This help file describes the configuration applet for the LEGO USB Tower. The applet allows you to set the default configuration for the towers connected to your PC.

**General Configuration**

**Advanced Configuration**

**Diagnostics**

Remember that the configuration parameters you set on the control panel are the default ones, and that specific applications can still change those values (e.g. range, communication mode, etc.) in order to fit their needs.
General Configuration

Infrared Range
You can use these radio controls to select the default range of your tower.

- *Short range* is about one meter
- *Medium range* is about 5-6 meters
- *Long range* is 10+ meters, depending on the environment conditions

In order for the tower to operate in long range, it needs to draw a higher amount of power from the PC. Therefore the long-range option is enabled only if you check the *Enable long range infrared transmission* check box (see below).

Enable Long Range Infrared Transmission
This checkbox enables the tower to be set in long range, but this requires the tower to draw more current from the PC. Typically, bus-powered USB hubs (and sometimes battery-powered notebooks) won't be able to deliver the requested amount of power. When this is the case, this option is disabled on the control panel.

If you enable long range and later on plug the tower on a hub that can't deliver the needed power, Windows will pop up with a dialog box inviting you to plug the device to a different hub. You can just press No and dismiss the dialog, as the tower driver will automatically scale down to low power consumption.

Default Communication Mode
Your LEGO USB Tower can use two different communication means: infrared (IR) and visible light link (VLL). Infrared is the default communication mode and is used to communicate with RCX and Scout bricks, remote controls, etc. VLL is used to communicate with the Scout and MicroScout bricks (the Droid Developer Kit ones).
N.B. The tower can only transmit VLL signals; it can't receive.

**Reset**

Pressing this button will automatically reset the configuration to the factory settings.
Advanced Configuration

This panel allow you to set some advanced defaults for the LEGO USB Tower device driver. You should never need to modify those values.

Timeouts

These edit controls let you change the default driver I/O timeouts. Values are in milliseconds.

- Write timeout
Diagnostics

This pane shows some diagnostic information that allows you to see whether your USB tower is correctly configured and accessible by applications. If you have more than one tower attached, you can switch from one to the other by using the Next tower and Previous tower buttons.

If currently there are no towers attached, the pane will display no information.
