` property.

---

public String getOnkeydown()

```java
onkeydown
```

Javascript

---

getOnkeydown

```java
public String getOnkeydown()
```

Return the value of the `onkeydown` property.
Contents: Javascript code executed when a key is pressed down over this element.

```java
public void setOnkeydown(String onkeydown)

  onkeydown

setOnkeydown

public void setOnkeydown(String onkeydown)

  Set the value of the onkeydown property.

```}

```java
public String getOnkeypress()

  onkeypress

Javascript

getOnkeypress

public String getOnkeypress()

  Return the value of the onkeypress property.

  Contents: Javascript code executed when a key is pressed and released over this element.

```}

```java
public void setOnkeypress(String onkeypress)

  onkeypress

```
**setOnkeypress**

public void **setOnkeypress**(*String* onkeypress)

Set the value of the onkeypress property.

---

**public String getOnkeyup()**

    onkeyup

**Javascript**

**getOnkeyup**

public **String** **getOnkeyup**()

    Return the value of the onkeyup property.
    
    Contents: Javascript code executed when a key is released over this element.

---

**public void setOnkeyup(String onkeyup)**

    onkeyup

**setOnkeyup**

public void **setOnkeyup**(*String* onkeyup)

    Set the value of the onkeyup property.
public String getOnmousedown()

    onmousedown

Javascript

getOnmousedown

public String getOnmousedown()

    Return the value of the onmousedown property.

    Contents: Javascript code executed when a pointer button is pressed down over this element.

public void setOnmousedown(String onmousedown)

    onmousedown

setOnmousedown

public void setOnmousedown(String onmousedown)

    Set the value of the onmousedown property.

public String getOnmousemove()

    onmousemove

Javascript
**getOnmousemove**

```java
public String getOnmousemove()
```

Return the value of the `onmousemove` property.

Contents: Javascript code executed when a pointer button is moved within this element.

**setOnmousemove(String onmousemove)**

```java
public void setOnmousemove(String onmousemove)
```

Set the value of the `onmousemove` property.

**getOnmouseout()**

```java
public String getOnmouseout()
```

Return the value of the `onmouseout` property.
Contents: Javascript code executed when a pointer button is moved away from this element.

public void setOnmouseout(String onmouseout)

  onmouseout

setOnmouseout

public void setOnmouseout(String onmouseout)

  Set the value of the onmouseout property.

public String getOnmouseover()

  onmouseover

Javascript

getonmouseover

public String getOnmouseover()

  Return the value of the onmouseover property.
  Contents: Javascript code executed when a pointer button is moved onto this element.

public void setOnmouseover(String onmouseover)

  onmouseover
**setOnmouseover**

**public void setOnmouseover(String onmouseover)**

Set the value of the `onmouseover` property.

---

**public String getOnmouseup()**

`onmouseup`

**Javascript**

---

**getOnmouseup**

**public String getOnmouseup()**

Return the value of the `onmouseup` property.

Contents: Javascript code executed when a pointer button is released over this element.

---

**public void setOnmouseup(String onmouseup)**

`onmouseup`

---

**setOnmouseup**

**public void setOnmouseup(String onmouseup)**

Set the value of the `onmouseup` property.
public String getStyle()

    style

CSS

getStyle

public String getStyle()

    Return the value of the style property.

    Contents: CSS style(s) to be applied when this component is rendered.

public void setStyle(String style)

    style

setStyle

public void setStyle(String style)

    Set the value of the style property.

public String getStyleClass()

    styleClass

CSS "class"
**getStyleClass**

```java
public String getStyleClass()
```

Return the value of the `styleClass` property.

Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

---

**public void setStyleClass(String styleClass)**

```
styleClass
```

**setStyleClass**

```java
public void setStyleClass(String styleClass)
```

Set the value of the `styleClass` property.

---

**public String getTabindex()**

```
tabindex
```

Tab  0  32767

**getTabindex**

```java
public String getTabindex()
```
Return the value of the `tabindex` property.

Contents: Position of this element in the tabbing order for the current document. This value must be an integer between 0 and 32767.

```
public void setTabindex(String tabindex)
```

`tabindex`

```
setTabindex
```

```
public void setTabindex(String tabindex)
```

Set the value of the `tabindex` property.

```
public String getTitle()
```

`title`

```
getTitle
```

```
public String getTitle()
```

Return the value of the `title` property.

Contents: Advisory title information about markup elements generated for this component.

```
public void setTitle(String title)
```
setTitle

public void setTitle(String title)

Set the value of the title property.

saveState

public Object saveState(FacesContext _context)

Description copied from interface: StateHolder

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.saveState(javax.faces.context.FacesContext) method on all those instances as well. This method must not save the state of children and facets. That is done via the StateManager

This method must not alter the state of the implementing object. In other words, after executing this code:

    Object state = component.saveState(facesContext);

component should be the same as before executing it.

The return from this method must be Serializable

Specified by:
public void restoreState(FacesContext _context, Object _state)

Description copied from interface: StateHolder

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object) method on all those instances as well.

Specified by:
restoreState in interface StateHolder

Overrides:
restoreState in class UIOutput

PS:
javax.faces.component.html  Class HtmlOutputLink

java.lang.Object
  ↓ javax.faces.component.UIComponent
     ↓ javax.faces.component.UIComponentBase
        ↓ javax.faces.component.UIOutput
           ↓ javax.faces.component.html.HtmlOutputLink

All Implemented Interfaces:
  StateHolder, ValueHolder

```
public class HtmlOutputLink
extends UIOutput

Extends: UIComponent > UIComponentBase > UIOutput

HTML  a  value URL

    rendererType "javax.faces.Link"  setRendererType()
```

Represents an HTML a (hyperlink) element that may be used to link to an arbitrary URL defined by the value property.

By default, the rendererType property must be set to "javax.faces.Link". This value can be changed by calling the setRendererType() method.

Field Detail

COMPONENT_TYPE

public static final String COMPONENT_TYPE

The standard component type for this component.

See Also:
Constant Field Values

Constructor Detail

public HtmlOutputLink()
public HtmlOutputLink()

Method Detail

public String getAccesskey()

accesskey

getAccesskey

public String getAccesskey()

Return the value of the accesskey property.

Contents: Access key that, when pressed, transfers focus to this element.

public void setAccesskey(String accesskey)

accesskey

setAccesskey

public void setAccesskey(String accesskey)

Set the value of the accesskey property.

public String getCharset()
getCharset

public String getCharset()

Return the value of the charset property.

Contents: The character encoding of the resource designated by this hyperlink.

public void setCharset(String charset)

ccharset

setCharset

public void setCharset(String charset)

Set the value of the charset property.

public String getCoords()

cords
getCoords

public String getCoords()

    Return the value of the coords property.

    Contents: The position and shape of the hot spot on the screen (for use in client-side image maps).

public void setCoords(String coords)

    coords

setCoords

public void setCoords(String coords)

    Set the value of the coords property.

public String getDir()

    dir

"LTR" left-to-right "RTL" right-to-left

getDir

public String getDir()

    Return the value of the dir property.

    Contents: Direction indication for text that does not inherit
directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).

public void setDir(String dir)

dir

setDir

public void setDir(String dir)

Set the value of the dir property.

public boolean isDisabled()

disabled

isDisabled

public boolean isDisabled()

Return the value of the disabled property.

Contents: Flag indicating that this element must never receive focus or be included in a subsequent submit.

public void setDisabled(boolean disabled)

disabled
**setDisabled**

public void setDisabled(boolean disabled)

Set the value of the disabled property.

---

**public String getHreflang()**

hreflang

**getHreflang**

public String getHreflang()

Return the value of the hreflang property.

Contents: The language code of the resource designated by this hyperlink.

---

**public void setHreflang(String hreflang)**

hreflang

**setHreflang**

public void setHreflang(String hreflang)

Set the value of the hreflang property.
public String getLang()

  lang

getLang

public String getLang()

  Return the value of the lang property.
  Contents: Code describing the language used in the generated markup for this component.

public void setLang(String lang)

  lang

setLang

public void setLang(String lang)

  Set the value of the lang property.

public String getOnblur()

  onblur

Javascript
getOnblur

public String getOnblur()

    Return the value of the onblur property.

    Contents: Javascript code executed when this element loses focus.

------------------------------------------

public void setOnblur(String onblur)

    onblur

setOnblur

public void setOnblur(String onblur)

    Set the value of the onblur property.

------------------------------------------

public String getOnclick()

    onclick

Javascript

getOnclick

public String getOnclick()

    Return the value of the onclick property.
Contents: Javascript code executed when a pointer button is clicked over this element.

public void setOnonclick(String onclick)

  onclick

setOnonclick

public void setOnonclick(String onclick)

  Set the value of the onclick property.

public String getOndblclick()

  ondblclick

Javascript

getOndblclick

public String getOndblclick()

  Return the value of the ondblclick property.

  Contents: Javascript code executed when a pointer button is double clicked over this element.

public void setOndblclick(String ondblclick)

  ondblclick
**setOndblclick**

public void setOndblclick(String ondblclick)

    Set the value of the ondblclick property.

---

**public String getOnfocus()**

    onFocus

*Javascript*

**getOnfocus**

public String getOnfocus()

    Return the value of the onFocus property.

    Contents: Javascript code executed when this element receives focus.

---

**public void setOnfocus(String onFocus)**

    onFocus

**setOnfocus**

public void setOnfocus(String onFocus)

    Set the value of the onFocus property.
public String getOnkeydown()

    onkeydown

Javascript

getonkeydown

public String getOnkeydown()

    Return the value of the onkeydown property.

    Contents: Javascript code executed when a key is pressed down over this element.

public void setOnkeydown(String onkeydown)

    onkeydown

setonkeydown

public void setOnkeydown(String onkeydown)

    Set the value of the onkeydown property.

public String getOnkeypress()

    onkeypress

Javascript
**getOnkeypress**

```java
public String getOnkeypress()
```

Return the value of the onkeypress property.

Contents: Javascript code executed when a key is pressed and released over this element.

---

**public void setOnkeypress(String onkeypress)**

```java
onkeypress
```

---

**setOnkeypress**

```java
public void setOnkeypress(String onkeypress)
```

Set the value of the onkeypress property.

---

**public String getOnkeyup()**

```java
onkeyup
```

**Javascript**

---

**getOnkeyup**

```java
public String getOnkeyup()
```

Return the value of the onkeyup property.
Contents: Javascript code executed when a key is released over this element.

---

**public void setOnkeyup(String onkeyup)**

`onkeyup`

---

**setOnkeyup**

**public void setOnkeyup(String onkeyup)**

Set the value of the `onkeyup` property.

---

**public String getOnmousedown()**

`onmousedown`

**Javascript**

---

**getOnmousedown**

**public String getOnmousedown()**

Return the value of the `onmousedown` property.

Contents: Javascript code executed when a pointer button is pressed down over this element.

---

**public void setOnmousedown(String onmousedown)**

`onmousedown`
**setOnmousedown**

public void setOnmousedown(String onmousedown)

Set the value of the onmousedown property.

---

**public String getOnmousemove()**

onmousemove

Javascript

**getOnmousemove**

public String getOnmousemove()

Return the value of the onmousemove property.

Contents: Javascript code executed when a pointer button is moved within this element.

---

**public void setOnmousemove(String onmousemove)**

onmousemove

**setOnmousemove**

public void setOnmousemove(String onmousemove)

Set the value of the onmousemove property.
public String getOnmouseout()

  onmouseout

Javascript

getOnmouseout

public String getOnmouseout()

  Return the value of the onmouseout property.

  Contents: Javascript code executed when a pointer button is moved away from this element.

public void setOnmouseout(String onmouseover)

  onmouseover

setOnmouseout

public void setOnmouseout(String onmouseover)

  Set the value of the onmouseover property.

public String getOnmouseover()

  onmouseover

Javascript
getOnmouseover

class public String getOnmouseover()

Return the value of the onmouseover property.

Contents: Javascript code executed when a pointer button is moved onto this element.

public void setOnmouseover(String onmouseover)

onmouseover

setOnmouseover

class public void setOnmouseover(String onmouseover)

Set the value of the onmouseover property.

public String getOnmouseup()

onmouseup

Javascript

getOnmouseup

class public String getOnmouseup()

Return the value of the onmouseup property.
Contents: Javascript code executed when a pointer button is released over this element.

```java
public void setOnmouseup(String onmouseup)

    onmouseup

setOnmouseup

public void setOnmouseup(String onmouseup)

    Set the value of the onmouseup property.

public String getRel()

    rel

getRel

public String getRel()

    Return the value of the rel property.

    Contents: The relationship from the current document to the anchor specified by this hyperlink. The value of this attribute is a space-separated list of link types.

public void setRel(String rel)
```
rel

setRel

public void setRel(String rel)

    Set the value of the rel property.

