

Welcome to the Krypton OutlookGrid Help

Krypton OutlookGrid v1.6.0

This is a sample conceptual topic. You can use this as a starting point for adding more conceptual content to your help project.

▲ Getting Started

To get started, add a documentation source to the project (a Visual Studio solution, project, or assembly and XML comments file). See the **Getting Started** topics in the Sandcastle Help File Builder's help file for more information. The following default items are included in this project:

- *ContentLayout.content* - Use the content layout file to manage the conceptual content in the project and define its layout in the table of contents.
- The *.Media* folder - Place images in this folder that you will reference from conceptual content using [mediaLink](#) or [mediaLinkInline](#) elements. If you will not have any images in the file, you may remove this folder.
- The *.Icons* folder - This contains a default logo for the help file. You may replace it or remove it and the folder if not wanted. If removed or if you change the file name, update the **Transform Args** project properties page by removing or changing the filename in the [logoFile](#) transform argument. Note that unlike images referenced from conceptual topics, the logo file should have its **BuildAction** property set to [Content](#).
- The *.Content* folder - Use this to store your conceptual topics. You may name the files and organize them however you like. One suggestion is to lay the files out on disk as you have them in the content layout file as shown in this project but the choice is yours. Files can be added via the Solution Explorer or from within the content layout file editor. Files must appear in the content layout file in order to be compiled into the help file.

See the **Conceptual Content** topics in the Sandcastle Help File Builder's help file for more information. See the **Sandcastle MAML Guide** for details on Microsoft Assistance Markup Language (MAML) which is used to create these topics.

Version 1.2.0

Krypton OutlookGrid v1.6.0

Version 1.2.0 was released on Jun 1, 2013.

▲ Changes in This Release

- + Added autohide column when grouped option
- + Added ability to sort groups by count value
- + Added function to expand/collapse only one group
- + Added date interval for DateTime GridGroup
- + Added month, quarter and day support for the OutlookGridDateTimeGroup
- + Added the group order is now taken into account when grouping a column by dragging it inside the groupBox
- + Added group sort order changed when dragging columns in the groupBox
- + Added column chooser in the integrated context menu (visible)
- + Added unlimited multi-column sorting by code or by clicking on column header with mouse left + holding shift key. Ungroup is done with holding Ctrl key
- unsort by using Ctrl key
- + Added persistence configuration (save / restore -sort of)
- + Added Group Image Click event
- + Added custom (x elements) text for group row
- * Fixed severe bug when initial group order was not taken into

account

- * Fixed bug where unused/wrong loops were done when sorting groups
- * Fixed issue #1471 "Adding TextImage column throws an null reference exceptions"
- * Various bug fixes
- - Removed OutlookGridYearGroup as it is now included in OutlookGridDateTimeGroup

Classes

	Class	Description
	CollapsedEventArgs	Class for Node collapsed events
	CollapsingEventArgs	Class for Node collapsing events
	ExpandedEventArgs	Class for Node expanding events
	ExpandingEventArgs	Class for Node expanding events
	KryptonOutlookGrid	Krypton DataGrid allowing nested groups and unlimited sorting
	KryptonOutlookGridGroupBox	GroupBox for the Krypton OutlookGrid
	OutlookGridAlphabeticGroup	This group simple example of an implementation where groups the items in an Alphabetic category

based only on the letter of each item this we need to override the Value property (for comparison) and a CompareTo function. Also the Clone method must be overridden. This Group object creates clones of itself. Cloning of the group used by the Outlook

	OutlookGridColumn	Column for the OutlookGrid
	OutlookGridColumnCollection	List of the current columns of the OutlookGrid
	OutlookGridColumnEventArgs	Class for events of column in the group
	OutlookGridDateTimeGroup	
	OutlookGridDefaultGroup	Each arrange/group class must implement the IOutlookGridComparable interface. The Group object will determine each object in the group whether it falls in or outside its group. The IComparable.CompareTo function to determine the item is in the group. This class groups elements by default.

