

Select Menu from Project Library File Dialog Box

Installed With: Base Package

In the [Insert Subpalette](#) dialog box, select the **Link to palette file in a project library** option, and select a [LabVIEW project library](#) from the file dialog box to display this dialog box. If the project library does not own a menu file, the dialog box does not display.

Use this dialog box to select a project library menu file to add to the palettes.

This dialog box includes the following components:

- **Available Project Library Menu Files**—Lists the menu files that are part of the project library. If a project library includes duplicate menu files, this list includes only the first instance of the menu file. LabVIEW searches each level of the list, starting with the top-most level, to find the first instance.
- **Always use the default project library menu**—Specifies whether to use the **Default Menu** for the project library. Use the [Project Library Properties](#) dialog box to set the default menu.
- **Default Menu**—Lists the default menu for the project library.