-------------------------------

public String getRev()

    rev

getRev

public String getRev()

    Return the value of the rev property.

    Contents: A reverse link from the anchor specified by this hyperlink to the current document. The value of this attribute is a space-separated list of link types.

-------------------------------

public void setRev(String rev)

    rev

setRev
public void setRev(String rev)

    Set the value of the rev property.

public String getShape()

    shape
default rect circle
poly

getShape

public String getShape()

    Return the value of the shape property.

    Contents: The shape of the hot spot on the screen (for use in client-side image maps). Valid values are: default (entire region); rect (rectangular region); circle (circular region); and poly (polygonal region).

public void setShape(String shape)

    shape

setShape

public void setShape(String shape)

    Set the value of the shape property.
public String getStyle()

  style

  CSS

getStyle

public String getStyle()

  Return the value of the style property.
  Contents: CSS style(s) to be applied when this component is rendered.

public void setStyle(String style)

  style

setStyle

public void setStyle(String style)

  Set the value of the style property.

public String getStyleClass()

  styleClass

CSS "class"
**getStyleClass**

public String getStyleClass()

    Return the value of the styleClass property.

    Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

**public void setStyleClass(String styleClass)**

    styleClass

**setStyleClass**

public void setStyleClass(String styleClass)

    Set the value of the styleClass property.

**public String getTabindex()**

    tabindex

    **Tab 0 32767**

**getTabindex**

public String getTabindex()
Return the value of the `tabindex` property.

Contents: Position of this element in the tabbing order for the current document. This value must be an integer between 0 and 32767.

```java
public void setTabindex(String tabindex)
```

Set the value of the `tabindex` property.

```java
public String getTarget()
```

Return the value of the `target` property.

Contents: Name of a frame where the resource retrieved via this hyperlink is to be displayed.

```java
public void setTarget(String target)
```
**setTarget**

```java
public void setTarget(String target)
```

Set the value of the `target` property.

---

**getTitle**

```java
public String getTitle()
```

Return the value of the `title` property.

Contents: Advisory title information about markup elements generated for this component.

---

**setTitle**

```java
public void setTitle(String title)
```

---
public String getType()

getType

public String getType()

    Return the value of the type property.
    
    Contents: The content type of the resource designated by this hyperlink.

public void setType(String type)

setType

public void setType(String type)

    Set the value of the type property.

public Object saveState(FacesContext _context)

saveState
public Object saveState(FacesContext _context)

**Description copied from interface: StateHolder**

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.saveState(javax.faces.context.FacesContext) method on all those instances as well. **This method must not save the state of children and facets.** That is done via theStateManager

This method must not alter the state of the implementing object. In other words, after executing this code:

Object state = component.saveState(facesContext);

*component* should be the same as before executing it.

The return from this method must be Serializable

**Specified by:**

saveState in interface StateHolder

**Overrides:**

saveState in class UIOutput

---

public void restoreState(FacesContext _context, Object _state)

**restoreState**

public void restoreState(FacesContext _context, Object _state)

**Description copied from interface: StateHolder**
Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object) method on all those instances as well.

Specified by: restoreState in interface StateHolder
Overrides: restoreState in class UIOutput

public class HtmlOutputText
extends UIOutput

Extends: UIComponent > UIComponentBase > UIOutput

I18N CSS  span

  rendererType "javax.faces.Text"  setRendererType()

Renders the component value as text, optionally wrapping in a span element if I18N attributes, CSS styles or style classes are specified.

By default, the rendererType property must be set to "javax.faces.Text". This value can be changed by calling the setRendererType() method.

class HtmlOutputText()

HtmlOutputText

class HtmlOutputText()

Method Detail

class public String getDir()

    dir

    "LTR" left-to-right "RTL" right-to-left

getDir

class public String getDir()

    Return the value of the dir property.

    Contents: Direction indication for text that does not inherit directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).
public void setDir(String dir)

dir

setDir

public void setDir(String dir)

Set the value of the dir property.

public boolean isEscape()

escape

HTML  XML  "true"

isEscape

public boolean isEscape()

Return the value of the escape property.

Contents: Flag indicating that characters that are sensitive in HTML and XML markup must be escaped. This flag is set to "true" by default.

public void setEscape(boolean escape)

escape
setEscape

public void setEscape(boolean escape)

  Set the value of the escape property.

public String getLang()

  lang

getLang

public String getLang()

  Return the value of the lang property.

  Contents: Code describing the language used in the generated markup for this component.

public void setLang(String lang)

  lang

setLang

public void setLang(String lang)

  Set the value of the lang property.
public String getStyle()

    style

CSS

getStyle

public String getStyle()

    Return the value of the style property.
    Contents: CSS style(s) to be applied when this component is rendered.

public void setStyle(String style)

    style

setStyle

public void setStyle(String style)

    Set the value of the style property.

public String getStyleClass()

    styleClass

CSS "class"
**getStyleClass**

```java
public String getStyleClass()
```

Return the value of the `styleClass` property.

Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

---

**public void setStyleClass(String styleClass)**

```java
styleClass
```

---

**setStyleClass**

```java
public void setStyleClass(String styleClass)
```

Set the value of the `styleClass` property.

---

**public String getTitle()**

```java
title
```

---

**getTitle**

```java
public String getTitle()
```
Return the value of the title property.

Contents: Advisory title information about markup elements generated for this component.

```java
public void setTitle(String title)
```

setTitle

```java
public void setTitle(String title)
```

Set the value of the title property.

```java
public Object saveState(FacesContext _context)
```

saveState

```java
public Object saveState(FacesContext _context)
```

Description copied from interface: StateHolder

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.saveState(javax.faces.context.FacesContext) method on all those instances as well. **This method must not save the state of children and facets.** That is done via the StateManager

This method must not alter the state of the implementing object. In other words, after executing this code:
Object state = component.saveState(facesContext);

component should be the same as before executing it.

The return from this method must be Serializable

Specified by:
   saveState in interface StateHolder
Overrides:
   saveState in class UIOutput

public void restoreState(FacesContext _context, Object _state)

Description copied from interface: StateHolder

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UICOMPONENT with event handlers, validators, etc.) this method must call the StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object) method on all those instances as well.

Specified by:
   restoreState in interface StateHolder
Overrides:
   restoreState in class UIOutput

</table>
String `getLang()`
    Return the value of the lang property.

String `getOnClick()`
    Return the value of the onclick property.

String `getOnDblick()`
    Return the value of the ondblclick property.

String `getOnKeyDown()`
    Return the value of the onkeydown property.

String `getOnKeyPress()`
    Return the value of the onkeypress property.

String `getOnKeyUp()`
    Return the value of the onkeyup property.

String `getOnMouseDown()`
    Return the value of the onmousedown property.

String `getOnMouseMove()`
    Return the value of the onmousemove property.

String `getOnMouseOut()`
    Return the value of the onmouseout property.

String `getOnMouseOver()`
    Return the value of the onmouseover property.

String `getOnMouseUp()`
    Return the value of the onmouseup property.

String `getRowClasses()`
    Return the value of the rowClasses property.

String `getRules()`
    Return the value of the rules property.

String `getStyle()`
    Return the value of the style property.

String `getStyleClass()`
    Return the value of the styleClass property.

String `getSummary()`
    Return the value of the summary property.

String `getTitle()`
    Return the value of the title property.

---
Constructor Detail

public HtmlPanelGrid()

HtmlPanelGrid

public HtmlPanelGrid()

Method Detail

public String getBgcolor()

bgcolor

getBgcolor

public String getBgcolor()

Return the value of the bgcolor property.

Contents: Name or code of the background color for this table.

public void setBgcolor(String bgcolor)

bgcolor

setBgcolor
public void setBackground(String bgcolor)

    Set the value of the bgcolor property.

public int getBorder()

    border

getBorder

public int getBorder()

    Return the value of the border property.

    Contents: Width (in pixels) of the border to be drawn around this table.

public void setBorder(int border)

    border

setBorder

public void setBorder(int border)

    Set the value of the border property.

public String getCaptionClass()
getCaptionClass

public String getCaptionClass()

Return the value of the captionClass property.

Contents: Space-separated list of CSS style class(es) that will be applied to any caption generated for this table.

setCaptionClass

public void setCaptionClass(String captionClass)

captionClass

setCaptionClass

public void setCaptionClass(String captionClass)

Set the value of the captionClass property.

public String getCaptionStyle()

captionStyle

CSS
**getCaptionStyle**

```java
public String getCaptionStyle()
```

Return the value of the `captionStyle` property.

Contents: CSS style(s) to be applied when this caption is rendered.

**public void setCaptionStyle(String captionStyle)**

```java
captionStyle
```

**setCaptionStyle**

```java
public void setCaptionStyle(String captionStyle)
```

Set the value of the `captionStyle` property.

**public String getCellpadding()**

```java
cellpadding
```

**getCellpadding**

```java
public String getCellpadding()
```

Return the value of the `cellpadding` property.

Contents: Definition of how much space the user agent should leave between the border of each cell and its contents.
public void setCellpadding(String cellpadding)

cellpadding

setCellpadding

public void setCellpadding(String cellpadding)

Set the value of the cellpadding property.

public String getCellspacing()

cellspacing

gCellSpacing

public String getCellspacing()

Return the value of the cellspacing property.

Contents: Definition of how much space the user agent should leave between the left side of the table and the leftmost column, the top of the table and the top of the top side of the topmost row, and so on for the right and bottom of the table. It also specifies the amount of space to leave between cells.

public void setCellspacing(String cellspacing)

cellspacing
**setCellspacing**

```java
public void setCellspacing(String cellspacing)

Set the value of the cellspacing property.
```

---

**public String getColumnClasses()**

```java
getColumnClasses

CSS "columns" "class"
"columns" "columns"
```

---

**getColumnClasses**

```java
public String getColumnClasses()

Return the value of the columnClasses property.

Contents: Comma-delimited list of CSS style classes that will be applied to the columns of this table. A space separated list of classes may also be specified for any individual column. If the number of elements in this list is less than the number of columns specified in the "columns" attribute, no "class" attribute is output for each column greater than the number of elements in the list. If the number of elements in the list is greater than the number of columns specified in the "columns" attribute, the elements at the position in the list after the value of the "columns" attribute are ignored.
```

---

**public void setColumnClasses(String columnClasses)**

```java
getColumnClasses
```

```java
columnClasses
```
**setColumnClasses**

```java
class {
    public void setColumnClasses(String columnClasses) {
        Set the value of the columnClasses property.
    }
}
```

**getColumnCount**

```java
class {
    public int getColumnCount() {
        return columns;
    }
}
```

**getColumns**

```java
class {
    public int getColumns() {
        return columns;
    }
}
```

Contents: The number of columns to render before starting a new row.

**setColumns**

```java
class {
    public void setColumns(int columns) {
        columns = columns;
    }
}
```

**setColumns**

```java
class {
    public void setColumns(int columns) {
        Set the value of the columns property.
    }
}
```
public String getDir()

dir

"LTR" left-to-right "RTL" right-to-left

getDir

public String getDir()

Return the value of the dir property.

Contents: Direction indication for text that does not inherit
directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-
left).

public void setDir(String dir)

dir

setDir

public void setDir(String dir)

Set the value of the dir property.

public String getFooterClass()

footerClass
CSS

**getFooterClass**

```java
public String getFooterClass()
```

Return the value of the footerClass property.

Contents: Space-separated list of CSS style class(es) that will be applied to any footer generated for this table.

---

**public void setFooterClass(String footerClass)**

```
footerClass
```

---

**setFooterClass**

```java
public void setFooterClass(String footerClass)
```

Set the value of the footerClass property.

---

**public String getFrame()**

```
frame
```

`noneabovelowersidesvsideslhrsrsboxborder`
getFrame

public String getFrame()

Return the value of the frame property.

Contents: Code specifying which sides of the frame surrounding this table will be visible. Valid values are: none (no sides, default value); above (top side only); below (bottom side only); hsides (top and bottom sides only); vsides (right and left sides only); lhs (left hand side only); rhs (right hand side only); box (all four sides); and border (all four sides).

public void setFrame(String frame)

frame

setFrame

public void setFrame(String frame)

Set the value of the frame property.

public String getHeaderClass()

headerClass

CSS

getHeaderClass

public String getHeaderClass()
Return the value of the headerClass property.

Contents: Space-separated list of CSS style class(es) that will be applied to any header generated for this table.

```java
public void setHeaderClass(String headerClass)

headerClass
```

**setHeaderClass**

```java
public void setHeaderClass(String headerClass)

Set the value of the headerClass property.
```

**getLang**

```java
public String getLang()

  lang
```

**getLang**

```java
public String getLang()

  Return the value of the lang property.

  Contents: Code describing the language used in the generated markup for this component.
```

```java
public void setLang(String lang)
```
**lang**

**setLang**

```java
public void setLang(String lang)
```

Set the value of the `lang` property.