		(string, int, ...)
	OutlookGridGroupBoxColumn	Column for the OutlookGrid Group
	OutlookGridGroupCollection	List of IOutlookGridGroup
	OutlookGridGroupHelpers	Class containing functions for the IOutlookGridGroup
	OutlookGridGroupImageEventArgs	Class for events (group image of a row.
	OutlookGridRow	<p>OutlookGridRow subclasses the DataGridView's DataGridViewRow. In order to support grouping with the look and feel as C# the behaviour of the DataGridViewRow is overridden by the OutlookGridRow. OutlookGridRow main additional properties: the Group belongs to and a IsRowGroup flag indicates whether OutlookGridRow behaves like a regular row (with data) or behave like a Group</p>
	OutlookGridRowNodeCancelEventBase	Base class

		OutlookGridRow^ cancellable event
	OutlookGridRowNodeCollection	List of IOutlookGridGrou
	OutlookGridRowNodeEventBase	Base class for OutlookGridRow^ events
	StaticValues	Static values

▲ Interfaces

	Interface	Description
	IOutlookGridGroup	IOutlookGridGroup specifies the interface of any implementation of a OutlookGridGroup class Each implementation of the IOutlookGridGroup can override the behaviour of the grouping mechanism Notice also that ICloneable must be implemented. The OutlookGrid makes use of the Clone method of the Group to create new Group clones. Related to this is the OutlookGrid.GroupTemplate property, which determines what type of Group must be cloned.

IOutlookGridGroup Interface

Krypton OutlookGrid v1.6.0

IOutlookGridGroup specifies the interface of any implementation of a OutlookGridGroup class Each implementation of the IOutlookGridGroup can override the behaviour of the grouping mechanism Notice also that ICloneable must be implemented. The OutlookGrid makes use of the Clone method of the Group to create new Group clones. Related to this is the OutlookGrid.GroupTemplate property, which determines what type of Group must be cloned.

[Copy](#)

```
public interface IOutlookGridGroup : IComparable,
    ICloneable
```

The IOutlookGridGroup type exposes the following members.

▲ Properties

	Name	Description
	AllowHiddenWhenGrouped	Allows the column to be hidden when it is grouped by
	Children	The children groups

Collapsed

indicates whether the group is collapsed. If it is collapsed, its group items (rows) will not be displayed.

Column

specifies which column is associated with this group

FormatStyle

Format style of the cell

GroupImage

Image associated to the group if any

Height

specifies the default height of the group each group is cloned from the GroupStyle object. Setting the height of this object will also set the default height of each group.

ItemCount

specifies the number of items that are part of the current group this value is automatically filled each time the grid is re-drawn e.g. after sorting the grid.

ItemsComparer

Gets or sets the items comparer.

	Level	The level in the depth of groups
	OneItemText	The text associated for the group text (1 item)
	ParentGroup	The parent group if any
	Rows	The list of the rows contained in a group
	SortBySummaryCount	Sort groups using count items value
	Text	the text to be displayed in the group row
	Value	determines the value of the current group. this is used to compare the group value against each item's value.

OutlookGridAlphabeticGroup Class

Krypton OutlookGrid v1.6.0

This group simple example of an implementation which groups the items into Alphabetic categories based only on the first letter of each item For this we need to override the Value property (used for comparison) and the CompareTo function. Also the Clone method must be overridden, so this Group object can create clones of itself. Cloning of the group is used by the OutlookGrid

OutlookGridDefaultGroup Class

Krypton OutlookGrid v1.6.0

Each arrange/grouping class must implement the `IOutlookGridGroup` interface the Group object will determine for each object in the grid, whether it falls in or outside its group. It uses the `IComparable.CompareTo` function to determine if the item is in the group. This class group the elements by default (string, int, ...)

OutlookGridRow Class

Krypton OutlookGrid v1.6.0

OutlookGridRow - subclasses the DataGridView's DataGridViewRow class In order to support grouping with the same look and feel as Outlook, the behaviour of the DataGridViewRow is overridden by the OutlookGridRow. The OutlookGridRow has 2 main additional properties: the Group it belongs to and a the IsRowGroup flag that indicates whether the OutlookGridRow object behaves like a regular row (with data) or should behave like a Group row.

Parameters

graphics

Type: [System.Drawing.Graphics](#)

The graphics.

clipBounds

Type: [System.Drawing.Rectangle](#)

The clip bounds.
cellBounds
Type: [System.Drawing.Rectangle](#)
The cell bounds.

rowIndex
Type: [System.Int32](#)
Index of the row.

cellState
Type: [System.Windows.Forms.DataGridViewElementStates](#)
State of the cell.

value
Type: [System.Object](#)
The value.

formattedValue
Type: [System.Object](#)
The formatted value.

errorText
Type: [System.String](#)
The error text.

cellStyle
Type: [System.Windows.Forms.DataGridViewCellStyle](#)
The cell style.

advancedBorderStyle
Type: [System.Windows.Forms.DataGridViewAdvancedBorderStyle](#)
The advanced border style.

paintParts
Type: [System.Windows.Forms.DataGridViewPaintParts](#)
The paint parts.