**public String getOnclick()**

**onclick**

**Javascript**

**getOnclick**

```java
public String getOnclick()
```

Return the value of the `onclick` property.

Contents: Javascript code executed when a pointer button is clicked over this element.

**public void setOnclick(String onclick)**

**onclick**

**setOnclick**

```java
public void setOnclick(String onclick)
```
Set the value of the `onclick` property.

```java
public String getOndblclick()

  ondblclick

Javascript

getOndblclick

public String getOndblclick()

  Return the value of the `ondblclick` property.

  Contents: Javascript code executed when a pointer button is double clicked over this element.

public void setOndblclick(String ondblclick)

  ondblclick

setOndblclick

public void setOndblclick(String ondblclick)

  Set the value of the `ondblclick` property.

public String getOnkeydown()

  onkeydown
getOnkeydown

public String getOnkeydown()

Return the value of the onkeydown property.

Contents: Javascript code executed when a key is pressed down over this element.

setOnkeydown

public void setOnkeydown(String onkeydown)

onkeydown

getOnkeypress

public String getOnkeypress()

onkeypress

getOnkeypress

public String getOnkeypress()
Return the value of the `onkeypress` property.

Contents: Javascript code executed when a key is pressed and released over this element.

```
public void setOnkeypress(String onkeypress)
```

```
setOnkeypress
```

```
public void setOnkeypress(String onkeypress)
```

Set the value of the `onkeypress` property.

```
public String getOnkeyup()
```

```
getOnkeyup
```

```
public String getOnkeyup()
```

Return the value of the `onkeyup` property.

Contents: Javascript code executed when a key is released over this element.

```
public void setOnkeyup(String onkeyup)
```
onkeyup

setOnkeyup

public void setOnkeyup(String onkeyup)

Set the value of the onkeyup property.

getOnmousedown

public String getOnmousedown()

onmousedown

Javascript

getOnmousedown

public String getOnmousedown()

Return the value of the onmousedown property.

Contents: Javascript code executed when a pointer button is pressed down over this element.

public void setOnmousedown(String onmousedown)

onmousedown

setOnmousedown

public void setOnmousedown(String onmousedown)
public String getOnmousemove()

  onmousemove

Javascript

getOnmousemove

public String getOnmousemove()

  Return the value of the onmousemove property.

  Contents: Javascript code executed when a pointer button is moved within this element.

public void setOnmousemove(String onmousemove)

  onmousemove

setOnmousemove

public void setOnmousemove(String onmousemove)

  Set the value of the onmousemove property.

public String getOnmouseout()

  onmouseout
Javascript

getOnmouseout

public String getOnmouseout()

    Return the value of the onmouseout property.

    Contents: Javascript code executed when a pointer button is moved away from this element.

public void setOnmouseout(String onmouseout)

    onmouseout

setOnmouseout

public void setOnmouseout(String onmouseout)

    Set the value of the onmouseout property.

public String getOnmouseover()

    onmouseover

Javascript

getOnmouseover

public String getOnmouseover()
Return the value of the onmouseover property.

Contents: Javascript code executed when a pointer button is moved onto this element.

```
public void setOnmouseover(String onmouseover)
```

```
setOnmouseover
```

```
public void setOnmouseover(String onmouseover)
```

Set the value of the onmouseover property.

```
public String getOnmouseup()
```

```
getOnmouseup
```

```
public String getOnmouseup()
```

Return the value of the onmouseup property.

Contents: Javascript code executed when a pointer button is released over this element.

```
public void setOnmouseup(String onmouseup)
```
onmouseup

setOnmouseup

public void setOnmouseup(String onmouseup)

    Set the value of the onmouseup property.

public String getRowClasses()

    rowClasses

CSS

getRowClasses

public String getRowClasses()

    Return the value of the rowClasses property.

    Contents: Comma-delimited list of CSS style classes that will be applied to the rows of this table. A space separated list of classes may also be specified for any individual row. Those styles are applied, in turn, to each row in the table. For example, if the list has two elements, the first style class in the list is applied to the first row, the second to the second row, the first to the third row, the second to the fourth row, etc. In other words, we keep iterating through the list until we reach the end, and then we start at the beginning again.

public void setRowClasses(String rowClasses)

    rowClasses
**setRowClasses**

```
public void setRowClasses(String rowClasses)
```

Set the value of the rowClasses property.

---

**public String getRules()**

```
    rules
```

**nongroups**

**rows**

**cols**

**all**

---

**getRules**

```
public String getRules()
```

Return the value of the rules property.

Contents: Code specifying which rules will appear between cells within this table. Valid values are: none (no rules, default value); groups (between row groups); rows (between rows only); cols (between columns only); and all (between all rows and columns).

---

**public void setRules(String rules)**

```
   rules
```

**setRules**
public void setRules(String rules)

    Set the value of the rules property.

public String getStyle()

    style

    CSS

getStyle

public String getStyle()

    Return the value of the style property.

    Contents: CSS style(s) to be applied when this component is rendered.

public void setStyle(String style)

    style

setStyle

public void setStyle(String style)

    Set the value of the style property.

public String getStyleClass()
getStyleClass

public String getStyleClass()

Return the value of the styleClass property.

Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

-------------------------------

public void setStyleClass(String styleClass)

styleClass

setStyleClass

public void setStyleClass(String styleClass)

Set the value of the styleClass property.

-------------------------------

public String getSummary()

summary

Braille
**getSummary**

```java
public String getSummary()
```

Return the value of the summary property.

Contents: Summary of this table's purpose and structure, for user agents rendering to non-visual media such as speech and Braille.

---

**public void setSummary(String summary)**

summary

---

**setSummary**

```java
public void setSummary(String summary)
```

Set the value of the summary property.

---

**public String getTitle()**

title

---

**getTitle**

```java
public String getTitle()
```

Return the value of the title property.

Contents: Advisory title information about markup elements
generated for this component.

public void setTitle(String title)

setTitle

public void setTitle(String title)

Set the value of the title property.

public String getWidth()

getWidth

public String getWidth()

Return the value of the width property.

Contents: Width of the entire table, for visual user agents.

public void setWidth(String width)

setWidth

public void setWidth(String width)
**setWidth**

```java
public void setWidth(String width)
```

Set the value of the `width` property.

**saveState**

```java
public Object saveState(FacesContext _context)
```

**Description copied from interface: StateHolder**

Gets the state of the instance as a `Serializable` Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a `UIComponent` with event handlers, validators, etc.) this method must call the `StateHolder.saveState(javax.faces.context.FacesContext)` method on all those instances as well. **This method must not save the state of children and facets.** That is done via the `StateManager`

This method must not alter the state of the implementing object. In other words, after executing this code:

```java
Object state = component.saveState(facesContext);
```

`component` should be the same as before executing it.

The return from this method must be `Serializable`

**Specified by:**
`saveState` in interface `StateHolder`

**Overrides:**
`saveState` in class `UIComponentBase`
public void restoreState(FacesContext _context, Object _state)

Description copied from interface: StateHolder

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object) method on all those instances as well.

Specified by: restoreState in interface StateHolder

Overrides: restoreState in class UIComponentBase
javax.faces.component.html  Class HtmlPanelGroup

java.lang.Object
   \ javax.faces.component.UIComponent
      \ javax.faces.component.UIComponentBase
         \ javax.faces.component.UIPanel
            \ javax.faces.component.html.HtmlPanelGroup

All Implemented Interfaces:
   StateHolder

public class HtmlPanelGroup
   extends JPanel

Extends: UIComponent > UIComponentBase > JPanel

   rendererType "javax.faces.Group"    setRendererType()

Causes all child components of this component to be rendered. This is useful in scenarios where a parent component is expecting a single component to be present, but the application wishes to render more than one.

By default, the rendererType property must be set to "javax.faces.Group". This value can be changed by calling the setRendererType() method.

---

Description copied from interface: `StateHolder`

Gets the state of the instance as a Serializable Object.
If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the `StateHolder.saveState(javax.faces.context.FacesContext)` method on all those instances as well. **This method must not save the state of children and facets.** That is done via the `StateManager`.

This method must not alter the state of the implementing object. In other words, after executing this code:

```java
Object state = component.saveState(facesContext);
```

`component` should be the same as before executing it.

The return from this method must be `Serializable`

**Specified by:**
- `saveState` in interface `StateHolder`

**Overrides:**
- `saveState` in class `UIComponentBase`

```java
public void restoreState(FacesContext _context, Object _state)
```

**restoreState**

```java
public void restoreState(FacesContext _context, Object _state)
```

**Description copied from interface: StateHolder**

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the...
StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object) method on all those instances as well.

Specified by:

restoreState in interface StateHolder

Overrides:

restoreState in class UIComponentBase
javax.faces.component.html  **Class**  
**HtmlSelectBooleanCheckbox**

java.lang.Object  
  ↳ javax.faces.component.UIComponent  
  ↳ javax.faces.component.UIComponentBase  
  ↳ javax.faces.component.UIOutput  
  ↳ javax.faces.component.UIInput  
  ↳ javax.faces.component.html.HtmlSelectBoolean

**All Implemented Interfaces:**
  EditableValueHolder, StateHolder, ValueHolder

---

```java
class HtmlSelectBooleanCheckbox
extends UISelectBoolean

Extends: UIComponent > UIComponentBase > UIOutput > UIInput > UISelectBoolean
```

```java
checkbox HTML input value

rendererType "javax.faces.Checkbox" setRendererType()

```

Represents an HTML input element of type checkbox. The checkbox will be rendered as checked, or not, based on the value of the value property.

By default, the rendererType property must be set to "javax.faces.Checkbox". This value can be changed by calling the setRendererType() method.

---

**Field Summary**
static String COMPONENT_TYPE
The standard component type for this component.

Constructor Summary

(HtmlSelectBooleanCheckbox())

Method Summary

String getAccesskey()
Return the value of the accesskey property.

String getDir()
Return the value of the dir property.

String getLabel()
Return the value of the label property.

String getLang()
Return the value of the lang property.

String getOnblur()
Return the value of the onblur property.

String getOnchange()
Return the value of the onchange property.

String getOnclick()
Return the value of the onclick property.

`restoreState(FacesContext _context, Object _state)`
void Perform any processing required to restore the state from the entries in the state Object.

Object

saveState(FacesContext _context)

Gets the state of the instance as a Serializable Object.

void setAccesskey(String accesskey)

Set the value of the accesskey property.

void setDir(String dir)

Set the value of the dir property.

void setDisabled(boolean disabled)

Set the value of the disabled property.

void setLabel(String label)

Set the value of the label property.

void setLang(String lang)

Set the value of the lang property.

void setOnblur(String onblur)

Set the value of the onblur property.

void setOnChange(String onchange)

Set the value of the onchange property.

void setOnclick(String onclick)

Set the value of the onclick property.

void setOndblclick(String ondblclick)

Set the value of the ondblclick property.

void setOnfocus(String onfocus)

Set the value of the onfocus property.

void setOnkeydown(String onkeydown)

Set the value of the onkeydown property.

void setOnkeypress(String onkeypress)

Set the value of the onkeypress property.

void setOnkeyup(String onkeyup)

Set the value of the onkeyup property.

void setOnmousedown(String onmousedown)

Set the value of the onmousedown property.

void setOnmousemove(String onmousemove)

Set the value of the onmousemove property.

void setOnmouseover(String onmouseover)

Set the value of the onmouseover property.

void setOnmouseout(String onmouseout)

Set the value of the onmouseout property.

void setOnmousemove(String onmousemove)

Set the value of the onmousemove property.
Methods inherited from class `javax.faces.component.UISelectBoolean`

getFamily, getValueBinding, getValueExpression, isSelected, setSelected, setValueBinding, setValueExpression

Methods inherited from class `javax.faces.component.UIInput`

addValidator, addValueChangeListener, compareValues, decode, getConvertedValue, getConverterMessage, getRequiredMessage, getSubmittedValue, getValidator, getValidatorMessage, getValidators, getValueChangeListener, getValueChangeListeners, isImmediate, isLocalValueSet, isRequired, isValid, processDecodes, processUpdates, processValidators, removeValidator, removeValueChangeListener, resetValue, setConverterMessage, setImmediate, setLocalValueSet, setRequired, setRequiredMessage, setSubmittedValue, setValidator, setValidatorMessage, setValue, setValueChangeListeners, updateModel, validate, validateValue

### Field Detail

**COMPONENT_TYPE**

```java
public static final String COMPONENT_TYPE
```

The standard component type for this component.

**See Also:**

[Constant Field Values](#)
Constructor Detail

public HtmlSelectBooleanCheckbox()

HtmlSelectBooleanCheckbox

public HtmlSelectBooleanCheckbox()

Method Detail

public String getAccesskey()

accesskey

getAccesskey

public String getAccesskey()

Return the value of the accesskey property.

Contents: Access key that, when pressed, transfers focus to this element.

public void setAccesskey(String accesskey)

accesskey
**setAccesskey**

```java
public void setAccesskey(String accesskey)
```

Set the value of the accesskey property.

---

**public String getDir()**

```java
dir
"LTR" left-to-right "RTL" right-to-left
```

**getDir**

```java
public String getDir()
```

Return the value of the dir property.

Contents: Direction indication for text that does not inherit directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).

---

**public void setDir(String dir)**

```java
dir
```

**setDir**

```java
public void setDir(String dir)
```

Set the value of the dir property.
public boolean isDisabled()

disabled

false  true  disabled="disabled"

isDisabled

public boolean isDisabled()

Return the value of the disabled property.

Contents: Flag indicating that this element must never receive focus or be included in a subsequent submit. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as disabled="disabled".

public void setDisabled(boolean disabled)

disabled

setDisabled

public void setDisabled(boolean disabled)

Set the value of the disabled property.

public String getLabel()

label
**getLabel**

public String getLabel()

Return the value of the label property.

Contents: A localized user presentable name for this component.

---

**public void setLabel(String label)**

label

**setLabel**

public void setLabel(String label)

Set the value of the label property.

---

**public String getLang()**

lang

**getLang**

public String getLang()

Return the value of the lang property.
Public void setLang(String lang)

setLang

public void setLang(String lang)

Set the value of the lang property.

Public String getOnblur()

getOnblur

public String getOnblur()

Return the value of the onblur property.

Contents: Javascript code executed when this element loses focus.

Public void setOnblur(String onblur)

setOnblur

public void setOnblur(String onblur)

onblur
**setOnblur**

```java
public void setOnblur(String onblur)
```

Set the value of the `onblur` property.

---

**getOnchange()**

```java
public String getOnchange()
```

Return the value of the `onchange` property.

Contents: Javascript code executed when this element loses focus and its value has been modified since gaining focus.

---

**setOnchange(String onchange)**

```java
public void setOnchange(String onchange)
```

---

**setOnchange**

```java
public void setOnchange(String onchange)
```

Set the value of the `onchange` property.
public String getOnclick()

  onclick

Javascript

getOnclick

public String getOnclick()

  Return the value of the onclick property.

  Contents: Javascript code executed when a pointer button is clicked over this element.

public void setOnclick(String onclick)

  onclick

setOnclick

public void setOnclick(String onclick)

  Set the value of the onclick property.

public String getOndblclick()

  ondblclick

Javascript
getOndblclick

public String getOndblclick()

    Return the value of the ondblclick property.

    Contents: Javascript code executed when a pointer button is double clicked over this element.

public void setOndblclick(String ondblclick)

    ondblclick

setOndblclick

public void setOndblclick(String ondblclick)

    Set the value of the ondblclick property.

public String getOnfocus()

    onfocus

Javascript

getOnfocus

public String getOnfocus()

    Return the value of the onfocus property.
Contents: Javascript code executed when this element receives focus.

public void setOnfocus(String onfocus)

  onfocus

setOnfocus

public void setOnfocus(String onfocus)

  Set the value of the onfocus property.

public String getOnkeydown()

  onkeydown

Javascript

getOnkeydown

public String getOnkeydown()

  Return the value of the onkeydown property.

  Contents: Javascript code executed when a key is pressed down over this element.

public void setOnkeydown(String onkeydown)

  onkeydown
setOnkeydown

public void setOnkeydown(String onkeydown)

Set the value of the onkeydown property.

public String getOnkeypress()

onkeypress

Javascript

getOnkeypress

public String getOnkeypress()

Return the value of the onkeypress property.

Contents: Javascript code executed when a key is pressed and released over this element.

public void setOnkeypress(String onkeypress)

onkeypress

setOnkeypress

public void setOnkeypress(String onkeypress)

Set the value of the onkeypress property.
public String getOnkeyup()

    onkeyup

Javascript

getOnkeyup

public String getOnkeyup()

    Return the value of the onkeyup property.

    Contents: Javascript code executed when a key is released over this element.

public void setOnkeyup(String onkeyup)

    onkeyup

setOnkeyup

public void setOnkeyup(String onkeyup)

    Set the value of the onkeyup property.

public String getOnmousedown()

    onmousedown

Javascript
getOnmousedown

public String getOnmousedown()

    Return the value of the onmousedown property.

    Contents: Javascript code executed when a pointer button is pressed down over this element.

_____________________________________________________

public void setOnmousedown(String onmousedown)

  onmousedown

setOnmousedown

public void setOnmousedown(String onmousedown)

    Set the value of the onmousedown property.

_____________________________________________________

public String getOnmousemove()

  onmousemove

Javascript

getOnmousemove

public String getOnmousemove()

    Return the value of the onmousemove property.
Contents: Javascript code executed when a pointer button is moved within this element.

```java
public void setOnmousemove(String onmousemove)

  onmousemove

setOnmousemove
```

```java
public void setOnmousemove(String onmousemove)

  Set the value of the onmousemove property.
```

```java
public String getOnmouseout()

  onmouseout

Javascript
```

```java
public String getOnmouseout()

  Return the value of the onmouseout property.

  Contents: Javascript code executed when a pointer button is moved away from this element.
```

```java
public void setOnmouseout(String onmouseout)

  onmouseout
```
setOnmouseout

public void setOnmouseout(String onmouseout)

    Set the value of the onmouseout property.

__________________________________________________________

getOnmouseover

public String getOnmouseover()

    onmouseover

Javascript

getOnmouseover

public String getOnmouseover()

    Return the value of the onmouseover property.

    Contents: Javascript code executed when a pointer button is moved onto this element.

__________________________________________________________

setOnmouseover

public void setOnmouseover(String onmouseover)

    onmouseover

setOnmouseover

public void setOnmouseover(String onmouseover)

    Set the value of the onmouseover property.
public String getOnmouseup()
  
  onmouseup

Javascript

getOnmouseup

public String getOnmouseup()

  Return the value of the onmouseup property.
  
  Contents: Javascript code executed when a pointer button is released over this element.

public void setOnmouseup(String onmouseup)

  onmouseup

setOnmouseup

public void setOnmouseup(String onmouseup)

  Set the value of the onmouseup property.

public String getOnselect()

  onselect

Javascript
getOnselect

public String getOnselect()

Return the value of the onselect property.

Contents: Javascript code executed when text within this element is selected by the user.

public void setOnselect(String onselect)

onselect

setOnselect

public void setOnselect(String onselect)

Set the value of the onselect property.

public boolean isReadonly()

readonly

false true readonly="readonly"

isReadonly

public boolean isReadonly()
Return the value of the `readonly` property.

Contents: Flag indicating that this component will prohibit changes by the user. The element may receive focus unless it has also been disabled. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as `readonly="readonly"`.

---

**public void setReadonly(boolean readonly)**

```java
readonly
```

---

**public String getStyle()**

```java
style
```

---

**CSS**

```java
public String getStyle()
```

Return the value of the `style` property.

Contents: CSS style(s) to be applied when this component is rendered.
public void setStyle(String style)

setState

public void setStyle(String style)

Set the value of the style property.

public String getStyleClass()

getStyleClass

public String getStyleClass()

Return the value of the styleClass property.

Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

public void setStyleClass(String styleClass)

setStyleClass

public void setStyleClass(String styleClass)

styleClass
**setStyleClass**

```java
public void setStyleClass(String styleClass)
```

Set the value of the styleClass property.

---

**public String getTabindex()**

`tabindex`

**Tab 0 32767**

---

**getTabindex**

```java
public String getTabindex()
```

Return the value of the `tabindex` property.

Contents: Position of this element in the tabbing order for the current document. This value must be an integer between 0 and 32767.

---

**public void setTabindex(String tabindex)**

`tabindex`

---

**setTabindex**

```java
public void setTabindex(String tabindex)
```

Set the value of the `tabindex` property.
public String getTitle()

title

getTitle

public String getTitle()

    Return the value of the title property.

    Contents: Advisory title information about markup elements generated for this component.

public void setTitle(String title)

title

setTitle

public void setTitle(String title)

    Set the value of the title property.

public Object saveState(FacesContext _context)

saveState

public Object saveState(FacesContext _context)
Description copied from interface: **StateHolder**

Gets the state of the instance as a **Serializable** Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the `StateHolder.saveState(javax.faces.context.FacesContext)` method on all those instances as well. **This method must not save the state of children and facets.** That is done via the **StateManager**

This method must not alter the state of the implementing object. In other words, after executing this code:

```java
Object state = component.saveState(facesContext);
```

`component` should be the same as before executing it.

The return from this method must be **Serializable**

**Specified by:**
`saveState` in interface **StateHolder**

**Overrides:**
`saveState` in class **UIInput**

---

**public void restoreState(FacesContext _context, Object _state)**

**restoreState**

```java
public void restoreState(FacesContext _context,
Object _state)
```

**Description copied from interface: **StateHolder**

Perform any processing required to restore the state from the entries in the state Object.
If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the 
StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object) method on all those instances as well.

** Specified by:**
restoreState in interface StateHolder

** Overrides:**
restoreState in class UIInput

PS:
public class HtmlSelectManyCheckbox

extends UISelectMany

**Extends:** UIComponent > UIComponentBase > UIOutput > UIInput > UISelectMany

checkbox HTML input

rendererType "javax.faces.Checkbox" setRendererType()

Represents a multiple-selection component that is rendered as a set of HTML input elements of type checkbox.

By default, the rendererType property must be set to "javax.faces.Checkbox". This value can be changed by calling the setRendererType() method.

---

Method Detail

```java
public String getAccesskey()
```

accesskey

getAccesskey
public String getAccesskey()

Return the value of the accesskey property.

Contents: Access key that, when pressed, transfers focus to this element.

public void setAccesskey(String accesskey)

accesskey

setAccesskey

public void setAccesskey(String accesskey)

Set the value of the accesskey property.

public int getBorder()

border

g.Border

public int getBorder()

Return the value of the border property.

Contents: Width (in pixels) of the border to be drawn around the table containing the options list.
public void setBorder(int border)

border

setBorder

class setBorder

public void setBorder(int border)

Set the value of the border property.

public String getDir()

dir

"LTR"left-to-right "RTL"right-to-left

getDir

class getDir

public String getDir()

Return the value of the dir property.

Contents: Direction indication for text that does not inherit directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).

public void setDir(String dir)

dir
setDir

public void setDir(String dir)

Set the value of the dir property.

public boolean isDisabled()

disabled

false true disabled="disabled"

isDisabled

public boolean isDisabled()

Return the value of the disabled property.

Contents: Flag indicating that this element must never receive focus or be included in a subsequent submit. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as disabled="disabled".

public void setDisabled(boolean disabled)

disabled

setDisabled

public void setDisabled(boolean disabled)

Set the value of the disabled property.
public String getDisabledClass()

    disabledClass

CSS

getDisabledClass

public String getDisabledClass()

    Return the value of the disabledClass property.
    
    Contents: CSS style class to apply to the rendered label on disabled options.

public void setDisabledClass(String disabledClass)

    disabledClass

setDisabledClass

public void setDisabledClass(String disabledClass)

    Set the value of the disabledClass property.

public String getEnabledClass()

    enabledClass

CSS
**getEnabledClass**

public String getEnabledClass()

Return the value of the enabledClass property.

Contents: CSS style class to apply to the rendered label on enabled options.

**public void setEnabledClass(String enabledClass)**

enabledClass

**setLabel**

public void setEnabledClass(String enabledClass)

Set the value of the enabledClass property.

**public String getLabel()**

label

**getLabel**

public String getLabel()

Return the value of the label property.
public void setLabel(String label)

setLabel

public String getLang()

getLang

Contents: Code describing the language used in the generated markup for this component.
setLang

public void setLang(String lang)

    Set the value of the lang property.

getLayout

public String getLayout()

    layout

"pageDirection" "lineDirection"
"lineDirection"

getLayout

public String getLayout()

    Return the value of the layout property.

    Contents: Orientation of the options list to be created. Valid values are "pageDirection" (list is laid out vertically), or "lineDirection" (list is laid out horizontally). If not specified, the default value is "lineDirection".

setLayout

public void setLayout(String layout)

    layout

setLayout
public void setLayout(String layout)

    Set the value of the layout property.

public String getOnblur()

    onblur

    Javascript

getOnblur

public String getOnblur()

    Return the value of the onblur property.

    Contents: Javascript code executed when this element loses focus.

public void setOnblur(String onblur)

    onblur

setOnblur

public void setOnblur(String onblur)

    Set the value of the onblur property.

public String getOnchange()

    onchange
getOnchange

```java
public String getOnchange()
```

Return the value of the onchange property.

Contents: Javascript code executed when this element loses focus and its value has been modified since gaining focus.

---

setOnchange

```java
public void setOnchange(String onchange)
```

Events:

```
onchange
```

setOnchange

```java
public void setOnchange(String onchange)
```

Set the value of the onchange property.

---

getOnclick

```java
public String getOnclick()
```

Events:

```
onclick
```

getOnclick

```java
public String getOnclick()
```
Return the value of the `onclick` property.

Contents: Javascript code executed when a pointer button is clicked over this element.

```java
public void setOnclick(String onclick)
```

`onclick`

`setOnclick`

```java
public void setOnclick(String onclick)
```

Set the value of the `onclick` property.

---

```java
public String getOndblclick()
```

`ondblclick`

`Javascript`

`getOndblclick`

```java
public String getOndblclick()
```

Return the value of the `ondblclick` property.

Contents: Javascript code executed when a pointer button is double clicked over this element.

```java
public void setOndblclick(String ondblclick)
```
setOndblclick

public void setOndblclick(String ondblclick)

Set the value of the ondblclick property.

public String getOnfocus()

onfocus

Javascript

getOnfocus

public String getOnfocus()

Return the value of the onfocus property.

Contents: Javascript code executed when this element receives focus.

public void setOnfocus(String onfocus)

onfocus

setOnfocus

public void setOnfocus(String onfocus)
Set the value of the onfocus property.

public String getOnkeydown()

onkeydown

Javascript

getOnkeydown

public String getOnkeydown()

Return the value of the onkeydown property.

Contents: Javascript code executed when a key is pressed down over this element.

public void setOnkeydown(String onkeydown)

onkeydown

setOnkeydown

public void setOnkeydown(String onkeydown)

Set the value of the onkeydown property.

public String getOnkeypress()
getOnkeypress

public String getOnkeypress()

    Return the value of the onkeypress property.

    Contents: Javascript code executed when a key is pressed and released over this element.

-----------------------------------------------

public void setOnkeypress(String onkeypress)

    onkeypress

setOnkeypress

public void setOnkeypress(String onkeypress)

    Set the value of the onkeypress property.

-----------------------------------------------

public String getOnkeyup()

    onkeyup

Javascript

getOnkeyup

public String getOnkeyup()
Return the value of the onkeyup property.

Contents: Javascript code executed when a key is released over this element.

```java
public void setOnkeyup(String onkeyup)
    onkeyup
```

### setOnkeyup

```java
public void setOnkeyup(String onkeyup)
    Set the value of the onkeyup property.
```

### public String getOnmousedown()

```java
public String getOnmousedown()
    onmousedown

Javascript
```

### getOnmousedown

```java
public String getOnmousedown()
    Return the value of the onmousedown property.

Contents: Javascript code executed when a pointer button is pressed down over this element.
```

```java
public void setOnmousedown(String onmousedown)
```

onmousedown

**setOnmousedown**

```java
public void setOnmousedown(String onmousedown)
```

Set the value of the `onmousedown` property.

---

**public String getOnmousemove()**

```java
onmousemove
```

Javascript

**getOnmousemove**

```java
public String getOnmousemove()
```

Return the value of the `onmousemove` property.

Contents: Javascript code executed when a pointer button is moved within this element.

---

**public void setOnmousemove(String onmousemove)**

```java
onmousemove
```

**setOnmousemove**

```java
public void setOnMouseMove(String onmousemove)
```
Set the value of the onmousemove property.

public String getOnmouseout()

onmouseout

Javascript

getOnmouseout

public String getOnmouseout()

Return the value of the onmouseout property.

Contents: Javascript code executed when a pointer button is moved away from this element.

public void setOnmouseout(String onmouseout)

onmouseout

setOnmouseout

public void setOnmouseout(String onmouseout)

Set the value of the onmouseout property.

public String getOnmouseover()
Javascript

getOnmouseover

public String getOnmouseover()

  Return the value of the onmouseover property.
  Contents: Javascript code executed when a pointer button is moved onto this element.

-----------------------------------------------

public void setOnmouseover(String onmouseover)

  onmouseover

setOnmouseover

public void setOnmouseover(String onmouseover)

  Set the value of the onmouseover property.

-----------------------------------------------

public String getOnmouseup()

  onmouseup

Javascript

getOnmouseup

public String getOnmouseup()
Return the value of the onmouseup property.

Contents: Javascript code executed when a pointer button is released over this element.

```java
public void setOnmouseup(String onmouseup)
```

`onmouseup`

---

**setOnmouseup**

public void setOnmouseup(String onmouseup)

Set the value of the onmouseup property.

---

**public String getOnselect()**

`onselect`

**Javascript**

---

**getOnselect**

public String getOnselect()

Return the value of the onselect property.

Contents: Javascript code executed when text within this element is selected by the user.

---

```java
public void setOnselect(String onselect)
```
onselect

setOnselect

public void setOnselect(String onSelect)

Set the value of the onSelect property.

------

public boolean isReadonly()

readonly

false true readonly="readonly"

------

isReadonly

public boolean isReadonly()

Return the value of the readonly property.

Contents: Flag indicating that this component will prohibit changes by the user. The element may receive focus unless it has also been disabled. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as readonly="readonly".

------

public void setReadonly(boolean readonly)

readonly
setReadonly

public void setReadonly(boolean readonly)

Set the value of the readonly property.

public String getStyle()

style

CSS

getAddress

public String getStyle()

Return the value of the style property.

Contents: CSS style(s) to be applied when this component is rendered.

public void setStyle(String style)

style

setStyle

public void setStyle(String style)

Set the value of the style property.
public String getStyleClass()

    styleClass

    CSS "class"

getStyleClass

public String getStyleClass()

    Return the value of the styleClass property.

    Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

public void setStyleClass(String styleClass)

    styleClass

setStyleClass

public void setStyleClass(String styleClass)

    Set the value of the styleClass property.

public String getTabindex()

    tabindex

Tab  0  32767
**getTabindex**

```java
public String getTabindex()
```

Return the value of the `tabindex` property.

Contents: Position of this element in the tabbing order for the current document. This value must be an integer between 0 and 32767.

**public void setTabindex(String tabindex)**

```java
public void setTabindex(String tabindex)
```

Set the value of the `tabindex` property.

**getTitle**

```java
public String getTitle()
```

**getTitle**

```java
public String getTitle()
```

Return the value of the `title` property.
public void setTitle(String title)

setTitle

public void setTitle(String title)

Set the value of the title property.

public Object saveState(FacesContext _context)

saveState

public Object saveState(FacesContext _context)

Description copied from interface: StateHolder

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to
instances that implement StateHolder (such as a UIComponent with
event handlers, validators, etc.) this method must call the
StateHolder.saveState(javax.faces.context.FacesContext) method
on all those instances as well. This method must not save the
state of children and facets. That is done via the StateManager

This method must not alter the state of the implementing object. In
other words, after executing this code:

Object state = component.saveState(facesContext);
component should be the same as before executing it.

The return from this method must be Serializable

Specified by:
    saveState in interface StateHolder
Overrides:
    saveState in class UIInput

public void restoreState(FacesContext _context, Object _state)

Description copied from interface: StateHolder

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object) method on all those instances as well.

Specified by:
    restoreState in interface StateHolder
Overrides:
    restoreState in class UIInput

PS:
javax.faces.component.html  Class HtmlSelectManyListbox

java.lang.Object
    ↓ javax.faces.component.UIComponent
       ↓ javax.faces.component.UIComponentBase
          ↓ javax.faces.component.UIOutput
             ↓ javax.faces.component.UIInput
                ↓ javax.faces.component.html.HtmlSelectMany

All Implemented Interfaces:
    EditableValueHolder, StateHolder, ValueHolder

public class HtmlSelectManyListbox

extends UISelectMany

Extends: UIComponent > UIComponentBase > UIOutput > UIInput > UISelectMany

HTML  select

    rendererType "javax.faces.Listbox"  setRendererType()

Represents a multiple-selection component that is rendered as an HTML select element, showing either all available options or the specified number of options.

By default, the rendererType property must be set to "javax.faces.Listbox". This value can be changed by calling the setRendererType() method.

Field Summary

| COMPONENT_TYPE |
The standard component type for this component.

Fields inherited from class javax.faces.component.UISelectMany
COMPONENT_FAMILY, INVALID_MESSAGE_ID

Fields inherited from class javax.faces.component.UlInput
CONVERSION_MESSAGE_ID, REQUIRED_MESSAGE_ID, UPDATE_MESSAGE_ID

Fields inherited from class javax.faces.component.UIComponent bindings

Constructor Summary

HtmlSelectManyListbox()

Method Summary

String getAccesskey()
Return the value of the accesskey property.

String getDir()
Return the value of the dir property.

String getDisabledClass()
Return the value of the disabledClass property.

String getEnabledClass()
Return the value of the enabledClass property.

String getLabel()
Return the value of the label property.

String getLang()
Return the value of the lang property.

String getOnblur()
Return the value of the onblur property.

String getOnchange()
Return the value of the onchange property.
String `getOnclick()`
Return the value of the `onclick` property.

String `getOndblclick()`
Return the value of the `ondblclick` property.

String `getOnfocus()`
Return the value of the `onfocus` property.

String `getOnkeydown()`
Return the value of the `onkeydown` property.

String `getOnkeypress()`
Return the value of the `onkeypress` property.

String `getOnkeyup()`
Return the value of the `onkeyup` property.

String `getOnmousedown()`
Return the value of the `onmousedown` property.

String `getOnmousemove()`
Return the value of the `onmousemove` property.

String `getOnmouseout()`
Return the value of the `onmouseout` property.

String `getOnmouseover()`
Return the value of the `onmouseover` property.

String `getOnmouseup()`
Return the value of the `onmouseup` property.

String `getOnselect()`
Return the value of the `onselect` property.

int `getSize()`
Return the value of the `size` property.

String `getStyle()`
Return the value of the `style` property.

String `getStyleClass()`
Return the value of the `styleClass` property.

String `getTabindex()`
Return the value of the `tabindex` property.

String `getTitle()`
Return the value of the `title` property.

Constructor Detail

```java
public HtmlSelectManyListbox()
```

```java
HtmlSelectManyListbox
```

```java
public HtmlSelectManyListbox()
```

Method Detail

```java
public String getAccesskey()
```

```java
accesskey
```

getAccesskey

```java
public String getAccesskey()
```
Return the value of the accesskey property.

Contents: Access key that, when pressed, transfers focus to this element.

```java
public void setAccesskey(String accesskey)
```

setAccesskey

```java
public void setAccesskey(String accesskey)
```

Set the value of the accesskey property.

```java
public String getDir()
```

dir

"LTR" left-to-right "RTL" right-to-left

getDir

```java
public String getDir()
```

Return the value of the dir property.

Contents: Direction indication for text that does not inherit directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).
public void setDir(String dir)

dir

setDir

public void setDir(String dir)

Set the value of the dir property.

public boolean isDisabled()

disabled

false true disabled="disabled"

isDisabled

public boolean isDisabled()

Return the value of the disabled property.

Contents: Flag indicating that this element must never receive focus or be included in a subsequent submit. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as disabled="disabled".

public void setDisabled(boolean disabled)

disabled
setDisabled

public void setDisabled(boolean disabled)

Set the value of the disabled property.

public String getDisabledClass()

disabledClass

CSS

getDisabledClass

public String getDisabledClass()

Return the value of the disabledClass property.

Contents: CSS style class to apply to the rendered label on disabled options.

public void setDisabledClass(String disabledClass)

disabledClass

setDisabledClass

public void setDisabledClass(String disabledClass)

Set the value of the disabledClass property.
public String getEnabledClass()

    enabledClass

CSS

getEnabledClass

public String getEnabledClass()

    Return the value of the enabledClass property.
    Contents: CSS style class to apply to the rendered label on enabled options.

public void setEnabledClass(String enabledClass)

    enabledClass

setLabel

public String getLabel()

    label
**getLabel**

public String getLabel()

    Return the value of the label property.

    Contents: A localized user presentable name for this component.

---

**public void setLabel(String label)**

      label

**setLabel**

public void setLabel(String label)

    Set the value of the label property.

---

**public String getLang()**

      lang

**getLang**

public String getLang()

    Return the value of the lang property.
public void setLang(String lang)

    lang

setLang

public void setLang(String lang)

    Set the value of the lang property.

public String getOnblur()

    onblur

Javascript

getOnblur

public String getOnblur()

    Return the value of the onblur property.

    Contents: Javascript code executed when this element loses focus.

public void setOnblur(String onblur)

    onblur
**setOnblur**

```java
public void setOnblur(String onblur)
```

Set the value of the `onblur` property.

---

**public String getOnchange()**

```java
public String getOnchange()
```

Return the value of the `onchange` property.

Contents: Javascript code executed when this element loses focus and its value has been modified since gaining focus.

---

**public void setOnchange(String onchange)**

```java
public void setOnchange(String onchange)
```

---

**setOnchange**

```java
public void setOnchange(String onchange)
```

Set the value of the `onchange` property.
public String getOnclick()

    onclick

Javascript

getOnclick

public String getOnclick()

    Return the value of the onclick property.

    Contents: Javascript code executed when a pointer button is clicked over this element.

public void setOnclick(String onclick)

    onclick

setOnclick

public void setOnclick(String onclick)

    Set the value of the onclick property.

public String getOndblclick()

    ondblclick

Javascript
**getOndblclick**

public String getOndblclick()

Return the value of the ondblclick property.

Contents: Javascript code executed when a pointer button is double clicked over this element.

---

**public void setOndblclick(String ondblclick)**

  ondblclick

**setOndblclick**

public void setOndblclick(String ondblclick)

  Set the value of the ondblclick property.

---

**public String getOnfocus()**

  onfocus

Javascript

**getOnfocus**

public String getOnfocus()

  Return the value of the onfocus property.
Contents: Javascript code executed when this element receives focus.

---

`public void setOnfocus(String onfocus)`

`onfocus`

 **setOnfocus**

`public void setOnfocus(String onfocus)`

Set the value of the `onfocus` property.

---

`public String getOnkeydown()`

`onkeydown`

**Javascript**

**getOnkeydown**

`public String getOnkeydown()`

Return the value of the `onkeydown` property.

Contents: Javascript code executed when a key is pressed down over this element.

---

`public void setOnkeydown(String onkeydown)`

`onkeydown`
**setOnkeydown**

```java
public void setOnkeydown(String onkeydown)
```

Set the value of the `onkeydown` property.

---

**public String getOnkeypress()**

```java
    onkeypress
```

**Javascript**

**getOnkeypress**

```java
public String getOnkeypress()
```

Return the value of the `onkeypress` property.

Contents: Javascript code executed when a key is pressed and released over this element.

---

**public void setOnkeypress(String onkeypress)**

```java
    onkeypress
```

**setOnkeypress**

```java
public void setOnkeypress(String onkeypress)
```

Set the value of the `onkeypress` property.
public String getOnkeyup()

    onkeyup

Javascript

getOnkeyup

public String getOnkeyup()

    Return the value of the onkeyup property.

    Contents: Javascript code executed when a key is released over this element.

public void setOnkeyup(String onkeyup)

    onkeyup

setOnkeyup

public void setOnkeyup(String onkeyup)

    Set the value of the onkeyup property.

public String getOnmousedown()

    onmousedown

Javascript
getOnmousedown

public String getOnmousedown()

Return the value of the onmousedown property.

Contents: Javascript code executed when a pointer button is pressed down over this element.

---------------------------------

public void setOnmousedown(String onmousedown)

onmousedown

setOnmousedown

public void setOnmousedown(String onmousedown)

Set the value of the onmousedown property.

---------------------------------

public String getOnmousemove()

onmousemove

Javascript

getOnmousemove

public String getOnmousemove()

Return the value of the onmousemove property.
Contents: Javascript code executed when a pointer button is moved within this element.

```java
public void setOnmousemove(String onmousemove)

    onmousemove

setOnmousemove
```

Set the value of the `onmousemove` property.

```java
public String getOnmouseout()

    onmouseout

Javascript
```

Return the value of the `onmouseout` property.

Contents: Javascript code executed when a pointer button is moved away from this element.

```java
public void setOnmouseout(String onmouseout)

    onmouseout
```
setOnmouseout

public void setOnmouseout(String onmouseout)

    Set the value of the onmouseout property.

-----------------------------------------------

getOnmouseover

public String getOnmouseover()

    onmouseover

    Javascript

getOnmouseover

public String getOnmouseover()

    Return the value of the onmouseover property.

    Contents: Javascript code executed when a pointer button is moved onto this element.

-----------------------------------------------

setOnmouseover

public void setOnmouseover(String onmouseover)

    onmouseover

setOnmouseover

public void setOnmouseover(String onmouseover)

    Set the value of the onmouseover property.
public String getOnmouseup()

    onmouseup

Javascript

getOnmouseup

public String getOnmouseup()

    Return the value of the onmouseup property.

    Contents: Javascript code executed when a pointer button is released over this element.

public void setOnmouseup(String onmouseup)

    onmouseup

setOnmouseup

public void setOnmouseup(String onmouseup)

    Set the value of the onmouseup property.

public String getOnselect()

    onselect

Javascript
getOnselect

public String getOnselect()

    Return the value of the onclick property.
    Contents: Javascript code executed when text within this element is selected by the user.

public void setOnselect(String onclick)

    onclick

setOnselect

public void setOnselect(String onclick)

    Set the value of the onclick property.

public boolean isReadonly()

    readonly

    false true readonly="readonly"

isReadonly

public boolean isReadonly()
Return the value of the `readonly` property.

Contents: Flag indicating that this component will prohibit changes by the user. The element may receive focus unless it has also been disabled. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as `readonly="readonly"`.

---

**public void setReadonly(boolean readonly)**

```
readonly
```

---

**setReadonly**

**public void setReadonly(boolean readonly)**

Set the value of the `readonly` property.

---

**public int getSize()**

```
size
```

---

**getSize**

**public int getSize()**

Return the value of the `size` property.

Contents: Number of available options to be shown at all times. If not specified, all available options are shown.
public void setSize(int size)

    size

setSize

public void setSize(int size)

    Set the value of the size property.

public String getStyle()

    style

CSS

getStyle

public String getStyle()

    Return the value of the style property.

    Contents: CSS style(s) to be applied when this component is rendered.

public void setStyle(String style)

    style
**setStyle**

```java
public void setStyle(String style)
```

Set the value of the `style` property.

---

**public String getStyleClass()**

```
styleClass
```

CSS "class"

---

**getStyleClass**

```java
public String getStyleClass()
```

Return the value of the `styleClass` property.

Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

---

**public void setStyleClass(String styleClass)**

```
styleClass
```

---

**setStyleClass**

```java
public void setStyleClass(String styleClass)
```

Set the value of the `styleClass` property.
public String getTabindex()

    tabindex

    Tab  0  32767

getTabindex

public String getTabindex()

    Return the value of the tabindex property.
    
    Contents: Position of this element in the tabbing order for the current document. This value must be an integer between 0 and 32767.

----------------------------------------------

public void setTabindex(String tabindex)

    tabindex

setTabindex

public void setTabindex(String tabindex)

    Set the value of the tabindex property.

----------------------------------------------

public String getTitle()

    title
**getTitle**

public `String` `getTitle()`

    Return the value of the `title` property.

    Contents: Advisory title information about markup elements generated for this component.

---

**public void setTitle(String title)**

    `title`

---

**setTitle**

public `void` `setTitle(String title)`

    Set the value of the `title` property.

---

**public Object saveState(FacesContext _context)**

**saveState**

public `Object` `saveState(FacesContext _context)`

    Description copied from interface: `StateHolder`

    Gets the state of the instance as a `Serializable` Object.

    If the class that implements this interface has references to instances that implement `StateHolder` (such as a `UIComponent` with event handlers, validators, etc.) this method must call the
**StateHolder.saveState(javax.faces.context.FacesContext)** method on all those instances as well. **This method must not save the state of children and facets.** That is done via the **StateManager**

This method must not alter the state of the implementing object. In other words, after executing this code:

```java
Object state = component.saveState(facesContext);
```

*component* should be the same as before executing it.

The return from this method must be **Serializable**

**Specified by:**

- **saveState** in interface **StateHolder**

**Overrides:**

- **saveState** in class **UIInput**

---

**public void restoreState(FacesContext _context, Object _state)**

**restoreState**

```java
public void restoreState(FacesContext _context, Object _state)
```

**Description copied from interface: **StateHolder**

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the **StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object)** method on all those instances as well.
Specified by:  
restoreState in interface StateHolder

Overrides:  
restoreState in class UIInput
**javax.faces.component.html**  
**Class** HtmlSelectManyMenu

```java
java.lang.Object
  └─javax.faces.component.UIComponent
      └─javax.faces.component.UIComponentBase
          └─javax.faces.component.UIOutput
              └─javax.faces.component.UIInput
                  └─javax.faces.component.UISelectMany
                      └─javax.faces.component.html.HtmlSelectManyMenu
```

**All Implemented Interfaces:**  
EditableValueHolder, StateHolder, ValueHolder

---

```java
public class HtmlSelectManyMenu

extends UISelectMany

**Extends:** UIComponent > UIComponentBase > UIOutput > UInput > UISelectMany

HTML select

    rendererType "javax.faces.Menu"    setRendererType()
```

Represents a multiple-selection component that is rendered as an HTML select element, showing a single available option at a time.

By default, the rendererType property must be set to "javax.faces.Menu". This value can be changed by calling the setRendererType() method.

---

**Field Detail**

COMPONENT_TYPE
public static final String COMPONENT_TYPE

The standard component type for this component.

See Also: Constant Field Values

Constructor Detail

public HtmlSelectManyMenu()

HtmlSelectManyMenu

public HtmlSelectManyMenu()

Method Detail

public String getAccesskey()

accesskey

getAccesskey

public String getAccesskey()

Return the value of the accesskey property.

Contents: Access key that, when pressed, transfers focus to this element.
public void setAccesskey(String accesskey)

accesskey

setAccesskey

public void setAccesskey(String accesskey)

Set the value of the accesskey property.

public String getDir()

dir

"LTR" left-to-right "RTL" right-to-left

getDir

public String getDir()

Return the value of the dir property.

Contents: Direction indication for text that does not inherit directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).
**setDir**

```java
public void setDir(String dir)
```

Set the value of the `dir` property.

---

**public boolean isDisabled()**

```java
disabled
false true disabled="disabled"
```

**isDisabled**

```java
public boolean isDisabled()
```

Return the value of the `disabled` property.

Contents: Flag indicating that this element must never receive focus or be included in a subsequent submit. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as disabled="disabled".

---

**public void setDisabled(boolean disabled)**

```java
disabled
```

**setDisabled**

```java
public void setDisabled(boolean disabled)
```

Set the value of the `disabled` property.
public String getDisabledClass()

disabledClass

CSS

getDisabledClass

public String getDisabledClass()

Return the value of the disabledClass property.

Contents: CSS style class to apply to the rendered label on disabled options.

public void setDisabledClass(String disabledClass)

disabledClass

setDisabledClass

public void setDisabledClass(String disabledClass)

Set the value of the disabledClass property.

public String getEnabledClass()

enabledClass

CSS
**getEnabledClass**

```java
public String getEnabledClass()
```

Return the value of the enabledClass property.

Contents: CSS style class to apply to the rendered label on enabled options.

**public void setEnabledClass(String enabledClass)**

```java
  enabledClass
```

**setLabel**

```java
public String setEnabledClass(String enabledClass)
```

Set the value of the enabledClass property.

---

**getLabel**

```java
public String getLabel()
```

```java
  label
```

Return the value of the label property.
public void setLabel(String label)

  label

setLabel

public void setLabel(String label)

  Set the value of the label property.

getLang

public String getLang()

  lang

getLang

public String getLang()

  Return the value of the lang property.

  Contents: Code describing the language used in the generated markup for this component.

public void setLang(String lang)

  lang
**setLang**

public void setLang(String lang)

Set the value of the lang property.

---

**public String getOnblur()**

onblur

Javascript

**getOnblur**

public String getOnblur()

Return the value of the onblur property.

Contents: Javascript code executed when this element loses focus.

---

**public void setOnblur(String onblur)**

onblur

**setOnblur**

public void setOnblur(String onblur)

Set the value of the onblur property.
public String getOnchange()

    onchange

Javascript

getOnchange

public String getOnchange()

    Return the value of the onchange property.

    Contents: Javascript code executed when this element loses focus and its value has been modified since gaining focus.

public void setOnchange(String onchange)

    onchange

setOnchange

public void setOnchange(String onchange)

    Set the value of the onchange property.

public String getOnclick()

    onclick

Javascript
getOnclick

public String getOnclick()

    Return the value of the onclick property.

    Contents: Javascript code executed when a pointer button is clicked over this element.

public void setOnclick(String onclick)

    onclick

setOnclick

public void setOnclick(String onclick)

    Set the value of the onclick property.

public String getOndblclick()

    ondblclick

Javascript

getOndblclick

public String getOndblclick()

    Return the value of the ondblclick property.
Contents: Javascript code executed when a pointer button is double clicked over this element.

```java
public void setOndblclick(String ondblclick)

    ondblclick
```

**setOndblclick**

```java
public void setOndblclick(String ondblclick)

    Set the value of the ondblclick property.
```

```java
public String getOnfocus()

    onfocus
```

**getOnfocus**

```java
public String getOnfocus()

    Return the value of the onfocus property.
    
    Contents: Javascript code executed when this element receives focus.
```

```java
public void setOnfocus(String onfocus)

    onfocus
```
**setOnfocus**

```java
public void setOnfocus(String onFocus)
```

Set the value of the `onFocus` property.

---

**public String getOnkeydown()**

```java
public String getOnkeydown()
```

Return the value of the `onkeydown` property.

Contents: Javascript code executed when a key is pressed down over this element.

---

**public void setOnkeydown(String onkeydown)**

```java
public void setOnkeydown(String onkeydown)
```

---

**setOnkeydown**

```java
public void setOnkeydown(String onkeydown)
```

Set the value of the `onkeydown` property.
public String getOnkeypress()

    onkeypress

Javascript

getOnkeypress

public String getOnkeypress()

    Return the value of the onkeypress property.

    Contents: Javascript code executed when a key is pressed and released over this element.

public void setOnkeypress(String onkeypress)

    onkeypress

setOnkeypress

public void setOnkeypress(String onkeypress)

    Set the value of the onkeypress property.

public String getOnkeyup()

    onkeyup

Javascript
getOnkeyup

public String getOnkeyup()

Return the value of the onkeyup property.

Contents: Javascript code executed when a key is released over this element.

public void setOnkeyup(String onkeyup)

setOnkeyup

public void setOnkeyup(String onkeyup)

Set the value of the onkeyup property.

public String getOnmousedown()

getOnmousedown

public String getOnmousedown()

Return the value of the onmousedown property.
Contents: Javascript code executed when a pointer button is pressed down over this element.

public void setOnmousedown(String onmousedown)

    onmousedown

setOnmousedown

public void setOnmousedown(String onmousedown)

    Set the value of the onmousedown property.

public String getOnmousemove()

    onmousemove

Javascript

getOnmousemove

public String getOnmousemove()

    Return the value of the onmousemove property.

    Contents: Javascript code executed when a pointer button is moved within this element.

public void setOnmousemove(String onmousemove)

    onmousemove
setOnmousemove

public void setOnmousemove(String onmousemove)

Set the value of the onmousemove property.

public String getOnmouseout()

onmouseout

Javascript

getOnmouseout

public String getOnmouseout()

Return the value of the onmouseout property.

Contents: Javascript code executed when a pointer button is moved away from this element.

public void setOnmouseout(String onmouseout)

onmouseout

setOnmouseout

public void setOnmouseout(String onmouseout)

Set the value of the onmouseout property.
public String getOnmouseover()

    onmouseover

Javascript

getOnmouseover

public String getOnmouseover()

    Return the value of the onmouseover property.
    Contents: Javascript code executed when a pointer button is moved onto this element.

public void setOnmouseover(String onmouseover)

    onmouseover

setOnmouseover

public void setOnmouseover(String onmouseover)

    Set the value of the onmouseover property.

public String getOnmouseup()
getOnmouseup

public String getOnmouseup()

    Return the value of the onmouseup property.

    Contents: Javascript code executed when a pointer button is released over this element.

public void setOnmouseup(String onmouseup)

    onmouseup

setOnmouseup

public void setOnmouseup(String onmouseup)

    Set the value of the onmouseup property.

public String getOnselect()

    onselect

Javascript

getOnselect

public String getOnselect()

    Return the value of the onselect property.
Contents: Javascript code executed when text within this element is selected by the user.

```java
public void setOnselect(String onSelect)

    onSelect
```

setOnselect

```java
public void setOnselect(String onSelect)

    Set the value of the onSelect property.
```

```java
public boolean isReadonly()

    readonly
```

false true readonly="readonly"

isReadonly

```java
public boolean isReadonly()

    Return the value of the readonly property.

    Contents: Flag indicating that this component will prohibit changes by the user. The element may receive focus unless it has also been disabled. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as readonly="readonly".
```
public void setReadonly(boolean readonly)

readonly

setReadonly

Set the value of the readonly property.

public String getStyle()

style

CSS

getStyle

public String getStyle()

    Return the value of the style property.

    Contents: CSS style(s) to be applied when this component is rendered.

public void setStyle(String style)

style
**setStyle**

```java
public void setStyle(String style)
```

Set the value of the `style` property.

---

**public String getStyleClass()**

```java
public String getStyleClass()
```

Return the value of the `styleClass` property.

Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

---

**public void setStyleClass(String styleClass)**

```java
public void setStyleClass(String styleClass)
```

---

**setStyleClass**

```java
public void setStyleClass(String styleClass)
```

Set the value of the `styleClass` property.
public String getTabindex()

    tabindex

    Tab 0 32767

getTabindex

public String getTabindex()

    Return the value of the tabindex property.

    Contents: Position of this element in the tabbing order for the current document. This value must be an integer between 0 and 32767.

public void setTabindex(String tabindex)

    tabindex

setTabindex

public void setTabindex(String tabindex)

    Set the value of the tabindex property.

public String getTitle()

    title
**getTitle**

```java
public String getTitle()
```

Return the value of the title property.

Contents: Advisory title information about markup elements generated for this component.

---

**public void setTitle(String title)**

title

---

**setTitle**

```java
public void setTitle(String title)
```

Set the value of the title property.

---

**public Object saveState(FacesContext _context)**

**saveState**

```java
public Object saveState(FacesContext _context)
```

**Description copied from interface: StateHolder**

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the
**StateHolder.saveState(javax.faces.context.FacesContext)** method on all those instances as well. **This method must not save the state of children and facets.** That is done via the **StateManager**

This method must not alter the state of the implementing object. In other words, after executing this code:

```java
Object state = component.saveState(facesContext);
```

`component` should be the same as before executing it.

The return from this method must be **Serializable**

**Specified by:**
- `saveState` in interface **StateHolder**

**Overrides:**
- `saveState` in class **UIInput**

---

**public void restoreState(FacesContext _context, Object _state)**

**restoreState**

**public void restoreState(FacesContext _context,**
- **Object _state)**

**Description copied from interface: **StateHolder**

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a UICOMPONENT with event handlers, validators, etc.) this method must call the **StateHolder.restoreState(javax.faces.context.FacesContext,**
- **java.lang.Object)** method on all those instances as well.
Specified by:  
restoreState in interface StateHolder

Overrides:  
restoreState in class UIInput
javax.faces.component.html  Class HtmlSelectOneListbox

java.lang.Object  
  ❏ javax.faces.component.UIComponent  
    ❏ javax.faces.component.UIComponentBase  
      ❏ javax.faces.component.UIOutput  
        ❏ javax.faces.component.UIInput  
          ❏ javax.faces.component.html.HtmlSelectOne

All Implemented Interfaces:
  EditableValueHolder, StateHolder, ValueHolder

public class HtmlSelectOneListbox
  extends UILSelectOne

Extends: UIComponent > UICOMPONENTBASE > UIOutput > UINput > UILSelectOne

HTML  select
  rendererType "javax.faces.Listbox"  setRendererType()

Represents a single-selection component that is rendered as an HTML select element, showing either all available options or the specified number of options.

By default, the rendererType property must be set to "javax.faces.Listbox". This value can be changed by calling the setRendererType() method.

Constant Field Values

Constructor Detail

```java
public HtmlSelectOneListbox()
```

```java
HtmlSelectOneListbox
```

```java
public HtmlSelectOneListbox()
```

Method Detail

```java
public String getAccesskey()
```

```java
accesskey
```

getAccesskey

```java
public String getAccesskey()
```
Return the value of the accesskey property.

Contents: Access key that, when pressed, transfers focus to this element.

```java
public void setAccesskey(String accesskey)
```

```java
setAccesskey
```

Set the value of the accesskey property.

```java
public String getDir()
```

```java
getDir()
```

Return the value of the dir property.

Contents: Direction indication for text that does not inherit directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).
public void setDir(String dir)

dir

setDir

public void setDir(String dir)

Set the value of the dir property.

public boolean isDisabled()

disabled

false true disabled="disabled"

isDisabled

public boolean isDisabled()

Return the value of the disabled property.

Contents: Flag indicating that this element must never receive focus or be included in a subsequent submit. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as disabled="disabled".

public void setDisabled(boolean disabled)

disabled
**setDisabled**

public void setDisabled(boolean disabled)

Set the value of the disabled property.

---

**public String getDisabledClass()**

disabledClass

CSS

**getDisabledClass**

public String getDisabledClass()

Return the value of the disabledClass property.

Contents: CSS style class to apply to the rendered label on disabled options.

---

**public void setDisabledClass(String disabledClass)**

disabledClass

**setDisabledClass**

public void setDisabledClass(String disabledClass)

Set the value of the disabledClass property.
public String getEnabledClass()

    enabledClass

    CSS

getEnabledClass

public String getEnabledClass()

    Return the value of the enabledClass property.
    Contents: CSS style class to apply to the rendered label on enabled options.

public void setEnabledClass(String enabledClass)

    enabledClass

setEnabledClass

public void setEnabledClass(String enabledClass)

    Set the value of the enabledClass property.

public String getLabel()

    label
**getLabel**

```java
public String getLabel()
```

Return the value of the `label` property.

Contents: A localized user presentable name for this component.

---

**public void setLabel(String label)**

```java
label
```

---

**setLabel**

```java
public void setLabel(String label)
```

Set the value of the `label` property.

---

**public String getLang()**

```java
lang
```

---

**getLang**

```java
public String getLang()
```

Return the value of the `lang` property.
Contents: Code describing the language used in the generated markup for this component.

```
public void setLang(String lang)

  lang

setLang
```

Set the value of the `lang` property.

```
public String getOnblur()

  onblur

Javascript
```

Return the value of the `onblur` property.

Contents: Javascript code executed when this element loses focus.

```
public void setOnblur(String onblur)

  onblur
```
setOnblur

public void setOnblur(String onblur)

    Set the value of the onblur property.

public String getOnchange()

    onchange

Javascript

getOnchange

public String getOnchange()

    Return the value of the onchange property.
    Contents: Javascript code executed when this element loses focus and its value has been modified since gaining focus.

public void setOnchange(String onchange)

    onchange

setOnchange

public void setOnchange(String onchange)

    Set the value of the onchange property.
public String getOnclick()

    onclick

Javascript

getOnclick

public String getOnclick()

    Return the value of the onclick property.

    Contents: Javascript code executed when a pointer button is clicked over this element.

public void setOnclick(String onclick)

    onclick

setOnclick

public void setOnclick(String onclick)

    Set the value of the onclick property.

public String getOndblclick()

    ondblclick

Javascript
getOndblclick

public String getOndblclick()

    Return the value of the ondblclick property.
    
    Contents: Javascript code executed when a pointer button is double clicked over this element.

public void setOndblclick(String ondblclick)

    ondblclick

setOndblclick

public void setOndblclick(String ondblclick)

    Set the value of the ondblclick property.

public String getOnfocus()

    onfocus

Javascript

getOnfocus

public String getOnfocus()

    Return the value of the onfocus property.
Contents: Javascript code executed when this element receives focus.

public void setOnfocus(String onfocus)

  onfocus

setOnfocus

public void setOnfocus(String onfocus)

  Set the value of the onfocus property.

public String getOnkeydown()

  onkeydown

Javascript

getOnkeydown

public String getOnkeydown()

  Return the value of the onkeydown property.

  Contents: Javascript code executed when a key is pressed down over this element.

public void setOnkeydown(String onkeydown)

  onkeydown
setOnkeydown

public void setOnkeydown(String onkeydown)

Set the value of the onkeydown property.

---

public String getOnkeypress()

onkeypress

Javascript

getOnkeypress

public String getOnkeypress()

Return the value of the onkeypress property.

Contents: Javascript code executed when a key is pressed and released over this element.

---

public void setOnkeypress(String onkeypress)

onkeypress

setOnkeypress

public void setOnkeypress(String onkeypress)

Set the value of the onkeypress property.
public String getOnkeyup()

    onkeyup

Javascript

getOnkeyup

public String getOnkeyup()

    Return the value of the onkeyup property.

    Contents: Javascript code executed when a key is released over this element.

public void setOnkeyup(String onkeyup)

    onkeyup

setOnkeyup

public void setOnkeyup(String onkeyup)

    Set the value of the onkeyup property.

public String getOnmousedown()

    onmousedown

Javascript
**getOnmousedown**

public String getOnmousedown()

    Return the value of the onmousedown property.

    Contents: Javascript code executed when a pointer button is pressed down over this element.

**public void setOnmousedown(String onmousedown)**

    onmousedown

**setOnmousedown**

public void setOnmousedown(String onmousedown)

    Set the value of the onmousedown property.

**public String getOnmousemove()**

    onmousemove

**Javascript**

**getOnmousemove**

public String getOnmousemove()

    Return the value of the onmousemove property.
Contents: Javascript code executed when a pointer button is moved within this element.

```java
public void setOnmousemove(String onmousemove)

  onmousemove
```

`setOnmousemove`

```java
public void setOnmousemove(String onmousemove)

  Set the value of the onmousemove property.
```

```java
public String getOnmouseout()

  onmouseout
```

`getOnmouseout`

```java
public String getOnmouseout()

  Return the value of the onmouseout property.

  Contents: Javascript code executed when a pointer button is moved away from this element.

  ```java
  public void setOnmouseout(String onmouseout)

    onmouseout
  ```
**setOnmouseout**

public void setOnmouseout(String onmouseout)

Set the value of the onmouseout property.

**public String getOnmouseover()**

onmouseover

Javascript

**getOnmouseover**

public String getOnmouseover()

Return the value of the onmouseover property.

Contents: Javascript code executed when a pointer button is moved onto this element.

**public void setOnmouseover(String onmouseover)**

onmouseover

**setOnmouseover**

public void setOnmouseover(String onmouseover)

Set the value of the onmouseover property.
public String getOnmouseup()

    onmouseup

Javascript

getOnmouseup

public  String  getOnmouseup()

    Return the value of the onmouseup property.

    Contents: Javascript code executed when a pointer button is released over this element.

public void setOnmouseup(String onmouseup)

    onmouseup

setOnmouseup

public void setOnmouseup(String onmouseup)

    Set the value of the onmouseup property.

public String getOnselect()

    onselect

Javascript
getOnselect

public String getOnselect()

Return the value of the `onselect` property.

Contents: Javascript code executed when text within this element is selected by the user.

setOnselect

public void setOnselect(String onselect)

onselect

isReadonly

public boolean isReadonly()

readonly

false true readonly="readonly"
Return the value of the `readonly` property.

Contents: Flag indicating that this component will prohibit changes by the user. The element may receive focus unless it has also been disabled. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as `readonly="readonly"`.

```java
public void setReadonly(boolean readonly)
    readonly
```

`setReadonly`

```java
public void setReadonly(boolean readonly)
    Set the value of the `readonly` property.
```

```java
public int getSize()
    size
```

`getSize`

```java
public int getSize()
    Return the value of the `size` property.

    Contents: Number of available options to be shown at all times. If not specified, all available options are shown.
```
public void setSize(int size)

    size

setSize

public void setSize(int size)

    Set the value of the size property.

public String getStyle()

    style

CSS

getStyle

public String getStyle()

    Return the value of the style property.

    Contents: CSS style(s) to be applied when this component is rendered.

public void setStyle(String style)

    style
**setStyle**

```java
public void setStyle(String style)
```

Set the value of the `style` property.

---

**getStyleClass**

```java
public String getStyleClass()
```

### styleClass

CSS "class"

---

**getStyleClass**

```java
public String getStyleClass()
```

Return the value of the `styleClass` property.

Contents: Space-separated list of CSS style class(es) to be applied when this element is rendered. This value must be passed through as the "class" attribute on generated markup.

---

**setStyleClass**

```java
public void setStyleClass(String styleClass)
```

### styleClass

---

**setStyleClass**

```java
public void setStyleClass(String styleClass)
```

Set the value of the `styleClass` property.
public String getTabindex()

    tabindex

Tab 0 32767

getTabindex

public String getTabindex()

    Return the value of the tabindex property.

    Contents: Position of this element in the tabbing order for the current document. This value must be an integer between 0 and 32767.

public void setTabindex(String tabindex)

    tabindex

setTabindex

public void setTabindex(String tabindex)

    Set the value of the tabindex property.

public String getTitle()

    title
getTitle

```java
public String getTitle()
```

Return the value of the title property.

Contents: Advisory title information about markup elements generated for this component.

---

public void setTitle(String title)

title

setTitle

```java
public void setTitle(String title)
```

Set the value of the title property.

---

public Object saveState(FacesContext _context)

saveState

```java
public Object saveState(FacesContext _context)
```

**Description copied from interface: StateHolder**

Gets the state of the instance as a Serializable Object.

If the class that implements this interface has references to instances that implement StateHolder (such as a UIComponent with event handlers, validators, etc.) this method must call the
**`StateHolder.saveState(javax.faces.context.FacesContext)`** method on all those instances as well. **This method must not save the state of children and facets.** That is done via the **StateManager**

This method must not alter the state of the implementing object. In other words, after executing this code:

```java
Object state = component.saveState(facesContext);
```

`component` should be the same as before executing it.

The return from this method must be **Serializable**

**Specified by:**

- `saveState` in interface **StateHolder**

**Overrides:**

- `saveState` in class **UIInput**

---

```java
public void restoreState(FacesContext _context, Object _state)
```

**restoreState**

```java
public void restoreState(FacesContext _context,
                        Object _state)
```

**Description copied from interface: ** **StateHolder**

Perform any processing required to restore the state from the entries in the state Object.

If the class that implements this interface has references to instances that also implement StateHolder (such as a `UIComponent` with event handlers, validators, etc.) this method must call the **`StateHolder.restoreState(javax.faces.context.FacesContext, java.lang.Object)`** method on all those instances as well.
Specified by:

restoreState in interface StateHolder

Overrides:

restoreState in class UIInput
javax.faces.component.html  Class HtmlSelectOneMenu

java.lang.Object
  ▼ javax.faces.component.UIComponent
      ▼ javax.faces.component.UIComponentBase
          ▼ javax.faces.component.UIOutput
              ▼ javax.faces.component.UIInput
                  ▼ javax.faces.component.html.HtmlSelectOne
                      ▼ javax.faces.component.html.HtmlSelectOneMenu

All Implemented Interfaces:
   EditableValueHolder, StateHolder, ValueHolder

public class HtmlSelectOneMenu
extends UISelectOne

Represents a single-selection component that is rendered as an HTML select element, showing a single available option at a time.

By default, the rendererType property must be set to "javax.faces.Menu". This value can be changed by calling the setRendererType() method.

---

Field Detail

COMPONENT_TYPE

public static final String COMPONENT_TYPE

The standard component type for this component.

See Also:
Constant Field Values

Constructor Detail

HtmlSelectOneMenu

public HtmlSelectOneMenu()
Method Detail

getAccesskey

public String getAccesskey()

Return the value of the accesskey property.

Contents: Access key that, when pressed, transfers focus to this element.

setAccesskey

public void setAccesskey(String accesskey)

Set the value of the accesskey property.

getDir

public String getDir()

Return the value of the dir property.

Contents: Direction indication for text that does not inherit directionality. Valid values are "LTR" (left-to-right) and "RTL" (right-to-left).

setDir

public void setDir(String dir)

Set the value of the dir property.

isDisabled
public boolean isEnabled()

    Return the value of the disabled property.

    Contents: Flag indicating that this element must never receive focus or be included in a subsequent submit. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as disabled="disabled".

---

setDisabled

public void setDisabled(boolean disabled)

    Set the value of the disabled property.

---

getDisabledClass

public String getDisabledClass()

    Return the value of the disabledClass property.

    Contents: CSS style class to apply to the rendered label on disabled options.

---

setDisabledClass

public void setDisabledClass(String disabledClass)

    Set the value of the disabledClass property.

---

getEnabledClass

public String getEnabledClass()

    Return the value of the enabledClass property.
Contents: CSS style class to apply to the rendered label on enabled options.

---

**setEnabledClass**

public void `setEnabledClass(String enabledClass)`

Set the value of the `enabledClass` property.

---

**getLabel**

public `String getLabel()`

Return the value of the `label` property.

Contents: A localized user presentable name for this component.

---

**setLabel**

public void `setLabel(String label)`

Set the value of the `label` property.

---

**getLang**

public `String getLang()`

Return the value of the `lang` property.

Contents: Code describing the language used in the generated markup for this component.

---

**setLang**

public void `setLang(String lang)`
Set the value of the `lang` property.

---

**getOnblur**

```java
public String getOnblur()
```

Return the value of the `onblur` property.

Contents: Javascript code executed when this element loses focus.

---

**setOnblur**

```java
public void setOnblur(String onblur)
```

Set the value of the `onblur` property.

---

**getOnchange**

```java
public String getOnchange()
```

Return the value of the `onchange` property.

Contents: Javascript code executed when this element loses focus and its value has been modified since gaining focus.

---

**setOnchange**

```java
public void setOnchange(String onchange)
```

Set the value of the `onchange` property.

---

**getOnclick**

```java
public String getOnclick()
```
Return the value of the `onclick` property.

Contents: Javascript code executed when a pointer button is clicked over this element.

---

**setOnclick**

```java
public void setOnclick(String onclick)
```

Set the value of the `onclick` property.

---

**getOndblclick**

```java
public String getOndblclick()
```

Return the value of the `ondblclick` property.

Contents: Javascript code executed when a pointer button is double clicked over this element.

---

**setOndblclick**

```java
public void setOndblclick(String ondblclick)
```

Set the value of the `ondblclick` property.

---

**getOnfocus**

```java
public String getOnfocus()
```

Return the value of the `onfocus` property.

Contents: Javascript code executed when this element receives focus.
**setOnfocus**

public void setOnfocus(String onfocus)

Set the value of the onfocus property.

---

**getOnkeydown**

public String getOnkeydown()

Return the value of the onkeydown property.

Contents: Javascript code executed when a key is pressed down over this element.

---

**setOnkeydown**

public void setOnkeydown(String onkeydown)

Set the value of the onkeydown property.

---

**getOnkeypress**

public String getOnkeypress()

Return the value of the onkeypress property.

Contents: Javascript code executed when a key is pressed and released over this element.

---

**setOnkeypress**

public void setOnkeypress(String onkeypress)

Set the value of the onkeypress property.
**getOnkeyup**

```java
public String getOnkeyup()
```

Return the value of the onkeyup property.

Contents: Javascript code executed when a key is released over this element.

**setOnkeyup**

```java
public void setOnkeyup(String onkeyup)
```

Set the value of the onkeyup property.

**getOnmousedown**

```java
public String getOnmousedown()
```

Return the value of the onmousedown property.

Contents: Javascript code executed when a pointer button is pressed down over this element.

**setOnmousedown**

```java
public void setOnmousedown(String onmousedown)
```

Set the value of the onmousedown property.

**getOnmousemove**

```java
public String getOnmousemove()
```

Return the value of the onmousemove property.
Contents: Javascript code executed when a pointer button is moved within this element.

---

**setOnmousemove**

```java
public void setOnmousemove(String onmousemove)

Set the value of the onmousemove property.
```

---

**getOnmouseout**

```java
public String getOnmouseout()

Return the value of the onmouseout property.

Contents: Javascript code executed when a pointer button is moved away from this element.
```

---

**setOnmouseout**

```java
public void setOnmouseout(String onmouseout)

Set the value of the onmouseout property.
```

---

**getOnmouseover**

```java
public String getOnmouseover()

Return the value of the onmouseover property.

Contents: Javascript code executed when a pointer button is moved onto this element.
```

---

**setOnmouseover**
public void setOnmouseover(String onmouseover)

Set the value of the onmouseover property.

---

getOnmouseup

public String getOnmouseup()

Return the value of the onmouseup property.

Contents: Javascript code executed when a pointer button is released over this element.

---

setOnmouseup

public void setOnmouseup(String onmouseup)

Set the value of the onmouseup property.

---

getOnselect

public String getOnselect()

Return the value of the onselect property.

Contents: Javascript code executed when text within this element is selected by the user.

---

setOnselect

public void setOnselect(String onselect)

Set the value of the onselect property.

---

isReadonly
public boolean isReadonly()

    Return the value of the readonly property.

    Contents: Flag indicating that this component will prohibit changes by the user. The element may receive focus unless it has also been disabled. A value of false causes no attribute to be rendered, while a value of true causes the attribute to be rendered as readonly="readonly".

---

setReadonly

public void setReadonly(boolean readonly)

    Set the value of the readonly property.

---

getStyle

public String getStyle()

    Return the value of the style property.

    Contents: CSS style(s) to be applied when this component is rendered.

---

setStyle

public void setStyle(String style)

    Set the value of the style property.

---

getStyleClass

public String getStyleClass()

    Return the value of the styleClass property.
